Instructions to Bidders

A. INTRODUCTION

1. **Scope of Bid**

1.1. The Procuring agency/Employer (PA), as indicated in the Bid Data Sheet (BDS) invites Bids for the execution of Works as specified in the BDS and Section V- Works Requirements. The name, identification, and number of lots (contracts) of this National/ International Competitive Bidding process are specified in the BDS.

2. **Source of Funds**

2.1. Source of funds as referred in Clause 2 of Bid Data Sheet.

3. **Eligible Bidders**

3.1. A bidder may be natural person, company or firm or public or semi-public agency of Pakistan or any foreign country, or any combination of them with a formal existing agreement (on Judicial Papers) in the form of a joint venture or consortium. In the case of a joint venture or consortium, all members shall be jointly and severally liable for the execution of the Contract in accordance with the terms and conditions of the Contract. The joint venture or consortium shall nominate a Lead Member as nominated in the BDS, who shall have the authority to conduct all business for and on behalf of any and all the members of the joint venture or consortium during the Bidding process, and in case of award of contract, during the execution of contract. Verifiable copy of the agreement that forms a joint venture, consortium or association shall be required to be submitted as part of the Bid.

Any bid submitted by the joint venture, consortium or association shall indicate the part of proposed contract to be performed by each party and each party shall be evaluated (or post qualified if required) with respect to its contribution only, and the responsibilities of each party shall not be substantially altered without prior written approval of the Procuring Agency and in line with any instructions issued by the Authority.

(The limit on the number of members of JV or Consortium may be prescribed

in BDS, in accordance with the guidelines issued by the PPRA).

3.2. The invitation for bids is open to all prospective bidders subject to any provisions of incorporation or licensing by the respective national/ international incorporating agency or statutory body established for that particular trade or business. Procuring agencies shall specify the registration/licensing requirements for the foreign bidder keeping in view the requirement of that business.

3.3. A Bidder shall not have a conflict of interest. All Bidders found to have a conflict of interest shall be disqualified. A Bidders may be considered to have a conflict of interest with one or more parties in this Bidding process, if they:

3.3.1. are associated or have been associated in the past, directly or indirectly with a firm or any of its affiliates which have been engaged by the Procuring agency/Employer to provide consulting services for the preparation of design or technical specifications of the works that are the subject of the bid; or

3.3.2. have controlling shareholders in common; or

3.3.3. receive or have received any direct or indirect subsidy from any of them; or

3.3.4. have the same legal representative for purposes of this Bid; or

3.3.5. have a relationship with each other, directly or through common third parties, that puts them in a position to have access to information about or influence on the bid of another bidder, or influence the decisions of the Procuring agency/Employer regarding this Bidding process; or

3.3.6. Submit more than one bid in this bidding process.

3.4. A Bidder may be ineligible if –

3.4.1. he is declared bankrupt or, in the case of company or firm, insolvent;

3.4.2. payments in favor of the bidder is suspended in accordance with the judgment of a court of law other than a judgment declaring bankruptcy and resulting (in accordance with the national laws) in the total or partial loss of the right to administer and dispose of its property;

3.4.3. the bidder is convicted, by a final judgment of a Court of Law or relevant Professional Statuary Body, of any offence involving professional conduct;

3.4.4. The bidder is debarred/ blacklisted by a national level Procuring agency/Employer and hence debarred due to involvement in corrupt and fraudulent practices, or performance failure or due to breach of bid securing declaration.

3.5. As and when required, bidders shall provide to the Procuring agency/Employer evidence of their eligibility, proof of compliance with the necessary legal requirements to carry out the contract effectively.

3.6. Bidders shall submit proposal relating to the nature, conditions and modalities of sub-contracting wherever the sub-contracting of any elements of the contract is envisaged.

4. **Eligible Material and Equipment**

4.1. All the material and equipment to be mobilized under the contract shall have their origin in eligible source countries, and all expenditures made under the contract will be limited to such materials and equipment. For this purpose, ineligible countries are stated in the section-IV titled as “Eligible Countries”.

B.BIDDING DOCUMENTS

1. **Contents of Bidding Documents**

1.1. The scope of Works, bidding procedures, and terms and conditions of the contract are prescribed in the bidding documents. In addition to the Invitation for Bids, the bidding documents which should be read in

conjunction with any addenda issued in accordance with ITB 7.1 include:

Section I -Invitation for Bids

Section II Instructions to Bidders (ITBs)

Section III Bid Data Sheet (BDS)

Section IV Eligible Countries

Section V Evaluation and Qualification Criteria

Section VI Works Requirements Technical Specifications & Schedule of Requirements

Section VII Standard Bidding Forms

Section VIII General Conditions of Contract (GCC)

Section IX Particular Conditions of Contract (PCC)

Section X Contract Forms

1.2. The bidder is expected to examine all instructions, forms, specifications, terms and conditions prescribed in the bidding documents. Failure to furnish all the information required in the bidding documents will be at the bidder’s risk and may result in the rejection of his bid.

2. **Clarification of Bidding Document, Pre-bid Meeting**

2.1. A prospective bidder requiring any clarification of the bidding document may notify the Procuring agency/Employer throughEPADS.

2.2. The Procuring agency/Employer shall respond to the request for clarification in accordance with Rule 31 of the Public Procurement Rules 2004.

2.3. Should the Procuring Agency deem it necessary to amend the BIDDING document as a result of a clarification, it shall do so following the procedure under ITB 7.

2.4. If indicated in the BDS, the bidder’s designated representative is invited at the bidder’s cost to attend a pre-bid meeting at the place, date and time mentioned in the BDS. During this pre-bid meeting, prospective bidders may request clarification of the schedule of requirement, the evaluation criteria or any other aspects of the bidding documents.

2.5. Minutes of the pre-bid meeting, if applicable, including the text of the questions asked by bidders, including those during the meeting (without identifying the source) and the responses given, together with any responses prepared after the meeting will be uploaded on EPADS. Any modification to the bidding documents that may become necessary as a result of the pre-bid meeting shall be made by the Procuring agency/Employer exclusively through the use of an Addendum pursuant to ITB 7. Non-attendance at the pre-bid meeting will not be a cause for disqualification of a bidder.

2.6. The bidder is advised to visit and examine the Site of Works and its surroundings and obtain for itself on its own responsibility all information that may be necessary for preparing the bid and entering into a contract for construction of the Works. The costs of visiting the Site shall be at the bidder’s own expense.

2.7. The bidder and any of its authorized personnel will be granted permission by the Procuring agency/Employer to enter upon its premises and lands for the purpose of such visit, but only upon the express condition that the bidder and its personnel will release and indemnify the Procuring agency/Employer from and against all liability in respect thereof, and will be responsible for death or personal injury, loss of or damage to property, and any other loss, damage, costs, and expenses incurred as a result of the inspection.

3. **Amendment of Bidding Documents**

3.1. The procuring agency may issue notification of any change, addition, modification or deletion in accordance with Rule 23 of the Public Procurement Rules 2004i.e.Bidding Documents.

3.2. To give prospective bidders reasonable time in which to take an addendum/corrigendum into account in preparing their bids, the Procuring agency/Employer may, at its discretion, extend the deadline for the submission of bids:
Provided that the Procuring agency/Employer shall extend the deadline for submission of bid in pursuance of Rule 27 of the Public ProcurementRules 2004,i.e. Extension of time for submission of bids, if such an addendum is

issued within last three (03) days of the bid submission deadline.

C. PREPARATION OF BIDS

1. **Language of Bid**

1.1. The bid prepared by the bidder, as well as all correspondence and documents relating to the bid exchanged by the bidder and the Procuring agency/Employer shall be written in the English language unless specified in the BDS. Supporting documents and printed literature furnished by the bidder may be in another language provided they are accompanied by an accurate translation of the relevant pages in the English language unless specified in the BDS, in which case, for purposes of interpretation of the bidder, the translation shall govern.

2. **Documents Constituting the Bids**

2.1. The Bids prepared by the Bidder shall constitute of all the documents required in the BDS.

3. **Documents Establishing Eligibility of Material, Equipment and Works, their Conformity to Bidding Documents**

3.1. The bid prepared by the bidder shall constitute the following components: -

3.1.1. Documentary evidence established in accordance with ITB 10 that the material and equipment to be utilized by the Bidder for the executions of works are eligible material and equipment and conform to the Bidding Documents;

3.1.2. Documentary evidence established in accordance with ITB 11 that the bidder has been authorized to carry out the Construction works;

3.1.3. Documentary evidence established in accordance with ITB 11 that the bidder is eligible and/or qualified for the subject bidding process;

3.1.4. Form of Bid and Bid Prices completed in accordance with ITB 12 and 13;

3.1.5. Completed schedules as required, including priced Bill of Quantities in accordance with ITB 13.

3.1.6. Technical Proposal completed in all aspects in accordance with ITB-15.

3.1.7. Bid security or Bid Securing Declaration furnished in accordance with ITB 17;

3.1.8. Any other document required in the BDS.

3.2. In addition to the requirements, bids submitted by a JV shall include a copy of the Joint Venture Agreement entered into by all members. Alternatively, a letter of intent to execute a Joint Venture Agreement in the event of a successful bid shall be signed by all members and submitted with the bid, together with a copy of the proposed Agreement.

3.3. The bidder shall furnish, as part of its bid, all those documents establishing the eligibility in conformity to the terms and conditions specified in the bidding documents for all material, equipment and works which the bidder proposes to execute.

3.4. The documentary evidence of conformity of the material, equipment and works to the Bidding Documents may be in the form of literature, drawings, and data, and shall consist of:

3.4.1. a detailed description of the work methodology, approach, schedule and resources to be mobilized at site;

3.4.2. an item-by-item commentary on the Procuring agency/Employer’s Technical Specifications demonstrating substantial responsiveness of the material, equipment and works to those specifications, or a statement of deviations and exceptions to the provisions of the Technical Specifications;

3.4.3. any other procurement specific documentation requirement as stated in the BDS.

3.5. The required documents and other accompanying documents must be in English. In case any other language than English is used the pertinent translation into English shall be attached to the original version.

4. **Documents Establishing Eligibility and Qualification of the Bidder**

4.1. The bidder shall furnish, as part of its bid, all those documents establishing the bidder's eligibility to participate in the bidding process and/or its qualification to perform the contract if its bid is accepted.

4.2. The documentary evidence of the bidder's eligibility to bid shall establish to the satisfaction of the Procuring agency/Employer that the bidder, at the time of submission of its bid, is from an eligible country as defined in Section-IV titled as "Eligible Countries".

4.3. The documentary evidence of the bidder's qualification to perform the contract if its bid is accepted shall establish to the satisfaction of Procuring agency/Employer that:

4.3.1. The bidder has the financial and technical capability necessary to perform the Contract, meets the qualification criteria specified in Section-V, Evaluation and Qualification Criteria and BDS.

4.3.2. In the case of a bidder not doing business within Pakistan, the bidder is or will be (if awarded the contract) represented by a local bidder (Joint Venture) in accordance with the PEC works bylaws, and in case of award of works such foreign firm is required to participate in the execution of works to carry out its obligations as prescribed in the Conditions of Contract and /or Technical Specifications.

4.3.3. That the bidder meets the qualification criteria listed in Section-V, Evaluation and Qualification Criteria and BDS.

5. **Forms of Bid**

5.1. The Bidder shall fill the Form of Bids furnished in the bidding documents. The Bids Form must be completed without any alterations to its format and no substitute shall be accepted.

6. **Bid Prices**

6.1. The bid prices quoted by the bidder in the Standard bid Forms, Bill of Quantities and in the Price Schedules shall conform to the requirements specified below or exclusively mentioned hereafter in the bidding documents.

6.2. The bidder shall fill in rates and prices for all items of the Works described in the Bill of Quantities. If a Price Schedule shows items listed but not priced, their prices shall be construed to be included in the prices of other items in the Bill of Quantities and will not be paid for separately by the Procuring agency/Employer.

6.3. Items not listed in the Price Schedule shall be assumed not to be included in the bid, and provided that the bid is still substantially responsive in their absence or due to their nominal nature, the corresponding average price of the respective item(s) of the remaining substantially responsive bidder(s) shall be construed to be the price of those missing item(s):
Provided that:

6.3.1. where there is only one (substantially) responsive bidder, or

6.3.2. where there is provision for alternate proposals and the respective items are not listed in the other bids,
The Procuring agency/Employer may fix the price of missing items in accordance with market survey, and the same shall be considered as final price.

6.4. The Bid price to be quoted in the Form of Bid in accordance with ITB 12 shall be the total price of the bid.

6.5. Unless otherwise specified in the BDS and the Contract, the rates and prices quoted by the bidder are subject to adjustment during the performance of the Contract in accordance with the provisions of the

Conditions of Contract.

6.6. If so specified in ITB 1.1, bids may be invited for individual lots (contracts) or for any combination of lots (packages).

6.7. Prices quoted by the Bidder shall be fixed during the bidder's performance of the contract and not subject to variation on any account. A bid submitted with an adjustable price will be treated as non-responsive and shall be rejected, pursuant to ITB 27, unless otherwise price adjustment is permissible under Conditions of the Contract.

6.8. All duties, taxes, and other levies payable by the Contractor under the Contract, or for any other cause, as of the date twenty-eight (28) days prior to the deadline for submission of bids, shall be included in the rates and prices and the total bid price submitted by the bidder.

7. **Currencies of Bid and Payment**

7.1. Prices shall be quoted in Pakistani Rupees unless otherwise specified in the BDS. Comparison of bids and tie of bid shall be treated in accordance withthe Rule 30(2) of Public ProcurementRules, 2004.

8. **Documents Comprising the Technical Proposal**

8.1. The bidder shall furnish a Technical Proposal including a statement of work methods, equipment, personnel, schedule and any other information as stipulated in Section VII – Standard Bid Forms, in sufficient detail to demonstrate the adequacy of the bidder's proposal to meet the work requirements and the completion time.

9. **Bid Validity Period**

9.1. Bids shall remain valid for the period specified in the BDS after the bid submission deadline prescribed by the Procuring agency/Employer. A bid valid for a shorter period shall be rejected by the Procuring agency/Employer as non-responsive. The period of bid validity will be determined from the complementary bid securing instrument i.e. the expiry period of bid security or bid securing declaration as the case may be.

9.2. Under exceptional circumstances, prior to the expiration of the initial Bids/Bid validity period, the Procuring Agency may request the Bidders' consent to an extension of the period of validity of their Bids/Bid. Such request for extension of the period of bid validity shall be carried out in accordance with Rule 26 ofthe Public ProcurementRules, 2004.

10. **Bid Security or Bid Securing Declaration**

10.1. Pursuant to ITB 11.1 unless otherwise specified in the BDS, the bidder shall furnish as part of its bid, a Bid Security in accordance with Rule 25ofthe Public ProcurementRules, 2004in the amount and currency specified in the BDS or Bid Securing Declaration as specified in the BDS in the format provided in Section VII (Standard Bidding Forms).

In case Procuring agency/Employer is inviting bids in lots / packages, the bidder shall be required to submit his bid security against the respective lot/ package for which he is submitting his bid.

Until the development of functionality of auto verification of financial instrument in EPADS, the scanned copy of bid security or bid securing declaration, as the case may be, shall be uploaded on E-PADS whereas the original instrument to be submitted to the procuring agency before closing of bid submission deadline,

10.2. The Bid Security shall be denominated in the local currency or in another freely convertible currency, and it shall be in the form specified in the **BDS** which shall be in any of the following:

10.2.1. A bank guarantee, an irrevocable letter of credit issued by a Scheduled bank in the form provided in the Bidding Documents or another form acceptable to the Procuring agency/Employer and valid for twenty-eight (28) days beyond the end of the validity of the Bid. This shall also apply if the period for Bid Validity is extended. In either case, the form must include the complete name of the bidder;

10.2.2. A cashier's or certified cheque; or

10.2.3. Another security as indicated in the **BDS**.

10.3. The Bid Security or Bid Securing Declaration shall be in accordance with the Form of the Bid Security or Bid Securing Declaration included in Section VII (Standard Bidding Forms) or another form approved by the Procuring agency/Employer prior to the bid submission.

10.4. The Bid Security shall be payable promptly upon written demand by the Procuring agency/Employer in case any of the conditions listed in ITB 17.9 are invoked.

10.5. Any bid not accompanied by a Bid Security or Bid Securing Declaration in accordance with ITB 17.1 or 17.3 shall be rejected by the Procuring agency/Employer and shall be declared as non-responsive bid, pursuant to ITB 27.

10.6. Unsuccessful bidders' Bid Security will be discharged or returned as promptly as possible, however in no case later than thirty (30) days after the expiration of the period of Bid Validity prescribed by the Procuring agency/Employer pursuant to ITB 16. The Procuring agency/Employer shall make no claim to the amount of the Bid Security, and shall promptly return the Bid Security document, after whichever of the following that occurs earliest:

10.6.1. The expiry of the Bid Security;

10.6.2. The entry into force of a procurement contract and the provision of a performance security (or guarantee), for the performance of the contract if such a security (or guarantee), is required by the Biding documents;

10.6.3. The rejection by the Procuring agency/Employer of all Bids;

10.6.4. The withdrawal of the bid prior to the deadline for the submission of bids, unless the biding documents stipulate that no such withdrawal is permitted.

10.7. The successful bidder's Bid Security will be discharged upon the bidder signing the contract pursuant to ITB 40, or furnishing the performance security (or guarantee), pursuant to ITB 41.

10.8. The Bid Security may be forfeited or the Bid Securing Declaration executed:

10.8.1. if a Bidder:

10.8.1.1. Withdraws its Bid during the period of Bid Validity as specified by the Procuring agency/Employer, and referred by the bidder on the Form of Bid except as provided for in ITB 16.2; or

10.8.2. In the case of a successful bidder, if the bidder fails:

10.8.2.1. to sign the contract in accordance with ITB 40; or

10.8.2.2. to furnish performance security (or guarantee) in accordance with ITB 41.

10.9. In case of Bid Security issued by the foreign bank is allowed by the Procuring agency/Employer, the same should be counter guaranteed by a corresponding bank in Pakistan. Furthermore, in case of joint venture, it should be in the name of Joint venture to ensure joint responsibility. In case the JV is not legally constituted at the time of bid submission, the bid security or bid securing declaration shall be in the names of all future members as named in the letter of bid.

11. **Withdrawal of Bids**

11.1. Before bid submission deadline, any bidder may withdraw, substitute, or modify its bid after it has been submitted by sending a written notice, duly signed by an authorized representative, and the corresponding must accompany the respective written notice.

12. **Format and Signing of Bid**

12.1. The Bidder shall prepare and submit Bids through EPADS with due diligence after carefully reading all the terms and condition before bid submission deadline.

D. SUBMISSION OF BIDS

1. **Submission of Bids through EPADS v2.0**

1.1. All bids shall be submitted through EPADS v2.0.

2. **Deadline for Submission of Bids**

2.1. All bids shall be received through **EPADS v2.0** not later than bid submission deadline as specified in the **BDS**.

2.2. The Procuring agency/Employer may, under exceptional circumstances and at its discretion, extend the deadline for the submission of bids, pursuant to Rule 27ofthe Public ProcurementRules, 2004.Extension of Time for submission of bid, by amending the Bidding Documents in accordance with ITB 7, in which case all rights and obligations of the Procuring agency/Employer and bidders previously subject to the deadline will thereafter be subject to the new deadline.

3. **Substitution and Modification of bids**

3.1. A bidder may substitute or modify his bid after it has been submitted, provided that written notice of the substitution or modification of the bid, is received by the Procuring agency/Employer prior to the deadline for submission of bids.

3.2. Revised bid may be submitted after the substitution or modification made in the original bid in accordance with the provisions referred in **ITB 18** .

E. OPENING AND EVALUATION OF BIDS

1. **Opening of Bids**

1.1. The Procuring Agency will open bids in accordance with Rule 28ofthe Public ProcurementRules, 2004and as specified in the BDS.

2. **Confidentiality**

2.1. Information relating to the examination, clarification, evaluation and comparison of bids and recommendation of contract award shall not be disclosed to bidders or any other persons not officially concerned with such process until the time of the announcement of the respective evaluation report.

3. **Clarification of Bids**

3.1. Clarification of Bidding Documents shall be carried out in accordance with Rule 31ofthe Public ProcurementRules, 2004.

3.2. The alteration or modification in the bid which in any case affect the following parameters will be considered as a change in the substance of a bid:

3.2.1. evaluation & qualification criteria;

3.2.2. required scope of work;

3.2.3. contract price;

3.2.4. all securities requirements;

3.2.5. tax requirements;

3.2.6. terms and conditions of bidding documents.

3.2.7. change in the ranking of the bidder

4. **Preliminary Examination of Bids**

4.1. Prior to the detailed evaluation of bids, the Procuring agency/Employer will determine whether each bid:

4.1.1. meets the eligibility criteria defined in **ITB 3** and **ITB 4**;

4.1.2. has been prepared as per the format and contents defined by the Procuring agency/Employer in the bidding documents;

4.1.3. has been properly signed;

4.1.4. is accompanied by the required securities; and

4.1.5. is substantially responsive to the requirements of the bidding documents.

The Procuring agency/Employer's determination of a bid's substantial responsiveness will be based on the contents of the bid itself.

4.2. A substantially responsive Bid is one which conforms to all the terms, conditions, and specifications of the Bidding Documents, without material deviation or reservation. A material deviation or reservation is one that: -

4.2.1. affects in any substantial way the scope, quality, or performance of the Works;

4.2.2. limits in any substantial way, inconsistent with the bidding documents, the Procuring agency/Employer's rights or the bidders' obligations under the Contract; or

4.2.3. if rectified, would affect unfairly the competitive position of other bidders presenting substantially responsive bids.

4.3. The Procuring agency/Employer will confirm that the documents and information specified under ITB 9, 10 and 11 have been provided in the bid. If any of these documents or information is missing, or is not provided in accordance with the Instructions to Bidders, the bid shall be rejected.

4.4. The Procuring agency/Employer may waive-off any minor informality, nonconformity, or irregularity in a bid which does not constitute a material deviation, provided such waiver does not prejudice or affect the relative ranking of any Bidder.

Explanation: A minor informality, non-conformity or irregularity is one that is merely a matter of form and not of substance. It also pertains to some immaterial defect in a Bid or variation of a bid from the exact requirements of the invitation that can be corrected or waived without being prejudicial to other bidders. The defect or variation is immaterial when the effect on quantity, quality, or delivery is negligible when contrasted with the total cost or scope of the works. The Procuring agency/Employer either shall give the bidder an opportunity to cure any deficiency resulting from a minor

informality or irregularity in a bid or waive the deficiency, whichever is advantageous to the Procuring agency/Employer. Examples of minor informalities or irregularities include failure of a bidder to –

4.4.1. *Submit the number of copies of signed bids required by the invitation;*

4.4.2. *Furnish required information concerning the number of its employees;*

4.4.3. *the firm submitting a bid has formally adopted or authorized, before the date set for opening of bids, the execution of documents by typewritten, printed, or stamped signature and submits evidence of such authorization and the bid carries such a signature.*

4.5. Provided that a Technical Bid is substantially responsive, the Procuring agency/Employer may request the bidder to submit the necessary information or documentation, within a reasonable period of time, to rectify nonmaterial nonconformities or omissions in the Technical Bid related to documentation requirements. Requesting information or documentation on such nonconformities shall not be related to any such aspect of the technical Proposal linked with the ranking of the bidders. Failure of the bidder to comply with the request may result in the rejection of its bid.

4.6. Provided that a Technical Bid is substantially responsive, the Procuring agency/Employer shall rectify quantifiable nonmaterial nonconformities or omissions related to the Financial Proposal. To this effect, the Bid Price shall be adjusted, for comparison purposes only, to reflect the price of the missing or nonconforming item or component.

4.7. If a bid is not substantially responsive, it will be rejected by the Procuring agency/Employer and may not subsequently be evaluated for complete technical responsiveness.

5. **Examination of Terms and Conditions; Technical Evaluation**

5.1. The Procuring agency/Employer shall examine the bid to confirm that all terms and conditions specified in the **GCC** and the **PCC** have been accepted

by the bidder without any material deviation or reservation.

For this purpose:

“Deviation” means departure from the requirements specified in the Bidding Document.

“Reservation” means setting of limiting conditions or withholding from complete acceptance of the requirements specified in the Bidding Document.

5.2. The Procuring agency/Employer shall evaluate the technical aspects of the bid submitted in accordance with ITB 30, to confirm that all requirements specified in Section VI – Works Requirement, Technical Specifications of the Bidding Documents have been met without material deviation or reservation.

5.3. If after the examination of the terms and conditions and the technical evaluation, the Procuring agency/Employer determines that the bid is not substantially responsive in accordance with ITB 27, it shall reject the bid.

6. **Correction of Arithmetic Errors**

6.1. Bids determined to be substantially responsive will be checked for any arithmetic errors. Errors will be corrected as follows: -

6.1.1. if there is a discrepancy between unit prices and the sub-total price that is obtained by multiplying the unit price and quantity, the unit price shall prevail, and the sub-total price shall be corrected, unless in the opinion of the Procuring agency/Employer there is an obvious misplacement of the decimal point in the unit price, in which the total price as quoted shall govern and the unit price shall be corrected;

6.1.2. if there is an error in a total corresponding to the addition or subtraction of sub-totals, the sub-totals shall prevail, and the total shall be corrected; and

6.1.3. where there is a discrepancy between the amounts in figures and in words, the amount in words will govern.

6.1.4. Where there is discrepancy between grand total of price schedule and amount mentioned on the Form of Bid, the amount referred in Price Schedule shall be treated as correct subject to elimination of other errors.

6.2. The amount stated in the Bid will, be rectified by the Procuring agency/Employer in accordance with the above procedure for the correction of errors and, with, the concurrence of the bidder, shall be considered as binding upon the bidder. If the bidder does not accept the corrected amount, its bid shall be rejected after forfeiture of Bid Security or execution of the Bid Securing Declaration, as the case may be, in accordance with **ITB 41.3**.

7. **Conversion to Single Currency**

7.1. The unit rates and the prices shall be quoted by the bidder entirely in Pak rupees. A bidder expecting to incur expenditures in other currencies for inputs to the Works from outside the Procuring agency/Employer's country (referred to as the "Foreign Currency Requirements") shall indicate the same in the letter of bid-financial proposal. The proportion of the Bid Price (excluding Provisional Sums) needed by him for the payment of such Foreign Currency Requirements either (i) entirely in the currency of the Bidder's home country or, (ii) at the bidder's option, entirely in Pak rupees provided always that a bidder expecting to incur expenditures in a currency or currencies other than those stated in (i) and (ii) above for a portion of the foreign currency requirements, and wishing to be paid accordingly, shall indicate the respective portions in his bid. Comparison of bids quoted in different currencies and conversion of bids into a single currency shall be carried out in accordance with Rule 30(2)ofthe Public ProcurementRules, 2004**.**

8. **Evaluation of Bids**

8.1. The Procuring agency/Employer shall evaluate and compare only the bids determined to be substantially responsive, pursuant to **ITB 27**.

8.2. In evaluating the Technical Proposal of each Bid, the Procuring agency/Employer shall use the criteria and methodologies listed in the BDS

and in terms of works requirement. No other evaluation criteria or methodologies shall be permitted.

8.3. The Procuring agency/Employer's evaluation of a bid will take into account:

8.3.1. the bid price, excluding provisional sums and the provision, if any, for contingencies in the summary bill of quantities, but including day work items, where priced competitively;

8.3.2. converting the amount resulting from applying above, if relevant, to a single currency in accordance with ITB 29;

8.4. The estimated effect of the price adjustment provisions of the Conditions of Contract, applied over the period of execution of the Contract, shall not be taken into account in bid evaluation.

8.5. If these bidding documents allow bidders to quote separate prices for different lots, and the award to a single bidder of multiple lots, the methodology of evaluation to determine the lowest evaluated lot combinations in the Form of Bid, is specified in the **BDS**.

8.6. If the bid, which results in the Evaluated Bid Price (Successful Bid), is seriously unbalanced or front loaded in the opinion of the Employer, the Employer may require the Bidder to produce detailed price analyses for any or all items of the Bill of Quantities, to demonstrate the internal consistency of those prices with the construction methods and schedule proposed. After evaluation of the price analyses, taking into consideration the schedule of estimated Contract payments, the Employer may require that the amount of the performance security be increased at the expense of the Bidder to a level sufficient to protect the Employer against financial loss in the event of default of the successful Bidder under the Contract.

Explanation:

"Unbalanced" or "front-loaded" bids consist of deliberately submitting bids with artificially high prices or unit rates for the early stages of a construction project, offset by artificially low prices or unit rates for the later stages of the project, to improve the contractor's cash flow.

9. **Domestic Preference**

9.1. If the **BDS** so specifies, the Procuring agency/Employer will grant a margin of preference to the domestic contractor in line with the rules, regulations, regulatory guides or instructions issued by the Authority from time to time.

10. **Determination of Successful Bid**

10.1. The Procuring agency/Employer shall compare the evaluated bids in accordance with the predefined bidding procedure, of all substantially responsive bids to determine the Successful bidder.

11. **Qualification of Bidder**

11.1. The Procuring agency/Employer shall determine to its satisfaction whether the bidder is substantially responsive and whose bid is declared as Successful bid either continues to meet (if prequalification applies) or meets (if post-qualification applies) the qualifying criteria specified in Evaluation and Qualification Criteria.
Note: In case of international bidding, the parameters for incorporation or licensing within Pakistan may be fulfilled as part of post qualification.

11.2. The determination shall be based upon an examination of the documentary evidence of the bidder’s qualifications submitted by the bidder, pursuant to **ITB 11**.

11.3. Prior to contract award, the Procuring agency/Employer will verify that the successful bidder (including each member of a JV) is not blacklisted/debarred. The Procuring agency/Employer will conduct the same verification for each sub-contractor proposed by the successful bidder.

12. **Sub-Contractors**

12.1. The bidder shall provide details regarding any specialized sub-contractor to the Procuring agency/Employer. In case change of sub-contractors, the bidder shall promptly notify the Procuring agency/Employer and obtain approval for replacement of sub-contractors.

12.2. Bidders may propose sub-contracting up to the percentage of total value of contracts or the volume of works as specified in the **BDS**.

13. **Abnormally Low Financial Bid**

13.1. A procuring Agency may reject abnormally low bids.The decision of the Procuring agency/Employer to reject a bid and reasons for the decision shall be recorded in the procurement proceedings and promptly communicated to the bidder concerned. Moreover, the Procuring agency/Employer shall not incur any liability solely by rejecting abnormally bid

Guidance for Procuring agency/Employer:

An abnormally low bid means, in the light of the Procuring agency/Employer's estimate and of all the bids submitted, the bid appears to be abnormally low by not providing a margin for normal levels of profit. In order to identify the Abnormally Low Bid (ALB) following approaches can be considered to minimize the scope of subjectivity:

13.1.1. Comparing the bid price with the cost estimate;

13.1.2. Comparing the bid price with the bids offered by other bidders submitting substantially responsive bids; and

13.1.3. Comparing the bid price with prices paid in similar contracts in the recent past either government- or development partner-funded.

13.2. The Procuring agency/Employer will determine to its satisfaction whether the bidder that is selected as having submitted the successful bid is qualified to perform the contract satisfactorily, in accordance with the criteria listed in **ITB 11**

13.3. The determination will take into account the bidder's financial and technical capabilities. It will be based upon an examination of the documentary evidence of the bidder's qualifications submitted by the bidder, pursuant to **ITB 11**, as well as such other information as the Procuring agency/Employer deems necessary and appropriate. Factors not included in these bidding documents shall not be used in the evaluation of the bidders' qualifications.

13.4. Procuring agency/Employer may seek “Certificate for Independent Price Determination” from the bidder and the results of reference checks may be used in determining award of contract.

Explanation: The Certificate shall be furnished by the bidder. The bidder shall certify that the price is determined keeping in view of all the essential aspects such as raw material, its processing, value addition, optimization of resources due to economy of scale, transportation, insurance and margin of profit etc.

13.5. An affirmative determination will be a prerequisite for award of the contract to the bidder. A negative determination will result in rejection of the bidder’s bid, in which event the Procuring agency/Employer will proceed to the next ranked bidder to make a similar determination of that bidder’s capabilities to perform satisfactorily.

F. AWARD OF CONTRACT

1. **Criteria of Award**

1.1. Subject to **ITB 36 and 37**, the Procuring agency/Employer will award the Contract to the bidder whose bid has been determined to be substantially responsive to the bidding documents and who has been declared as Successful Bidder, provided that such bidder has been determined to be:

1.1.1. eligible in accordance with the provisions of **ITB 3**;

1.1.2. is determined to be qualified to perform the Contract satisfactorily; and

1.1.3. Successful negotiations have been concluded, if any.

2. **Negotiations**

2.1. The Committee of the Procuring agency/Employer may negotiate with the Most Advantageous Bidder relating to the following areas:

2.1.1. a minor alteration to the technical (drawings, design technical specifications) details of the statement of works;

2.1.2. Methodology, work plan, staffing in view to streamline the work;

2.1.3. a minor amendment to the Particular conditions of Contract;

2.1.4. finalizing payment arrangements;

2.1.5. clarifying details that were not apparent or could not be finalized at the time of Bidding;

2.2. Where negotiation fails to result into an agreement, the Procuring agency/Employer may invite the next ranked bidder for negotiations. Where negotiations are commenced with the next ranked bidder, the Procuring agency/Employer shall not reopen earlier negotiations.

3. **Procuring agency's Right to reject All Bids**

3.1. The procuring agency has the right to reject all bids in accordance with Rule 33ofthe Public ProcurementRules, 2004. However, the Authority (i.e. **PPRA**) may call from the Procuring agency/Employer the justification of those grounds.

4. **Notification of Award**

4.1. The procuring agency shall announce and publish the evaluation result in accordance with Rule 35ofthe Public ProcurementRules, 2004.

4.2. Where no complaints have been lodged, the bidder whose bid has been accepted will be notified of the award by the Procuring agency/Employer prior to expiration of the bid validity period through EPADS. However, the Procuring agency/Employer shall not award any procurement contract at least for five (05) days after the announcement of final evaluation report. The notification letter (herein after and in the condition of the contract and contract form called “Letter of Acceptance” will specify the sum that the Procuring agency/Employer will pay the successful bidder in consideration for the execution and completion of the works as prescribed by the Contract

(hereinafter and in the Contract called the "Contract Price).

4.3. The notification of award will constitute the formation of the Contract, subject to the bidder furnishing the Performance Security (or guarantee) in accordance with **ITB 41** and signing of the contract in accordance with **ITB 40**.

4.4. Upon the successful bidder’s furnishing of the performance security (or guarantee) pursuant to **ITB 41**, the Procuring agency/Employer will promptly notify each unsuccessful bidder, the name of the successful bidder and the Contract amount and will discharge the Bid Security or Bid Securing Declaration of the bidder(s) pursuant to **ITB 17**.

5. **Signing of Contract**

5.1. Promptly after notification of award, Procuring agency/Employer shall send the successful bidder the draft agreement, incorporating all terms and conditions as agreed by the parties to the contract.

5.2. Immediately after the Redressal of grievance by the **GRC**, and after fulfillment of all conditions precedent of the Contract Form, the successful bidder and the Procuring agency/Employer shall sign the contract.

5.3. Where no formal signing of a contract is required, work order issued to the bidder shall be construed to be the contract.

6. **Performance Security (or Guarantee)**

6.1. After the receipt of the Letter of Acceptance, the successful bidder, within the specified time, shall deliver to the Procuring agency/Employer a Performance Guarantee in the amount and in the form stipulated in the BDS and PCC, denominated in the type and proportions of currencies in the Letter of Acceptance and in accordance with the Conditions of Contract.

6.2. If the Performance Guarantee is provided by the successful bidder and it shall be in the form specified in the BDS which shall be in any of the following:

6.2.1. certified cheque, cashier's or manager's cheque, or bank draft;

6.2.2. irrevocable letter of credit issued by a scheduled bank of Pakistan or in the case of an irrevocable letter of credit issued by a foreign bank, the letter shall be confirmed or authenticated by a scheduled bank of Pakistan;

6.2.3. bank guarantee confirmed by a reputable local bank or, in the case of a successful foreign bidder, bonded by a foreign bank; or

6.2.4. surety bond callable upon demand issued by any reputable surety or insurance company.
Any Performance Guarantee submitted shall be enforceable in Pakistan.

6.3. Failure of the Most Advantageous Bidder to comply with the requirement of **ITB 40** shall constitute sufficient grounds for the annulment of the award and forfeiture of the Bid Security or declare blacklisted (in case bid securing declaration is submitted) in which event the Procuring agency/Employer may make the award to the next most advantageous bidder or reinitiate the procurement process afresh (as a case may be).

7. **Advance Payment**

7.1. Advance payment will be provided to the bidder in percentage and in the manner as agreed by the both parties in terms of Conditions of the Contract.

7.2. The Procuring agency/Employer will provide an advance payment as stipulated in the Conditions of Contract, subject to a maximum amount, as stated and/or Conditions of the Contract. The advance payment request shall be accompanied by an advance payment security (guarantee) in the form provided in Section X. For the purpose of receiving the advance payment, the bidder shall make and estimate of, and include in its bid, the expenses that will relate to the purchase of equipment, machinery, materials, and on the engagement of labor during the first month beginning with the date of the Procuring agency/Employer's "**Notice to Commence**" as specified in the **PCC**.

8. **General Performance of the Bidders**

8.1. The Procuring agency/Employer reserves the right to obtain information regarding performance of the bidders on their previously awarded contracts / works. The Procuring agency/Employer may seek information / report from the previous employer for consideration. However, the Procuring agency/Employer shall incorporate such parameters in the evaluation criteria and accordingly decide the fate of the bid submitted.

9. **Corrupt & Fraudulent Practices**

9.1. Procuring agencies (including beneficiaries of Government funded projects and procurement) as well as Bidders/Suppliers/Contractors under Government financed contracts, observe the highest standard of ethics during the procurement and execution of such contracts, and will avoid to engage in any corrupt and fraudulent practices.

G. GRIEVANCE REDRESSAL & COMPLAINT REVIEW MECHANISM

1. **Grievance Redressal**

1.1. Grievance Redressal shall be carried out in accordance with Rule 48ofthe Public ProcurementRules, 2004 i.e. Redressal of grievances by the procuring agency and “Redressal of Grievances Regulations 2021”.

H. MECHANISM OF BLACKLISTING

1. **Mechanism of Blacklisting**

1.1. The Procuring agency/Employer shall proceed Blacklisting of Bidders/Contractors in accordance with Rule 19ofthe Public ProcurementRules, 2004 i.e. Blacklisting and “Blacklisting and Debarment of Bidders or Contractors Regulations 2024.

Bid Data Sheet

Bids Data Sheet (BDS)

The following specific data for the procurement of Goods to be procured shall complement, supplement, or amend the provisions in the Instructions to Bidders (ITB). Whenever there is a conflict, the provisions herein shall prevail over those in ITB.

BDS Clause Number	ITB Number	Amendments of, and Supplements to, Clauses in the Instruction to Bidders
A. Introduction		
1	**1.1**	Name of Procuring Agency:**Attabad Lake Hydropower Project (Member (Water) WAPDA)** The subject of procurement is:**Procurement of EPC Contractor for Package-III Electrical and Mechanical Works** Expected commencement date: **Friday, January 1, 2027**
2.	**2.1**	Financial year for the operations of the Procuring Agency:**2025-26** Name and identification number of the Contract: **P13301**
3.	**3.1**	JV/Consortium or AssociationAllowed: **Yes** Number of JV/Consortium Members: **4**
B. Bidding Documents		

4.	**6.2 & 6.4**	The Bidders may seek clarifications through **EPADS v2.0**: Clarification Date: Thursday, June 4, 2026 Pre-Bid Meeting: Tuesday, April 14, 2026 11:00 AM Venue: Conference Hall / Committee room WAPDA House, Lahore.
5.	**7.2**	Any addendum, in case issued, shall be published on **Attabad Lake Hydropower Project (Member (Water) WAPDA)** website and on **EPADS v2.0**.

C. Preparation of Bids

PUBLIC PROCUREMENT REGULATORY AUTHORITY (PPRA) EPADS

6.	**8.1**	List of documents required along with the bid: 1. Application Submission Letter 2. Letter of Proposal – Technical Part (With Technical Bid) 3. Letter of Proposal – Financial Part (With Financial Bid) 4. Bid Security (Bank Guarantee): Scanned original bid security must be attached 5. Power of Attorney authorizing the signatory 6. JV Agreement / Letter of Intent to form JV (if applicable) 7. Completed Qualification Forms (ELI, CON, FIN Forms) 8. Technical Proposal including Methodology, Work Program, and Personnel 9. Manufacturer's/ Subcontractor Authorization (where applicable) as per attached annexure 10. Guarantees/Warranties: Any required performance guarantees or advance payment guarantees, as per instructions. 11. Certificate of Registration and Tax Documents: Copies of business licenses, registration certificates (e.g. PEC license), tax clearance certificates, etc., proving legal status. 12. The General Experience Form EXP 4.1 (as per attached EPC bidding document) submission is mandatory 13. The Specific Construction and Contract Management Experience Form EXP 4.2 (a) (as per attached EPC bidding document) submission is mandatory

7.	**9.1**	The qualification criteria to establish the supply / production capability of the bidder. *see Eligibility Criteria*
8.	**11.2**	**Works and Their relateddocuments:** *See section Required Scope of Work*
9.	**11.1**	Price schedule will be provided according to the format defined and acquired. *see section price schedule.*
10.	**11.4**	**Specifications:** *see section of specifications.*
11.	**11.5 & 13.5**	The price shall be **Fixed**. The bid price shall be adjusted in accordance with Appendix provided – Formula for Price Adjustment.
12.	**14.1**	Currency of the Bids shall be : **PKR**
13.	**16.1**	The Bids/Bid Validity period shall be: **180 Days**
14.	**17.1**	The amount of Bid Security shall be as defined in Bid Security Section for items and lots given in **BDS 6**
15.	**17.2**	The Bid Security shall be in the form of: **Bank Guarantee**
16.	**15.1**	Alternative Bids to the requirements of the bidding documents willnot be permitted.

D. Submission of Bids

17.	**18.1 & 21.1**	Bid shall be submitted online on EPADS v2.0 whereas hard copy of the bid security should be submitted to the following; **Liaison Office: Office of Chief Engineer/ Project Director Attabad Lake Hydropower Project (ALHPP) WAPDA, Sunny View estate, Kashmir Road, Lahore, Pakistan** Bids that are not submitted on EPADS v2.0 shall be disqualified. The deadline for Bids submission is: **Tuesday, June 16, 2026 11:00 AM**

E. Opening and Evaluation of Bids

18.	**24.1**	The Bids opening shall take place on **EPADS v2.0**. Day *:* ***Tuesday*** Date:***June 16, 2026*** Time *:* ***11:30 AM***
19.	**30.2**	Selection technique adopted will be: **Quality and Cost Based Selection (QCBS)** *see Evaluation Criteria*

F. Award of Contract

20.	**41.1 & 41.2**	The Performance guarantee shall: **10.00%**. The Performance Guarantee shall be acceptable in the form of:**Bank Guarantee**
21.	**45.1**	Arbitrator shall be appointed by mutual consent of the both parties.

G. Review of Procurement Decisions

22.	**37**	Grievance against this procurement shall be submitted online on EPADS v2.0.

PUBLIC PROCUREMENT REGULATORY AUTHORITY (PPRA) EPADS

Eligibility Criteria

Bidder's Type	Required Registration
Partnership Firm Company (Private Limited) Company (Public Limited)	FBR (NTN) FBR (GSTN) SECP PEC

Eligibility Criteria	Document
Nationality: The bidder shall have the nationality of an eligible country in accordance with the provisions of the attached EPC Bidding Document. Submission Requirement: The bidder shall provide the required information in Forms ELI-1.1 and ELI-1.2 of the attached EPC Bidding Document Volume 1 to demonstrate compliance with this eligibility requirements. Compliance Requirement: Single Entity must meet requirement, Each Member of JV must meet requirement	Yes
Conflict of Interest:The bidder shall not have a conflict of interest in accordance with the provisions of the attached EPC Bidding Document. Submission Requirement: The bidder shall provide confirmation through the Letter of Proposal – Technical Part of the attached EPC Bidding Document volume 1 demonstrating compliance with this requirement. Compliance Requirement: Single Entity must meet requirement, Each Member of JV must meet requirement	Yes
Eligibility: The bidder shall not have been declared ineligible by the Government of the Islamic Republic of Pakistan, as described in ITP 4.8 of the attached EPC Bidding Document Volume 1. Submission Requirement: The bidder shall provide the required information in Form ELI-1.1 of the EPC Bidding Document volume 1demonstrating compliance with this eligibility requirement. Compliance Requirement: Single Entity must meet requirement, Each Member of JV must meet requirement	Yes

State Owned Entity: If the bidder is a state-owned entity, it shall meet the conditions specified in ITP 4.6 of the attached EPC Bidding Document Volume 1.Submission Requirement: Forms ELI-1.1 and ELI-1.2 as per attached EPC bidding document volume 1 along with relevant supporting attachments. Compliance Requirement: Single Entity must meet requirement, Each Member of JV must meet requirement	Yes
United Nations Eligibility Requirement: The bidder shall not have been excluded from participation by any decision of the United Nations Security Council taken under Chapter VII of the Charter of the United Nations .Submission Requirement: The bidder shall provide the required information in Forms ELI-1.1 and ELI-1.2 in attached EPC Bidding Document Volume 1. Compliance Requirement: Single Entity must meet requirement, Each Member of JV must meet requirement	Yes
PEC: The Proposer shall be duly licensed by the Pakistan Engineering Council (PEC) for the year 2026 in Category CA. Submission Requirement: Provisional / standard PEC license. In case validity of License has expired, application for renewal of required category while other JV partners shall have a least category (as per requirement. Compliance Requirement: Single Entity must meet requirement, Each Member of JV must meet requirement according to share, Lead partner must meet C-A category.	Yes
Pakistani Firm Tax Registration: The bidder shall be registered with the Federal Board of Revenue (FBR) for taxation purposes in Pakistan in accordance with the applicable laws and regulations. Submission Requirement: Valid National Tax Number (NTN) and General Sales Tax Registration (GSTN) certificates issued by the Federal Board of Revenue. Compliance Requirement: Single Entity must meet requirement, Each Member of JV must meet requirement.	Yes
(ESHS) Past Performance Declaration: Declare any E&M work contracts that have been suspended or terminated and/or performance security called by an employer for reasons related to non-compliance with environmental, social, health or safety (including Sexual Exploitation and Abuse) contractual obligations during the past fifteen (15) years. Submission Requirement : Form CON-3 – ES Performance Declaration as per attached EPC bidding document. Each JV Member/ single entity must meet requireme	Yes

Employer’s SEA and/or SH Disqualification(i) At the time of Contract Award, the proposer shall not be subject to disqualification by the Employer for non-compliance with SEA/SH obligations. (ii) If previously disqualified, the proposer must demonstrate that appropriate measures have been taken to address the issue. Submission Requirement :Application Submission Letter and Form CON-4 as per attached EPC bidding document volume 1. Each JV member/ single entity must meet the requirement	Yes
Suspension Based on Execution of Bid/Proposal Securing Declaration by the Employer: Not under suspension based on execution of a Bid/Proposal Securing Declaration pursuant to ITP 19 of attached EPC document Volume 1. Submission Requirement: Letter of Proposal Technical Part . Each JV Member/ Single Entity/ All JV members combined Must meet requirement	Yes
General Experience: Experience in the role of Prime Contractor, JV Member, Sub-Contractor or Management Contractor of at least fifteen (15) years. Single Entity: Must Meet Requirement. Each Member: Must meet requirement. (For details see attached EPC bidding document volume 1 Eligibility and Qualification Criteria) Required document Form EXP 4.1	Yes
Specific Construction & Contract Management Experience: For details see attached EPC bidding document volume 1 Eligibility and Qualification Criteria Required document Form EXP 4.2 (a)	Yes
Experience in Key Activities: For details see attached EPC bidding document volume 1 Eligibility and Qualification Criteria Required document Form EXP 4.2 (b)	Yes
Specific Experience in managing ESHS aspects: For details see attached EPC bidding document volume 1 Eligibility and Qualification Criteria Required document Form EXP 4.2 (c)	Yes
Financial Capabilities: For details see attached EPC bidding document volume 1 Eligibility and Qualification Criteria Required documents: Form FIN 3.1, with attachments	Yes
Average Annual Construction Turnover: For details see attached EPC bidding document volume 1 Eligibility and Qualification Criteria Required documents: Form FIN 3.2	Yes

History of Non- Performing Contracts: For details see attached EPC bidding document volume 1 Eligibility and Qualification Criteria Required documents: Form CON 2	Yes
Pending Litigation: For details see attached EPC bidding document volume 1 Eligibility and Qualification Criteria Required documents: Form CON 2	Yes
Litigation History: For details see attached EPC bidding document volume 1 Eligibility and Qualification Criteria Required documents: Form CON 2	Yes

Evaluation Criteria

Quality and Cost Based Selection (QCBS)

Technical Marks	**100**
Passing Marks	**60**
Technical Evaluation Criteria	

Proposed Works: To what extent the Proposed Works (Proposed Generating Capacity) exceed the Employer's Requirements (Evaluation shall be based on the output at Step up Transformer Terminals) (Qualitative)(Doc Required) Sufficient information that Significantly exceed the requirement/ Proposal contributes to significant value addition **(5)** Sufficient information to demonstrate that the requirement will be marginally exceeded **(4)** Sufficient information to demonstrate how the requirement will be met **(3)** Required feature present with deficiencies such as insufficient or information that lacks clarity **(2)** Required feature is absent; no relevant information to demonstrate how the requirement is met **(0)**	5
Technical Plant Data (E&M Works) for details see attached EPC bidding document Volume 1 (Qualitative)(Doc Required) Sufficient information that Significantly exceed the requirement/ Proposal contributes to significant value addition **(20)** Sufficient information to demonstrate that the requirement will be marginally exceeded **(18)** Sufficient information to demonstrate how the requirement will be met **(16)** Required feature present with deficiencies such as insufficient or information that lacks clarity **(10)** Required feature is absent; no relevant information to demonstrate how the requirement is met **(0)**	20

Design Methodology for details see attached EPC bidding document Volume 1 (Qualitative)(Doc Required) Sufficient information that Significantly exceed the requirement/ Proposal contributes to significant value addition **(10)** Sufficient information to demonstrate that the requirement will be marginally exceeded **(9)** Sufficient information to demonstrate how the requirement will be met **(8)** Required feature present with deficiencies such as insufficient or information that lacks clarity **(5)** Required feature is absent; no relevant information to demonstrate how the requirement is met **(0)**	10
Testing and Commissioning Strategy for details see attached EPC bidding document Volume 1 (Qualitative)(Doc Required) Sufficient information that Significantly exceed the requirement/ Proposal contributes to significant value addition **(10)** Sufficient information to demonstrate that the requirement will be marginally exceeded **(9)** Sufficient information to demonstrate how the requirement will be met **(8)** Required feature present with deficiencies such as insufficient or information that lacks clarity **(5)** Required feature is absent; no relevant information to demonstrate how the requirement is met **(0)**	10

Method Statement for key construction activities for critical equipment for details see attached EPC bidding document Volume 1 (Qualitative)(Doc Required) Sufficient information that Significantly exceed the requirement/ Proposal contributes to significant value addition **(15)** Sufficient information to demonstrate that the requirement will be marginally exceeded **(14)** Sufficient information to demonstrate how the requirement will be met **(12)** Required feature present with deficiencies such as insufficient or information that lacks clarity **(8)** Required feature is absent; no relevant information to demonstrate how the requirement is met **(0)**	15
Optimization of Timelines for E&M Equipment for details see attached EPC bidding document Volume 1 (Qualitative)(Doc Required) Sufficient information that Significantly exceed the requirement/ Proposal contributes to significant value addition **(10)** Sufficient information to demonstrate that the requirement will be marginally exceeded **(9)** Sufficient information to demonstrate how the requirement will be met **(8)** Required feature present with deficiencies such as insufficient or information that lacks clarity **(5)** Required feature is absent; no relevant information to demonstrate how the requirement is met **(0)**	10

Code of Conduct for details see attached EPC bidding document Volume 1 (Qualitative)(Doc Required) Sufficient information that significantly exceed the requirement/ Proposal contributes to significant value addition **(5)** Sufficient information to demonstrate that the requirement will be marginally exceeded **(4)** Sufficient information to demonstrate how the requirement will be met **(3)** Required feature present with deficiencies such as insufficient or information that lacks clarity **(2)** Required feature is absent; no relevant information to demonstrate how the requirement is met **(0)**	5

Scope of Work

The scope of work under this Contract comprises the Engineering, Procurement and Construction (EPC) of the Electro-Mechanical Works for Package-III of the Attabad Lake Hydropower Project, including all activities necessary for the complete and satisfactory design, manufacture, supply, delivery, installation, testing, commissioning and successful operation of the electro-mechanical

equipment and associated systems.

The Contractor shall be fully responsible for the complete detailed engineering design, preparation and submission of drawings, design calculations, technical documentation, procurement and manufacturing of all electro-mechanical equipment, auxiliaries, accessories and associated systems, as well as the transportation, insurance, handling, storage, erection, installation, testing and commissioning of all equipment required for the proper functioning of the hydropower plant.

The Contractor’s responsibilities shall include, but shall not be limited to, turbines, generators, control and protection systems, instrumentation, mechanical auxiliaries, electrical systems, associated balance-of-plant equipment, and all other components necessary for the safe, reliable and efficient operation of the generating units and related facilities.

Notwithstanding any omission or discrepancy in the bidding documents, the Contractor shall be deemed to have included in the Contract Price all works, equipment, materials, services and facilities necessary for the complete and functional operation of the Electro-Mechanical Works in accordance with the Employer’s Requirements. The Contractor shall ensure that the installed equipment and systems meet the specified performance guarantees, reliability requirements and operational standards.

The scope further includes performance testing, preparation of operation and maintenance manuals, provision of special tools and recommended spare parts, training of the Employer’s personnel, and completion of all services required for safe, reliable and continuous operation of the hydropower facility.

The procurement and execution of the works shall be carried out in accordance with the EPC Bidding Documents for Package-III (Electro-Mechanical Works), comprising Volume-I to Volume-VIII, which are attached with this procurement and shall form an integral part of the Contract and govern the rights, obligations, technical requirements and contractual conditions of the works.

All works shall be executed in accordance with the EPC Contract, Employer’s Requirements, applicable international standards, and relevant statutory and regulatory requirements.

General Conditions of Contract

A. General

1. **Definitions**

1.1. Unless the context otherwise requires, the following terms whenever used in this Contract shall have the same meaning and shall be interpreted as indicated

1.1.1. “Applicable Law” means the laws and any other instruments having the force of law in the Government’s Country, or in such other country as may be specified in the Special Conditions of the Contract (SC), as they may be issued and in force from time to time;

1.1.2. “The Contract” means an agreement enforceable by law;

1.1.3. “The Contract Price” means the price payable to the Contractor under the Contract for the full and proper performance of its contractual obligations;

1.1.4. “The Services” means the work to be performed by the Contractor pursuant to this Contract and as prescribed in the Specifications and Schedule of Activities included in the Contractor’s Bid;

1.1.5. “Ancillary Services” means those services ancillary to the provision of Services, such as transportation and insurance, and any other incidental services, such as installation, commissioning, provision of technical assistance, training, and other such obligations of the Contractor covered under the Contract;

1.1.6. “GCC” means the General Conditions of Contract contained in this section;

1.1.7. “SCC” means the Special Conditions of Contract by which the GCC may be amended or supplemented;

1.1.8. **“**Day” means calendar day unless indicated otherwise;

1.1.9. “Effective Date” means the date on which this Contract comes into force and effect;

1.1.10. “The Contractor” means the individual or corporate body whose Bids to provide the Services has been accepted by the Procuring Agency;

1.1.11. “The Project Site,” where applicable, means the place or places named in Bid Data Sheet and technical Specifications;

1.1.12. “Government” means the Government of Pakistan;

1.1.13. “Local Currency” means the currency of Pakistan;

1.1.14. “In Writing” means communicated in written form with proof of receipt;

1.1.15. “Completion Date” means the date of completion of the Services by the Contractor as certified by the Procuring Agency;

1.1.16. “Foreign Currency” means any currency other than the currency of the country of the Procuring Agency;

1.1.17. “Party” means the Procuring Agency or the Contractor, as the case may be, and “Parties” means both of them;

1.1.18. "Service" means any object of procurement other than goods or works;

1.1.19. “Subcontractor” means any entity to which the Bidder subcontracts any part of the Services.

2. **Applicable Law**

2.1. The contract shall be governed and interpreted in accordance with the laws of Pakistan, unless otherwise specified in SCC.

3. **Language**

3.1. The Contract as well as all correspondence and documents relating to the Contract exchanged between the Contractorand the Procuring Agency, shall be written in the **English language** unless otherwise stated in the **SCC** . Supporting documents and printed literature that are part of the Contract may be in another language provided these are accompanied by an accurate translation of the relevant passages in English, in which case, for purposes of interpretation of the Contract, this translation shall govern.

4. **Notices**

4.1. Any notice, request, or consent made pursuant to this Contract shall be in writing and shall be deemed to have been made when delivered in person to an authorized representative of the Party to whom the communication is addressed, or when sent by registered mail, telex, telegram, or facsimile to such Party at the address specified in the **SCC**.

5. **Location**

5.1. The Services shall be performed at such locations as the Procuring Agency may approve and as specified in **SCC.**

5.2. A {DOCUMENTS}

6. **Authorized Representatives / Authority of Member in charge**

6.1. Any action required or permitted to be taken, and any document required or permitted to be executed, under this Contract by the Procuring Agency or the Contractor may be taken or executed by the officials specified in the **SCC**.

B. Commencement, Completion, Modification, and Termination of Contract

1. **Effectiveness of Contract**

1.1. This Contract shall come into effect on the date the Contract is signed by both parties and such other later date as may be stated in the **SCC.**

2. **Commencement of Services**

2.1. The Contractor shall confirm availability of Key Experts and begin carrying out the Services not later than the number of days after the Effective Date specified in the **SCC.**

3. **Program schedule**

3.1. Before commencement of the Services, the Contractor shall submit to the Procuring Agency for approval a Program showing the general methods, arrangements, order and timing for all activities. The Services shall be carried out in accordance with the approved Program as updated.

4. **Starting Date/Expiration Date**

4.1. The Contractor shall start carrying out the Services Five (05) days after the date the Contract becomes effective, or at such other date as may be specified in the **SCC.**

4.2. Unless terminated earlier pursuant to Clause **GCC 14** hereof, this Contract shall expire at the end of such time period after the Effective Date as specified in the **SCC.**

5. **Entire Agreement**

5.1. This Contract contains all covenants, stipulations and provisions agreed by the Parties. No agent or representative of either Party has authority to make, and the Parties shall not be bound by or be liable for, any statement, representation, promise or agreement not set forth herein.

6. **Modification**

6.1. Any modification or variation of the terms and conditions of this Contract, including any modification or variation of the scope of the Services, may only be made by written agreement between the Parties. However, each Party shall give due consideration to any modification(s) or variation(s) made by the other Party.

6.2. In cases of any modification(s) or variation(s), the prior written consent of the Procuring Agency is required.

7. **Force Majeure**

7.1. **Definition**
For the purposes of this Contract, “Force Majeure” means an event which is beyond the reasonable control of a Contractor and which makes a Contractor’s performance of its obligations under the Contract impossible or so impractical as to be considered impossible under the circumstances.

7.2. **No Breach of Contract**
The failure of a Party to fulfill any of its obligations under the contract shall not be considered to be a breach of, or default under, this Contract in so far as such inability arises from an event of Force Majeure, provided that the Party affected by such an event (a) has taken all reasonable precautions, due care and reasonable alternative

measures in order to carry out the terms and conditions of this Contract, and (b) has informed the other Party as soon as possible about the occurrence of such an event.

7.3. **Extension of Time**
Any period within which a Contractor shall, pursuant to this Contract, complete any action or task, shall be extended for a period equal to the time during which such Party was unable to perform such action as a result of Force Majeure.

7.4. **Payments**
During the period of their inability to perform the Services as a result of an event of Force Majeure, the Contractor shall be entitled to continue to be paid under the terms of this Contract, as well as to be reimbursed for additional costs reasonably and necessarily incurred by them during such period for the purposes of the Services and in reactivating the Service after the end of such period.

8. **Termination**

8.1. **By the Procuring Agency**
The Procuring Agency may terminate this Contract in case of the occurrence of any of the events specified in paragraphs (a) through (e) of this Clause. In such an occurrence the Procuring Agency shall give at least thirty (30) calendar days' written notice of termination to the Contractor in case of the events referred to in (a) through (d); at least sixty (60) calendar days' written notice in case of the event referred to in (e);

8.1.1. If the Contractor fails to remedy a failure in the performance of its obligations hereunder, as specified in a notice of suspension;

8.1.2. If the Contractor becomes (or, if the Contractor consists of more than one entity, if any of its members becomes) insolvent or bankrupt or enter into any agreements with their creditors for relief of debt or take advantage of any law for the benefit of debtors or go into liquidation or receivership whether compulsory or voluntary;

8.1.3. If the Contractor fails to comply with any final decision reached as a result of arbitration proceedings;

8.1.4. If, as the result of Force Majeure, the Contractor is unable to perform a material portion of the Services for a period of not less than sixty (60) calendar days;

8.1.5. If the Procuring Agency, in its sole discretion and for any reason whatsoever, decides to terminate this Contract;

8.2. **By the Contractor**
The Contractor may terminate this Contract, by not less than thirty (30) calendar days' written notice to the Procuring Agency, in case of the occurrence of any of the events specified in paragraphs (a) through (d) of this Clause.

8.2.1. If the Procuring Agency fails to pay any money due to the Contractor pursuant to this Contract and not subject to dispute within forty-five (45) calendar days after receiving written notice from the Contractor that such payment is overdue;

8.2.2. If, as the result of Force Majeure, the Contractor is unable to perform a material portion of the Services for a period of not less than sixty (60) calendar days;

8.2.3. If the Procuring Agency fails to comply with any final decision reached as a result of arbitration;

8.2.4. If the Procuring Agency is in material breach of its obligations pursuant to this Contract and has not remedied the same within forty-five (45) days (or such longer period as the Bidder may have subsequently approved in writing) following the receipt by the Procuring Agency of the Contractor's notice specifying such breach.

C. Obligations of the Contractor

1. **General**

1.1. **Standard of Performance**

1.1.1. The Contractor shall perform the Services and carry out the Services with all due diligence, efficiency and economy, in accordance with generally accepted professional standards and practices, and shall observe sound management practices, and employ appropriate technology and safe and effective equipment, machinery, materials and methods. The Contractor shall always act, in respect of any matter relating to this Contract or to the Services, as a faithful adviser to the Procuring Agency, and shall at all times support and safeguard the Procuring Agency's legitimate interests in any dealings with the third parties;

1.1.2. The Contractor shall employ and provide such qualified and experienced Experts and Sub-Contractors as are required to carry out the Services.

1.2. **Law Applicable to Services**

The Contractor shall perform the Services in accordance with the Contract and in accordance with the Law of Pakistan and shall take all practicable steps to ensure that any of its Experts and Sub-Bidders, comply with the Applicable Law.

2. **Conflict of Interests**

2.1. **Contractor Not to Benefit from Commissions and Discounts**

The remuneration of the Contractor shall constitute the Contractor's sole remuneration in connection with this Contract or the Services, and the Contractor shall not accept for their own benefit any trade commission, discount, or similar payment in connection with activities pursuant to this Contract or to the Services or in the discharge of their obligations under the Contract, and the Contractor shall use their best efforts to ensure that the Personnel, any Subcontractors, and agents of either of them similarly shall not receive any such additional remuneration.

2.2. **Contractor and Affiliates Not to be Otherwise Interested in Project**

The Contractor agree that, during the term of this Contract and after its termination, the Contractor and its affiliates, as well as any Subcontractor and any of its affiliates, shall be disqualified from providing Services (other than the Services and any continuation thereof) for any project resulting from or closely related to the Services.

2.3. **Prohibition of Conflicting Activities**
Neither the Bidder nor its Subcontractors nor the Personnel shall engage, either directly or indirectly, in any of the following activities:

2.3.1. during the term of this Contract, any business or professional activities in the Government's country which would conflict with the activities assigned to them under this Contract;

2.3.2. during the term of this Contract, neither the Contractor nor their Subcontractors shall hire public employees in active duty or on any type of leave, to perform any activity under this Contract;

2.3.3. after the termination of this Contract, such other activities as may be specified in the **SCC.**

3. **Insurance to be Taken Out by the Contractor**

3.1. The Contractor(a) shall take out and maintain, and shall cause any Subcontractors to take out and maintain, at its (or the Sub-contractors', as the case may be) own cost but on terms and conditions approved by the Procuring Agency, insurance against the risks, and for the coverage, as shall be specified in the **SCC**; and (b) at the Procuring Agency's request, shall provide evidence to the Procuring Agency showing that such insurance has been taken out and maintained and that the current premiums have been paid.

4. **Contractor's Actions Requiring Procuring Agency's Prior Approval**

4.1. The Contractor shall obtain the Procuring Agency's prior approval in writing before taking any of the following actions:

4.1.1. appointing such members of the Personnel not provided by the Contractor;

4.1.2. changing the Program of activities; and

4.1.3. any other action that may be specified in the **SCC.**

5. **Reporting Obligations**

5.1. The Contractor shall submit to the Procuring Agency the reports and documents in the numbers, and within the periods as prescribed by the Procuring Agency.

6. **Liquidated Damages**

6.1. **Payments of Liquidated Damages**
The Contractor shall pay liquidated damages to the Procuring Agency at the rate per day stated in the **SCC** for each day that the Completion Date is later than the Intended Completion Date. The total amount of liquidated damages shall not exceed the amount defined in the **SCC**. The Procuring Agency may deduct liquidated damages from payments due to the Contractor. Payment of liquidated damages shall not affect the Contractor's liabilities.

6.2. **Correction for Over-payment**
If the Intended Completion Date is extended after liquidated damages have been paid, the Procuring Agency shall correct any overpayment of liquidated damages by the Contractor by adjusting the next payment certificate. The

Contractor shall be paid interest on the overpayment, calculated from the date of payment to the date of repayment, at the rates specified in **SCC.**

6.3. **Lack of performance penalty**
If the Contractor has not corrected a Defect within the time specified in the Procuring Agency's notice, a penalty for Lack of performance will be paid by the Contractor. The amount to be paid will be calculated as a percentage of the cost of having the Defect corrected, assessed as specified in the Contractor

7. **Performance Guarantee**

7.1. Within the time stipulated in the acceptance letter from the Procuring Agency, the successful Bidder shall furnish the Performance Guarantee in shape and amount **specified in SCC.**

7.2. The proceeds of the Performance Guarantee shall be payable to the Procuring agency as compensation for any loss resulting from the Supplier's failure to complete its obligations under the Contract.

7.3. The Performance Guarantee shall be denominated in the currency of the Contract, or in a freely convertible currency acceptable to the Procuring agency and shall be in the acceptable form as specified in **SCC**.

7.4. The Performance Guarantee will be discharged by the Procuring agency and returned to the Supplier not later than thirty (30) days following the date of completion of the Supplier's performance obligations under the Contract, including any warranty obligations, unless otherwise **specified in SCC.**

8. **Sustainable Procurement**

8.1. The Contractor shall conform to the sustainable procurement contractual provisions, if and as specified in the **SCC.**

D. Contractor's Personnel

1. **Description of Personnel**

1.1. The titles, agreed job descriptions, minimum qualifications, and estimated periods of engagement in the carrying out of the Services of the Contractor's Key Personnel. The Key Personnel listed by title as well as by name are hereby approved by the Procuring Agency.

2. **Removal and / or Replacement of Personnel**

2.1. Except as the Procuring Agency may otherwise agree, no changes shall be made in the Key Personnel. If, for any reason beyond the reasonable control of the Contractor, it becomes necessary to replace any of the Key Personnel, the Contractor shall provide as a replacement a person of equivalent or better qualifications.

2.2. If the Procuring Agency finds that any of the Personnel have (i) committed serious misconduct or have been charged with having committed a criminal action, or (ii) have reasonable cause to be dissatisfied with the performance of any of the Personnel, then the Contractor shall, at the Procuring Agency's written request specifying the grounds thereof, provide as a replacement a person with qualifications and experience acceptable to the Procuring Agency.

2.3. The Contractor shall have no claim for additional costs arising out of or incidental to any removal and/or replacement of Personnel.

E. Obligations of the Procuring Agency

1. **Change in the Applicable Law**

1.1. If, after the date of this Contract, there is any change in the Applicable Law with respect to taxes and duties which increases or decreases the cost of the Services rendered by the Contractor, then the remuneration and reimbursable expenses otherwise payable to the Contractor under this Contract shall be increased or decreased accordingly by agreement between the Parties, and corresponding adjustments shall be made to the amounts referred in the **SCC.**

2. **Services and Facilities**

2.1. The Procuring Agency shall make available to the Contractor and the Experts, for the purposes of the Services and free of any charge, the services, facilities and property described in the Terms of Reference, at the times and in the manner specified in the Terms of Reference.

2.2. In case that such services, facilities and property shall not be made available to the Contractor, the Parties shall agree on (i) any time extension that it may be appropriate to grant to the Contractor for the performance of the Services, (ii) the manner in which the Contractor shall procure any such services, facilities and property from other sources, and (iii) the additional payments, if any, to be made to the Contractor as a result thereof.

F. Payments to the Contractor

1. **Contract Price**

1.1. The price payable shall be in Pakistani Rupees unless otherwise specified in the **SCC**.

2. **Terms and Conditions of Payment**

2.1. Payments will be made to the Contractor according to the payment schedule stated in the **SCC** and as per actual invoice submitted by the Contractor.

2.2. Unless otherwise stated in the **SCC**, the advance payment shall be made against the provision by the Contractor of a bank guarantee for the same amount, and shall be valid for the period stated in the **SCC.** Any other payment shall be made after the conditions listed in the **SCC** for such payment have been met, and the Contractor have submitted an invoice to the Procuring Agency specifying the amount due.

3. **Quality Control Identifying Defects**

3.1. The principle and modalities of Inspection of the Services by the Procuring Agency shall be as indicated in the **SCC.** The Procuring Agency shall check the Contractor’s performance and notify him of any Defects that are

found. Such checking shall not affect the Contractor's responsibilities. The Procuring Agency may instruct the Contractor to search for a Defect and to uncover and test any service that the Procuring Agency considers may have a Defect. Defect Liability Period is as defined in the **SCC**.

3.2. A {INSPECTION}

4. **Correction of Defects, and Lack of Performance Penalty**

4.1. The Procuring Agency shall give notice to the contractor of any Defects before the end of the Contract. The Defects liability period shall be extended for as long as Defects remain to be corrected.

4.2. Every time notice a Defect is given; the contractor shall correct the notified Defect within the length of time specified by the Procuring Agency's notice.

4.3. If the contractor has not corrected a Defect within the time specified in the Procuring Agency's notice, the Procuring Agency will assess the cost of having the Defect corrected, the contractor will pay this amount, and a Penalty for Lack of Performance.

5. **Settlement of Disputes Amicable Settlement**

5.1. The Parties shall use their best efforts to settle amicably all disputes arising out of or in connection with this Contract or its interpretation.

6. **Dispute Settlement**

6.1. **Arbitration**

If any dispute of any kind whatsoever shall arise between the procuring agency and the contractor in connection with or arising out of the Contract, including without prejudice to the generality of the foregoing, any question regarding its existence, validity or termination, or the execution of the contract, the parties shall seek to resolve any such dispute or difference by mutual consultation. If the parties fail to resolve such a dispute or difference even after negotiations or mediation, then the dispute shall be referred within fourteen (14) days in writing by either party to the Arbitrator, with a copy to the other party.

Any dispute in respect of which a notice of intention to commence arbitration has been given, in accordance with **GCC sub-clause 32.1**, shall be finally settled by arbitration. Arbitration may be commenced prior to or after completion of the Contract. Arbitration proceedings shall be conducted in accordance with Arbitration Act 1940. Notwithstanding any reference to arbitration herein, the parties shall continue to perform their respective obligations under the Contract unless otherwise agreed. The Procuring Agency shall continue to pay the Contractor any undisputed amounts due under the Contract during the resolution of any dispute.

Special Conditions of Contract

SECTION VIII. SPECIAL CONDITIONS OF CONTRACT

The following Special Conditions of Contract shall supplement the General Conditions of Contract. Whenever there is a conflict, the provisions herein shall prevail over those in the Conditions of Contract. The corresponding clause number of the GCC is indicated in parentheses.

GCC 16	**Conflict of Interest:** The Procuring Agency reserves the right to determine on a case-by-case basis whether the Bidder should be disqualified from providing goods or services due to a conflict of a nature described in Clause GCC 17**.**
GCC 20	**Liquidated Damages** If the Bidder fails to provide services as required under the contract or in case of any data loss/data breach or any incident compromising the data security or other such failures related to any services, the Bidder shall pay to the Procuring Agency as Liquidated Damages at a rate of **0.38%** to **10.00%**of the Contract value, in accordance with the extent of performance failure & the cost of investigating such incidents as judged by the Authority.
GCC 21	**Performance Guarantee:** The amount of performance guarantee shall be 10.00%of the contract price in acceptable form of Bank Guarantee
GCC 27	**Currency of Payment:** All the payment to be released to the contractor/Bidder shall be in Pakistani Rupees.
GCC 28	**Payment terms:** Payment will be made to the Bidder against the procured Goods and services according to the actual invoice or running bills submitted by the Bidder against the services provided within the time given in the conditions of the contract.

GCC 29	**Identifying Defects:** The Authority reserves the right at any time to inspect the premises of the provider to inspect the goods and monitor the goods being provided. Inspections & Tests Requirements Brand New Equipment Certificate: The supplier shall provide a certificate confirming that all equipment is brand new, unused, and bears clearly identifiable reference numbers consistent with the bid and manufacturer's documentation Physical Fitness Certificate: A certificate from the supplier must confirm that the equipment is physically intact, free from damage, and suitable for installation and operation. Country of Origin Certificate: A certificate issued by the original manufacturer verifying the country of origin of the equipment, consistent with the quoted origin in the proposal. Factory Acceptance Test (FAT) and Site Acceptance Test (SAT): FAT shall be conducted at the manufacturer's facility (where applicable) and SAT at the project site, witnessed by the Employer's Engineer. Both shall be performed in accordance with Volume II – Technical Provisions Type Test Certificates: Type test certificates for each major equipment/system shall be submitted, as per requirements specified in the technical evaluation criteria of the bidding documents Testing & Commissioning Strategy: The Contractor shall submit a comprehensive Testing & Commissioning Plan detailing methodology, sequence, safety measures, and expected performance benchmarks QA/QC Documentation: Complete traceability records, quality assurance reports, and control documents from the manufacturer shall be provided for all major systems and components. Successful Operation Certificate: Upon completion of installation, testing, and commissioning of the equipment, a certificate of successful operation shall be issued by the Employer confirming that the equipment has been installed in accordance with contract specifications, has undergone full commissioning, and is operating satisfactorily under site conditions Delivery & Documents Copies of the Supplier's invoice showing Goods' description, quantity, unit price, and total amount; Original and two copies of the usual transport document (for example, a negotiable bill of lading, a non-negotiable sea waybill, an inland waterway document, an air waybill, a railway consignment note, a road consignment note, or a multimodal transport document) which the buyer may require to take the goods; Copies of the packing list identifying contents of each package; Insurance Certificate;

GCC 31	**Following is the guidance for Dispute Resolution**

1. If any dispute of any kind whatsoever shall arise between the Authority and the Bidder in connection with or arising out of the Contract, including without prejudice to the generality of foregoing, any question regarding its existence, validity, termination and the execution of the Contract – whether during developing phase or after their completion and whether before or after the termination, abandonment or breach of the Contract – the parties shall seek to resolve any such dispute or difference by mutual diligent negotiations in good faith within 14 (fourteen) days following a notice sent by one Party to the other Party in this regard**.**

2. At future of negotiation the dispute shall be resolved through mediation and mediator shall be appointed with the mutual consent of the both parties**.**

3. At the event of failure of mediation to resolve the dispute relating to this contract such dispute shall finally be resolved through binding Arbitration by sole arbitrator in accordance with Arbitration Act 1940. The arbitrator shall be appointed by mutual consent of the both parties**.** The Arbitration shall take place in Islamabad, Pakistan and proceedings will be conducted in English language.

4. The cost of the mediation and arbitration shall be shared by the parties in equal proportion however the both parties shall bear their own costs and lawyer's fees regarding their own participation in the mediation and arbitration. However, the Arbitrator may make an award of costs upon the conclusion of the arbitration making any party to the dispute liable to pay the costs of another party to the dispute**.**

5. Arbitration proceedings as mentioned in the above clause regarding resolution of disputes may be commenced prior to, during or after completion of the contract.

Notwithstanding any reference to the arbitration herein, the parties shall continue to perform their respective obligations under the Contract unless they otherwise agree that the Authority shall pay the Bidder any monies due to the Bidder.

Arbitrator's fee:

The fee shall be specified in Pak Rupees, as determined by the Arbitrator, which shall be shared equally by both parties**.**

Appointing Authority for Arbitrator:

By the Mutual Consent or in accordance with the provisions of Arbitration Act, 1940, in case the parties fail to reach a consensus on the name of sole arbitrator, any party may submit an application to the Chief Justice Islamabad High Court for appointment of sole arbitrator. The Chief Justice IHC may appoint a former judge of any High Court or Supreme Court as the sole arbitrator to resolve the dispute between the parties.

Rules of procedure for arbitration proceedings:

Any dispute between the Authority and a Bidder who is a national of the Islamic Republic of Pakistan arising in connection with the present Contract shall be referred to adjudication or arbitration in accordance with the laws of the Islamic Republic of Pakistan including Arbitration Act 1940, however above provision shall prevail in referring the case to the Arbitrator.

Place of Arbitration and Award:

The arbitration shall be conducted in English language and place of arbitration shall be at

Bid Securing Declaration

Form 9: Bid Securing Declaration

Date: *[insert date (as day, month and year)]*

Bid No.:***P13301***

To: **Attabad Lake Hydropower Project (Member (Water) WAPDA),Chief Engineer/ PDLiaison Office: Office of Chief Engineer/ Project Director Attabad Lake Hydropower Project (ALHPP) WAPDA, Sunny View estate, Kashmir Road, Lahore, Pakistan**

We, the undersigned, declare that:

We understand that, according to your conditions, Bids must be supported by a Bid Securing Declaration.

We accept that we will be blacklisted and henceforth cross debarred for participating in respective category of public procurement proceedings for a period of (not more than) six months, if fail to abide with a bid securing declaration, however without indulging in corrupt and fraudulent practices, if we are in breach of our obligation(s) under the Bid conditions, because we:

1. have withdrawn or modified our Bid during the period of Bid Validity specified in the Form of Bid;

2. Disagreement to arithmetical correction made to the Bid price; or

3. having been notified of the acceptance of our Bid by the Procuring Agency during the period of Bid Validity, (i) failure to sign the contract if required by Procuring Agency to do so or (ii) fail or refuse to furnish the Performance Security or to comply with any other condition precedent to signing the contract specified in the Bidding Documents.

We understand this Bid Securing Declaration shall expire if we are not the successful

Bidder, upon the earlier of (i) our receipt of your notification to us of the name of the successful Bidder; or (ii) twenty-eight (28) days after the expiration of our Bid.

Contract Form

SECTION IX: CONTRACT FORMS

THIS AGREEMENT made the _____ day of _____ 20_____ between**Attabad Lake Hydropower Project (Member (Water) WAPDA),Chief Engineer/ PDLiaison Office: Office of Chief Engineer/ Project Director Attabad Lake Hydropower Project (ALHPP) WAPDA, Sunny View estate, Kashmir Road, Lahore, Pakistan**

(hereinafter called "the Procuring Agency") of the one part and *[name of Bidder]* of *[city and country of Bidder]* (hereinafter called "the Bidder") of the other part:

WHEREAS the Procuring Agency invited Bids for provision of goods, viz., **Procurement of EPC Contractor for Package-III Electrical and Mechanical Works (*P13301*)** and has accepted a Bids by the Bidder for the provision of Goods in the sum of *[contract price in words and figures]* (hereinafter called "the Contract Price").

NOW THIS CONTRACT WITNESSETH AS FOLLOWS:

1. In this Contract words and expressions shall have the same meanings as are respectively assigned to them in the Conditions of Contract referred to.

2. The following documents shall be deemed to form and be read and construed as part of this Contract, In the event of any ambiguity or conflict between the Contract Documents listed below, the order of precedence shall be the order in which the Contract Documents are listed below:-

1. This form of Contract;
2. the Form of Bids and the Price Schedule submitted by the Bidder;
3. the Schedule of Requirements;
4. the Technical Specifications;
5. the Special Conditions of Contract;
6. the General Conditions of the Contract;
7. the Procuring Agency's Letter of Acceptance; and
8. [*add here: any other documents*]

3. In consideration of the payments to be made by the Procuring Agency to the Bidder as hereinafter mentioned, the Bidder hereby covenants with the Procuring Agency to provide the Goods related services and to remedy defects therein in conformity in all respects with the provisions of the Contract.

4. The Procuring Agency hereby covenants to pay the Bidder in consideration of the provision of Goods and the remedying of defects therein, the Contract Price or such other sum as may become payable under the provisions of the contract at the times and in the manner prescribed by the contract.

IN WITNESS whereof the parties hereto have caused this Contract to be executed in accordance with their respective laws the day and year first above written.

Annexure

Cover Annexure – Supersession of PPRA SBD Sections by Project Specific EPC Bidding Documents Volume-I Bidding Procedures and Conditions of Contract

Description

This is to certify that the following sections of the EPC Bidding Documents for Attabad Lake Hydropower Project (54 MW) – Package-III: Electro-Mechanical Works shall take precedence over the corresponding sections of the PPRA Standard Bidding Documents (SBD – Works) wherever applicable

PPRA SBD Section	Superseded By Sections from attached EPC Bidding Document
Section II – Instructions to Bidders (ITB)	Volume I – Section I: Instructions to Proposers (ITP)
Section III – Bid Data Sheet (BDS)	Volume I – Section II: Proposal Data Sheet (PDS)
Section IV – Eligible Countries	Volume I – Section V: Eligible Countries
Section V – Evaluation and Qualification Criteria	Volume I – Section III: Evaluation & Qualification Criteria
Not Applicable in PPRA SBD	Volume I – Section VI: Fraud and Corruption (including Integrity Pact)
Section VI – Works Requirements	Volume II – Employer's Requirements (Parts I, II & III)
Section VII – Standard Bidding Forms	Volume I – Section IV: Proposal Forms
Section VIII – General Conditions of Contract (GCC)	Volume I – Section VII: General Conditions (FIDIC 2017 – EPC/Turnkey)
Section IX – Particular Conditions of Contract (PCC)	Volume I – Section VIII: Particular Conditions (Contract Data + SP)
Section X – Contract Forms	Volume I – Section X: Contract Forms

The attached EPC Bidding Documents (Volumes I to VIII) shall govern the procurement process, bid evaluation, contract award, execution, and all related obligations, in accordance with PPRA Rules.

All the form that are neccessary for submission of Bids may also be filled and submitted on EPADs along with forms of attached EPC document.

Procurement Forms

Past Experience and Completed Contracts

The bidder must meet the expeirence requirement in Section III Qualification and Evaluation Criteria (D. Experience) of attached EPC bidding document Volume 1

See Form Under Additional Forms and Documents: **Past Experience and Completed Contracts** (page number: 2750)

Historical Contract Non-Performance, and Pending Litigation and Litigation History

Qualifciation Requirement

Non-performance of a contractdid not occur as a result of EPC Contractor’s default since 1st January 2010.

Compliance Requirement: Single Entiry Must Meet Requirement

All JV Member Combined: Must Meet Requirement

Each JV Member:Must Meet Requirement

Submission Requiement: Form CON-2 as per attached EPC bidding document volume 1

See Form Under Additional Forms and Documents: **Historical Contract Non-Performance, and Pending Litigation and Litigation History** (page number: 2751)

Current Contracts and Their Progress

The requirements for disclosure of current contract commitments and works in progress shall be governed by the attached EPC Bidding Document. Bidders shall submit the required information in accordance with Form FIN-3.3 (Current Contract Commitments / Works in Progress) of the EPC Bidding Document Volume 1.

See Form Under Additional Forms and Documents: **Current Contracts and Their Progress** (page number: 2753)

Financial Capacity and Net Worth Evaluation Form

The financial capability requirements shall be governed by the attached EPC Bidding Document Volume 1. Bidders shall submit the required financial information in accordance with Form FIN-3.1 (Financial Data) of the EPC Bidding Document, including audited financial statements for the previous three (03) years

See Form Under Additional Forms and Documents: **Financial Capacity and Net Worth Evaluation Form** (page number: 2754)

Average Annual Turnover

The requirements for submission of Average Annual Construction Turnover shall be governed by the attached EPC Bidding Document. Bidders shall submit the required information in accordance with Form FIN-3.2 (Average Annual Construction Turnover) of the EPC Bidding Document Volume 1.

SECTION 1 SCOPE OF WORK

1.1 GENERAL

The Contractor shall Design, Procure the necessary Equipment and Materials, Construct, Install, Test and Commission the Power Plant according to the scope of work as defined in forthcoming sections. This Section describes the Scope of Work, to be performed by the Contractor under a lump sum, fixed price EPC Contract for delivering the Employer with fully Commissioned and Operative Attabad Lake Hydropower Project 54 MW, including Joint Operation and Defect Notification Period of Two (02) year, for Electro-Mechanical works from Commercial Operation Date. The Contractor shall plan and co-ordinate his activities with those being undertaken by the Civil Works Contractor under Package-I - Civil and Auxiliary Services Works.

For equipment supplied under E&M Contract all built in steel work, holding down bolts, liner tubes, nuts, washers, any embedment's and packing shall be installed by the Contractor. The Civil Works Contractor will provide such openings, holes, plinths and subsidiary foundations as may be necessary for the work under E&M Contract, except for the Two (02) 132 kV Line End Bays at 132/66 kV Aliabad Grid Station, for which the associated Civil Works are included within the scope of the E&M Contractor (Package-III).

The Civil Works Contractor shall make application to the Employer for the date by which embedment's to be installed by E&M Contractor. If sufficient information and the necessary materials, templates and embedment's etc. are not installed within such time, any alterations or additions to such foundations, walls, floor ducts, pipes and trenches etc. resulted will be made by Civil Works Contractor at the expense of the E&M Contractor.

The Contractor shall provide in accordance with a schedule to be agreed early in the Contract period all loads that his equipment will impose upon the civil structure and other equipment already existing or to be provided as part of the Project.

The Contractor shall plan and co-ordinate his activities with those being undertaken by the Civil Works Contractor under Package-I Civil Works. The E&M Contractor shall liaise with the Employer's to ensure that their plant erection is well coordinated with related component activities of the Contractor for Civil Works. As there is a single contract for E&M plant the interfaces between the turbine, generator and other Electro-Mechanical equipment shall be the responsibility of the E&M Contractor.

The Employer shall liaise with the Civil Works Contractor with regard to the interface with the civil works. No Contractor shall be deemed to have fulfilled his obligation insofar as the commissioning of the Plant is concerned until complete end-to-end tests have been carried out to the satisfaction of the Employer.

The Contractor shall be responsible for all aspects of Design and Construction of the Project in accordance with the Design Criteria and Specifications furnished herein, and in accordance with additional and supplementary Design Criteria and Specifications prepared by the Contractor and accepted by the Employer.

The scope of work to be carried out by the Contractor will include, but not be limited to:

a. Preparation of all "Detailed Design Criteria, Design Analysis, Design Calculations, Technical Specifications, E&M installation and Erection & assembly drawings, Detailed Construction and Shop Drawings, Quality Control Procedures, and Environmental Management Plans necessary for the complete Construction of the Project together

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

with Operation and Maintenance (O&M) Manuals, Baseline Study Report and As Built Record Drawings";

b. Layout of individual Project Components including Equipment Layout in the Powerhouse, Switchyard, Line End Bays, Intake and other ancillaries;

c. Preparation of Detailed Construction Drawings, necessary Shop Drawings, Schedules etc. for Erection Sequence Drawings for E&M Equipment;

d. Ancillary and Environmental Protection Works necessary during implementation of the Project;

e. Telecommunication and Internet Facility;

f. Quality Plan and Quality Assurance System;

g. Health and Safety Measures Plans;

h. Preparation of Construction Program and Method Statements;

i. Fabrication, Delivery to site, Erection, Testing and Commissioning of specified Plants;

j. Provision of Operation and Maintenance (O&M) Manuals in English language;

k. Inspection testing plan

l. As-Built Record Drawings;

m. Training of Employer's O&M staff;

1.1.1 Civil Works for 132kV Line End Bays at Remote End

The Contractor under this Package shall also be responsible for the design, construction, testing and completion of all civil works associated with the 132 kV Line End Bays at 132/66kV Aliabad Regional Grid station, forming part of the Scope of Works.

The civil works under this Package shall include, but not be limited to, equipment foundations, cable trenches, grounding/earthing system, fencing, backfilling, drainage, gravel and all associated concrete and structural works required for the proper installation and operation of the Line End Bays.

The Civil Works shall be executed in accordance with the relevant technical specifications, material standards, workmanship requirements, inspection and testing procedures defined under Package-I (Civil and Auxiliary Services Works), insofar as they are applicable to the Line End Bay Works. Only those provisions directly related to the scope under this Package shall apply.

In the event of any discrepancy between the provisions of Package-I and this Package, the provisions of this Package shall prevail.

The Contractor shall be deemed to have reviewed the applicable Civil specifications and standards of Package-I and shall have allowed for compliance therewith in his Contract Price.

1.2 PROJECT COMPONENTS

Feasibility Project Layout, Alternative Project Layout or any other more Feasible / Applicable Project Layout(s) shall be reviewed and evaluated by Contractor during Bidding Stage.

As a result of evaluation of the Feasibility Project Layout and assessments during the Site Visit, another appropriate / applicable Project Layout i.e., "Modified Alternative 1-A" has been

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

identified comprising the following main Electro-Mechanical Components as defined by the Management Consultants. The Conceptual Drawings describing this Project Layout are provided in Part-III of this Volume-II.

1.2.1 Electro-Mechanical Components

1.2.1.1 Powerhouse

a. Three (3) Vertical Shaft Francis Turbines of 18.94 MW each, including all associated Ancillaries, Auxiliary Equipment, Instrumentation and Control Systems.

b. Three (3) Turbine Acoustic Flow Meters.

c. Three (3) Speed Governors including all associated Allied and Auxiliary Equipment.

d. Three (3) Turbine Main Inlet Valves with Hydraulic Operators and all associated Auxiliary Equipment.

e. Powerhouse Mechanical Auxiliary Systems including but not limited to Cooling Water System, Dewatering and Drainage Systems, Compressed Air System, Oil Purification Systems, and Fire Detection and alarm System for Generators and Transformers

f. One (1) Electrically Operated Traveling (EOT) Overhead Bridge Crane of Tentative Capacity 70 Ton for Powerhouse Machine Hall Erection and Maintenance.

g. Mechanical Workshop Equipment complete in all respects.

h. One (1) Electrically Operated Traveling Powerhouse Passenger Elevator with a lifting capacity of 1000 kg (or 13 persons).

i. Three (3) Alternating Current Vertical Shaft Synchronous Generators of 18.56 MW (23.20 MVA) each, complete with all associated Ancillary and Auxiliary Equipment.

j. Three (03) Static Excitation System along with complete Protection Systems and Three Phase Dry Type Excitation Transformers.

k. Three (03) Segregated Phase Bus between Generators and Generator Step-Up Transformers at Switchyard.

l. Four (04) Generator Step-Up Transformers with rating of 20/26 MVA each, including One (01) spare Transformer.

m. Three (03) Generator Circuit Breakers of Capacity of 1600 A each, shall be part of Medium Voltage Switchgear along with dedicated Compartments provided for connection with Segregated Phase Bus.

n. The entire Plant shall include the following Protections:

   i. Three (3) sets of complete Generator Protection Systems.
   ii. Three (3) sets of complete Generator Step-Up Transformers Protection Systems.
   iii. Three (3) sets of complete Protection Systems for the Auxiliary Transformers.

o. Plant Control System (PCS) complete with Hardware, Software and Interfaces.

p. Telecommunication System.

q. Two (02) set of 220V DC System and UPS system complete with Batteries and Chargers.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

r. Four (04) Station Auxiliary Transformers (11/0.4kV), Rating of 630kVA each, Dry Type, including One (01) spare Station Auxiliary Transformer.

s. One (01) Set of Low Voltage Switchgear, Earthing System (For Equipment Protective Earthing Connections) and associated Cables and accessories etc.

t. One (01) Set of Emergency Diesel Generator of Rating 500 kVA for powerhouse.

u. One (01) Set of Medium and Low Voltage (MV/LV) Power Supply and Distribution Networks complete in all respects.

1.2.1.2 Power Intake

a. Two (2) sets of Trash rack.
b. One (1) set of Stoplogs.
c. Two (2) Fixed Wheel Gates.
d. One (1) Gantry Crane, complete with all auxiliary equipment.
e. One (1) Set of Trash rack Cleaning Machine, complete in all respects.
f. Two (02) Auxiliary Transformers at Intake (11/0.4kV), Rating of 400kVA, Oil Type including One (01) spare Transformer.
g. Two (02) set of 220V DC System and UPS system, complete with Batteries and Chargers.
h. One (01) Emergency Diesel Generator with Rating of 100 kVA for Intake.
i. One (01) set of Medium and Low Voltage (MV/LV) Power Supply and Distribution Networks, including Earthing & Bonding System for E&M equipment and structures

1.2.1.3 Flushing Intake

a. One (01) Guard Gate (Fixed Wheel Type), complete with operating mechanism.
b. One (01) Service Gate (Fixed Wheel Type), complete with operating mechanism.
c. One (01) set of Stoplogs (Optional).

1.2.1.4 Draft Tube

a. Three (03) Bulkhead Gates (Fixed Wheel Type).
b. One (01) Gantry Crane for Draft Tube Gates.

1.2.1.5 132kV AIS Switchyard

a. 132kV AIS Switchyard shall consist of Three (03) Transformer Bays (Generator Step Up Transformers), One (01) Power Transformer Bay and Two (02) 132kV Transmission Line Bays. The 132kV Transmission Line Bays shall be arranged in a One-and-a-Half Circuit Breaker Scheme.
b. One (01) 132/33 kV Power Transformer with a Rating of 10/13 MVA.
c. One (01) 33/11 kV Power Transformer with a Rating of 6.3 MVA.
d. One (01) Emergency Diesel Generator Set with a Rating of 200 kVA.
e. One (01) set of 110V DC System and UPS system complete with Batteries and Chargers.
f. 33 kV Switchgear
g. MV/LV Switchgear.
h. Protection System.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

i. Substation Automation System (SAS)
j. SCADA and Telecommunication System.
k. Equipment Protective Earthing connections, complete in all respect.
l. The specifications mentioned in the Employer's Requirements in respect of goods and materials to be provided and considered in the Works shall be new, unused, of the most recent or current models and shall incorporate all recent improvements in design and materials.

1.2.1.6 132KV Line End Bays at Remote End

The Equipment includes but is not limited to the following.

a. Two (02) complete 132kV AIS Line End Bays including extension and integration with the existing 132kV busbar, protection, control, grounding, and SCADA systems at 132/66 kV Aliabad Regional Grid Station, complete in all respects. 132kV remote end line bays shall be arranged in a Single Bus Bar Scheme.
b. LV cables and integration with existing system.
c. Extension of Lighting system (if required).
d. Cable trays, conduits and accessories.
e. Construction of fence, its lighting and grounding.
f. Any other item which is not included here but is necessary for the safe, reliable and Integrated operation of the Line End Bays as advised by the Employer.
g. Construction of all associated civil facilities (equipment foundations, cable trenches, backfilling, drainage system, gravel etc.

1.3 DETAILED DESIGN AND PLANNING OF THE WORKS

The Contractor shall perform Engineering Services pertinent to planning and Detailed Design of the Works in accordance with accepted International Standards and codes. In addition, the Contractor shall establish a Quality Control/Quality Assurance (QA/QC) Program to verify that the Work performed by the Contractor is in accordance with the requirements of the Contract.

The Electro-Mechanical and any other Designs included in the Feasibility Report and Conceptual Drawings in Part-III of Volume-II, Employer's Requirement, are only for the information of the Proposers to understand the Project. The Proposers shall review all such designs and may develop and firm up their Proposal level Designs and Drawings in view of the Employer's Requirements, applicable Standards and Specifications to fulfill their responsibility as a Contractor.

The Contractor shall prepare a Basic Design as part of preparation of its Proposal for construction of Works. The Contractor shall be solely and fully responsible to develop the detailed design for implementation of the Project, including consideration of all requirements stated Volume-II. Any details or information shown in the Basic Design shall be verified and confirmed by the Contractor before incorporation in the Detailed Design of the Works. Any deviations from the requirements stated in Volume-II, Part-I, Part-II and Part-III shall be brought to the attention of the Employer in writing and shall be subjected to Employer's approval.

The Contractor shall prepare and execute all the site investigations and surveys necessary for the detailed design and Project execution at its own responsibility and cost with the prior approval of the Employer.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

The Contractor shall provide the entire Works, complete in all respects fully equipped, and ready for operation together with all spare parts and consumables required for the operation for the specified period in Volume-II Part-II (Technical Provisions) to the Employer. If the EPC Contractor shall operate the Works, either for a “trial period” in accordance with sub-clause 9.1 or as directed by the Employer.

1.3.1 Detailed Design

All Designs shall be performed in accordance with the requirements given in the following Section 2, Basic Design Criteria. The Design responsibilities of the Contractor shall be as follows but shall not be limited to:

a. The Contractor shall carry out the Detailed Design and prepare Construction Drawings of the Permanent Works to be performed under this Contract, including all required site investigations, surveys and analysis deemed necessary for detailing the design. These analyses shall include, but shall not be limited to the analysis listed below.

   - Stability Analysis;
   - Head Loss Calculations of complete waterways and Turbine setting to minimum Tailwater Level;
   - Annual Energy Calculations (in tabulated form) considering Average Daily Flows and Actual Plant Efficiencies;
   - Using Computer Simulation Modelling, carry out Hydraulic Transient Analysis to determine speed & pressure rise values and flywheel effect (GD^2) keeping in mind that the Power Plant will be required to stably operate in isolated mode;
   - The hydraulic complete design shall be vetted by the Turbine’s Manufacturer;
   - Structural Design Calculations and Drawings of Hydraulic Steel Structures (HSS) including Gates, Stoplogs, Trash rack along with their Service / Support Structures;
   - Detailed Piping and Instrumentation Diagrams (P&ID) for the Mechanical Auxiliary Systems along with System Description, Design Data, Calculations and Design Briefs.
   - Using computer simulation modelling, carry out surging analysis in the waterways considering applicable cases of load rejection and load acceptance to verify if the maximum upsurge and down surge in the surge chamber are within safe operating limits against worst case scenario.

b. The Contractor shall prepare the Detailed Design and Drawings of the necessary Temporary Works to be performed under this Contract;

c. The Contractor shall prepare Construction Method Statements and an Execution and Implementation Plan;

d. The Contractor shall prepare the Detailed Design and Connection Shop Drawings of the Hydromechanical and Electro-Mechanical Equipment to be installed under this Contract;

e. The Contractor shall prepare the Detailed Design Drawings and Shop Drawings of 132 kV Switchyard and associated Connection Facilities including Grid Connection after Site Investigation / Testing if necessary.

f. In the event that any unforeseen underground or overhead utility lines or services are encountered during the course of the Project, the Contractor shall be responsible for identifying and proposing suitable alternatives or modifications to the design during the detailed design stage. All such alternatives must be submitted for review and prior

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

approval by the Engineer/Employer before implementation, ensuring minimal disruption to existing services and Project timelines.

The activities to be performed under the Detailed Design are outlined as follows but shall not be limited to:

- Review the work done and prepare a Summary of all Tests and Investigations planned to be carried out in connection with the Detailed Design;
- Design Memoranda;
- Detailed Design Calculations;
- Providing and/or incorporating Manufacturer's Drawings;
- Manufacturing and Delivery Schedule for Major Equipment;
- Detailed information of Site Offices and Camp Facilities;
- Quality Control and Quality Assurance plans and Procedures for Construction;
- Environmental Management Plan including measures for rehabilitation and restoration of work areas;
- Construction Security, Health and Safety plans; and
- Basic Outline of the Operation and Maintenance Manuals, and proposed Training Program.

The Contractor shall prepare Detailed Design Documentation to include, as a minimum for the review of Employer:

- Review of Assumptions and Design Procedures adopted, Design Criteria, Loads, Load Cases used and the Safety Factors;
- Short Description of each Method of Analysis, Computer Programs and Software etc. used;
- Calculations and Principal Results of the Detailed Design Analysis;
- Detailed Design Drawings and Specifications for Construction;
- Manufacturer's Shop Drawings;
- All other information necessary for Construction/Completion of Works.

1.4 QUALIFICATION EXPEREINCE REQUIREMENT FOR DESIGN FIRM FOR ENGINEERING OF E&M PLANT EQUIPMENT

If the Proposer has an experience of design and manufacturing of E&M Equipment as a Manufacturer and Sub-Contractor only, then for E&M Plant Engineering like Hydraulic Transient Analysis, Power System Studies, Earthing Design, BOP Design, AC/DC System Design, Control & Protection Schemes Design etc., the Proposer shall engage the services of reputed international design firm having proven design experience of at least successfully completed two Projects of similar nature and complexity of E&M Plant Engineering of Hydro power Plant.

All design activates shall be carried out only after approval of design firm by the Employer Representative.

Following information shall be submitted to evaluate the design capability of the proposed design firm:

- Experience/Performance Certificates/ Verifiable Documentary Proof of at least Two (2) Hydropower Projects clearly mentioning design activities of E&M Plant Engineering of Hydropower Plant, carried out by the Design Firm for those Projects like Transient Analysis, Power System Studies, Earthing Design, BOP Design etc.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- CVs of Key Design Experts showing relevant qualification, skills and experience in specific design activities
- List of design software and tools, which are used by the Design Firm for similar design activities for design of E&M Plant Engineering.

1.5 QUALIFICATION EXPERIENCE REQUIREMENT FOR E&M PLANT AND EQUIPMENT

During execution stage, the following minimum qualification and experience criteria shall be applied to all Suppliers/Sub-Contractors/Manufacturers, which are intended to be used by the Contractor for the Works.

a) The proposed Supplier/Sub-Contractor/Manufacturer must demonstrate at least Five (05) years of business on international Projects outside their home countries according to international standards.

b) The proposed Supplier/Sub-Contractor/Manufacturer must have supplied the equipment to at-least One (01) similar Project in Pakistan or outside the home country of the Sub-Contractor/Supplier/Manufacturer during last Ten (10) years supported by documentary evidence such as completion certificates or employer references.

c) Similar type of equipment as offered for the Project must have been in satisfactory commercial operation for at least Three (03) years prior to the bid submission date proven by the reference documentation from the end user/owner.

d) The Employer reserves the right to verify the submitted credentials, inspect manufacturing facilities, and reject any proposed Supplier/Sub-Contractor/Manufacturer that does not meet the above requirements.

1.6 PROVISION OF FIELD CAMPS AND OFFICES AND OPERATING FACILITIES

1.6.1 General

Provision of field camps and site offices, accommodation complete with all facilities for their own staff shall be made by the Contractor positively within Three (03) months of issuance of notice to proceed in accordance with Employer's prior approval and requirements. If the Contractor fails to complete this activity within Three (03) months of issuance of notice to proceed, all the expenses as a result of alternate offices residences and other facilities for their own staff, shall be deducted from the invoices claimed by the Contractor.

The Contractor shall design, install, operate, provide all consumable items, spares, replacements etc.; and shall maintain throughout the execution of the work all camp and office facilities required for the Works.

The Contractor shall provide, maintain and operate suitable capacity diesel generators along with all associated lubricants, fuels, filters and spares; One (01) for accommodation for their own till completion of the Project and demobilization.

The Contractor shall be responsible for ensuring that, during the construction period, there should be no adverse impact on the operations of any structures owned by government of Pakistan and Gilgit Baltistan and Private sector and shall promptly repair or compensate for any damage caused due to his activities.

During the entire construction period and Defect Notification Period, the Contractor shall be responsible for the maintenance of the entire telephone system and cellphones facilities inclusive of rental, call and data charges.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

The Contractor shall make available canteen and catering facilities for his own needs. The capacity shall be adjusted to the peak manpower requirement at Site. Canteen facility (lunch and tea) should be made available in field office free of cost. These facilities shall be able to serve hygienic meals at all times of the day to the Contractor and Employer's Staff. Adequate recreational facilities shall be provided.

Possession of the Project land will be taken from the Government of Gilgit Baltistan (GoGB) which will be handed over by the Employer for construction of the permanent Project components.

The Contractor shall provide an adequate number of trained and licensed security guards for effective, continuous and vigilant watch and ward on a 24-hour basis for the Project area, along with all necessary security equipment, communication devices and tools, in accordance with sub-clause 1.4.8 and applicable laws and local security regulations.

1.6.2 Temporary Site Installations

The Contractor shall design, install and maintain throughout the execution of the Works all temporary facilities, such as, but not limited to, Survey control points, foundations for construction plant, workshops, offices, site laboratory (to carry out all necessary tests) and stores etc. required for the Work.

On completion of the Project, the Contractor shall remove all temporary facilities, including their foundations that are not required to be handed over to the Employer, and restore the area to a level acceptable to the Employer.

1.6.3 Temporary Facilities to be handed over to the Employer

At the Completion date, selected temporary facilities or part thereof shall be handed over to the Employer if and as the Employer requires. These facilities shall be handed over to the Employer at no additional cost in good, safe and serviceable conditions so that these can be utilized by the Employer immediately without any further treatment, repair or renovation.

1.6.4 Construction Power and Water Supply

The Contractor shall be responsible for the design and provision of temporary power supply for all sites during construction of the works (if small Micro/Mini Hydro Generators). Such facilities shall be handed over to the Employer at no additional cost in good operable and serviceable conditions so that these can be utilized without any further treatment or renovation by the Employer.

The Contractor shall be responsible for the supply of adequate potable water as well as treatment/ environmentally accepted disposal of wastewater as well as appropriate disposal of solid waste for their own staff in accordance with applicable environmental laws and to be acceptable to the Employer.

1.6.5 Water Distribution System

The water distribution system shall be designed and installed by the Contractor and shall be maintained during the entire duration of the Project Construction, Defect Liability Period and any Period during which the Contractor rectifies the defects.

Prior to execution, the Contractor shall submit all necessary layouts and detailed drawings to the Employer for approval.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

1.6.6 Sewerage and Pollution Disposal System

The Contractor shall design sewerage and pollution disposal system according to applicable national and relevant international standards. The design shall be approved by Employer. The Contractor shall execute and maintain sewerage system for all of his site installations staff.

The sewerage system shall be in accordance with the sufficient required capacity of the sewerage system comprising sewer pipes in all dimensions, manholes, complete sewage treatment plants and all other installations and civil works to put the complete system into operation.

The treated wastewater shall be discharged downstream of Tailrace Channel located in the vicinity of the site area. The sanitary drainage and sewerage treatment system shall be provided with a suitable capacity of sewerage treatment compact pumping station, Septic Tank, Leach Field, Chlorine Contact Chamber, piping, power supplies, Valves and other accessories as per requirements of the Project.

At all workshops and other areas where losses of lubrication oil can occur, the Contractor shall provide oil traps, oil separators or other measures to avoid environmental pollution. The oil shall be properly disposed of at location and method approved by the relevant environmental authorities.

1.6.7 Contractor's Site Office

a. The Contractor shall establish the site office and its facilities which he requires for the Project.
b. The Contractor is foreseen to have One (01) main office.
c. The Contractor shall establish site office on temporary land at his own cost. Risk and responsibility.
d. Unless otherwise instructed by the Employer, at the end of the Construction period, all site office buildings and storage buildings (including the foundations), electric services, buried utilities, and fencing shall be removed and the site restored to the condition found before the camp was developed.

1.6.8 Contractor's Camp

1.6.8.1 General

The Contractor camp shall be constructed by the Contractor in accordance with the requirements of the Project construction. The Contractor will be responsible for development and operation & maintenance of the Contractor Camps for its own requirement.

Overall development of the Contractor Camp for their own staff is the responsibility of the Contractor. Contractor camp will be established on Temporary Land which will be arranged by the Contractor at his own cost, subject to approval of the Employer and relevant authorities.

1.6.8.2 Boundary Wall, Fencing and Watch Towers

Proper Boundary wall (3.5 m high) around construction camp along with barbed wire and razor wire fencing and appropriate number of search light towers for proper surveillance by security staff will be provided by Contractor.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

1.6.8.3 Camp Security

Security inside the perimeter of the Contractor camp shall be the responsibility of the Contractor for the duration of the Works. In addition to premises security, storage buildings, all work and office areas shall be provided with security to prevent loss of materials as well as maintaining the stored equipment.

Contractor shall arrange the security equipment and security guards which includes but not limited to:

a. Walkie-Talkies.
b. Walk through gates.
c. Metal Detector.
d. Search Lights for security surveillance.
e. Installation of CCTV cameras
f. Barracks for security guards and designated GB police personnel will also be provided by the Contractor.
g. Necessary arms and ammunition strictly in accordance with local laws and licensing requirements.
h. Pop-up barriers.

1.6.8.4 Security Field Cabins and Barracks

Contractor will provide, establish and maintain appropriate number of field security cabins and barracks with all accessories and utilities over the duration of Project and defect notification period. Cost shall be included in the Contract Price.

Security outside of the premises of the Employer camp and Contractor camp shall be provided by the GB police which will be arranged by the Contractor.

1.6.8.5 Removal of the Camp

Unless otherwise instructed by the Employer, at the end of the Construction period, all camp buildings and storage buildings (including the foundations), electric services, buried utilities, and fencing shall be removed and the site restored to the condition found before the camp was developed and to the satisfaction of the Employer.

1.6.8.6 First Aid Facilities

a. A first aid station shall be provided to serve all personnel at the site. The first aid station (Dispensary) shall be equipped as required by applicable Pakistani and Gilgit Baltistan laws.
b. A qualified emergency medical officer shall be on duty at the first aid station (Dispensary) on each working shift and day.
c. One Ambulance with driver fully equipped to handle the emergency shall be on duty at site for working day.
d. The Contractor shall furnish proof to the Employer that he has a continual arrangement with an approved hospital and Medicare arrangements for the emergency evacuation and admittance at any time and subsequent medical and hospital care for injured employees.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

1.6.9 Temporary Electrical Facilities

1.6.9.1 Scope of Work

The Contractor shall be responsible for complete design, supply, installations, earthing, testing and commissioning of the power supply networks, including Distribution Transformers, along with allied hardware's, consisting of but not limited to all material, labor, tools and accessories etc. or (unless specifically stated otherwise) required for proper completion shall be included in the Contractor's Scope of Works.

a. The Contractor will construct his own independent temporary power supply network from Diesel Generator sets or other approved sources to various parts of the works including his offices, equipment, construction areas, testing areas, workshops, plant, and all other needed facilities.

b. Diesel generator set shall be provided and operated by the Contractor as a main power supply for the various parts of the works including Contractor offices, equipment, work areas, workshops, and plant.

c. Lighting and small power system (indoor/outdoor) for various parts of the works and for their own facilities

The Contractor shall remain responsible for site clearance, removal of any defects detected in the works for achieving satisfactory operation/ functioning/ service of the works. The contract shall include furnishing of all construction equipment, tools, labor, supervisory staff, plants, transport, power, testing apparatus/arrangements and all construction materials as shall be required for satisfactory completion of works strictly in accordance with DISCO's technical specifications & Standards. The cost of the aforementioned scope including tariff cost of electricity bill, diesel etc. shall be borne by the Contractor.

1.6.10 Site Communication

a. The Contractor shall furnish and completely install a reliable telephone system as communication facility for his own requirements.

1.6.11 Project Vehicles

The Contractor shall provide three (03) brand-new Double Cabin Four-Wheel Drive vehicles and three (03) brand-new Jimny Jeeps for the Employer. Additionally, the Contractor shall provide two (02) brand-new Double Cabin Four-Wheel Drive vehicle and One (01) brand-new Jimny Jeep for the Attabad Hydropower Management Consultants. The Contractor shall be responsible for all costs related to registration, licensing, insurance, operation, and maintenance, including fueling and dedicated drivers, throughout the Project duration, including the Defect Notification Period. Upon Project completion, all Project vehicles shall be handed over to the Employer.

1.6.12 Project Working Scale Physical Model

Contractor shall prepare Project working scale physical model of minimum size 1.2m x 0.8m along with proper stands and associated features illustrating the main Project components to the satisfaction of the Employer.

1.7 QUALITY ASSURANCE/QUALITY CONTROL

1.7.1 General

a. The Proposer is required to demonstrate by documentation his proven capability to design, manufacture, supply, install and commission all equipment specified herein.

b. The documentation shall be based upon the requirements set forth in ISO 9001:2015, "Quality systems, Model for quality assurance in design/development, production, installation and servicing". Copy of valid and current certificate shall be presented to the Employer.

c. The Contractor shall be completely responsible for implementing a Quality Assurance Plan covering all the Works contained in the Contract. The Quality Assurance Plan will be prepared by the Contractor and reviewed and authorized by the Employer and will be implemented by the Contractor. Specifically, it will be managed by the Contractor's Quality Assurance Manager. The Contractor's Quality Assurance Plan is the means by which the Contractor ensures the control and quality of all design functions, all fabrications by the suppliers and Sub-Contractors and all construction activities carried out by Contractor's forces and the Sub-Contractors, all work by equipment installation engineers and the testing and commissioning activities associated with all the mechanical and electrical equipment.

1.7.2 Contractor's Quality Assurance Plan

The Contractor's Quality Assurance Plan shall meet all the requirements of ISO 9001- 2015. As appropriate the Contractor will impose on his designers, suppliers, fabricators and sub-Contractors the requirements of ISO 9002, ISO 9003 and ISO 9004. The Quality Assurance Plan will be prepared and presented in three (3) different volumes namely:

Volume 1 Quality Plan;
Volume 2 Quality Assurance Procedures; and
Volume 3 Quality Control Procedures

Collectively the three Volumes shall comprise the Contractor's Quality Assurance Plan (PLAN). Each volume will address the issues enumerated in the following articles of this Section. The Quality Assurance Plan shall recognize and include the potential necessity for revision during the Project at which time reauthorization shall be sought from the Employer. Within thirty (30) days of the date of the Letter of Acceptance, the Contractor shall produce and submit to the Employer an outline of the Plan. Within a further 30 days of the above submittal date, the Contractor will submit the detailed Plan incorporating the comments made by the Employer. The authorized detailed Plan will be supplemented by comprehensive details for specific work activities at least 28 days prior to their commencement. The Contractor's Quality Assurance Plan will be managed and directed by a dedicated Quality Assurance (QA) Manager who will be physically present on the Project Site throughout the implementation and will report directly to both the Contractor's Site Project Manager and independently and directly to the Contractor's Home Office Senior Management. The QA Manager shall represent and be authorized by the company to manage quality assurance activities and to implement the Contractor's QA system.

1.7.3 Volume 1 "Quality Plan"

This section of the Contractor's Quality Assurance Plan will address the following topics:

a. Purpose and Scope;

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

b. Policy;
c. Organization and Responsibilities;
d. Project Manager Review;
e. Applicable Standards; and
f. Definitions.

The purpose, scope and policy sections will establish the general philosophy and parameters that the Contractor's Senior Management requires for the Quality Assurance Plan. Organization and Responsibilities will clearly present the detailed Contractor's Organization as it pertains to Quality Assurance and Quality Control activities. A description of assigned responsibilities is required. Project Management Review will address the Contractor's procedures for addressing quality issues raised by the Quality Manager to the Site Project Manager and Head Offices Senior Management. The standards that will be used to support the Contractor's Quality Assurance Plan are required to be listed. These will include all applicable industry codes, standards and practices and specifically those referenced in the Contract Documents and the Technical Specifications. For clarification in the use of the Contractor's Quality Assurance Plan document by Contractor's personnel it is required that a glossary of specific terms used in the documents be itemized (Definitions).

1.7.4 Volume 2 "Quality Assurance Procedures"

This Volume will present clearly the Quality Assurance (QA) procedures developed by the Contractor to provide a planned and disciplined approach for the achievement of Project quality objectives. The procedures, in general, require the prompt detection and correction of deviations, which are or may be, detrimental to quality or safety and generate documentation necessary to provide objective evidence of achievement of quality and safety objectives during design, fabrication, construction and commissioning phases of the Project. As a minimum the QA procedures will include but not limited to:

- Contractor's quality statement;
- Contractor's organization structures including quality control organization;
- Contractor's quality procedures addressing requirements of ISO 9001;
- Principal staff and its tasks and responsibilities;
- Contractor's plant management procedures;
- Construction program management;
- Progress reporting procedures;
- Contractor's design procedures;
- Contractor's procedures for selecting and appointing Sub-Contractors and Suppliers including independent testing laboratories;
- Contractor's procedures for obtaining, reviewing and approving sub-Contractors and Suppliers quality procedures and for quality auditing of sub-Contractors and Suppliers;
- Contractor's risk assessments and method statements reporting in detail the proposed safe methods of working and measures to reduce risks or hazards to as low as reasonably practicable;
- Control of construction procedures with emphasis on Materials control and approval; and Method statements, including transportation and handling of materials;
- Verification, testing and reporting procedures for design, equipment, materials and workmanship in the office, factory or on site;
- Document control procedure;

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- Health and safety procedures;
- Environmental Management plan;
- Site operational control procedures;
- Contractor's internal quality audit control procedures;
- Non-conformance reporting (NCR) procedures;

1.7.5 Closing out NCR for the Taking-Over procedures;

- Training procedures;
- Interim measurements and payment procedures;
- Final measurement procedures;
- As-built information and operation and maintenance manuals; and
- Change control of Project quality procedures.

The plan shall include organization charts illustrating the main task and their sub-division, the reporting structure and:

- Interface between the Contractor and the Employer;
- Interface within the Contractor's internal Project team;
- The Contractor's coordination with local and statutory authorities; and
- The Contractor's internal quality management arrangement including quality assurance and auditing personnel.

The QA Procedures are the requirement for the Quality Assurance Manager to formulate an audit plan, designate organizational elements subject to audits and establish a schedule for providing regular auditing activities. The Contractor's internal quality audit control procedures will be written and submitted to the Employer for review and approval and as a minimum will contain the following items:

- Audit title and number;
- Organization affected;
- Purpose;
- Scope;

Activities to be audited;

- Performance standards;
- Audit team members overall schedule;
- Any interfaces;
- Review and approval authority; and
- Schedule of audits.

The Contractor's internal quality audit control procedures and schedule of audits will be forwarded to the Site Project Manager and other key members of his organization. Employer shall have the right to require revision of the Contractor's internal quality audit control procedures during the Project.

1.7.6 Volume 3 "Quality Control Procedures"

a. This volume will present the procedures and systems that the Contractor will perform to maintain an effective Quality Control (QC) program. In general, the Contractor will perform sufficient checks, inspection and tests on all items of the Work including:

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- Design Engineers;
- Suppliers;
- Sub-Contractors; and
- Contractor's site work activities.

b. The Contractor shall ensure conformity with respect to the design, materials, workmanship, construction, finish and functional performance. The Quality Control Plan shall include adequate provision for full access by the Employer to inspect any and all facilities of the Project and facilities such as laboratories etc. required to implement the plan. Specifically, Volume 3 will address the following items as a minimum:

- The QC organization;
- The number and qualifications of personnel to be used;
- Authority and responsibility of QC personnel;
- Methods and procedures of QC control for all the work including design, suppliers and Sub-Contractors;
- Inspection and Testing Plan;
- Details of the site laboratory including the physical layout and proposed on-site testing equipment;
- Details of any off-site laboratory testing;
- Details of the physical site tests and laboratory tests proposed for all the construction materials with emphasis on cement, concrete, soils and rock testing. Frequency of testing shall be included;
- Off-site testing of manufactured items and type testing;
- Procedures that will ensure that the latest applicable Drawings, shop drawings, the Employer's Requirements and instructions required by the Contract Documents, as well as authorized changes, are used for fabrication, construction, inspection and testing.

c. Procedure for the issuance, tracking and closeout of Non-Conforming Reports (NCR's) and Deviation Reports (DR's) shall be defined. This procedure shall prioritize the NCR's and ensure the closeout of such matters in a timely manner to the satisfaction of the Employer and no NCR shall remain open at the time of Taking-Over unless expressly approved by the Employer.

1.8 ENVIRONMENTAL COMPLIANCE

The Contractor shall comply with all applicable national and local environmental regulations and guidelines. The Contractor shall also comply with the Environmental Impact Assessment (EIA) Report and the conditions that will be laid down in "No Objection Certificate (NOC)" that will be issued by the GoGB, Environmental Protection Agency (EPA).

Reference is made to the environmental requirements given in;

a. The Laws and Regulations of Government of Pakistan and Government of Gilgit Baltistan, and relevant international standards;

b. GB Environmental Protection Act, 2014 and other applicable environmental rules and standards and good engineering practices and guidelines related to ESHS;

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

c. Employer's Requirements regarding ESHS given in subsequent Sections of Bidding Documents (refer Section 1.11.13 and sub clause 4.2 respectively);

d. Sub-clauses of General Condition of Contract and any other clause or sub-clause having any relevance to Environment;

e. The Contractor shall within One (01) month of receipt of Notice to Proceed, appoint qualified ESHS Personnel as specified under Section 4.2 of Special Provisions, whose broad responsibilities are to guide the construction personnel on ESHS matters, to communicate and to make liaison with the Employer, local stakeholders, relevant departments such as GB EPA, Fisheries Department, Wildlife Department and other relevant departments;

f. The Contractor shall (a) establish an operational system for managing ESHS impacts and risks, (b) carry out all the monitoring and mitigation measures set forth in the EIA and Environmental Management Plan (EMP) for the Project, and (c) allocate the budget required to ensure that such measures are carried out, and all cost for the implementation of such measures shall be borne by the Contractor in letter and spirit. The Contractor shall submit to the Employer, monthly and quarterly environmental reports on the carrying out of such measures as identified in the EIA, EMP, NOC and Contract;

g. The EPC Contactor needs to prepare the Site-Specific Environmental Management Plan (SSEMP) and Site-Specific Health and Safety Management Plan (SSHSMP) and any other management plans as suggested in the EIA Report;

h. The Contractor will be responsible to update the EIA including EMP based on the final design and submit to the Employer for review and approval prior to implementation; and

i. The Contractor shall apply for the operational stage NOC after the completion of the Construction works with GB EPA.

The detailed requirements with regards to the environmental provisions are provided in Section 4.2.

1.9 DOCUMENTARY FILM

The Contractor will prepare a professional documentary film showing all important events of construction, sub-assemblies and erection, testing and commissioning assemblies, of all the equipment. The documentary will provide a commentary giving full details of events. Three (3) copies of the documentary Film will be provided to the Employer before completion of the Project. The Contractor will present the Employer the updated documentary film on three (3) month basis for the review and approval of Employer.

1.10 JOINT OPERATION AND DEFECT NOTIFICATION PERIOD

The E&M Works Contractor shall successfully complete the joint operation of Electro-Mechanical works for a period of Two (02) years, which shall run concurrently with the Defect Notification Period (DNP).

Upon successful testing and commissioning, the Contractor shall assist in the joint operation of facilities for training the Employer’s staff.

The Contractor shall deploy qualified and experienced personnel for the operation, maintenance, and rectification of any defects related to Electro-Mechanical works during this period.

The Contractor shall remain fully responsible for rectifying defects within its scope during the Defect Notification Period at no additional cost to the Employer.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

The Contractor shall coordinate with the Civil Works Contractor to ensure seamless integration and operation of systems requiring both civil and E&M inputs.

Any defect requiring joint coordination between Civil and E&M Contractors shall be addressed through Employer, ensuring timely resolution.

Upon successful completion of the Defect Notification Period, the Contractor shall formally hand over all related works to the Employer.

The final acceptance shall be subject to the satisfactory performance of all components and compliance with contractual requirements.

1.11 MOBILIZATION AND DEMOBILIZATION

a. The Contractor shall also furnish all the labor, materials, equipment and shall perform all work required for mobilization to and demobilization from the Project site.

b. Mobilization shall include, but not be limited to, moving personnel, plant, and equipment to the Site; arranging for necessary Site utilities; establishing camps, shops, offices and administrative facilities; and obtaining all required permits, licenses, and other regulatory authorizations required by the Contractor for the construction of the Project.

c. Demobilization shall include, but shall not be limited to, removing all plant, equipment, and temporary facilities from the Site; disconnecting temporary utilities; relocating personnel from the Site; cleaning-up and restoring all areas occupied by the Contractor; closing out permits, licenses, and other regulatory authorizations; and disposal of all waste materials and excess construction materials which are not the property of the Employer in accordance with environmental requirements.

d. Cost of mobilization and demobilization shall be deemed to cover in overall Contract Price, and no separate payment shall be made.

1.12 PROPOSAL SUBMISSIONS

1.12.1 General

The following documents are to be submitted with the Proposal for the purpose of evaluation.

1.12.1.1 General

a. Completely filled schedules & data sheets.

b. Letter of Technical Proposal along with schedules.

c. Complete list of any Technical or Commercial Deviations clearly identified and justified.

d. Price and Payment schedule.

e. Comprehensive list of drawings to be submitted by the Contractor during detailed engineering.

f. Outline of Testing and commissioning Plan for tests on Completion.

g. Outline of Training Program for Employer's personnel.

1.12.1.2 Technical

a. Hydraulic Design and Head loss Calculations.

b. Power & Energy Studies.

c. Proposal Design Report covering basic design of E&M Plant.

d. Proposal Drawings for E&M works.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

e. Construction Specifications.

f. The Proposer shall submit the necessary calculations, documents, and drawings as part of the Proposal to enable the Employer to assess the technical conformance of the proposed process. However, the detailed Hydraulic Analysis shall be finalized and submitted during the Level-1 Design stage.

1.12.2 Proposal Design

The Proposer shall submit as a minimum to define his offer, Drawings, Design Criteria, Data and Design Briefs and Construction Specifications. The Design Briefs shall be intended to represent the type and quantity of information required to evaluate the Proposals and to highlight:

a. Design parameters and Methodology.

b. Design Criteria.

c. Head Loss Calculations.

d. Power and Energy Calculations.

e. Construction Work Schedule.

f. Operating characteristics of the Project and its component parts.

1.12.3 Proposal Drawings for Electrical and Mechanical Equipment

As a minimum the following drawings shall be necessary to define the Project Hydromechanical and Electro-Mechanical equipment;

a. Drawings showing the general arrangement of the equipment including single line diagrams.

b. Plans.

c. Elevations.

d. Sections. (Including principal dimensions).

1.12.4 Schedule Requirements

a. The Contractor shall plan and execute the Works to achieve the time for completion of the Section or the Works given in Contract.

b. An integrated Project schedule shall be provided to demonstrate that Time for Completion given in Contract could be achieved. The integrated Project schedule shall provide schedule dates for all Milestone Dates and will be used to monitor the Contractor's progress with reference to completion of the Works.

1.12.5 Contractor's Staff

a. Contractor will be responsible to arrange a strong state of the art design team or at least produce an MOU or agreement with some reputed and experienced Engineering Consulting Firm, acceptable to the Employer.

b. The Contractor shall assign a qualified Project Manager acceptable to the Employer and adequate staff with sufficient relevant experience. The Project Manager should have relevant construction experience of Fifteen (15) years (minimum) and should have successfully managed at least Two (02) similar Projects of US$ 40 million value each in a lead management role.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

1.13 CONTRACTOR SUBMITTALS AND RESPONSIBILITIES

1.13.1 General

The Contractor shall submit Contractor's Documents for review as specified. Unless otherwise specified in the Contract, the Contractor shall provide each Design and Construction Document to the Employer as per details specified in Table 1-1 included at the end of this Section.

Notwithstanding the time periods listed in Table 1-1, the Contractor shall submit all documents as early as reasonably practical to mitigate any possibility of delays arising from review by the Employer or by third parties.

The Employer's review period and provision to comment shall be to assure the Engineer of the Contractor's compliance with the Contract. It is intended that Employer shall have a review and comment opportunity for each construction document, for each submittal or resubmittal. Such review shall not relieve the Contractor of any responsibility or liability under the Contract.

Prior to the Commencement Date, the Contractor shall prepare and submit a "Design Management Plan (DMP)" outlining the procedures to be used for control of design activities, schedule for design, coordination of the main Project design with the activities of sub-Contractors, design quality control procedures, authorizations for review and approval of design, description of design documents such as design criteria, design memoranda, and design reports, and other information necessary to demonstrate that the Contractor can effectively manage the design of the Works.

All Project documentation and submittals shall be in English Language.

All specifications, drawings, reports, design calculations and other essential data are subject to the Employer review. Comments shall be given in writing by the Employer within twenty-eight (28) days after receipt of such documents, unless otherwise stipulated in the Contract. Any work carried out prior to such approval shall be at the Contractor's own risk and expense. The number of drawings and documents to be submitted for information or approval shall be limited to the required minimum for the purposes of the Employer. The exact number and mode of distribution for drawings and documents will be agreed upon between the Contractor and Employer at the Commencement Date.

The Contractor shall submit a drawing schedule, which will be subject to the review by the Employer. The drawing schedule shall be consistent with the Contractor's integrated Project schedule. The drawing schedule shall show design phase, structure, drawing number, titles, status, schedule dates and other relevant information. At four (04) week intervals, the Contractor shall submit copies of the revised drawing schedule showing the actual status of the drawings, i.e., preliminary, reviewed by Employer, approved for construction by Contractor, for information only, or as-built, and the date for completion of each phase of the drawings.

The Contractor shall also submit a document control schedule, which will be subject to the review by the Employer. The document control schedule shall be consistent with the Contractor's integrated Project schedule. The document control schedule shall show the number, titles, status, schedule dates and other relevant information. At four (04) week intervals, the Contractor shall submit copies of the revised document control schedule showing the actual status of the documents, i.e., preliminary, reviewed by Employer, approved for construction by Contractor, for information only, or as-built, and the date for completion of each phase of documentation.

The construction documents shall comprise the documents described in this Section in addition to other documents specified in the Contract.

Table 1-1: Schedule of Design and Construction Submittals

Description	Review Period	No of Copies for Review	No of Copies for Final Issue	Digital Copy
List of Design Documents for Review, Approval & Information	28 days	4	6	2
Design Criteria & Basic Design (Level-1 Design)	28 days	4	6	2
Detailed Design Criteria & Detailed Design (Level-2 Design)	28 days	4	6	2
Detailed Design (Level-2)	28 days	4	6	2
Detailed Design Specifications	28 days	4	6	2
Construction drawings	28 days	4	6	2
Manufacturer's shop drawings	28 days	4	6	2
Inspection and Test Plans	28 days	4	6	2
O&M Manuals	28 days	10	10	2
Erection & Testing manuals	28 days	4	6	2

1.13.2 Procedure

a. The Contractor's Documents to be submitted to the Employer for review as defined in Conditions of Contract.

b. The sequence in which documents are submitted shall follow a logical progression such that all information is available to the Employer to facilitate review of each submittal when it is received. The program for detailed design shall allow the required time for review by the Employer without affecting the Time for Completion.

c. All submittals shall include One (01) copy in Digital form as well as the prescribed number in hard copy. In general design submittals shall be in:

   i. MS Word format for all text and reports.
   ii. AutoCAD version as advised for all drawings.
   iii. MS Excel for all calculations.

d. The Contractor shall provide on each submittal a clear space for the Employer's review stamps and comments.

e. Drawings and all supporting data, catalogs, or similar information shall be prepared by the Contractor or his suppliers and sub-Contractor but shall be submitted as instruments of the Contractor who shall remain fully responsible for their accuracy and completeness.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

f. The Employer will review submittals only for conformance with the design concept of the Project and for compliance with the contract. Such review shall not relieve the Contractor of any obligations, responsibilities or liabilities under the Contract. Contractor shall make any and all corrections required.

g. After Employer has performed his review of submittals, Employer will return one print to the Contractor with one of the following notations:

   i. Approved. (A)
   ii. Approved Except as Noted. (AEN)
   iii. Revise and resubmit. (RC)

h. When submittals are returned marked with (ii), the Contractor shall make such revisions and/or corrections and resubmit the drawings or other material in the same manner as specified in submittals schedule. Construction works can be undertaken under category (ii) after incorporating comments.

i. When submittals are marked with (iii), the Contractor shall make new submission as directed by Employer for review and approval before commencing the related Works.

j. When drawings and submittals are returned with authorization to proceed with the work, Contractor shall provide the number of prints or copies of drawings as is required for field distribution and shall ensure that only the latest approved revisions are used for construction.

1.13.3 Design Documents

a. Design Documents means documents of a technical nature provided by the Contractor under the Contract. Design Documents shall include but not be limited to:

   i. Equipment layout plans
   ii. Sections at different elevations
   iii. Embedment details required for civil works
   iv. Calculations, analyses and designs.
   v. Site investigation plans, reports, memoranda
   vi. Construction and manufacturing drawings.
   vii. Model test reports.
   viii. Hydraulic Model Test Reports.
   ix. Transient analysis report and calculations.
   x. Design briefs and design reports.
   xi. Technical specifications and performance curves.
   xii. Parts and components list.
   xiii. Circuit diagrams
   xiv. Wiring diagrams
   xv. Equipment outlines diagrams
   xvi. P&ID Diagrams

b. The Contractor shall provide the Employer with all necessary Design Documents and any other document or information as may be relevant to the performance, operation and maintenance of the Project and Employer's operating and maintenance activities and transfer obligations and to satisfy Employer’s Requirements under the Contract.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

c. The Design Documents shall be submitted in four basic stages and shall include the following:

   i. Stage-I, Basic Design Documents.
   ii. Stage-II, Detailed Design Documents.
   iii. Stage-III, Construction and Erection Design Documents.
   iv. Stage-IV, As Built Documents.

1.13.3.1 Stage-I: Basic Design Documents

The Contractor shall provide Basic Design Documents to demonstrate that the design complies with the Contract. Basic Design Documents to be routinely submitted for non-objection during this phase shall include:

a. Basic Design Report
b. Design basis memoranda for each work package
c. Detailed design criteria.
d. Calculations and Reports.
e. Manufacturer's turbine model test report.

The model acceptance tests report shall cover at a minimum, the following items:

Specifications of the model test equipment and instruments, drawings of model, sample calculations, turbine efficiency and output characteristics, cavitation limits and characteristics, hydraulic thrust and counterthrust (steady state and calculated transient characteristics), runaway speed and accompanying discharge, wicket gate torque and turbine runner characteristics, the pressure fluctuations, aeration tests, and flow-index pressure differentials.

a. General arrangement and outline drawings.
b. Architectural drawings.
c. Preliminary construction specifications.
d. Design Certification in respect of the design of each work package.
e. All other Design Documents as scheduled for submission under the Contractor's "Design Management Plan".

The Employer may at any time request Design Documents to a greater level of detail than that provided by the above documents. The Contractor shall respond promptly to any such request and, when appropriate, shall submit Design Documents for non-objection showing the requested details. The basic design of the Works shall be submitted together with any agreed modifications incorporated in the Contract Agreement. The detailed designs shall comprise development of the Basic Design to the level of detail necessary for fabrication and construction.

1.13.3.2 Stage-II: Detailed Design Documents

Engineering/Detailed designs shall be submitted to the Employer for review prior to construction including:

a. Detailed Design Report
b. Summary of all tests and investigations planned to be carried out in connection with the detailed design
c. Design memorandum

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

d. Detailed design, Model Testing and NOC
e. Hydraulic model testing
f. Construction drawings and as built drawings
g. Manufacturer's Shop drawings to the extent necessary for the Employer's design review and operation and maintenance
h. Plan of the methods of achieving the construction requirements
i. Report on construction methods to be used for all major works
j. Principal items of construction plant to be used
k. Detailed information of site offices and camp facilities
l. Quality Control and Quality Assurance procedures for construction
m. Site Specific Environmental Management Plan (SSEMP) including measures for rehabilitation of work areas
n. Site Specific Health and Safety Management Plan (SSHSMP)
o. Construction Security Plans; and
p. Basic outline of the Operation and Maintenance Manuals, and proposed Training Program
q. Manufacture's turbine model test report. If the efficiency of the turbine during turbine model test is lower than required efficiency the Employer have right to reject the test.

If in the opinion of the Employer, the engineering designs do not comply with the basic design documents for which the Employer's non-objection was given; the Employer can request further details of the engineering designs. The Contractor shall provide such details and shall justify or rectify any such non-compliance.

1.13.3.3 Stage-III: Construction and Erection Design Documents

Final detailed design shall be submitted to the Employer for information prior to the start of construction of work. Documents to be submitted at this stage include:

a. Method statements.
b. Inspection and Test Plans.
c. Designs and drawings of Temporary Works.
d. Fabrication details.
e. Project data.
f. Embedment details
g. Equipment erection plans, procedures, drawings and details.

The Contractor shall prepare and submit Method Statement for the review and approval of Employer prior to the execution of any permanent works at site after the approval of detail design. The Method Statement shall describe activity process to be carried out at site with the resource description deployed for the same. The resources to be inducted by the Contractor shall include Manpower resources, Equipment Resources and Material Resources. The Method Statement shall also describe the relevant standards and reference drawings to be employed during the execution of works. The ESHS requirements involved in the execution of the works will also be a part of Method Statement. The Method Statement shall require formal approval from Employer prior to the commencement of works at site. The Contractor shall follow the approved Method Statement for works during the execution otherwise the Contractor shall be subjected to Non-Conformance as per the QA/QC Standards.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

The Contractor shall prepare and submit the Inspection and Test Plan for the review and approval of Employer prior to the execution of any work at site. The Inspection and Test Plan shall have Review point, Witness Point, Hold Point and Surveillance Point for each activity of the works and Contractor shall specify applicable points for the approval of Employer for each activity The Inspection and Test Plan shall be approved prior to the commencement of works and shall be followed at site otherwise Contractor will be subjected to Non-Conformance as per the QA/QC standards.

If in the opinion of the Employer the final designs for construction do not comply with the Basic Design Documents for which the Employer's non-objection was given, the Employer can request further details of the final designs. The Contractor shall provide such details and shall justify or rectify any such non-compliance.

1.13.3.4 Stage-IV: As Built Documents

A final report shall be submitted to describe the As Built condition of the Works. Documents to be submitted at this stage include:

a. Final Design Report updated to include the As Built condition of the Works
b. As Built Construction drawings
c. Project data
d. Operation and Maintenance Procedures
e. Operating constraints and limitations that could affect the use of the Project

The Contractor shall provide Six (06) copies of detailed "as-built" drawings for the entire Project, including all Mechanical, and Electrical general arrangements, and shop drawings of major equipment. These are to be based on the Contractor's "approved shop" drawings and field information.

Both E&M and Civil Works Contractors shall coordinate to ensure consistency and accuracy in interface areas. A consolidated set of as-built drawings shall be jointly prepared, ensuring proper alignment between E&M and Civil works prior to final submission.

All drawings shall be provided in hard copy on Mylar, and the Contractor shall use his best efforts to provide "AutoCAD" files, as advised version, on computer hard disk or compact disk.

If in the opinion of the Employer the as built designs do not comply with the Basic Design Documents for which the Employer's non-objection was given or with the Contract, the Employer can request further details of the as built designs. The Contractor shall provide such details and shall justify or rectify any such non-compliance.

1.13.4 Design Liability

Notwithstanding any review carried out by the Employer, the Contractor shall accept full responsibility for all aspects of the design, procurement, construction and commissioning of the Project.

1.13.5 Program

The Contractor shall submit the proposed program for the design and execution of the Works in accordance with Clause 12.1 of the Conditions of Contract in a format and media approved by the Employer. The proposed program shall be prepared at Two (02) levels of details as follows:

a. The Overall Program which shows the major work items of the Works.
b. The Detailed Working Program which shows further breakdown of the major work items into activities involved in the sub-items.

The Contractor shall identify critical activities and key dates and shall present the program in bar chart form indicating activities and dates critical to completion of the Work on time.

The Contractor shall submit an explanatory report covering any aspect of the chart or network that the Contractor cannot show on the chart. The Contractor shall agree with the Employer on the work section, activities, sub-activities, interface and other critical dates, which the Contractor has to identify in the programs. Upon agreement by the Employer, the proposed Overall Program shall become the Overall Works Program based on which the Contractor shall complete the Works on time. This Overall Works Program shall not be changed unless agreed with the Employer.

The Detail Working Program shall contain the items, which are breakdowns of the major items, such that no single activity shall have a duration not exceeding thirty (30) days. The program shall identify any interface requirements affecting the work, the main quantities of material and other agreed relevant information.

1.13.6 . Progress Reports

Each month the Contractor shall report on a day in a format and media approved by the Employer, the progress and financial status of the Works of the previous month. The report shall accurately estimate the work completed on each activity including the design activities shown on the accepted Overall Works Program and the Working Program. The Contractor's progress report shall include relevant progress photographs. The Contractor shall agree with the Employer and shall implement progress control procedures.

The Contractor’s execution of the construction work shall not deviate from the sequence shown in the approved overall Work Program without prior written permission from the Employer.

1.13.7 Fortnightly Progress Meetings

Fortnightly progress meetings will be held with the Employer. Bottlenecks will be discussed and resolved. Special meetings will be held as and when required.

The Fortnightly Detailed Working Program shall be submitted to the Employer for approval fortnightly and must show at least previous Fortnightly progress and the future Two (02) Fortnightly planned works.

1.13.8 Photographic Records

The Contractor shall take progress photographs in digital camera during progress of work, which shall be attached to the monthly progress report. Each of these photos shall be submitted in 3-fold as paper copies in color. The sizes of the photos shall be 10 x 15cm. Every month at least twenty (20) color photos for each report shall be supplied.

The Contractor shall also prepare a professional-quality documentary video in accordance with international standards, covering all major construction, installation, testing and commissioning activities from commencement to completion of the Project.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

1.13.9 Project Meetings

Monthly Project management meeting shall be held at site to review the Monthly Progress Report with the Employer. The Contractor shall present his report verbally at the meeting.

Weekly Site management meetings shall be held with the Employer to review site progress and procedures.

1.13.10 Integrated Project Schedule

Prior to the Commencement Date, Contractor shall submit an Integrated Project Schedule, including engineering, procurement, manufacturing, fabrication, transportation, construction, and start-up activities. The Project schedule shall be presented in Electronic format acceptable to the Employer as well as hardcopy.

The Employer shall review and comment on the schedule to ensure that his plan meets the schedule requirements and does not conflict with any Employer obligations. The schedule shall be binding on the Contractor.

The Contractor shall utilize the Primavera Software, or other construction planning software acceptable to the Employer, for the Critical Path Method (CPM) of planning and scheduling to produce the Integrated Project Schedule.

The Contractor shall develop a detailed construction plan covering the entire scope of the work. Each task shall consider relevant information, such as construction design schedule, description and duration, work relationships, material or equipment deliveries, access limitations, interfaces, and other details that affect the sequence and duration of the works. Negative lags and constraining dates shall not be allowed.

The Monthly Progress Reports shall include a schedule update and progress tracking to compare the actual status of the Project with the scheduled baseline progress. Actual status shall be measured and reported using Earned Value techniques approved by the Employer.

The Employer may require the Contractor to modify any portion of his schedule and work plan, judged impractical, unfeasible, unreasonable, or not in compliance with the Contract.

The Contractor shall coordinate with all equipment and material suppliers of the Works to get the relevant information in order to fulfill its obligations relating to the preparation of Integrated Project Schedule under this Section.

1.13.11 Construction Specifications

The Contractor shall prepare specifications for the complete Works to incorporate any and all provisions arising from the Design. Contractor shall submit to Employer for review six (6) copies of all specifications issued by the Contractor to suppliers for procurement of materials or sub-Contract services, conformed for purchase.

1.13.12 Drawings for Construction

The Contractor shall provide Six (06) printed copies and One (01) electronic copy, of documents issued by Contractor for construction, as required in Design Documents and Construction Drawings, of the Project Design Requirements.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

1.13.13 Environment, Social, Health and Safety (ESHS) Components

a. Contractor should place prime importance on environment, social, health and safety (ESHS) issues and requires that Contractor subscribe to and actively pursue the highest standards of ESHS performance;

b. Contractor shall perform the Work in full compliance with the provisions, which is relevant for the Work, for the duration of the work;

c. Contractor should implement ESHS routines, which will ensure that all Personnel are fully aware of the existence, content and expectations of the ESHS;

d. Contractor will be responsible for ensuring that all Personnel understand and operate in accordance with the principles and requirements of ESHS provisions;

e. The Contractor shall submit to the Employer, monthly and quarterly environmental reports on the carrying out of such measures as identified in the EIA, EMP, NOC and Contract;

f. Contractor shall ensure each work group has at least One (01) Person present at all times who is fluent in both the primary language of the Worksite and the language of the workers; and

g. Within Thirty (30) days after Commencement date, the Contractor shall provide an ESHS Program including SSEMP, SSHSMP and associated working instructions and procedures i.e., Standard Operating Procedures (SOPs), establish systems such as Log in and Tag Out, Work Permits etc. as modified to be applicable to the Project.

The detailed requirements with regards to the Health and Safety provisions are provided in Section 4.2 of Special Provisions.

1.13.14 Quality Control and Quality Assurance Plan

a. Within thirty (30) days after Commencement Date, Contractor shall provide a Quality Control and Quality Assurance Plan in accordance with Section 1.6 of Special Provisions. A Quality Control and Quality Assurance Plan shall be prepared by the Contractor in accordance with his approved Quality Assurance Manual and in accordance with ISO Standard.

b. The Contractor’s Quality Control and Quality Assurance Plan shall comprise procedures for quality control and quality assurance. The Employer will audit the Contractor’s quality assurance on the basis of the quality control and quality assurance plan without relieving the Contractor for any of his contractual obligations.

c. The Contractor's Quality Control and Quality Assurance Manuals (QC/QA Manual), as modified to be applicable to this Contract, shall be submitted to the Employer for review.

d. The QC/QA Manual shall define and document the Contractor’s commitment to and policy for quality. The Contractor shall ensure that the policy and the associated procedures are understood, implemented and maintained at all levels in his organization, including all Sub-Contractors and suppliers. The Contractor's Quality Control and Quality Assurance Plan shall be based on well-established principles, risk-based quality management and proven performance.

e. The parts and components produced, and the services provided in fulfilling the requirements of the specifications shall be performed in accordance with the requirements of the Contractor's Quality Assurance Program. The Contractor's Quality Assurance Program shall be documented in sufficient detail to assure the Employer that the Contract requirements will be met during the design assembly and test of the materials and components. The Contractor's Quality Assurance Program, as a minimum, shall provide the implementing details to address to the Employer requirements as given hereinafter.

f. The Contractor shall monitor and approve his own work using the QC/QA Manual. The Employer will monitor the Contractor's ability to follow approved plans and procedures throughout the entire Project. The Contractor shall provide copies of review reports and test reports to the Employer on a monthly basis as required by the Contract. The Employer may audit the Contractor's records and facilities at any time to verify that sufficient reviews, checks, and tests are being performed.

g. The Quality Control and Quality Assurance Plan shall describe Contractor's Quality Assurance organization and delineate the responsibility and authority of the various personnel and groups involved. The Quality Assurance Department's relationships with other departments shall be defined and their independence of engineer, construction cost, and scheduling shall be stated. An organization chart shall be included with lines of authority and communication.

h. The Quality Control and Quality Assurance Plan shall contain provisions for the development, implementation and maintenance of training and certification programs as required to maintain acceptable quality control personnel. The programs shall comply with such codes and standards as required in the Contract Document or common industry usage.

i. The Quality Control and Quality Assurance Plan shall provide assurance that the Plant Characteristics Project Design Requirements are correctly translated into and included in the Contractor's documents and Drawings. The QA/QC Program shall further ensure that the latest approved revisions of documents (including changes) are available to and used by the required manufacturing, inspection and test personnel. The review shall be performed by individuals other than those involved in the original design and that the review is documented.

j. The Contractor's procurement process shall ensure that purchased items, whether purchased directly or through his sub-Contractors comply with the "Employer's Requirements". This assurance shall be provided by the inclusion of the quality requirements into the Contractor's procurement documents and adequate inspection of the material at its source or upon receipt.

k. The Quality Control and Quality Assurance Plan shall provide assurance that procured and subsequently processed material meets the specification requirements. Material identification shall be provided and maintained throughout the manufacturing cycle. Controls shall be provided for the documentation and disposition of nonconforming material, parts or components, and their subsequent rework or repair and re-inspection. The program shall also provide for the prior written notification to the Employer of proposed rework or repair on nonconformance, for this evaluation and approval.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

l. Special processes such as welding, soldering, brazing, heat treatment, cleaning, nondestructive examination etc., shall be performed in accordance with documented process procedures and by qualified and certified quality personnel. The procedure shall describe the process sequence and methods, process pre-requisites, equipment, qualification of personnel and equipment, and acceptance criteria. The procedures shall also describe the preparation and retention of documents used to record the results of special processes.

m. Non-Destructive Testing (NDT) shall be done to written procedures. The current edition of American Society of Mechanical Engineer (ASME), Section V shall be used as a guide for the NDT procedures.

n. The Quality Control and Quality Assurance Plan shall provide for the in-process and final inspection of items and activities to assure compliance with the requirements of the specifications. Examinations or measurements shall be performed at each applicable work operation. Inspection activities shall be performed by qualified individuals other than those who performed the activities being inspected.

o. Procedures shall be established to assure that test and measuring devices used to test, inspect, or accept material or components are calibrated at specified intervals to maintain the proper accuracy. Devices used shall be of the proper range, type, and sensitivity to reliably measure the parameters being evaluated. The calibration of such devices shall be documented and shall be performed using certified measurement standards.

p. The Contractor's test program shall be suitably documented to assure that the required component or sub-component testing is properly performed. The test program shall address pertinent test pre-requisites, such as test instrumentation selection and calibration, acceptance criteria, documentation of test results, and evaluation of test results by qualified personnel.

q. The level of quality control applied by the Contractor shall be adjusted to the importance of the items in terms of cost of repairs, personnel safety and loss of production if applicable.

r. During construction, after each assessment or measurement of quality, cases of non-conformity identified by the Employer or by the Contractor's quality control supervisors or by the personnel in charge of execution will be divided into four categories:

- NC-1: Minor defects which will be repaired immediately, then recorded on standard follow-up documents.
- NC-2: Defects which can be repaired according to a pre-established procedure. The repairs will be carried out immediately and recorded on a special document.
- NC-3: Defects which cannot be repaired according to a pre-established procedure. The decision to repair, modify or rebuild or re-manufacture the item shall be proposed by the Contractor for the Employer's approval.
- NC-4: Major defects on critical items affecting safety, performance, or compliance with Contract requirements. The Contractor shall propose a corrective action plan to the Employer, and the Employer shall make the final decision.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

s. The Quality Control and Quality Assurance Plan shall provide for audits of Contractor's and his sub-Contractors operations by his Quality Assurance Manager during the course of the Work and by the Employer, if required. The audits shall be used to determine the organization's compliance to Contract requirements and to the Quality Plan procedures.

t. The Quality Control and Quality Assurance Plan shall include a system to ensure that the documentation necessary to attest the completion of fabrication, erection, and installation; use of correct material; completion of required inspections and tests; and acceptability of results are generated, reviewed, maintained and turned over to the Employer at the required time.

u. The system shall ensure that such documentation is reviewed by Contractor for legibility, completeness, validity of data, traceability of document to activity or equipment and acceptability of results prior to submission to the Employer.

v. Documentation to be generated and maintained shall include, as a minimum:

- Mill test reports for raw material.
- Weld and weld repair procedure.
- Inspection and test procedures.
- Inspection and test reports (vendor and site).
- Vendor surveillance reports (Contractor).
- Heat treatment records.
- Final inspection reports (vendor, Contractor).
- Certificates of compliance (vendor).

w. The Contractor shall coordinate with the suppliers of the equipment to get the relevant parts of Quality Control and Quality Assurance Plan in order to fulfill its obligations relating to the preparation of consolidated Quality Control and Quality Assurance Plan under this Section.

1.13.15 Training Program Plan

At least one hundred eighty (180) days prior to tests on completion, the Contractor shall provide a plan to train the Employer's O&M personnel. The training program shall cover operation, routine maintenance, troubleshooting, safety procedures, emergency response, and long-term reliability of the Plant, and shall include training schedules, course contents, training materials, duration, and qualification of instructors.

1.13.16 Insurance and Construction Consents

At least ten (10) days before the start of construction, the Contractor shall submit evidence demonstrating that the Contractor has obtained all material permissions and Consents for the start of construction.

On or before the start of construction, the Contractor shall certify that all conditions required by the Contractor to implement the Contractor's All Risk and Marine Cargo Insurance have been fulfilled, and that such insurances are valid, effective, and in full force for the duration required under the Contract.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

1.13.17 Purchase Orders

Unpriced purchase orders shall be submitted by the Contractor for all purchased materials and any sub-Contracted services related to the execution of the Works. Every thirty (30) days the Contractor shall update and submit four (4) copies of the purchase order log showing order status, delivery dates, and critical milestones.

1.13.18 Geotechnical Surveys

If the Contractor determines that additional geotechnical investigations are required specifically for the installation of Electro-Mechanical equipment, the Contractor shall conduct such Investigations at his own cost and risk and submit six (6) copies of the results, reports, or recommendations to the Employer for review.

However, any geotechnical investigations related to overall site stability, civil structures, or foundations shall remain the responsibility of the Civil Works Contractor.

1.13.19 Shop Inspection and Test Reports

Six (6) copies of all shop inspection and test reports for Materials and Equipment shall be submitted to Employer for review.

1.13.20 Quality Control Reports

The Contractor shall submit Four (04) copies of quality control records related to E&M works, including but not limited to pump alignment, motor mounting, continuity wiring checks, and stress relieving where applicable.

Additionally, structural steel bolting and weld inspections (visual and non- destructive testing) shall be documented for E&M equipment supports and associated structures in accordance with approved inspection and test plans (ITPs).

To ensure seamless integration at interface areas, the E&M Contractor shall coordinate with the Civil Works Contractor, particularly for quality control processes related to embedded steel, equipment foundation tolerances, and alignment of interfacing components.

Both Civil and E&M Contractors shall participate in joint inspections and provide verification reports to maintain a harmonized approach.

1.13.21 Project Procedures

Where structural or embedded works interface with E&M installations, the Civil Works Contractor shall coordinate with the E&M Contractor to ensure alignment of quality control processes.

Joint inspections and verification of critical interfaces, such as equipment foundation tolerances and embedded steel elements, shall be conducted to ensure compliance with the Project specifications prior to installation of E&M equipment.

1.13.22 Special Requirement for Site Installation

a. The Contractor shall submit, with his relevant stage drawings showing the overall layout of the proposed special site installations. This layout shall be compatible with the general layout included in the Conceptual Drawings. The final layout of site installation shall be agreed with the Employer prior to award of the Contract.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

b. The Contractor shall present at least Twenty-One (21) calendar days in advance of the starting date of the works, drawings and specifications sufficiently detailed to enable the Employer to check the suitability of the proposed construction and installation and their conformity with this Specification.

1.13.23 Training Program

After successful testing & commissioning, the Contractor will maintain and jointly operate the plant on commercial basis for training of the Employer's staff during Two (02) year defect Notification period.

The Basic O&M Program shall primarily explain the provisions and procedures related to Electro-Mechanical Works as contained in the E&M Works O&M manuals. In addition to the various manuals, the class materials will include Drawings, Technical Specifications and other technical and educational material necessary for the complete training of O&M Personnel.

The Contractor Basic Training Program shall cover O&M manuals written for all equipment components, particularly all E&M equipment, gates and gate handling equipment. The classroom training will be supplemented by visits to the Project facilities to facilitate the transfer of information and know-how.

The Contractor shall provide a training program in operation and maintenance for the Employer's O&M personnel. The training program will consist of following Two (02) main components:

a. On-the-job Training.
b. Formal O&M Training Seminars.

Under both programs, training shall cover Operation and Maintenance of the entire Project (Electro-Mechanical works).

1.13.23.1 On-the-job Training

The Employer shall assign staff to monitor construction activities at the various work fronts. The Contractor shall provide informal, On-The-Job training as it relates to the O&M of the entire Project (Electro-Mechanical Works).

a. Electrical and Mechanical Equipment

During the electrical and mechanical equipment erection, assembly and installation the Contractor shall provide informal on-the-job training that will cover aspects of equipment maintenance and operation. The informal training program shall be led by representatives from equipment manufacturers and shall be based on Design Memoranda, Technical Specifications, Drawings and other informational materials necessary for the adequate training and orientation of Employer's O&M personnel. The informal training program shall be conducted during the erection, and testing of all Project equipment, including but not limited to turbines, generators, excitation system, control, protection, transformers, MV and LV switchgear, governors, valves and switches, gates and gate handling equipment etc.

1.13.23.2 Formal O&M Training Seminars

Formal Training shall include a Basic O&M Program. The Training Programs shall be conducted in a classroom setting, in the Project offices at the construction site. The formal training will incorporate a Quality Control Program within the Formal Training program, including written testing, to ensure that the O&M Personnel are suitably trained and capable

of operating and maintaining the Project after it is turned over to the Employer. At least four (04) months prior to initiation of the Formal Training Program, the Contractor shall submit a written plan and schedule for the Program, for Employer's review and approval. Such plan shall include course outlines, Curriculum Vitae of the proposed Training Instructors, and a detailed schedule. To initiate the Formal Training, the O&M Manuals must be a minimum of 90 % complete. The official language for all type of trainings must be English.

The Contractor shall train a total of up to ten (10) people in the Basic O&M Program. The Trainees shall generally include Employer's staff who participated in the monitoring of the Project construction and are familiar with the works. In general, the Basic O&M Program shall take approximately Five (05) days and a total of Six (06) hours per day, comprising two three-hour sessions, separated by a Two (02) hour break.

1.13.23.3 Electrical and Mechanical Equipment Factory Acceptance Tests/Inspections

The Contractor shall at its own expense carry out all such tests and/or inspections of the Plant and any part of the Plant as are specified in the Contract. At least Two (02) representatives of the Employer/ Employer's representatives shall inspect/witness the manufacturing and factory testing of electrical & mechanical equipment and workshop facilities at manufacturer's works for a period of approximately Ten (10) days each trip including travel time. All reasonable facilities (laboratory, tools, instruments, machines, samples etc.) as provided in the specifications or followed by trade and industry in general shall have to be offered to the inspectors, by Contractor at his expense for carrying out Testing and Inspection. The Contractor shall fully assist the nominated inspectors in submission of visa application(s) by providing all supporting document on his part and help in attaining visa through necessary correspondence with the embassy.

The Contractor shall give at least Eight (08) weeks' advance notice for tests to be conducted abroad and Four (04) weeks' advance notice for tests to be conducted within Pakistan to the Employer for all important Factory Acceptance Tests/Inspections of major plant equipment (i.e., turbines, inlet valves, cranes, HPU for governors/inlet valves, generator, exciter, digital governor, control & protection, switchgears, transformers, DC system, SAS, telecom equipment, etc.). All expense regarding witnessing of factory acceptance tests/inspections or repetition (i.e., pre-travel arrangements, air travel from Islamabad/Lahore, Pakistan to the place of inspection/testing and back, hotel stay (boarding and lodging in A-Class accommodation), inland transportation and daily allowance @ 200 US$/day (prevailing government-approved rate and is in line with the average foreign DA rates notified by the Finance Division, Government of Pakistan refer to **SCHEDULE TO FINANCE DIVISION'S OFFICE Aug 02, 2023, R-10/2006-259)** for one person for foreign inspections and @ 15,000 PKR/day for one person for local inspections) shall be considered in the price of respective equipment.
Approximately forty (40) Factory Acceptance Tests (FAT)/Inspections visits are anticipated. For each FAT/Inspection, Two (02) representatives (one from Employer and one from Employer's representative) shall attend for up to Ten (10) days, including travel, totaling an estimated eight hundred (800) man-days. The numbers are tentative and all associated costs shall be borne by the Contractor and included in the price of respective equipment.

1.13.23.4 Commissioning Reports

Within One (01) month after the Completion Date the Contractor shall issue to the Employer the Commissioning report including copies of all test records.

1.13.23.5 Operation and Maintenance Manuals

At least Three (03) Months prior to scheduled commissioning of the Project, the Contractor shall provide detailed manuals with drawings and schematics, setting out the Operations and Maintenance Procedures, in English language, for all the Electrical and Mechanical works and equipment, including Specifications, Equipment Data Sheets, Vendor Data and Shop Drawings.

The Contractor shall provide Operation and Maintenance Manuals, for all Electro-Mechanical Equipment/Systems, which must be in English language.

The Contractor shall provide to the Employer tools and spare parts sufficient for Five (05) years of operation together with a recommended priced list of spare parts. The foreseen mandatory spares are tentatively listed in subsequent sections which the Contractor shall revise in its Proposal as per estimated essential requirements. The Contractor shall construct proper and sufficient storage facilities for such tools and spare parts.

All instruction manuals shall be issued in Two (02) volumes, one containing all operating information required including drawings and the other containing maintenance instructions. Ten (10) hard copies and One (01) electronic copy of each volume of instruction manuals shall be furnished along with of the reproducible original one copy drawings/sketch forming part of manuals.

If after the commissioning and initial operation of the plant, the instruction manuals require any modifications/additions/changes, the same shall be incorporated and the updated final instruction manuals in the form of One (01) set of electronic files as CD and Ten (10) copies shall be submitted by the Contractor to the Employer. All manuals shall also be provided in electronic version (Microsoft Word and pdf formats).

The submission of Operation and Maintenance Manuals as well as other documents shall be made in the English language.

1.13.24 Project Records

Contractor shall maintain One (01) record copy of:

a. Contract Drawings
b. Specifications
c. Addenda
d. Change Orders and Other Modifications to the Contract
e. Approved Shop Drawings, Product Data and Samples
f. Approved Construction Drawings & Erection Sequence Drawings for E&M Equipment.
g. Approved control, protection and instrumentation Drawings
h. Field Test Records
i. Inspection Certificates
j. Manufacturer's Certificates

Record Documents and samples shall be stored in Contractor’s Field Office apart from documents used for construction. Files, racks, and secure storage for Record Documents and samples shall be provided.

Record Documents shall be maintained in a clean, dry and legible condition. Record Documents shall not be used for construction purposes.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Record Documents and samples shall be available for inspection by Employer.

1.13.24.1 Submittals

On completion of works, Contractor shall deliver Record Documents to Employer including the Contracts Drawings in reproducible ink-on-mylar sheets that match the contract documents (size. sheet content and title block).

Accompany submittal with transmittal letter, in duplicate, containing:

- Date
- Project title and number
- Contractor's name and address
- Title and number of each record document
- Certification that each document as submitted is complete & accurate
- Signature of Contractor, or his authorized representative

1.14 GENERAL DESIGN CRITERIA FOR ELECTRO-MECHANICAL WORKS AND HYDRAULIC STEEL STRUCTURES

1.14.1 General

The plant and equipment shall be designed according to the latest version of international standards relevant to the particular section of works. The completed work shall be safe, durable and adequate for intended purpose under most severe loading conditions where there are differences between the various standards; the most stringent standards shall be adopted.

Contractor must make available Two (02) hard copies of applicable standards in English language. If other standards shall be chosen, the Contractor shall supply copies of those standards in English language only, clearly identifying or referring to the particular chapters or sections that shall be applied. The approval for adoption of such standards must be necessary from the Employer.

For the dimensioning, design and layout of the various plant components and installations, consider the following features and aspects:

- The ambient conditions at the Project site;
- Ratings to safely cope with all normal and fault conditions, avoiding any overstressing of material and equipment;
- Altitude correction factor above 1,000 m.a.s.l. as per IEC;
- Equipment to be of standard design, providing highest degree of safety, reliability, availability and ease of operation;
- Equipment arrangements to consider adequate space and access for transport, installation, commissioning, operation and maintenance.

1.14.2 Compliance with Local Regulations

In addition to the general design criteria, the design shall also conform to the requirements of all relevant local, state and federal authorities where approvals for that section of works is needed from the relevant authorities specially, in case of interconnection and interfacing the relays and metering should be in accordance with prevailing WAPDA/NGC standards/ quality and of the same manufacturers as installed in the WAPDA/NGC system. Type test for electrical equipment shall be carried out according to WAPDA/NGC standards from STL approved lab. Cost of such tests shall be included in the cost of relevant equipment. No

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

additional payment shall be made to carry out and witness type tests in case of unavailability of valid type report from STL approved lab.

1.14.3 Equipment Standards

All equipment and parts related to engineering design concerning choice of materials, main dimensions and function should conform to latest international standards. However, for Grid Station/Switchyard Equipment, Contractor is bound to fully comply with relevant WAPDA/NGC standards and STL approved type test reports shall be mandatory. All equipment of the Project including Protection and SCADA equipment shall comply with the reference standards mentioned in relevant sections.

The equipment and materials furnished under this Contract shall conform to the requirements of the Specification and to the designated Standards.

1.14.4 WAPDA/NGC Approvals

During design review and prior to start of manufacturing, WAPDA/NGC review/approval shall be required at least but not limited for the following equipment;

- 132kV Switchyard Equipment
- Type and Range of Transformer Tap Changer
- Telecommunication Equipment
- Protection and Control (SCADA) Equipment
- Tariff Metering Equipment
- Key Single Line Diagrams
- Protection and Metering Single Line Diagrams
- SCADA Signal List

The Contractor is bound to facilitate the Employer during review/approval process by NGC and will provide all the required information, technical data/test reports as per WAPDA/NGC requirements. Any delay arising from non-compliance or incomplete submissions shall be at the Contractor's risk and cost.

1.14.5 Inspection and Test Plans

Inspection and test plans shall be submitted for factory Tests and Tests on Completion for approval of the Employer. Tests on Completion shall be carried out in two stages: Dry tests followed by wet testing, commissioning and reliability tests. The Contractor shall notify the Employer sufficiently in advance to witness such tests.

1.14.6 WPS & WQR, Fabrication & Installation Schedules

Welding procedure specifications, welders' qualification records, fabrication and installation schedules shall be submitted prior to commencement of any welding, fabrication and installation work.

1.14.7 Erection and Testing Manuals

Detailed erection and testing procedures shall be submitted along with instructions regarding handling and storage of all equipment at least Two (02) months before the start of erection of the first unit.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

1.14.8 Operation and Maintenance Manuals

Three (03) months prior to scheduled commissioning of the Project, the Contractor shall provide detailed manuals (in English) with drawings and schematics setting out the operations and maintenance procedures for all mechanical and electrical works and equipment, including specifications, equipment data sheets, vendor data and shop drawings.

1.14.9 As-Built Drawings

The Contractor shall provide five (05) copies of detailed "as-built" drawings for the entire Project, including all mechanical, and electrical general arrangements, concrete outlines, and shop drawings of major equipment. These are to be based on the Contractor's “approved shop” drawings and field information.

The Contractor shall also furnish to the Employer one mylar polyester base full size reproducible of each As-built and other Drawing, which, in the opinion of the Employer, may be required for operation, maintenance, dismantling and reassembly, for identification of parts; and for ordering replacement parts and materials. The mylar shall be 0.1 mm thick, double matte film, wash off film, printed on the front. The Contractor shall use his best efforts to provide "AutoCAD" files, version as advised, on portable hard drive.

1.14.10 Commissioning Reports

Within One (01) month after the Completion Date the Contractor shall issue to the Employer the Commissioning reports including copies of all test records.

1.15 TESTING AND COMMISSIONING AND VERIFICATION OF PERFORMANCES AND GUARANTEES

1.15.1 General

The Contractor shall prepare a detailed testing and commissioning plans for the works and submit to the Employer for approval. The plan shall include inspection and testing at the factory and verification testing at site.

Testing and commissioning shall comprise factory and field-testing designed to verify the performance of the Project. The Contractor shall prepare testing and commissioning plans and procedures to verify performances of the complete Project including tests prior to synchronization, reliability run test, commercial operations test, demonstration of energy from the Project, and system performance.

Except as otherwise specified, all tests shall be performed in accordance with relevant standards from ASME, IEEE, IEC, and ISO.

1.15.2 Tests at Site

Tests on Project, equipment, systems and facilities at Site shall be carried out, by the Contractor, and passed prior to taking over of the Works by the Employer, and shall comprise main stages of testing as follows:

1.15.2.1 Preliminary Tests

Which are tests prior to rotation of, energizing at normal voltage, or admission of air, water or oil at normal pressures to the main or auxiliary Project under test.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

1.15.2.2 Test on Completion

Which are tests to progressively prove the correct operation of all Project, equipment, systems and facilities.

1.15.2.3 Test after Completion

Which are tests to be undertaken periodically to confirm continued compliance of the Project, equipment, systems and facilities with the performance guarantees specified in the Contract.

The Contractor shall use calibrated testing instruments for site testing. These instruments shall be calibrated before the measurements at site are carried out. The Master Calibration device itself shall be calibrated and tested not longer than Five (05) years ago by either an independent Authority or the original Manufacturer. Appropriate documentation shall be supplied.

Test results shall be recorded for the Site tests conducted on the Project, equipment, system and facilities. The test results shall be in the form of test certificates or test reports. Comprehensive testing and commissioning reports shall be prepared for all Project, equipment, system and facilities.

The Contractor shall be responsible for testing and operation of all Project, equipment, systems and facilities until an associated Taking over Certificate is issued. Before taking over and prior to issuing the Taking over Certificate, the Contractor shall at the request of the Employer, open-up or dismantle any part of the Works for inspection by the Employer.

1.15.3 Testing and Verification of Performance and Guarantees

1.15.3.1 General

The Contractor shall provide the Employer on an on-going basis with relevant information regarding its program for testing the Project. Not less than ninety (90) days prior to the commencement of such test program, the Contractor will deliver in writing the final program for testing the Project, including the expected duration of the start-up testing program and a tentative schedule for conducting all tests required by the contract. The Contractor shall advise in writing of any changes in its final schedule for the testing program not less than thirty (30) days prior to the commencement of the tests. If the schedule for any test is adjusted after the Contractor has provided the final testing program schedule, then the Contractor shall advise not less than Seventy-Two (72) hours prior to the commencement of any such test.

On each day beginning with the day on which testing commences, the Contractor shall provide a schedule of the tests to be conducted on the following day or days (if such test will continue for more than One (01) day). All testing of the Project shall satisfy the commissioning and test criteria provided in the Contract and shall be carried out in accordance with applicable international standards.

The Contractor shall at his own expense provide all such personnel, equipment and instruments etc. as required to carry out the testing and commissioning of the works, and prepare complete reports with all the records and findings to be submitted to the Employer. No additional payment shall be made for testing and commissioning activities.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

1.15.3.2 Preliminary Tests

Preliminary tests are tests conducted prior to rotation of, energizing at normal voltage, admission of air, water or oil at normal pressures to the Project, equipment, systems or facilities of the Works under test.

Preliminary tests shall be conducted on all Project, equipment, systems and facilities and shall comprehensively demonstrates readiness for commencement of the Tests on Completion for such Project, equipment, systems and facilities. No Tests on Completion shall commence unless all relevant preliminary tests have been successfully completed and approved by the Employer.

Site preliminary tests shall include, but not be limited to, the following.

a. Non-destructive tests of welds and welded components
b. Hydrostatic pressure tests
c. Leakage and deflection tests
d. Voltage withstands tests
e. Insulation resistance tests
f. Conductivity tests
g. Proof of phasing and/or polarity of power supplies and circuits
h. Operation of all Mechanical, Electrical and control equipment to prove freedom of movement and correct operation, including timing checks, power consumption etc.
i. Functional and operational checks on Project, equipment, components and systems (including control, protection and SCADA systems)
j. Demonstration of sensitivity and operation of all monitoring, control, protection and alarm devices to the nominated settings
k. Tests of all indications, displayed quantities and device output signals
l. Check all protective devices for correct ratings (fuses, miniature circuit breakers etc.)
m. Tests of automatic voltage regulator setting and adjusting in stand-still condition and with the generator running at no load
n. Turbine governor control checks, including a turbine over speed test
o. Open circuit tests on the generator
p. Short circuit saturation characteristics tests on the generator
q. Verification of the protection level settings for the following:
    i. Stator earth fault
    ii. Negative phase sequence
    iii. Generator transformer over current and earth fault; and
    iv. High voltage bus bar protection

Results in details of the proposed preliminary tests shall be submitted to the Employer.

1.15.4 Prior to Commencement of Tests

The following systems and facilities shall be commissioned and in service prior to the commencement of tests on each generating unit:

a. All work on or near the unit shall be substantially finished.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

b. Tests on Completion shall be satisfactorily completed for all directly related main, auxiliary and ancillary Project, equipment, systems and facilities. All such plant, equipment, systems and facilities shall be operational and in service.

c. The monitoring, control, protection, SCADA and communication systems relating to the unit being tested and the associated grid station and transmission facilities shall be fully operational.

d. All tests without water shall be finished.

e. The cooling system shall be in operation.

f. The transmission lines shall be in operation and phase tests shall be completed satisfactorily.

g. All gate and stop log operating systems and associated hoists shall be tested, proven and in service.

1.15.5 Tests Prior to Synchronization of units

The Contractor shall carry out the following tests for each Unit prior to synchronizing with the power system:

a. Automatic voltage regulator setting and adjusting in stand-still condition and with the generator running at no load.

b. Turbine governor control checks, including a governor over speed test.

c. Open and short circuit tests on the generator.

d. Functional testing and timing of high voltage switchgear in the switchyard of the Project.

The protection level settings shall be approved by the Employer for following systems.

a. Stator earth fault.

b. Negative phase sequence.

c. Generator transformer over current and earth fault.

d. High voltage bus bar protection.

e. Calibration of under-frequency relay used for load shedding.

Voltage phasing checks will be carried out between the switchyard of the Project, and the Grid system. All inter-tripping circuits between the Project and the Power Purchaser equipment will be proved.

1.15.6 Tests on Completion of Units

Tests on Completion are tests to progressively prove the correct operation, output and efficiency of complete auxiliary systems, main Project items, and the generating units. Tests on Completion shall be carried out for each Section of the Project prior to issuance of the relevant Taking-Over Certificate.

Tests on Completion shall be conducted on all equipment, systems and facilities and shall comprehensively demonstrate correct, reliable and safe operation of such Section and the Project, equipment, systems and facilities under normal and abnormal operating conditions. Tests on Completion shall include:

a. The tests required by the design standards.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

b. Such other inspection and tests as may be necessary to demonstrate compliance with the Contract.

c. Any other test deemed necessary by the Employer.

Details of the proposed Tests on Completion shall be submitted to the Employer for review and approval.

1.15.6.1 Unit Tests on Completion

Tests on Completion shall be carried out as necessary to demonstrate that the performance criteria established in the Contract are satisfied and that the Section of the Project, as the case may be. All tests shall confirm the requirements established by the Grid code. The tests on Completion for each of the generating units shall, as a minimum, including the following:

1.15.6.1.1 Step 1: Rotation Test without Voltage

- Initial spinning test by manual start
- Brake test
- Test of bearings
- Alignment, balance, vibration and other mechanical tests
- Over speed test
- General inspection
- Generator insulation tests
- Governor test / adjustment
- Emergency shutdown test

1.15.6.1.2 Step 2: Rotation Test with Voltage

- Excitation of the generator and check of excitation equipment
- Primary test of signaling and protection devices
- Commissioning of voltage regulator and demonstration that the Automatic Voltage Regulator Droop can control generator voltage over the range of ±10% or rated voltage with a droop characteristic of ±0.5%
- Short circuit characteristics test
- Operation of the turbine governor
- Test of specific generator data (residual voltage, shaft voltage, voltage waveform, open circuit test, phase sequence, and start, stop and emergency stop functions)

1.15.6.1.3 Step 3: Test with Connected Network

- Initial load test by taking up load in predefined steps up to full load
- Load increasing / decreasing test (MW/minute, ramp rates, step loads
- Testing and adjusting governor parameters at successive steps as per contract
- Governor primary, secondary and high frequency response, limited high frequency response and output at reduced system frequency tests
- Servomotor test (closing force and characteristics)
- Unit start/stop automatic sequence control tests and checks
- Unit loading/unloading rate adjustment checks

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- Test to demonstrate capability of the Project to operate at rated voltage and frequency at the system power factors and reactive power conditions provided in the contract document
- Reactive power load rejection tests
- AVR, automatic voltage regulator droop, and power system stabilizer tests
- Minimum load continuous stability tests
- Unit capability tests
- Active power load rejection test (25%, 50%, 75%, 100% load)
- Unit temperature stability tests (heat run)
- Unit Reliability Run Tests, including:

(i) Stable and reliable operation for at least 24 hours at varying outputs between the maximum possible and minimum allowable capacity of the unit without any failure or interruption and with no more than 2 start/stop cycles.

(ii) within a continuous 72-hour period, at least 10 successive cycles of starting (i.e., including synchronizing and loading to the dispatch level) and stopping (i.e., including unloading from the dispatch level down to no load and stopping to standstill).

(iii) A reliability run for a period of Seven Hundred and Twenty (720) hours and including One Hundred and Sixty-Eight (168) continuous hours at maximum continuous rating. The output during the remaining hours of the test will be as requested by the Employer; provided that in no event shall the requested output be outside the technical limits. The test shall have been satisfactorily completed only if it continues without interruption for not less than 720 hours.

(iv) The successful reliability test shall be a condition for issuing the Handing/Taking over Certificates.

1.15.7 Efficiency/ Performance Tests

The efficiency/performance tests at Site shall be carried out after the units have been satisfactorily put into commercial operation and within the specified period of guarantee of the turbines and governors. Efficiency/performance tests shall be conducted on at least one turbine. The test includes the following:

a. Unit efficiency tests (including continuous running of the Unit at predefined outputs) as per IEC 60041.

b. Runaway Speed Test shall be made to demonstrate that all parts of the turbine shall successfully withstand the stresses incidental to its operation at the no-load runaway speed. The unit shall be operated at this speed for a period of not more than five minutes.

1.15.8 Contractor's O&M Staff during Testing and Commissioning

The Employer shall engage an O&M Staff to operate the Project. Reference to the O&M Staff may be construed as reference to the Employer, as the context requires.

Nominated personnel of the O&M Staff shall attend commissioning and testing of the Project as counterpart for the training purposes. The Contractor shall include the O&M Staff in the Contractor's commissioning teams responsible for all commissioning, testing, stage-up and trial operation of Project.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

During commissioning, the O&M Staff are required to participate the activities associated with commissioning under supervision of the Contractor. The participation of the O&M Staff in the Contractor's commissioning teams shall be arranged to ensure that the skills, knowledge and documentation acquired by the O&M Staff will be sufficiently focused and targeted to prepare them for the task of operating the Project. The O&M Staff shall only take an active part in commissioning at the Contractor's entire responsibility.

During reliability run tests the O&M Staff is required to operate the facilities under supervision of the Contractor.

1.15.9 Spare Parts

All mandatory spare parts for the equipment shall be provided as mentioned in the relevant sections of these specifications. However, the Proposer shall submit list of any other spare parts (which in the opinion of the Contractor) necessary for plant as per recommendation of the equipment supplier(s).

All spares furnished shall be new and interchangeable with the corresponding original parts. They shall also be of the same material and workmanship, and shall have all the features and provisions of the corresponding original parts. Second-hand spare parts shall be rejected.

All spares are to be suitably treated and packed for long storage under conditions prevailing at the Site. Each spare shall be clearly marked or labelled on the outside of its packing with description and purpose, and, when more than one spare is packed in a single case, box or container, an inventory is to be shown on the outside of same, and a detailed list enclosed inside. All cases, containers, boxes and other packages shall be suitably marked and numbered for purposes of identification.

The Contractor shall manufacture the spare parts and deliver them to Site at the same time as the rest of the Plant. Spares shall be handed over to the Employer not later than the date 30 days prior to the start of the Tests upon Completion.

Spare parts catalogues and/or necessary drawings with item lists shall be supplied giving all necessary data for ordering spare parts directly from the manufacturers. The spare parts catalogues shall include data on complete modules and assemblies as well as sub-modules, sub-assemblies and individual components. The drawings shall show the location, main dimensions and the ways of disassembly or assembly of the various spare parts.

Additionally, the Contractor shall propose recommended spare parts with itemized prices. The Employer shall have the option of ordering or omitting any of the spares listed. Delivery, storage and handing-over of spares shall be at the Contractor's risk

1.15.10 Consumable Goods

All consumable goods needed for completing the installation as well as for maintaining and operating the Work for at least Three (03) years or the period mentioned in relevant sections in technical provisions after Taking Over shall be furnished and included in the Contract Price, and shall be handed over to the Employer not later than at the date 30 days prior to the start of the Tests upon Completion. Such consumables shall be separately packed and shall include oil, grease, paint, electrodes (if required), solvents, filters, electrical articles, fuses and any other goods as required for normal maintenance and operation.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

1.15.11 Erection & Testing Equipment and Maintenance Tools

The Contractor shall provide Erection and Testing Equipment and Maintenance Tools in new and unused condition, as specified in Schedule of Prices. The special erection equipment shall be of the type not normally available and re necessitated by the design of the Plant and is required or convenient for the erection, testing and commissioning of Plant ready for operation. The list of equipment shall include description and use, as well as quantity of each item and the unit rates and prices for the total quantity proposed for each item.

The Contractor shall furnish, suitably boxed, complete sets of tools, including wrenches, spanners, other special tools etc. as listed in the Schedule of Prices, and which are necessary or convenient for operation maintenance or replacement of any part of Plant under the Contract. Complete lists of all such tools and equipment shall be submitted to the Employer before delivery of the tools. Shipment containers shall become the property of the Employer and shall be suitable for permanent storage of the tools.

Each tool or appliance shall be clearly marked with its size/or purpose, shall not be used for erection and shall be handed over in new condition. Copies of its certificates for lighting appliances shall be handed over at the time of Taking Over of Unit 1.

Each set of maintenance tools and appliances shall be suitably arranged in boxes of mild steel construction, the number of boxes being determined in relation to the layout of the equipment in question. If the weight of any box and its content should be such that it cannot conveniently be carried (maximum 25kg), its shell be supported on steerable rubber-tire wheels.

Each box shall be painted, fitted, with a lock and clearly marked in white letters with the name of the item of equipment for which the tools and appliance contained are intended to be use.

The tools & appliances with the appropriate boxes shall be handed over to the Employer at the time of issue of the Taking-Over of Unit 1. All tools and equipment shall be handed over in unused condition and shall become the property of the Employer upon Taking-Over.

1.15.12 Access for Operation and Maintenance

Where safe and easy plant operation and maintenance cannot be arranged from provided floor levels, the Contractor shall supply and erect all platform galleries, stairways, access ways and ladders necessary for providing safe and easy access to the plant items. The Contractor shall ensure that the whole of the access ways is of uniform design and pattern throughout the Works. Where access is required for operation then standard design stairways must be provided, but if infrequent access for maintenance only is required then provision of vertical ladders will be considered as long as appropriate safety guards are provided.

The design of all stairways, access ways etc. shall conform to the requirements of this Specification.

1.15.13 Interlocks

A complete system of interlocks and safety devices shall be provided so that the following requirements and any other conditions necessary for the safe and continuous operation of the plant are provided:

a. Safety of personnel engaged in operational or maintenance work on the plant.
b. Correct sequence of operation of the plant during start up and shut down periods.
c. Safety of the plant when operating under normal or emergency conditions.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

d. Interlocks shall be preventive, as distinct from corrective in operation.

Where plant supplied under this Contract forms the whole or a part of a system for which one or more interlocking schemes are required, the Contractor shall be responsible for all interlocking schemes. General descriptions of interlocking requirements are given in the Specifications, but the Contractor shall include any other additional interlocks he considers necessary.

1.15.14 Guards

All moving parts, shafts, couplings, flywheels, bare conductors and hot or cold surfaces shall be adequately and securely guarded in accordance with good industry practice and the legislation prescribed in Pakistan to afford complete safety for all personnel.

1.15.15 Locks, Padlocks and Key Cabinets

The Contractor shall provide padlocks, locks, chains or other locking devices for the locking of all equipment cubicles, electrical isolating switches, selector switches, valves, etc.

All locking devices and chains shall be manufactured from corrosion resistant material. All mechanisms shall be provided with a cover to minimize entry of water or dust.

Certain locks may be required to conform to a master keying feature to be agreed with the Project Manager for groups of equipment. It is the Contractor's responsibility to discuss details of the master keying system with the Employer prior to installation.

All locks shall have individual high integrity locks and shall be provided with three (3) set keys. Each key shall be provided with a label.

The Contractor shall supply and fit key cabinets equipped with labelled hooks, each identified with its appropriate key. Every cabinet shall be provided with a nameplate identifying the cabinet with its respective item or items of plant. Sufficient cabinets shall be provided to store all keys supplied under this Contract.

The Contractor shall provide comprehensive lock and key schedules to permit identification readily with equipment and doors. Such schedules are not required for loose padlocks.

1.16 CONSTRUCTION AND ERECTION REQUIREMENTS

1.16.1 GENERAL

The descriptions given in forthcoming sub-sections are outlined descriptions only. Such descriptions do not include or give full description of all materials or other items to be supplied or all Works and services to be executed by the Contractor in order to fulfil its obligations in compliance with the Contract. Once completed the Works shall include all that is necessary to satisfy the Project Requirements, or is implied by the Contract and all Works (which although not mentioned in the Contract) are necessary for stability or for the completion, or safe and proper operation, of the Works suitable and fit for the purposes for which Works are intended as set out in the Contract. Any Works, equipment or services not expressly mentioned but which are necessary for stability, safety, completion, reliability or proper operation of the Works shall be deemed to be included in the Scope of the Contract at no additional cost to the Employer.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

1.16.2 ELECTRO-MECHANICAL WORKS

1.16.2.1 Mechanical Equipment (Powerhouse)

1.16.2.1.1 Operating conditions

a. The generating units shall have to work mainly under seasonal varying head and discharge with respect to the variations in flow in the source River.

b. The electrical energy generated will be evacuated to the grid system through the proposed 132 kV transmission line to the 132/66 kV Aliabad Regional Grid Station and through the existing 33 kV transmission line to the Sost Grid Station, respectively.

c. In case of load rejection, the water hammering/discharge/flow of the power plant is to be released by specially designed surge chamber.

d. Special starting operation of the turbines is required to control and limit the hydraulic transients considering the inertia of the water column in the tunnel.

e. The turbine operating criteria shall be based on the following values of head water levels (HWL) and tail water levels (TWL).

1.16.2.1.2 Head

- Headrace water level: 2412.0 m.a.s.l.
- Tailrace water level: 2301.86 m.a.s.l.
- Gross head: 110.14 m
- Rated net head: 104 m

1.16.2.1.3 Net Head Variation

- Maximum at the maximum level: 104.14 m
- Minimum at the minimum level: 102.14 m

1.16.2.1.4 Turbines

The Contractor shall be fully responsible for final turbine selection, sizing, hydraulic design and performance to meet the guaranteed output and efficiency under all specified operating conditions.

1.16.2.1.5 Key Technical Parameters of Turbines

Description	Unit	Data
No of Units	No.	Three (03)
Type of Turbine	Type	Vertical Shaft Francis Turbines
Rated Turbine Output at Shaft	MW	18.94
Rated Net Head	m	104.0
Rated Turbine Speed (n)	rpm	375
Turbine Runaway Speed (nr)	rpm	655
Unit Discharge (Qunit)	m3/sec	20.0
Runner Diameter	m	1.68
Min. Turbine Efficiency (η)	%	93

The parameters stated are indicative and shall not relieve the Contractor from achieving all guaranteed performances under the Contract.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

1.16.2.1.6 Inlet Valve

The following parts of each valve shall be supplied.

a. Butterfly Valve (Internal Diameter 1.8m)
b. Bypass Valves Assembly
c. Extension Pipes
d. Dismantling Joint
e. Counter Weight
f. Hydraulic Operator
g. Associated Piping

1.16.2.1.7 Governor System

The governor shall operate with a hydraulic pressure supply system and remote control. The governor system shall set the turbine speed and servomotors positions smoothly and gradually, no harmful oscillations should occur at all electrical loadings and load rejections.

The governor system shall provide stable operation of the turbine for all operating conditions and shall cope with worst condition on full load rejection. The stabling of frequency must be as per international Standards.

1.16.2.1.8 Powerhouse Crane

The powerhouse crane shall serve all normal requirements for lifting and moving heavy components during installation, maintenance work and operation. The lifting capacity of the main hoist shall be determined by Contractor with appropriate factor of safety. The Powerhouse overhead crane shall cover the entire Powerhouse length. It shall have an auxiliary hoist of 10Tons. The traveling and hoisting speeds shall conform to those given in the feasibility report. The design shall conform to FEM standard.

1.16.2.1.9 Auxiliary Mechanical Systems

Auxiliary systems to be provided shall include but not be limited to the following main facilities:

Cooling water system, dewatering and drainage systems, compressed air system, oil purification systems, fire detection & alarm and firefighting system for Generators.

The design of the auxiliary systems shall be carefully considered to ensure a well-functioning, easy to operate and easy to maintain power plant. The layout and location of auxiliary installation (such as compressor, strainer and pumps) shall be considered with respect to performance considerations and maintenance access. Air intakes for compressors shall minimize introducing dust and moisture into the compressed air. Strainers shall be arranged so that the baskets may be withdrawn readily without losing the entrapped material.

1.16.2.2 Hydraulic Steel Structures

Hydraulic Steel Structures to be provided shall include but not be limited to the following main facilities.

a. Power Intake: Trash rack, Stoplogs, Electrical Gates, Gantry Crane, Trash rack Cleaning Machine
b. Flushing Intake: Service Gate, Guard Gate, Stoplogs (Optional)
c. Draft Tube: Bulkhead Gates, Gantry Crane

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

All hydraulic steel structures shall be designed for hydraulic loads, seismic loads and operational loads in accordance with applicable international standards and Pakistan regulations

1.16.2.3 Electrical Equipment (Powerhouse)

1.16.2.3.1 Generators

Key Technical Parameters of Generators

Description	Unit	Data
No. of Units	No.	Three (03)
Guaranteed rated capacity, each	MVA	23.20
Real Power at 0.8 pf lagging	MW	18.56
Rated Voltage	kV	11
Rated Frequency	Hz	50
Rated Speed	rpm	375
Stator/Rotor Winding Insulation	Class	F/F
Minimum Efficiency	%	98

The generator shall be designed, constructed and tested in accordance with IEC Publications No. 60034 and other relevant parts dealing with rotating electrical machines.

The generator and all accessories shall be capable of withstanding all temperature changes and sudden three phase short circuit, at its terminal without damage to the equipment.

1.16.2.3.2 Excitation and Voltage Regulation System

The excitation control equipment shall be a solid-state microprocessor based digital system suitable for operation over the full range of ambient conditions. The excitation control system shall be of fully static type and shall include following.

a. Excitation Control Equipment, incorporating:
    i. Automatic Voltage Regulator
    ii. Manual Field Current Regulation
    iii. Power System Stabilizer
    iv. Thyristor firing circuit output
    v. Monitoring of Excitation Control System
    vi. Interface with DCS
    vii. Limiters and Protection System
b. Excitation Power Transformers
c. Full wave (Force Air cooled) Thyristor Convertor with Controller
d. Field Suppression Circuit and rotor overvoltage protection
e. Field Circuit Breaker

1.16.2.3.3 Generator Step-Up Transformers

The plant shall be provided with four (04) Nos. three-phase, ONAN/ONAF, On-Load tap changers step-up transformers (20/26 MVA) including one spare transformer. The secondary side of all three transformers shall be connected with the switchyard bays (one and a half breaker scheme).

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

The transformer voltage ratio has been chosen to match the generator voltage finally adopted as 11kV. The generator side of the transformers will be connected in delta formation and the HV side in star (YNd11 vector group). To cater wide range of daily voltage variation in the transmission system, step-up transformers with On-Load tap changers shall be provided.

1.16.2.3.4 11/0.4 kV Auxiliary Transformers

The powerhouse station auxiliary system shall be equipped with four (04) no. 11kV/0.4kV, 630 kVA, dry type station auxiliary transformers including one spare, connecting HV side to 11 kV busbar and LV side to 400V switchgear and associated enclosure complete with accessories.

The power distribution system at intake shall be equipped with Two (02) no. 11kV/0.4 kV, oil type 400 kVA auxiliary transformers including one spare transformer.

Auxiliary power systems shall be designed to ensure uninterrupted supply to essential loads under all operating and emergency conditions.

1.16.2.3.5 Medium and Low Voltage Switchgear

The 11kV busbar shall be fed from the generators and connected with the generator step-up transformers through generator circuit breakers. Three (03) 630 kVA transformers shall be fed though 11kV busbars and supplying power to main low voltage busbars.

The low voltage board shall be connected with two nos. incoming through 630kVA station auxiliary transformers and other from switchyard. This arrangement guarantees enough reliability to secure all essential power needs for security, protection and black start-up.

The intake area shall be fed from 11kV overhead line (single circuit). Distribution transformers shall be installed at respective areas.

The low voltage AC distribution system shall be designed as a 400 V, 3-phase four wire plus protective (Earth) conductor system. The distribution system shall supply power to the all-plant services systems, lighting and battery chargers, including power cables and local control cabinets with necessary starter motors and sub-distribution panels.

The battery system shall provide a safe and reliable supply of power and control voltage to all primary functions. The system shall be independent of all power systems and ensure reliable execution of the control functions, both for normal operation and during possible fault conditions. The battery system shall be designed with sufficient autonomy to meet the Project requirements during black start and emergency conditions.

Some instrument protection devices or computer interfaces shall need 24V or 48V DC supply. AC/DC converters shall be used.

1.16.2.3.6 Plant Control System

The Plant Control Systems shall be so designed that in the event of subsequent modifications to the controls and associated signal processing, expansion of the system is convenient and straightforward.

The actual implementation of the plant control system shall be proposed by the Contractor in the Basic Design. Control and operation of the power station shall include following:

a. Automated Plant Control System (PCS) at powerhouse Central Control Room
b. Backup control at bay/unit level allowing safe manual operation in case of PCS failure,
c. Auxiliary control at device level for local operation and maintenance purposes.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

d. Interface to the Substation Automation System (SAS), transmitting and receiving data to meet the requirements of the remote load dispatch center

e. Remote control / communication between Plant Control System (PCS) and superior remote-control system (Regional Control Centre)

Supplier shall include provisions for:

a. Powerhouse Control and Protection

b. Generator Control and Protection

c. Transformer Control and Protection

d. Turbine Protection

e. Regulators

f. Metering

1.16.2.3.7 Protection and Relay Equipment

The general principle for the protection of Generators, Generator Step-up Transformers and Auxiliary Transformers shall be that these are covered by two high speed protection schemes which shall be independent to avoid common-mode failures.

The protection equipment shall be complete with all relay panels, instruments, meters, interposing and auxiliary relays, control switches, interposing current and voltage transformers, transducers and all auxiliary equipment. The protection scheme shall be provided with Cyber security support for compliance to IEC 62351 with Centralized Account Management. Separate cores of current transformer (CT) and voltage transformer (VT) shall be used for each protection and metering. Minimum of One (01) core shall be provided as spare for each CT and VT. Whereas, separate CTs and VTs shall be used for primary and backup protection.

Protection equipment shall be designed and supplied to provide maximum discrimination between faulty and healthy circuits. All equipment is to remain inoperative during transient phenomena which may arise during switching or other disturbances to the system.

1.16.2.3.8 EPABX, PAS And CCTV

1.16.2.3.8.1 EPABX

The EPABX shall be state-of-the-art, digital, non-blocking type utilizing Pulse Code Modulation (PCM) and Time Division Multiplexing (TDM) and Stored program Control (SPC). It must be field proven and conform to ITU-T A-Law Companding standard. It shall at least be equipped with 64 subscriber lines and 08 trunk lines. The system shall allow simultaneous voice and data communication over one twisted pair telephone cable.

1.16.2.3.8.2 Public Address System (PAS)

The system shall be modular in design, flexible and field programmable. The system shall feature an “attention alarm” signal to precede the spoken messages.

1.16.2.3.8.3 Video Surveillance System (CCTV)

The Video surveillance system shall comprise CCTV cameras, power supplies and video recording equipment enabling selected locations of the power house premises to be monitored remotely from the power house control building. The objective of video surveillance system shall be to monitor the entry/exit gates, boundaries, power house premises for security purposes.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

1.16.2.3.8.4 Radio/Microwave Communication

Microwave/ Radio Links shall be used to the OFC as a backup digital radio communication link and will be provided from powerhouse to intake for communication and protection purposes.

1.16.2.3.9 Emergency Diesel Generator Set

The emergency diesel generator of powerhouse is required to provide “black start” capability of the generating unit when power from normal or alternate source is not available. The generator shall also be required to meet emergency load requirements in the power plant when the power supply fails. The governor shall be of the droop type to enable paralleling the generator to the distribution system for load testing. The Contractor shall determine the capacity of the diesel generator based on the loads and submit to Employer for approval. The Contractor shall use the following criteria for specifying the main parameters of the emergency generator set and its control system:

- Voltage level of the system to be supplied from the generator is 400V.
- Load requirements and duration.
- Control and automation.

The emergency diesel generators shall be furnished with speed governor, lubricating oil facility, air inhalation, cooling facility, fuel supply facility, exhaust facility, battery starting system, exciter, voltage adjuster and control panel.

The emergency diesel generator capacity and configuration shall ensure full black-start capability of one generating unit.

1.16.2.3.10 132kV Switchyard and 132kV Line End Bays at Remote End

The switchyard shall be constructed nearby the plant which consist of three transformer bays, one power transformer bay and two 132 kV transmission line bays. The 132kV bays shall be arranged in breaker & half scheme. The Attabad Lake HPP will be interconnected to the proposed 132/66 kV grid station at Aliabad and existing 33kV grid station at Sost. Two (2) 132 kV Line End Bays shall be constructed at 132/66 kV Aliabad Regional Grid Station, Aliabad.

The interconnection with 132kV switchyard and power plant shall be through 11kV segregated phase bus. AC auxiliary supply be fed from power plant through One (01) No. feeder and another feeder from switchyard power transformer (6.3 MVA). A complete DC system shall be installed in switchyard control house building.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

SECTION 2 GENERAL HYDROMECHANICAL AND HYDRAULIC STEEL STRUCTURES REQUIREMENTS

2.1 GENERAL HYDROMECHANICAL REUIREMENTS

2.1.1 General Design Requirements

All mechanical works under this Contract shall comply with these General Mechanical Requirement and with the Particular Sections of these Specifications. The Contractor shall be fully responsible for the complete design, engineering, manufacture, supply, inspection, testing, transportation, installation, commissioning and performance of all Hydromechanical equipment. The equipment shall be of an approved, reliable design providing the highest possible degree of uniformity and interchangeability.

The design and arrangement of equipment and installations shall facilitate erection, testing, operation and maintenance and shall ensure safe access and compliance with applicable health and safety regulations.

All equipment shall be pre-assembled in the manufacturers workshop to an utmost extent. Revolving parts shall be truly balanced both statically and dynamically. If running at normal speed and at any load up to the maximum, no vibration may occur due to lack of balance.

Contact between dissimilar metal parts shall be avoided as far as practicable, especially in any fully or partially submerged application. Suitable insulating material such as plastic, neoprene or paint shall be provided where possible to prevent metal to metal contact between dissimilar metals. If it is necessary to use dissimilar metals in contact with each other, the two metals shall be as close as possible to each other in the galvanic series and practical experience shall be submitted to demonstrate their compatibility. Where welding of dissimilar metals is unavoidable, approved welding procedures and corrosion protection measures shall be submitted for Employer’s review. Overlapping paint shall be applied where dissimilar metals are welded together.

2.1.1.1 Standards

All equipment, parts and materials, main dimensions and function shall conform to the appropriate standards recommended in the Employer Requirements. For this purpose, the Proposer’s will be requested to specify in their Proposal’s the relevant standards for the main items of their supply and clearly identify the parts, phases, operations, etc. to which each particular standard shall be applied. For example, the Contractor shall indicate the standards to be applied for design, calculations, materials, and fabrication of the supply.

The Contractor shall supply copies of specified standards at the Employer's request, clearly identifying or marking the particular chapters or sections that are being applied. The following standards are recommended.

- EN European Standards
- FEM Federation Europeenne de la Manutention
- IEC International Electrotechnical Commission
- DIN German standards issued by Deutsches Institut fuer Normung e.V.
- ANSI American National Standards
- ASTM American Society for Testing of Materials
- ASME American Society of Mechanical Engineers
- AISC American Institute of Steel Construction

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- AWS American Welding Society
- BS British Standards Institute
- IEEE Institute of Electrical and Electronic Engineers
- JIS Japanese Industrial Standard
- NFPA National Fire Protection Association, USA
- ASCE American Society of Civil Engineers
- FEM Federation Europeans de la Manutention
- SSPC Society for Protective Coatings
- NGC National Grid Company (Former NTDC)
- NTDC National Transmission & Dispatch Company

The standard chosen shall be made available to the Employer and the Employer in the English language. The latest revision or edition in effect at the time of the Invitation of Proposal's shall apply.

All equipment and materials related to the supply contract shall conform to the requirements of the Specifications and to the designated standards. In case of discrepancy between the designated standards and the Specifications, the latter shall prevail.

2.1.1.2 Materials

A. General

The material shall be of highest grade free from defects and imperfections, of recent manufacture and unused.

All materials incorporated in the equipment supplied shall be of quality, grades and conditions as set forth in the approved Standards.

Materials not specifically designated herein shall be subject to the approval of the Employer, shall be suitable for their purpose and shall as far as practicable to comply with the latest issue or revision of the designated standards or their approved equivalent.

Materials for general purposes shall be delivered according to the following standards given in Table 2-1, or their equivalent. The grade used will depend on stress levels, environmental conditions, resulting material thickness and manufacturing and inspection procedures.

The material grade shall unless otherwise specified be proposed by the Contractor but are subject to the Employer approval. Such approval shall not relieve the Contractor of full responsibility for the suitability and performance of the materials.

Table 2-1: Standards

Material	Specification
Structural Aluminum	ASTM B308/B308M, "Specification for Aluminum - Alloy 6061-T6 Standard Structural Profiles".
Carbon Steel Castings	ASTM-A27, "Specification for Mild to Medium-Strength Carbon-Steel Castings for General Application," Grade 65- 35, Grade 70-36, and Grade 70-40.
Low-Alloy Steel Castings	ASTM-A148, "Specification for High-Strength Steel Castings for Structural Purposes," Grade 80-50.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Material	Specification
Corrosion-Resistant Steel Castings	ASTM-A743/A 743M, "Specification for Casting, Iron- Chromium, Iron-Chromium-Nickel, and Nickel Base (Corrosion-Resistant) Alloy Castings for General Application," Grade CA-15, Grade CF-8 and Grade CA- 6NM.
Corrosion-Resistant Steel Plate	ASTM-A167, "Specification for Stainless and Heat- Resisting Chromium-Nickel Steel Plate, Sheet, and Strip."
	ASTM-A176, "Specification for Stainless and Heat- Resisting Chromium Steel Plate, Sheet, and Strip."
	ASTM-A240, "Specification for Stainless and Heat- Resisting Chromium and Chromium-Nickel Steel Plate, Sheet, and Strip for Fusion-Welded Unfired Pressure Vessels," Type 405 and Type 410.
Corrosion-Resistant Steel Bars	ASTM-A582, "Specification for Free-Machining Stainless and Heat-Resisting Steel Bars, Hot-Rolled or Cold- Finished," Type 303 and Type 416.
Nickel-Copper Alloy Plate (Monel)	ASTM-B127, "Specification for Nickel-Copper Alloy Plate, Sheet, and Strip (UNS No. 4400)."
Iron Forgings	ASTM A48/A48M, “Specification for Gray Iron Castings”, Class 30
Carbon and Alloy Steel Forgings	ASTM-A668, "Specification for Steel Forgings, Carbon and Alloy for General Industrial Use," Class D.
Carbon Steel Forgings (for pipe flanges, fittings, etc.)	ASTM-A181, "Specification for Forged or Rolled Steel Pipe Flanges, Forged Fittings, and Valves and Parts for General Service," Grade I and Grade II.
Carbon Steel Plates (for low- stressed parts)	ASTM-A283, "Specification for Low and Intermediate Tensile Strength Carbon Steel Plates of Structural Quality (Plates 50 mm and Under in Thickness)," Grade A and Grade B.
	ASTM-A36, "Specification for Structural Steel."
Carbon Steel Plates	ASTM-A285, "Specification for Low and Intermediate Tensile Strength Carbon Steel Plates for Pressure Vessels (Plates 2 in and Under in thickness)," Grade B and Grade C.
Intermediate Strength Steel Plates (for important stress- carrying parts)	ASTM-A516, "Specification for Carbon Steel Plates for Pressure Vessels for Moderate and Lower Temperature Service," Grade 60 or better, except that all plates thicker than one inch shall be normalized to produce grain refinement.
High Strength Steel Plates (for highly stressed parts)	ASTM-A517, "Specification for High Strength Alloy Steel Plates, Quenched and Tempered, for Pressure Vessels."
Bronze Castings	ASTM B584, “Specification for Copper Alloy Sand Castings for General Applications”, UNS Alloy Nos. C90300 and C92300.
Bronze Castings, Bronze (for bearings, wearing plates, etc.)	ASTM-B584, "Specification for Copper Alloy Sand Castings for General Applications, UNS Alloy Nos. C93200 and C93700."

B. Test of Materials

2.1.1.3 General

Unless otherwise agreed by the Employer, all materials or parts shall be new and shall be tested by the material supplier, in conformity with applicable methods prescribed by the ASTM, or such other equivalent international standards organizations approved by the Employer. For mass produced equipment, the supplier shall indicate that material testing is part of its quality program acceptable to the Employer.

2.1.1.4 Test Certificates (Mill Certificates)

Certified material test reports shall be submitted by Contractor to the Employer as soon as possible after the tests are made. The test certificates shall identify the component for which the material is to be used and shall contain all information necessary to verify compliance with the Contract. The Employer reserves the right to request additional testing or verification at the Contractor's cost in case of doubt.

2.1.1.5 Workmanship

Except where the manner of design, manufacture or execution is otherwise specifically set forth in this Contract, the Works shall be designed and executed in a proper and workmanlike manner, all in accordance with prudent industry practice for such Works. All work shall be done by personnel skilled in the related professions and trades.

All parts shall be made accurately to a standard gage, so as to facilitate replacement and repairs. All bolts, nuts, screws, rivets, threads, pipe, gauges, gears, and measurements or dimensions shown on the Contractor's Drawings shall conform to customary standards.

The Contractor shall provide and maintain in storage for at least Ten (10) years, free of cost to the Employer, sufficient templates, gauges, patterns, and other records to enable the Employer to make repair and replacement parts. All special gages and templates necessary for field erection shall be furnished and shall become the property of the Employer. Patterns shall remain the property of the Contractor.

2.1.1.6 Working Stresses

A. Loading

Ample factors of safety shall be used throughout the design of the equipment, especially in the design of parts and components subject to alternating stresses, vibration, impact or shock.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

In general, the loading shall be divided into 3 different classes according to the following typical examples.

2. Normal Loading

a. Loading due to dead loads
b. Hydrostatic loads, from vacuum to design water pressure
c. External pressure
d. Hydrodynamic loads, design values for surges and pressure rise
e. Friction loads
f. Forces due to temperature variations
g. Environmental loads with a return period of 50 years
h. Dynamic loads due to normal operation
i. Vibration loads caused by flowing water or by ordinary operation

3. Unusual loading

a. Sediment loading. Construction shall be appropriate for an increased load due to sedimentation
b. Un-symmetric loading due to uneven frictional forces

4. Extreme loading

a. Earthquake loading (Maximum horizontal acceleration of 0.3 g; Maximum vertical acceleration of 0.15 g)
b. Loading due to transportation and erection
c. Pressure testing at 50 % above design pressure
d. Loading due to maximum (PMF) floods
e. Loading due to transportation and erection
f. Emergency situations, complete short circuit forces in generator
g. Emergency hoisting
h. Continuous run away of the generating unit

Earthquake loading shall be based on site-specific seismic parameters and applicable Pakistan seismic codes, with the stated accelerations treated as minimum requirements.

The various loads shall for normal loading be combined if physically possible, and the most severe shall determine the design conditions. At unusual and extreme loading, each unusual or extreme load cases shall be combined with the most severe normal loading. Unusual or extreme load cases do not need to be combined.

B. Design Conditions

5. Normal Design Conditions

The following stress levels at the different load cases are the maximum allowable values. Lower stress levels may be prescribed in the particular specifications for the individual sections of work, or under Construction Elements in these General Specifications, or in the various design standards used for particular components.

Under design conditions, the combined stress levels calculated according to von Mises theory shall not exceed what is allowed according to the approved standards but shall in no case

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

exceed the values in Table 2-2 unless otherwise stated by the Contractor and approved by the Employer.

Table 2-2: Normal Design Condition Stress Limits

Material	Stress Condition	Stress Limit
Structural steel materials	Maximum general stress level	60% of the yield strength
Structural steel materials	Average stress at points with local stress concentrations, calculated according to methods approved be the Employer	75% of the yield strength, provided the quality of material can be confirmed by approved methods at the point with stress concentration.
Other materials	Maximum stress in tension or compression	33% of the yield strength or 20% of the ultimate strength of the material
Cast steel	Maximum general stress level	50% of the yield strength
Cast steel	Average stress at point with local stress concentrations, calculated according to methods approved by the Employer	67% of the yield strength provided the quality of material can be confirmed by approved methods at the point with stress concentration.
Cast iron	Maximum general stress level	20 N/mm²
Ductile materials in general	Shear stresses	57% of allowable stresses in tension
Ductile materials in general	Hydrostatic pressure testing	90% of the yield strength
Vertical pump, turbine and generator shafts	Maximum torsion shear stress	40 N/mm²
Horizontal pump and turbine shafts exposed to water	Maximum torsion shear stress	35 N/mm²

- Ratio between ultimate strength and yield strength minimum 1.2
- Elongation, A, test length 5.65. minimum 17%
- Impact Strength, KV, at design temperature minimum 27 J

The minimum properties shall be tested in the direction of highest principal stress of any component, including weld zones.

The yield strength shall mean the guaranteed, minimum yield strength. For materials not having a defined yield point, the 0.2% proof stress shall be used.

All components shall be designed for a lifetime of Forty (40) years under normal running conditions, and components subject to fatigue shall have a theoretical safety factor of not less than 1.5 against failure unless otherwise stated. Due consideration shall be made to dynamic

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

stresses, which shall be kept within the stress limits stated above. The effects of corrosion, stress concentrations, notches, etc., shall be duly considered.

The maximum general stress levels shall be calculated in accordance with the elastic theory, considering all main stress components.

The resulting effect of peak stresses, due to secondary bending moments, may be calculated using a non-linear theory, provided that the material is not subject to fatigue, the ductility allows limited yielding without danger of cracking and that the quality control procedures during production with a satisfactory degree of probability shall detect cracks well below the critical crack size.

Materials for pressure vessels, spiral casings, larger valve housings and similar which are heat treated after manufacture, shall have a critical crack length which will cause the crack depth to penetrate the vessel, thus causing the vessel to leak without bursting at its lowest operation temperature and at the general maximum stress level. For vessels not heat treated, the same shall apply for stresses equal to the yield stress.

6. Unusual Design Conditions

For structural steel materials the general maximum stress level may be increased to 75 % of the yield strength, and up to 80% of yield strength for the maximum stress at points with local stress concentrations.

For other materials, the stresses may be increased accordingly in compliance with the applicable standards and subject to Employer approval.

7. Extreme Design Conditions

For structural steel materials the general maximum stress level may be increased to 80 % of the yield strength, and up to 90 % of yield strength for the maximum stress at points with local stress concentrations.

For other materials, the allowable stresses may be increased accordingly subject to the Employer approval.

a) Pressure Testing

Before pressure testing of larger components, the critical crack size shall be calculated and compared with the crack detection level. The general membrane stress in any part shall not exceed 80% of the yield stress during pressure testing.

b) Runaway Conditions

Under maximum runaway conditions, the increasing forces due to deformations under loading shall be considered.

Earthquake loading shall be calculated using the specified horizontal and vertical acceleration. Site-specific seismic parameters and applicable Pakistan seismic codes shall be applied as minimum requirements. The method of calculation shall be subject to approval of the Employer.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

2.1.1.7 Special Design Criteria

a. Shaft Bending Frequency

The following criteria shall be observed for main shaft systems (turbine/generator, pump/motor, diesel-engine/generator etc.):

- The first order shaft natural bending frequency shall exceed the maximum transient runaway speed by 25% or more. The shaft natural bending frequencies shall have a separation of 25% or more to the operating speed, to the line frequency (50 Hz) and to other predominant system frequencies.
- The first order shaft natural torsion frequency shall exceed the maximum transient runaway speed by 25% or more. The shaft natural torsion frequencies shall have a separation of 25% or more to the operating speed, to the line frequency (50 Hz) and to other predominant system frequencies.

For auxiliary motors, pumps and other rotating equipment, the shaft speed shall not exceed 90% of the first order shaft natural frequencies at a temporary line frequency or75 Hz.

Standardized electrically driven equipment rated less than 6 kW shall, after approval by the Employer, be exempted from these criteria.

The deformations shall at all loads be within acceptable limits according to the best engineering practice.

The Contractor shall assume full responsibility for an adequate design and shall use lower stresses wherever necessary.

2.1.2 Welding

2.1.2.1 General

All welding shall be performed by the electric-arc method, by a process that excludes the atmosphere from the molten metal, using approved welding procedures (WPS) and, where practicable, by automatic machines, however, manual welding shall be performed on the welds where automatic welding cannot be performed due to access issues.

After being deposited, all welds shall be cleaned of slag by shot blasting, unless otherwise approved by Employer, and shall be uniform, smooth, showing good fusion with the base metal, and free of voids, crack, and clinkers.

Machined surfaces of parts affected by welding shall be machined to final dimensions after welding. Machined surfaces of parts requiring stress relief shall be machined to final dimensions after the parts have been stress relieved. Localized stress relieving shall not be permitted for shop-welded parts.

All principal load-carrying welds shall be full penetration type welds. Strength of welded joints shall be based upon the allowable stress of the parent materials. Welding methods shall be such that residual stresses shall be reduced to a minimum. The weld seams shall, as far as possible, be positioned outside zones of stress concentration.

All joining of plates in the principal stress direction shall be carried out using double welded butt joints. Adjacent plates, carrying high stresses, shall in general not differ more than 3 mm in thickness. If the difference is greater, the thicker plate shall be chamfered to a maximum 1: 4.

Principal welds shall be ground as specified in the approved welding procedure. Besides, all welds exposed to water having a velocity of 10 m/s or more, shall be ground flush with the plates unless otherwise approved by the Employer.

Cracked or defective tacks shall be removed before welding.

For double welded butt joints, the root shall be completely removed by grinding or back gauging before proceeding with the welding on the other side in order to prevent the presence of residues.

Where auxiliary structural members are welded to components for the purpose of assembly and installation, the connecting welds shall be given particular care. Once an installation has been completed, these auxiliary structural members shall be removed by burning them off, followed by grinding the affected areas flush with the plate, without introducing additional local thermal stresses. Knocking off of such members shall not be permitted.

The electrodes for arc welding shall be classified on the basis of mechanical properties of the as welded deposited weld materiel, type of covering, hydrogen absorption, welding position of the electrodes and type of current.

Electrodes shall be used only in the positions and under the conditions of intended use in accordance with instructions with each container. Electrodes for manual welding shall be suitable for welding in any position.

During the welding operations the electrodes shall be stored and dried in electric heaters prior to welding, according to the instructions from the manufacturer and approval of the Employer.

The ignition of welding-electrodes shall not be initiated at the steel surface adjacent to the weld, but at the groove flanks to prevent detrimental increments of local hardness. Where ignition points of electrodes are discovered, they shall be ground appropriately.

Designs shall be such as to minimize Site welding.

Unless otherwise stated the qualification of welding procedures, welders, and welding operations, including weld repairs of castings shall conform to Section IX of the ASME "Boiler and Pressure Vessel code".

Unless otherwise stated all welded parts shall be designed, fabricated, inspected and tested in accordance with Section VIII of the ASME "Boiler and Pressure Vessel code" and shall be stress relieved prior to machining in accordance with the requirements of the same code. No Site welds shall require stress relieving.

For certain structural items welding, welders and weld procedure shall be in accordance with AWS Standards. These items shall be identified in these Specifications. All pressure vessels and items subject to penstock pressure shall be welded to ASME "Boiler and Pressure Vessel code".

Welds shall in general be treated so that they shall display good appearance and a surface suitable for painting. Structural welds shall be ground and blended to avoid stress raisers. All welds which require non-destructive examinations shall be dressed by chipping and grinding as required for good interpretation by the selected weld examination methods.

All welds shall be continuous, watertight and free from voids.

Welded-on fabrication aids shall be kept to a minimum. They shall be attached only by approved welders and shall be removed by flame cutting not less than 1.5 mm above the parent plate surface and then by subsequent grinding and crack detection of the weld area.

All plate butt welds shall be full penetration back gouged and welded from both sides.

The minimum size of fillet welds shall be 6.5 mm measured on the leg. Undercutting not exceeding 1 mm shall be removed by grinding. Undercutting exceeding 1 mm shall be filled by welding.

The edges of surfaces (up to the thickness of the metal) to be welded shall be of sound metal free from visible defects such as laminations or defects caused by cutting operations and free from rust, oil grease and other foreign matters.

2.1.2.2 Edge Preparation

Members to be joined by welding may be cut to shape and size by mechanical means such as shearing, machining, grinding, or by gas or arc cutting, to suit the conditions. Design of welded joints and selection of weld filler metal shall allow thorough penetration and good fusion of the weld with the base metal. The edges of surfaces to be welded shall be sound metal free of visible defects, such as laminations or defects caused by cutting operations, and free from rust, oil, grease and other foreign matters.

2.1.2.3 Welding Qualifications

The qualification welding procedures, of welders, and of welding operators shall conform to standards at least equal to ISO 9606 or Sections VIII and IX of the ASME Boiler and Pressure Vessel Code. The Contractor shall furnish the facilities and all equipment, materials, and other articles required to perform qualification tests of its welders and welding operators. The Contractor shall prepare the procedure for qualification testing of the field welders, and the qualification tests shall be witnessed and accepted by the Contractor. All welders' and welding operators' test certificates shall be submitted to the Employer. Welders for on-site work shall be tested no earlier than three (3) months prior to commencing site work. Contractor shall replace any welder or welding operator deemed unacceptable by Employer.

WPS and Welder Qualification Tests shall be in accordance with the relevant welding standard and shall be performed by the Contractor and witnessed by the Employer.

2.1.2.4 Welding of Stainless Steel

All welding of stainless steel shall be carried out using the inert gas method (TIG/MIG). Pipes shall be locally filled with inert gas during welding.

Butt welds on thin-walled pipes shall have a smooth, fully penetrated weld seam inside and outside. Partly penetrating, drops or metal sputter shall not be accepted.

All welds and heat affected zones shall be carefully descaled and cleaned with a suitable cleaning paste and fresh water if inert gas has not been applied or if the inert gas method has failed. Carbon steel tools shall not be used.

2.1.2.5 Field-Weld-Filler Metal

The calculated quantity of weld-filler electrodes or wire required for field-welded joints plus twenty percent (20%) additional shall be furnished. The Contractor shall select the proper filler material for all field-welded connections and shall specify it on the applicable Contractor's

Drawings submitted for the Employer approval, together with the detailed design of the field-weld joint.

2.1.2.6 Heat Treatment

The need for heat treatment shall be determined in accordance with the approved Design Standard and/or Boiler and Pressure Vessel Code, taking into account the stress levels and design temperature, material properties including notch toughness, material thickness and forming, welding and inspection procedures. The shop heat treatment of welded components shall be performed on the completed component prior to final machining.

Procedures for heat treatment shall be submitted to the Employer for approval.

Heat treatment of site welding shall be performed according to the specifications for the welding procedure for the corresponding parts, which shall be submitted to the Employer for approval.

2.1.2.7 Quality and Procedure Control

Quality testing and inspection methods, e.g., inspections by non-destructive testing (NDT) means, shall be carried out in accordance with the appropriate manufacturing code. However, the Contractor shall indicate clearly on the drawings the extent to which these methods shall be used.

2.1.2.8 Documentation

The Contractor shall maintain a strict quality control program for the welding work performed in the shop. Weld procedure specifications (WPSs) shall be submitted for review and approval by the Employer prior to starting the fabrication work. All welds shall be identified on the Contractor's Drawings by numbers. All welding work shall be performed by qualified welders and welding operators and shall be properly documented.

2.1.2.9 Nondestructive Testing

a) General

Unless otherwise indicated, all nondestructive tests shall be in accordance with the applicable section of ASTM Standards, Part III, Metallography Nondestructive Tests or approved equivalent. The Contractor's Drawings submitted to the Employer for review and approval shall define the areas, extent, and type of nondestructive examination employed.

b) Examination of Welds

All welds on weld-fabricated parts, except minor parts or low stressed parts, shall be given complete nondestructive examination by Contractor. Weld examination shall be by TOFD, dye penetrant and magnetic particle methods, supplemented by radiographic examination. Supplemental radiographic examination shall include examination of critical high-stressed areas where interpretations of other methods are unclear, or where the integrity of the weld is doubtful. All butt-welded joints exposed to headwater pressure, or to significant stress levels shall be given a one hundred percent (100%) radiographic or TOFD inspection by Contractor, accompanied by a one hundred percent (100%) magnetic particle or liquid penetrant inspection. At least, 25% of Butt Welds at Site shall be radiographic tested. The Employer shall have the right to request random spot-check examination of welds, including radiographic examination, as part of its inspection of the equipment. The Employer shall have the right to review films of previously performed radiographic examinations. The nondestructive

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

examination scope, procedures and acceptance standards of welds shall be clearly indicated on the Contractor's Drawings. The detailed program for nondestructive examination of welds shall be submitted by Contractor for review and approval by the Employer.

2.1.2.10 Machine Work

a) General

Sufficient machining stock shall be allowed on all parts to be machined to ensure true finished surfaces of solid material. Finished contact or bearing surfaces shall be true and exact to secure full contact. Journal and sliding surfaces shall be polished, and all surfaces shall be finished with sufficient smoothness and accuracy to ensure proper operation when assembled. No machining shall be done on working surfaces of self-lubricating bushings or washers.

b) Finished Surfaces

In addition to the machined surfaces indicated on the Contractor's Drawings, all surfaces that require machining for their intended function and those surfaces that are normally machined in good shop practice shall be machined.

c) Unfinished Surfaces

All work shall be laid out to secure proper matching of adjoining unfinished surfaces. Where there is a large discrepancy between adjoining unfinished surfaces, they shall be chipped and ground smooth, or machined, to secure proper alignment. Unfinished surfaces shall be true to the lines and dimensions shown on the Contractor's Drawings and shall be chipped or ground free of all projections and rough spots. Depressions or holes not affecting the strength or usefulness of the parts may be filled in an approved manner. Corrosion-resistant-steel, seal plate surfaces in contact with seals shall be thoroughly cleaned to have a smooth and even surface.

d) Pins and Pin Holes

Pin holes shall be drilled smooth and straight and at right angles to the axis of the member. The drilling shall be done after the member is securely fastened in position.

e) Assembly

Before assembly, all bearing surfaces, journals, and grease and oil grooves shall be carefully cleaned and lubricated with an approved oil or grease. Solvents shall not be used on self-lubricating bearings. After assembly, each lubricating system shall be filled with an approved lubricant. Self-lubricating bearings shall not be greased and shall be assembled dry according to the manufacturer's instructions.

f) Surface Finish

The quality of all surface finishes shall be selected with due regard for the nature and function of the surface and in accordance with conservative design practice. Surface finish shall be subject to approval.

2.1.2.11 Steel Forgings

The Contractor shall supply a list of all important forgings and draw up material specifications for each forging. Copies of this list and specifications shall be supplied to the Employer for his use.

Steel forgings shall be in accordance with the requirements of BS Standards, the equivalent ISO Standards, or agreed national Standards.

Test blocks from which mechanical test pieces will be machined shall be cut from forgings at positions to be agreed by the Employer. On large and important forgings several test pieces shall be taken from radial and longitudinal directions.

Forgings shall be free from cracks externally or internally, extensive non-metallic inclusions and surface defects. The Contractor shall carry out non-destructive testing of forgings during machining to verify that no unacceptable defects are present.

Repairs by welding or other means shall not be undertaken on forgings at any stage of the production cycle.

Each forging shall be suitably branded with an identification number which shall be transferred throughout all final machining stages. The identification number shall be marked on all documents and test certificates related to the forging.

2.1.2.12 Casting

a) General

Test bars shall be provided from medium and large castings for all necessary material and chemical tests which are to be witnessed by the Employer or his authorized representative. If required by the Employer any castings for rotating or highly stressed parts are to be subjected to non-destructive testing by approved methods including radiographic and ultrasonic means, the cost of which shall be borne by the Contractor.

All castings shall be homogeneous and free of shrinkage, pipes, under sizing, porosity or voids. "Burn in" repairs are not acceptable and no welding, filling, interlocking or plugging of defective parts shall be done without the Employer approval in writing. All repairs shall be subjected to non-destructive examination (ultrasonic, X-rays, gamma rays) after completion of heat treatment and final machining.

b) Steel Castings

The Contractor shall prepare material purchasing specifications for all important castings. Each document shall indicate fully the quality and inspection requirements for the component casting covered. Copies of the Specification shall be issued to the Employer for his approval.

Castings shall be repaired by welding providing the approval of the Employer is first obtained in writing. The Contractor shall submit drawings, sketches or photographs and metallurgical test reports showing the location and principal dimensions of the defect together with the proposed weld repair procedure. The maximum size of defect for which weld repair shall be permitted is:

- Maximum length of defect: 20 mm
- Maximum width of defect: 10 mm
- Maximum depth of defect: no greater than 10% of the wall thickness but in no case greater than 20 mm

Only welders who have passed an appropriate qualification test shall be employed on the repair of castings. All repairs shall be carried out by the metal arc process.

Ultrasonic inspection shall be applied to all important castings to locate the extent of sub surface defects and to check the wall thickness after repair and heat treatment.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

All castings shall be identified by stamped or cast on reference marks which shall be entered on all relevant documents and test certificates to ensure full traceability.

The Employer may require that certain castings shall be examined using radiographic techniques. The Contractor shall include for this eventuality and shall comply with the Employer instructions when issued without entitlement to additional payment.

c) Cast Iron Castings

Cast iron shall not be used for any part of equipment which is in tension or which is subjected to impact, or to a working temperature exceeding 200 °C unless specifically approved by the Employer in writing.

Weldable grades of Ni resist austenitic cast iron castings shall be repaired by welding provided the approval of the Employer is first obtained. The Contractor shall submit full details of the proposed weld repair procedure and weld procedure qualification test prior to making any weld repairs. The maximum size of defect for which weld repair shall be permitted is:

- Maximum length of defect: 20 mm
- Maximum width of defect: 10 mm
- Maximum depth of defect: No greater than 10% of the wall thickness.

Test blocks shall be integrally cast on all medium and large castings.

The Employer may require that certain castings shall be checked using radiographic techniques. The Contractor shall include for this eventuality and shall comply with the Employer instructions when issued at no additional cost.

d) Aluminum Bronze Castings

The Contractor shall prepare material purchasing specifications for all important castings. Each document shall indicate fully the quality and inspection requirements for the component casting covered. Copies of the Specification shall be issued to the Employer for his use.

The inspection and quality requirements shall include an analysis of each cast, mechanical testing of test bars from each cast, pressure testing where applicable, penetrant flaw detection and radiographic examination of selected critical areas.

Weldable grades of aluminum bronze shall be repaired by welding provided the written approval of the Employer is first obtained. The Contractor shall submit full details of the proposed weld repair procedure and weld procedure qualification test prior to making any weld repairs. The maximum size of defect for which weld repair shall be permitted is:

- Maximum length of defect: 20 mm
- Maximum width of defect: 10 mm
- Maximum depth of defect: No greater than 10% of the wall thickness but not more than 20 mm

On completion of repairs, welded areas shall be ground smooth and carefully blended into the parent material. The repaired areas shall be examined for defects using penetrant flaw detection and radiography. Crack like linear defects shall not be permitted under any circumstances.

2.1.3 Corrosion Resistant Elements

All new bolts, nuts, studs, dowels, pins and other elements provided as part of the Works that are exposed to water or high humidity or subjected to frequent adjustment or frequent removal

shall be of corrosion resistant steel or bronze. Bolts and nuts shall be of different grades of stainless steel to avoid problems of spalling and galling.

2.1.4 Nameplates

Each major and auxiliary item of upgraded equipment shall have a nameplate permanently affixed thereto showing in a legible and durable manner the serial number, name and address of the manufacturer, ratings, characteristics, weight, manufacturing date and other significant information, as applicable. Nameplates of distributing agents only shall not be acceptable.

Additional nameplates shall be provided to indicate main operating instructions, caution or warning for personnel and operational safety. In addition, each panel-mounted instrument, position indicator, pushbutton, switch, light, or other similar device shall be identified by a permanently affixed nameplate that describes the control functions. Electrical wiring and instruments including relays shall also be labeled to correspond to the numbers assigned on the electrical control schematics.

The above general nameplate requirements shall be used in preparing nameplate lists and drawings shall be submitted to the Employer for review and approval. Contractor's Drawings for nameplates, as they will appear on the finished equipment, shall be submitted to Employer for review and approval.

All nameplates shall be in English and shall be suitably engraved and shall be weather-resistant. All nameplates shall be permanently attached to the respective parts, components, or equipment items in clearly visible locations. Nameplates for control equipment shall be screw- mounted laminated plastic, white with black cores, with engraved capital letters 6.4 mm minimum height.

2.1.5 Foundation Materials

2.1.5.1 General

All permanent foundation materials including all anchor bolts, jacks, tie rods, turnbuckles, anchor loops, leveling screws, supporting columns made of pipe or structural steel, soleplates, embedded anchor plates, bracing, and all other foundation materials required for anchoring and/or supporting the parts during concreting, shall be provided with all equipment.

2.1.5.2 Anchor Bolts

All anchor bolts and anchoring materials, for anchoring the equipment and accessories, shall be provided. Calculations showing the stresses in the anchor bolts for the, shall be submitted for review and approval by the Employer.

2.1.6 Fasteners and Anchor Bolts

2.1.6.1 General

All bolts, studs, nuts, etc., shall have a standard metric threading and conform to the relevant standards as regards shape and tolerance. They shall be marked by the manufacturer's symbol and class of strength.

Nuts and bolt-heads shall be hexagonal in shape and truly faced. Bolts and screws with sunk heads such as Hexagon Socket Head Cap Screws or Hexagon Socket Countersunk Head Cap Screws shall be made from stainless steel only unless approved by the Employer.

All bolts, studs, nuts, washers, screws, etc., above size M10, shall, if not in stainless steel or other corrosion resistant material, be hot dip galvanized, except for bolts above Strength Class 8.8, for which corrosion resistant materials or electrolytic zinc-coating shall be preferred.

All bolts and nuts used in bolted and screwed joints in hydraulic steel structures shall have a minimum dimension of M16.

Expansion bolts shall have a minimum dimension of M16 and shall be stainless steel.

Bolts, nuts, studs and screws which require frequent tightening and unbolting during inspection or maintenance procedures shall be of stainless steel.

For equipment within closed cabinets, in oil sumps and similar locations the Employer shall approve other types of corrosion protection.

All bolts, nuts and screws shall be secured in an approved manner against their becoming loose during operation.

The Contractor shall supply the net quantities plus 5% spare of all permanent bolts, screws and other similar items and materials required for installation of the works at the site. Any such bolts, screws, etc., which are surplus after the installation of the equipment has been completed shall become spare parts and shall be wrapped, marked and handed over to the Employer.

Washers, locking devices and anti-vibration arrangements shall be provided and shall be subject to the approval of the Employer. Taper washers shall be fitted where necessary.

Nuts, bolts and screws that might become loose during operation shall be locked in fastened position by means approved by the Employer.

Bolts shall be designed so that with the nuts fully tightened, the stress intensity at the bottom of the thread shall not exceed half the yield stress of the material under all conditions.

All torque values shall be stated on the Contractor's Drawings or torque value listing and shall be applied during installation.

All existing fasteners in contact with water shall be replaced. All existing fasteners, which exhibit corrosion, or are not reusable, shall be replaced by the Contractor at no additional cost.

Bolts, nuts and studs, except for fitting-up bolts and shaft coupling bolts, shall be as specified in Table 1-3.

Society of Automotive Engineers

SAE J429 Fasteners	Mechanical and Material Requirements for Externally Threaded
SAE J1199 Steel Fasteners	Mechanical and Material Requirements for Metric Externally Threaded

2.1.6.3 Fasteners

A. Threads

I. All bolts, studs, machine screws, nuts and tapped holes shall be threaded in accordance with ASME B1.13M, B1.21M for metric forms.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

II. Fine pitched threads shall be made to Class 3 tolerances for U.S. Customary forms and to Class 4H and 5H for metric bolts and nuts respectively.

III. Fasteners subjected to fatigue loads shall have rolled UNJ or MJ thread forms.

B. Bolts

I. Bolts shall be finished hex bolts conforming to either ASME 18.2.1 for U.S. Customary or ASME B18.2.3. xM for metric.

II. Carbon steel bolts shall be SAE J429 Grade 2 or higher and/or SAE J1199 Grade 5.8 or higher.

C. Nuts

I. Nuts shall be finished hex nuts conforming to either ASME B18.2.2 or ASME B18.2.4. xM for metric.

II. Nuts and tapped holes shall be selected/designed to support more load than the bolt, and to minimize galling.

D. Cap and Set Screws

I. Cap and set screws shall conform to the applicable requirements of ASME B18.3 and/or to ASME B18.3.1M for metric screws.

II. The hardness of socket head cap screws utilized in load carrying members shall not exceed Rockwell C40.

E. Machine Screws and Nuts

I. Machine screws and nuts shall conform to the requirements to ASME B18.6.7M for metric screws.

F. Washers

II. Plain washers shall be hardened and conform to the requirements of ASME B18.22M for metric.

III. Lock washers shall conform to the requirements of ASME B18.21.1 for helical spring type.

2.1.6.4 Anchor Bolts

A. General Requirements

I. Anchor bolts shall be supplied in accordance with the anchor manufacturer's recommendations for the equipment design, details shown on the approved Contractor's Drawings and with the requirements of the Specification unless otherwise directed.

II. The anchor bolts specified herein are intended for anchorage of equipment to new concrete foundations or existing concrete structures. Such items include but are not limited to: anchorage of the connection ring liner prior to welding, anchorage of sump tanks, accumulator tanks, equipment skids, pipe hangers and supports.

III. Anchor bolts shall be of the dimension, size and grade as indicated in the Contract documents. Nuts and washers shall be as specified for grade, type and style.

IV. Chemical anchors with past due expiration dates shall not be used and shall be properly discarded.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

V. Anchors for lighter static loads shall be of the drilled, wedge type of 303 or 304 stainless steel.

VI. After anchor bolts have been embedded, Contractor shall protect threads by applying grease and by having the nuts screwed on until the time of installation of the equipment or metalwork.

B. Embedment Depth

Minimum depth of embedment of drilled mechanical anchors shall be as recommended by the manufacturer, but no less than six and one-half bolt diameters.

2.1.7 Coupling Guards

All rotating shafts and couplings shall be fitted with rigid guards of wire mesh or plate so designed that accidental contact with the rotating parts is not possible in accordance with applicable safety standards.

2.1.8 Locks

Locks shall be supplied for all normally closed valves and for electrical cabinets and cubicles. Three keys shall be supplied for each lock, and all keys shall be non-interchangeable. All padlocks shall be of brass.

A key cabinet shall be supplied to accommodate the keys. The keys shall have an engraved identification tag and the key hooks in the cabin shall also have engraved labels.

2.1.9 Lubrication

Grease, oil and hydraulic fluid for all Plant and systems shall be provided by the Contractor for initial filling of all the equipment, plus an additional fifty percent. The types of lubricants and hydraulic fluids to be used shall be coordinated with the Employer so that the same types shall be used throughout the Project. Upon completion of the design, the Contractor shall provide a schedule showing the types, the quantities of oil, hydraulic fluid and grease required for the initial filling of each item of Plant.

Lubricants and greases shall be of types readily available in Pakistan.

During erection, use shall be made of an approved anti-scuffing lubricant, such as molybdenum-di-sulphide, on threads of bolts and nuts for items requiring subsequent routine dismantling.

2.1.10 Handling Devices

The Contractor shall furnish any required special handling and lifting devices for handling all newly furnished components.

Lifting lugs, brackets, and eyes as required for attaching lifting devices shall be provided on all of the major components of new equipment.

All equipment over 50 kg weight shall be equipped with lifting lugs or screwed sockets for eye bolts conveniently located for ease of handling. Sufficient eye bolts shall be supplied for the equipment to be handled and these shall be handed over to the Employer at the end of the erection period in good working condition. The lugs and eye bolts shall meet the requirements of FEM or other approved recognized international Standards. Lugs and eye bolts shall have a factor of safety of 5 in relation to the load being handled and shall be ultrasonically examined before use.

2.1.11 Pumps

2.1.11.1 General

All pumps to be supplied for the Works shall be of a reputable make and of a type best suited for their purpose. They shall be furnished complete with electrically driven motors of ample capacity to provide safe and continuous service under all operating conditions of the respective system including continuous operation, start/stop duty, and emergency conditions. Each pump shall be supplied with a common base plate or support, as the case shall be for its drive motor.

The main dimensions shall as far as possible be standardized, as an example according to ISO 2858 or similar relevant standards acceptable to the Employer.

Pumps rated less than 100 kW, shall in general be delivered with guarantees according to ISO 2548 Class C, unless otherwise specified.

Pumps rated above 100 kW shall in general be delivered with guarantees according to ISO 3555 Class B, unless otherwise specified.

Pump bodies of larger pumps (above 30 kW rating) or maximum pressure above 6 bar, shall be of nodular cast iron quality not less than 400-12 ISO 1083 (GGG 40 DIN 1693), or cast steel 45.3 DIN 1681 or approved equivalent international standard.

Pump bodies of smaller pumps (less than 6 kW) may be of cast iron of a quality not less than GG 25 DIN 1691 or approved equivalent.

All wearing parts, sealing faces and shafts, etc., shall be of a corrosion proof material suitable for the water chemistry at Site and easy to replace. The shafts shall have to wear collars where required. Mechanical shaft seals shall be preferred. Shafts sealed by stuffing boxes shall be fitted with sleeves. Seals shall be exchangeable without extensive disassembly of the pump. Leakage water shall be led to suitable canals/gutters. Each pump shall have air and drain valves.

Pump impellers and labyrinth rings shall be of Ni Al - bronze or stainless steel. For standard pumps being supplied with more than one impeller diameter, the proposed impeller shall not be of the maximum nor the minimum size for the selected pump.

Pumps intended for continuous operation with water with suspended sediments shall have materials and surface coating for impeller, labyrinths and shaft seal specially designed for such service.

Pumps shall not require frequent lubrication of the shaft bearings.

All pumps shall be fitted with a suitable manometer, as specified hereafter. The pressure tapping for this item as well as other instruments required in the Specifications shall be arranged so as to ensure a correct indication of the value to be measured, as indicated in ISO 3555 or DIN 1944. All instruments shall be easily visible. Should transfer pipes be required, they shall be of a corrosion proof material with an isolating valve at the connecting point.

The size of the pump motor forming part of the supply of pumps shall be:

Pm = 1.10 x Pp

Pm = rated motor power

Pp = maximum required power at the rated pump capacity

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

The pumps shall withstand corrosion and wear by abrasive matters within reasonable limits.

For submersible pumps, pump and motor shall be contained in the same casing and designed as a package unit with incorporated suction strainer. The impeller shall be of bronze or with rubber lining or of stainless steel. For dirt water pumps, the flow channels shall be rubber or epoxy lined with minimum coating thickness specified by the manufacturer.

Dirt water submersible pumps with the motors mounted on top of the pump shall be suitable for running dry continuously, without damage to seals, bearings, or motors for a minimum duration as specified by the manufacturer.

For any pump, the overall pump/motor efficiency for the specified rated head and discharge shall not be less than 60%.

If requested by the Employer, one out of three pumps with Pp larger than 30 kW shall pass a performance test to ISO 2548 Class C (DIN 1944, Class II), with measurements taken at discharges of 0%, 50%, 80%, 100% and 110% of nominal capacity at rated speed. The results have to be certified in a Workshop certificate. For pumps with Pp larger than 100 kW, these tests shall be compulsory.

Prior to the test, the Contractor shall provide certified motor performance curves.

All pumps shall have a pressure rating, guaranteed by the manufacturer, of minimum 50% above the normal system working pressure.

Acceptance test of oil pumps shall be performed according to relevant standards approved by the Employer at the manufacturer's shop or at the Site at no additional cost to the Employer.

2.1.11.2 General Requirements of Centrifugal Pumps

Preventive and routine maintenance time shall be minimized by the selection of appropriate design of pumps, preferably those that leave casing to piping joints intact, i.e., horizontal split-casing types for large centrifugal pumps and horizontal, back pull-out types for smaller units.

Where a significant saving in floor space or improvement of layout can be demonstrated, a vertical pump may be acceptable.

All pumps above 150 kW shall be provided with temperature sensors on the bearing of the pump and the motor. Vibration sensors shall also be fitted on pumps above 150 kW.

Pumps shall be capable of continuous operation with minimum maintenance over the operating range from minimum flow to maximum flow. The Contractor shall define this range.

The rating of the driver and the pumps net positive suction head (NPSH) requirements shall be such that the pump is capable of a flow rate 10% in excess of the maximum flow rate required.

In addition, pumps shall be designed to have a reasonable margin on head (normally 5% on head for clean fluids, 10% for solids bearing fluids) to compensate for normal wear of pump components. There shall be an adequate margin on NPSH, normally greater than 1 m for values of NPSH required and between 2 m and 12 m with flow rates up to the stated maximum.

When pumps are installed to operate in parallel, they shall be capable of equal load sharing throughout the operating range. This implies a pump head flow characteristic that falls continuously from shut valve to duty point by at least 10%. The pump unit shall, when operating over its normal range of flow rates, comply with the noise emission requirements stated in this section.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

All pump motor units shall be installed on a substantial base plate, with isolating valves, a discharge non-return valve, air release valves (for both pump casing and seal chamber), drain valves, suction and discharge pressure gauges unless otherwise stated. The supplier should review the minimum flow rates stated and advice if a leak off system is necessary, in which case all minimum flow detection devices, diversion valves and pipe work shall be supplied.

2.1.11.3 Technical Requirements for Centrifugal Pumps

In selecting bearing type, account should be taken of possible vibration damage to the bearing surfaces while the machine is stationary. Where sleeve bearings are used, bearing shells shall be replaceable without removing pump or motor shaft. Bearing housings shall be effectively sealed against loss of lubricant and ingress of fluid or dirt. Oil seals shall be replaceable without major dismantling of the pump.

All oil lubricated bearings shall have housings fitted with means of drainage, visual oil level indicator and capped filler or a constant level oiler which is accessible whilst the unit is operating. Grease lubricated bearings shall be connected to readily accessible greasing points either singly or at a battery plate. Lubrication should be by means of a pressure gun.

Where rolling contact bearings are used, they shall be sized to provide a minimum L10 life of 16,000 hours (as per ISO Standard 281/1) under conditions of maximum load on the bearings.

In the case of a close coupled pump, this requirement applies to the motor bearings. Replaceable case wear rings shall be fitted where diameters exceed 150 mm and replaceable impeller neck rings where diameters exceed 250 mm. All wear rings shall be a press fit on or in their respective component and positively locked against rotation.

Casing design pressure shall be at least 1.1 times the pump shut valve pressure with the pump operating at maximum possible inlet pressure. The pump casing and base plate shall be capable of withstanding all hydraulic forces, together with externally applied pipe moments and loads as stated in the technical particulars. The supplier shall state the pump's pipe load limitations.

The pump unit and all removable components greater than 10 kg in weight shall be fitted with suitable lifting lugs and eyes to facilitate all erection and maintenance tasks. Any special lifting tackle shall be supplied.

Suitable means, such as jacking screws, shall be provided to aid the separation of pump components; these shall be arranged so that no damage can be done to mating or sealing faces by their use.

The method of fitting the impeller to the shaft shall adequately center the component but allow its removal without risk of damage to either component. Torque shall be transmitted to the impeller by keying, other than in the case of a multistage vertical pump for which a collect drive may be acceptable. The main impeller nut or screw shall not have its thread exposed to the pumped fluid and shall either be locked or maintained tight by virtue of the normal direction of rotation.

The pump shafts shall be designed such that the first critical speed of the pump is at least 20% higher than the maximum speed encountered in service.

All rotating components shall be dynamically balanced, and the complete pump shall comply with the requirements of the vibration section of this section.

Where two pumps are connected in parallel, the units shall be capable of reverse rotation under full pump head without sustaining any damage for a duration as specified by the manufacturer.

2.1.11.4 Shafts, Seals and Couplings

The pump shall be fitted, depending on its duty with a packed gland or mechanical seals of a reputable manufacturer, preferably of a pressure balanced type. The design of the unit shall allow the mechanical seal to be replaced or the gland to be repacked without disturbing the pump or driver.

Any leakage at the gland shall be intercepted by a flinger.

All pump glands shall be provided with trays and guards to catch leakage. Piping shall be fitted for drainage to an approved location. Other than on small pumps (i.e., with driver less than 50 kW) auxiliary pipe work for seal harnesses, drains, etc., shall be not less than 20 mm bore.

Couplings shall be dynamically balanced, and the couplings shall be match marked. Where a spacer coupling is used, the spacer shall similarly comply.

2.1.11.5 Pump Materials

Materials of construction shall be selected with due regard to the corrosive nature of the pumped fluid and risk of corrosion, cavitation, and metal to metal galling that can occur within a pump in all its modes of operation. It is the Contractor's responsibility to select materials that shall provide an adequate service life.

2.1.12 Hydraulic Systems

Hydraulic systems shall fulfill the general safety requirements set forth in ISO 4413 or other relevant standards.

2.1.12.1 Oil Pumps

Pumps for hydraulic systems shall be of the displacement type. Parallel to each pump or group of pumps operating in parallel, a relief valve of sufficient capacity to by-pass the full delivery of the pumps at a pressure only 10% above the maximum allowable working pressure shall be provided as a safety measure.

The pumps shall be provided with check valves and pressure switches for actuating the starting equipment. Hand operated valves shall be provided to isolate any pump from the hydraulic system and permit its removal without losing oil pressure.

2.1.12.2 Oil Pressure Tanks

Oil pressure tanks shall be of welded construction, designed, constructed and tested in accordance with the ASME Boiler and Pressure Vessel Code, Section VIII, part 1, for 1.5 times the maximum system operating pressure.

The welded joints of the tank shall be finished smooth. The welds shall not be ground to the extent that the tank is weakened structurally, but it shall be free of irregularities that would throw highlights when painted.

2.1.12.3 Sump Tanks

The capacity of the sump tank shall, unless otherwise specified, not be less than that required to contain all of the oil that can be discharged back into the sump by completely discharging the oil in the system. The oil volume in the sump tank shall be sufficient to maintain the oil level within an adequate working level during operation.

- Oil sump tanks shall be provided with:
- Suitable access openings
- Fine mesh strainer(s) combined with a magnetic filter/plug which all oil returning shall pass. The strainer(s) shall be readily removable for cleaning.
- Humidity separating air filter.
- Flush mounted oil level indicator(s), covering most of the tank height.
- Capped filler hole with a suitable strainer
- Drain connection with hand operated shut off valve.

Sump tanks shall be installed so that the bottom of the tank and the drain connection are at least 400 mm above the floor.

The interior of the tank shall be free of crevices, open joints, or dead-end holes, and all welds inside the tank shall be continuous. Oil sumps shall be made from stainless steel. The interior and exterior surfaces of any sump tanks not made from stainless steel shall be cleaned and painted as specified in these specifications.

2.1.12.4 Hydraulic Oil Piping

All main piping shall be seamless tubing with welded joints, approved couplings or steel flanges for bolted connections. All piping shall be thoroughly cleaned (removing all mill scale, weld deposits, etc.), oiled inside, painted on the outside as specified in these specifications, and protected for shipment by protectors on all flanges and plugs on pipe ends. If stainless steel piping is used, no painting is required, such piping requires couplings and fittings of identical material. All gate valves in the pressure lines shall be of the cast steel, solid wedge, rising stem, type with close guide clearances to minimize vibration of the gates when operating at partial opening. Piping shall be shop fabricated to the maximum extent possible, consistent with erection, handling and shipping requirements, so as to reduce field work.

Oil piping shall be completed with taps for oil sampling and pressure testing.

Adequate pipe supports shall be provided to prevent vibration and movement of the oil piping during sudden pressure changes. All necessary studs, bolts, nuts, washers, oil resisting seals, pipe supports, and hangers for field assembly of the oil pressure system shall be furnished.

2.1.13 Piping

2.1.13.1 General

Pipe work drawings shall be in accordance with ISO 6412.

Piping shall be arranged to facilitate access for maintenance, and such that removal or replacement of Plant can be achieved with the minimum dismantling of piping. The design of piping shall be such as to minimize Site welding.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

All pipes work 25 mm and below shall be stainless steel. All piping for cooling water system shall be Stainless steel unless otherwise specified or approved by the Employer. The piping shall have material combinations which avoid galvanic corrosion.

Provision shall be made for the draining and release of air in systems. Plugged drain and air release bosses shall be welded to pipes at appropriate points to facilitate hydraulic testing.

All interior water pipes shall be lagged with fiberglass lagging not less than 1” or equivalent as approved by the Employer.

Embedded pipe should be kept to a minimum. In preference to running pipe in covered floor trenches it shall be supported from walls and ceilings.

Floor collars or wall box shall be provided at all points where pipes pass through floors and walls. The floor collars shall have raised kerbs not be less than 75 mm in height. All wall boxes shall be sealed and flush fitting.

The Contractor shall provide all necessary fittings for the passage of pipes through external walls and roofs, together with all necessary components for the protection against weather.

In the case of flanged pipe work, boxes shall be large enough to permit the passage of the flange.

2.1.13.2 Identification of Piping

The Contractor shall furnish and apply pipe identification markers on all piping systems. The markers shall be applied after all insulation and painting work has been completed. Each pipe shall be identified at each valve, at every point of pipe entry or exit where two or more lines go through a wall, at each tee joint, and on continuous lines, at least once in every unit block. A direction of flow marker shall be affixed downstream of each pipe identification marker. Markers shall be applied on the two lower quarters of the pipe where the view is unobstructed. The markers shall be of adhesive-coated vinyl cloth which shall be applied in accordance with the manufacturer's instructions and shall be white with black letters. Letters shall vary between 10 mm and 40 mm in height to suit the piping size. Pipe marker legends shall be designated by the Employer.

2.1.13.3 Welding

Pipe work welding, testing and inspection shall conform to the appropriate ASME and ASTM Standards and where applicable AWS.

2.1.13.4 Hydrostatic Testing

Except as precluded by shipment in parts for Site welding due to size, hydrostatic works tests shall be carried out by the Contractor on all casings, vessels, valves, pipes and other pressure fittings. Such tests shall be at 50% above the maximum operating pressure. The test pressure and date shall be stamped on all parts tested and certificates or written particulars of each test shall be supplied to the Employer.

In each case the pressure shall be maintained for a period of thirty minutes, the item under test remaining tight under the specified pressure.

All valves shall be tested for both "open end" and "closed end" conditions. All piping systems shall be hydrostatically tested at Site.

2.1.13.5 Pipe Supports and Anchors

Pipe work and accessories shall be supported and mounted in accordance with ANSI B31.1 Power Piping. All necessary slings, saddles, structural steelwork, foundation bolts, foundation inserts and plates, fixing bolts, locks and all other attachments shall be supplied.

No point of passage of pipes through floors or walls shall be used as a point of support.

2.1.13.6 Flanges

All pipe flanges, shall be in accordance with ISO 7005 Standard as applicable for the appropriate condition. Threaded pipes shall be in accordance with ISO 7 and ISO 228 as applicable.

2.1.13.7 Jointing Material

Complete jointing material, bolts, nuts and washers shall be provided for flanged pipes, valves and fittings supplied under this Contract. Threads and other details of fasteners shall comply with ISO Standards. The quantities supplied shall include twenty percent excess to allow for wastage.

2.1.13.8 Internal Cleaning of Pipes

The Contractor shall ensure that the internal surfaces of all pipelines are thoroughly clean.

All internal surfaces prior to erection shall be cleaned to remove accumulations of dirt, rust, scale, and welding slag due to Site welding before erection.

Prior to and during erection, all parts shall be inspected to make sure that they are clean, and adequate steps shall be taken to prevent entry of foreign matters both during and after erection. Each section erected shall be cleaned out before the next section is connected to it. All headers shall be cleaned before closing up.

All ferrous oil pipe work shall be acid pickled and flushed with oil prior to erection. All pipe work after erection shall be flushed using the same fluid as for the system.

The Contractor shall provide all necessary facilities in the pipe system for cleaning including any temporary pipe work.

2.1.13.9 Pipe Terminations and Connections

The Contractor shall co-operate fully with other Contractors and the Employer to establish agreement on the jointing technique at terminal points.

All pipe connections shall be fusion welded except where flange connections are required or specified to facilitate erection or maintenance, or where pipe materials used preclude welding.

Screwed pipe work shall only be permitted for pipes of less than 50 mm bore in non-critical air or water services.

Below 25 mm bore connections shall be of flared connectors or welded cone nipple in positions where leakage shall not introduce any hazard and the type of coupling and particular application has been approved by the Employer.

Pipe work flanges shall comply with the requirements of the code to which the pipe work is designed. Flanges having ratings less than 10 bar g shall not be permitted except where agreed with the Employer.

All metallic pipe flanges either for high or low pressure or for high or low temperature shall be in accordance with ANSI/ASME B16.5, and other approved standards, as applicable for the appropriate condition.

All plastic pipe flanges shall be in accordance with ISO 2536 and 3663 and the other standards issued by Technical Committee 138 (TC138) of the International Organization for Standardization.

Jointing material, bolts, nuts and washers shall be provided where necessary for flanged pipes, valves and fittings supplied under this Contract.

In the case of cast iron flanges full face gaskets shall be used so that bending stresses shall not be induced in the flange by bolt tightening.

Jointing of thermoplastic piping shall be carried out in strict accordance with the Manufacturer's recommendation.

2.1.13.10 Fluid Velocities in Pipes

The maximum allowable velocity of flow in pipes shall be as listed in the following table:

Table 2-3: Maximum Allowable Flow Velocity in Pipes

Service	Maximum Allowable Velocity (m/s)
Compressed air	15
Cooling water	3
Lubricating Oil	2
All other pipe work	0.6 m/s per 25 mm bore up to a maximum of 4.2

The Contractor shall demonstrate that selected velocities do not cause unacceptable noise, erosion, vibration, pressure losses, or water hammer.

2.1.13.11 Embedded Pipe Work

All service pipe work embedded in concrete shall be of stainless steel.

2.1.14 Valves

2.1.14.1 General

All valves shall comply with the relevant ISO Standards.

All valves shall be arranged so that the hand wheel moves in a clockwise direction to close the valve. The face of each hand wheel shall be clearly marked with the words "open" and "closed" and shall be provided with an arrow to indicate direction for opening and closing. As far as possible, valves shall not be fitted in an inverted position.

All valves shall be readily accessible for both operating and maintenance and, where necessary for ease of manual operation, the spindles shall be extended and an approved form of pedestal hand wheel provided at convenient operating floor or intermediate floor level. Pedestals shall not be mounted on checkered plate cover or floor gratings.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

All hand operated valves shall be capable of being opened or closed against their maximum working pressure with a force at the hand wheel not exceeding 200 N.

Valves of 100 mm nominal bore and above shall be provided with valve position indicators. All valves shall be fitted with labels showing duty and identification number.

All hand wheels shall be of metal. Bonnets and valve covers shall be bolted in position, not screwed.

Valves used for isolation purposes shall not be smaller than the pipeline size.

Where appropriate all valves of 250 mm bore and above other than drain valves shall be provided with by-passes connected to the valve body unless technically unjustified and approved by the Employer.

A complete valve schedule for each pipe work system shall be provided for approval prior to procurement.

Parallel slide or gate valves shall be used for isolation purposes for water, oil and gas services. In general valves shall not be used for throttling service. Flow control shall be achieved by stainless steel orifice plate mounted between flanges for ease of adjustment. To the approval of the Employer needle valves shall be used for throttling services in special cases. Butterfly valves shall be used for application of 200 mm diameter and above.

Parallel slide or gate valves shall be such that the bore of the fully open valve is unobstructed by any part of the gate.

Non-return valves shall be of the non-slam type. Safety relief valves shall be of the pop action type.

2.1.14.2 Parallel Slide, Gate and Sluice Valves

Parallel slide and gate valves shall be used generally for isolating purposes. The valves shall be of the full way open type unless approved to the contrary and when in the fully open position, the bore of the valve shall not be obstructed.

Where applicable bypasses and equalizing pipes shall be fitted to parallel slide and gate valves in accordance with the following table:

Table 2-4: Use of Parallel Slide and Gate Valves

Valve type	Pressure Range	Valve Size
Parallel slide only	0 to 19 bar g	250 mm and above
Parallel slide and gate valves	19 to 65 bar g	200 mm and above

For potable water supplies, sluice valves shall be cast iron wedge gate valves with bronze trim in accordance with BS 5163 or equivalent approved standard. The valves shall be of solid wedge gate type. The valve bodies shall be of the best quality cast iron complying with BS 1452 (Grade 14). Valve seals and facing rings shall be zinc free bronze or gunmetal and spindles of manganese bronze. The valve gates shall be provided with bronze guide shoes and locating channels where necessary to oppose unbalanced forces during opening and closing. The spindles of valves subject to unbalanced pressures during operation shall also be provided with ball thrust collars to reduce the turning effort required. The ball bearings shall be contained within totally enclosed grease packed housings with seals to prevent the ingress of dust and moisture.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Large bore wedge gate valves are to be provided with easing screws and a suitable flushing connection, complete with valve, which shall be fitted at the valve sealing to facilitate removal of any dirt preventing complete closure.

Gate valves to be used for seawater shall have the body and internals manufactured from materials as specified in this Specification.

2.1.14.3 Globe Valves

Globe valves shall generally be used for regulating purposes. The valve shall have radiused or spherical sealings and the disc shall be free to revolve on the spindle. An arrow indicating the direction of flow through the valve shall be clearly cast or embossed on the body of each valve.

Globe valves shall comply with BS 5154 or BS 5160 or equivalent as might be applicable to the particular installation requirement.

2.1.14.4 Safety Relief Valves

Pressure relief valves shall be of the spring-loaded type unless otherwise specified, or unless the Employer has given written permission for the use of a different type of valve actuation.

Safety valves shall comply with BS 6759 or equivalent.

Spring loaded valves shall be fitted with easing gear which shall not be extended.

Where necessary relief valves shall be supplied with vent pipes, silencers and drains, and with gagging equipment for hydraulic testing following erection and in the long-term maintenance of the plant.

2.1.14.5 Butterfly Valves

Butterfly valves shall have bodies of either the flanged or lugged wafer type. The actuator/manual gearbox shall be mounted direct to the valve body, other than where both actuator and body are fitted with feet for pedestal mounting; no actuator loads shall be transmitted via the pipe work. The valve should be mounted with spindle set horizontal. If the valve is designed for unidirectional flow, an arrow shall be cast or embossed in a prominent position on the valve body to indicate that direction.

The valve shall be capable of positive shut off in both directions against full system pressure. Unless an alternative type is proposed by the Contractor and approved by the Employer as being fully suitable for the particular duty, the seating of the disc shall be positive (that is, the disc shall not be capable of passing through the shut position); a stop fitted on the actuator/operating level is not adequate for this purpose.

Unless the Contractor can demonstrate that some alternative design is capable of adequate long-term sealing, the design shall be such that the shaft is offset from the seal ring. That is, there shall be an unbroken peripheral seal when the valve is shut.

Internal shaft bearings shall be capable of operating dry, that is, not dependent on the presence of the pumped fluid.

In the case of butterfly valves for potable water supply mains, they shall be of cast iron resilient seal construction and in accordance with BS 5155 or an equivalent approved standard.

Each valve body shall be of best quality cast iron conforming to BS 1452 (Grade 14 or 17) with a closure sealing of bronze or stainless steel, or the resilient seal material. The valve disc shall be of high-quality cast iron with the seat facing of bronze, stainless steel or the resilient seal material.

The disc shaft is to be of stainless steel to ASTM 316L. Shaft bearings shall preferably be of the self-lubricating type, with "O" ring seals.

The actual position of the valve disc shall be clearly shown by an external indicator.

Besides mechanical operation tests, each valve shall be subjected to a body pressure/leakage test and strength/leakage test in accordance with applicable standards.

2.1.14.6 Float Valves

Float valves should be of the equilibrium ball float type. Floats for cold water duty shall be plastic, of a grade that does not deteriorate in sunlight. All operating rods, guides, brackets and covers shall be of non-ferrous material.

Float valves operating in liquids other than fresh water shall be of materials to the Employer approval. Float valve shall comply with BS 1212 or equivalent and be complete with float rods, guides, covers and brackets where required.

2.1.14.7 Non-Return Valves

For severe service conditions, cushioned check valves shall be used. Cushioning piston and valve disc area shall be as nearly equal as possible to produce balance and obviate valve clatter.

Swing check valves shall have facilities for quickly examining the clack. The body seat shall be inclined at such an angle from the vertical as shall facilitate closing and prevent clatter, and the clack shall be arranged to possess a movement in favor of closure increasing in the final stages of the swing. The clack shall be secured to the hinge in a manner which allows for the self-seating of the clack. Counterpoise devices and dashpots shall not be used except when specifically approved by the Employer. Where solids are liable to hazard operation of the valve, due precautions shall be taken.

All non-return valves shall be provided with means of draining the space between the valve and its adjacent isolating valve. The design shall preclude the possibility of the valve jamming in the open position; the effect of solid particles settling out in dead spaces within the valve should be recognized in this respect. Where screw down non-return valves are supplied, they shall provide a demonstrable leak tight joint.

Unless stated to the contrary, non-return valves should be rapid closing. Power assisted closing is acceptable where necessary for rapid shut off. For large non-return valves on air and water services, consideration shall be given to the consequences of valve slam and the possible requirements for a hydraulic snubber to minimize slam effects.

2.1.14.8 Pressure Reducing Valves and Relief Valves

Pressure reducing valves shall be of the external pilot valve operated type capable of passing the required total flow while operating over the same head range as the turbine. The minimum discharge head shall include a generous margin to overcome the total losses of the raw water system and discharge to the tailrace. It shall be complete with all necessary fittings. The pressure reducing valve shall be designed to close reliably on cessation of flow. A relief valve

shall be provided, designed to open at 10% overpressure and pass full flow at 25% overpressure and shall be factory tested prior to delivery.

2.1.14.9 Power Operated Valve General Requirements

Valves, dampers and similar devices requiring abnormal physical effort to operate or high-speed operation, shall be provided with powered actuation. Hand operating equipment shall also be fitted for closing and opening, which is effectively decoupled during power operation.

The following criteria are preferred in the selection of the power source for the servo mechanism:

Isolation and other duties not subject to operation of more than once in 10 minutes - electrical, compressed air.

Continuous or intermittent modulation - compressed air, electro hydraulic.

Continuous or intermittent modulation involving heavy control forces likely to produce fluttering or hunting - electro hydraulic, electrical.

Emergency control or isolating duties - compressed air, spring loaded, or electro hydraulic with sufficient reservoir capacity to complete the operation without an external source.

Electric actuators for on/off duties shall be fitted with travel limiting devices capable of accurate and positive adjustment. Torque limiting or other devices shall be provided to prevent damage to the mechanism in the event of jamming of the driven device.

All powered valve or damper mechanisms shall be provided with accurate indication of the position of the driven device.

Electrically operated devices shall be provided with integral or separate switch/control equipment in accordance with the requirements of the Control and Instrumentation Specification. Provision shall be made for the inclusion of interposing relays and volt free contacts to suit modern control systems, including digital control systems.

Power supplies shall be in accordance with those specified in Electrical General Design Specifications.

Direct solenoid operation of valves shall comply with the requirements of the Control and Instrumentation Specification.

Reversing contactors and limit switches, used to control electric power-driven mechanisms, shall be robust and of proven reliability by both type test and commercial operation. Solid state switching shall be accepted when temperature conditions permit.

2.1.14.10 Compressed Air Systems

Compressed air systems shall fulfill the safety requirements set forth in EN-983 or other relevant standards.

Vessels shall be of the cylindrical, vertical type. The vessel shall be mounted on a structural steel base. Each vessel shall be equipped with the following provisions:

- Inlet sockets with valves
- Outlet sockets with valves
- Pressure safety valve
- Dial pressure gauges, one with four electric contacts or separate pressure switches

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- Manhole or inspection hole
- Drain valve

In case the pressure vessel is used for pressurized oil or water systems, the vessel shall further be equipped with:

- One (magnetic) level gauge with shut off valves
- Level indicators with electric contacts in a number as required or specified

Each vessel has to pass a pressure test at 1.5 x nominal pressure lasting for 8 hours in the manufacturer's Workshop before coating is applied.

Each vessel shall be furnished with a test certificate of an independent, internationally reputable underwriters' society.

Compressors shall be provided with:

- Automatic lubrication
- Air intake filter and silencer
- Pressure Gauges
- Thermometer for measuring temperature of the compressed air
- Automatic shut down if the discharge air temperature exceeds a predetermined adjustable value
- Unloading valves
- Water drains valves
- Water and oil separator
- Pressure safety valve
- Cooler for compressed air
- Non-return valve
- Inlet pressure valve
- Outlet pressure valve

The water and oil separator shall be equipped with an automatic solenoid operated drain valve to achieve automatic draining during standstill. Both compressor stages shall be equipped with unloader valves, which shall close time delayed after start to avoid compressor start against full pressure.

The compressors shall be delivered as package units on common frame with the appropriately sized AC squirrel cage motor and the respective motor control center ready for operation.

If requested by the Employer, each compressor shall pass a performance test in the manufacturer's Workshop according to ISO 1217 (DIN 1945), without extra cost. The ready assembled compressors, controls and switchgear have to pass a functional test.

2.1.15 Noise

The Plant shall be designed and constructed to operate within the following noise limits:

- Within the building or structure containing the Works not exceeding ISO 1996 level NR 90 between 62.5 and 8000 Hz.
- Within control rooms not exceeding ISO 1996 NR 50 between 250 & 2000 Hz. Noise levels shall be measured by the Contractor during commissioning of the Plant.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

If the noise level of the Plant is found to be more than the specified limits, the Contractor shall take necessary measures and carry out any modification/additions to the Plant to meet the requirements of these Specifications.

2.1.16 Vibration and Balance

The amplitude of vibration of rotating Plant when measured on the bearing housings under steady state conditions at the designed operating speeds shall not exceed the values given by the 2.8 mm/s criterion of ISO 3945.

Provision shall be made for the reduction of vibration transmitted to covers, cladding, platforms and structures that are liable to vibrate. The vibration of any such radiating surface shall not exceed the values shown in Table 1-6.

Table 2-5: Radiating Surface Vibration Limits

Frequency (Hz)	Peak-to-Peak Amplitude (mm)
5	0.40
10	0.20
25	0.08
50	0.04
100	0.02
120	0.017

2.1.17 Painting and Protection

2.1.17.1 General Design for Protective Coatings

Unless otherwise specified all Plant shall be painted using lead-free paints. The design and layout of the Plant shall be such that all surfaces can be recoated after erection.

Where corrosion resistant materials (e.g., concrete, galvanizing, copper, aluminum) are used no decorative finish shall be applied unless otherwise specified.

Surface preparation and protective coatings shall conform to SSPC.

2.1.17.2 Painting

a) Surface Preparation

After fabrication, the Contractor shall clean and paint the Plant in accordance with this Clause and the paint schedule given in these Specifications. Painted surfaces shall be protected from abrasion or other damage at all times.

Surfaces to be painted shall be cleaned of all mill scale, dirt and other foreign substances by scraping, chipping, blasting, wire brushing or other effective means in accordance with the applicable sections of SSPC Specification. All oil and grease shall be removed from the surfaces. In the event that rust forms or the surfaces otherwise become contaminated in the interval between cleaning and painting, the surfaces shall be recleaned. Surfaces of stainless steel, bronze and machined surfaces shall be protected by effective masking during the cleaning and painting of adjacent metal work.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

b) Application Procedures

Paint and coating materials shall be in a thoroughly mixed condition at the time of application. If necessary, to improve application properties, the paint shall be heated by means of a hot water bath to a temperature not exceeding 40°C. Paint other than primer shall not be thinned. Priming paint shall be thinned if necessary to improve application qualities but shall be thinned only with mineral spirits not exceeding 1 part of thinner per 8 parts of paint. Paint shall not be applied when the temperature of the metal or of the surrounding air is below 10°C or is above 40°C. Surfaces shall be free from moisture at the time of painting. The first coat shall be applied immediately after cleaning. All paint shall be applied strictly in accordance with the manufacturer's instructions. When paint is applied by spraying, suitable means shall be provided to prevent segregation during the painting operations. Means shall be provided for removing all free oil and moisture from the air supply lines of all spraying and blasting equipment. Different colors or shades shall be used for each coat. Each coat of paint shall be free from runs, sags and missed areas and shall be allowed to dry and harden thoroughly before the succeeding coat is applied.

c) Painting Schedules

Painting schedules are given in these Specifications. The make of paints to be used shall be selected by the Contractor. The Contractor shall submit his proposed paint schedules together with applicable paint specifications for approval. Surface preparation shall be done in accordance with the methods specified in the paint schedules given in these Specifications.

2.1.17.3 Metallic Coating Galvanizing

All punching, cutting, drilling, screw tapping and removal of burrs shall be completed before galvanizing.

All galvanizing shall be done by the hot dip process with spelter, not less than 98% of which shall be pure zinc. Subject to the approval of the Employer, where an item is of a size or shape to render hot-dip galvanizing impracticable, zinc spraying or other approved method of coating shall be adopted. Common bolts shall be completely galvanized including the threads, but the threads shall be left uncoated in the case of nuts. High tensile steel bolts shall not be galvanized.

The zinc coating shall be uniform, clean and smooth. The zinc coating shall weigh not less than 400 g/m² of area covered and be not less than 0.060 mm in thickness.

Galvanized wire shall comply with the requirements of ASTM A641 a. Nuts and bolts and small components shall be coated in accordance with ISO 1461.

All galvanized parts shall be protected from injury to the zinc coating during the periods of transit, storage and erection. Damaged areas of the coating less than 50 mm² shall be cleaned back to bright metal, feathering the edge of the surrounding galvanized coating, and touched up with zinc-rich paint. Parts which have suffered greater damage shall be re-galvanized.

a) Metal Spraying

Surface preparation prior to metal spraying shall be dry grit blasting SA 2½.

Immediately after grit blasting the surface shall be cleaned of any traces of blast product on the surface and in pockets, pits, and corners by brushing with clean brushes, blowing with dry compressed air or vacuum cleaning.

The surface shall be coated with the metal spray before discoloration occurs.

b) Chromium Plating

The chromium plating shall comply with the requirements of ISO 2081.

2.1.17.4 Color

The Contractor shall submit, for the approval of the Employer, within 266 days after the date of the Letter of Acceptance of the finish colors for the individual items of Plant.

Pipework shall be identified by a color banding code. The Contractor shall submit, for the approval of the Employer, of the code as it is applicable to this Contract within 266 days of the Letter of Acceptance.

2.1.18 Witnessing of Shop Assemblies and Tests

The shop assemblies and tests specified for the various items of equipment shall be witnessed by a representative(s) of the Employer and the Contractor and the completed shop inspection and test forms showing the results shall be signed by both parties. Copies of all shop inspection and test records shall be furnished to the Employer. No equipment shall be shipped from the shop until it has been inspected and tested, or the Employer has waived the inspection in writing. However, the waiver of any test or the witnessing of shop assemblies and tests by the Employer shall not constitute a release of the Contractor's responsibility to meet fully the requirements of this Contract. A minimum of Sixty (60) days prior to major shop assemblies and tests, the Contractor shall submit an outline of the procedures and tests it plans, to demonstrate fulfillment of the requirements specified in subsequent Sections of the Specification for the equipment. Target dates for shop assembly and tests shall be included in the Program, projecting dates for shop tests far into the future.

2.1.19 Tools and Spare Parts

2.1.19.1 Tools, Wrenches and Lifting Devices

Prior to shipment Contractor shall furnish and deliver to the Employer a complete set of any specialized tools, fixtures, devices, slings, lifting devices, appurtenances, or other equipment that shall be required or convenient for the most expeditious assembling, dismantling and maintenance of the equipment supplied under this Contract.

The Contractor shall permanently label all specialized tools and devices to indicate their purpose and the equipment on which they are to be used. All custom tools and devices shall be accurately machined to fit the parts to be handled. The tools shall be supplied in a neat metal toolbox or cabinet or on a neat tool board with each item marked clearly for identification.

Special installation tools, fixtures, lifting devices, jacks, spiders and appurtenances for parts which cannot be removed after installation shall be furnished as part of the Contract.

2.1.19.2 Spare Parts

All spare parts shall be interchangeable with and be of the same materials and workmanship as the corresponding parts of the original equipment furnished.

All mandatory spare parts for the equipment shall be provided as mentioned in the relevant sections of these specifications. However, the Proposer shall submit list of any other spare parts (which in the opinion of the Proposer) are necessary for plant as per recommendation of the equipment supplier(s).

All spares furnished shall be new and interchangeable with the corresponding original parts. They shall also be of the same material and workmanship, and shall have all the features and provisions of the corresponding original parts. Second-hand spare parts shall be rejected.

All spares are to be suitably treated and packed for long storage under conditions prevailing at the Site. Each spare shall be clearly marked or labelled on the outside of its packing with description and purpose, and, when more than one spare is packed in a single case, box or container, an inventory is to be shown on the outside of same, and a detailed list enclosed inside. All cases, containers, boxes and other packages shall be suitably marked and numbered for purposes of identification.

The Contractor shall manufacture the spare parts and deliver them to Site at the same time as the rest of the Plant. Spares shall be handed over to the Employer not later than at the date 30 days prior to the start of the final performance tests.

Spare parts catalogues and/or necessary drawings with item lists shall be supplied giving all necessary data for ordering spare parts directly from the manufacturers. The spare parts catalogues shall include data on complete modules and assemblies as well as sub-modules, sub-assemblies and individual components. The drawings shall show the location, main dimensions and the ways of disassembly or assembly of the various spare parts.

The Proposer shall recommend additional spare parts required for Five (05) years of plant operation. Moreover, the Proposer shall also confirm the manufacturing/availability of spares till next 20-25 years and shall provide them on demand.

2.2 GENERAL HYDRAULIC STEEL STRUCTURE

The Hydraulic steel structures included in scope of work shall conform to the following basic requirements and specifications and shall be suitable for long-term operation under site-specific hydraulic, environmental and seismic conditions.

2.2.1 Design & Stress Levels

2.2.1.1 Gates

a) Various components of the gates and embedded parts shall be designed in accordance with the provisions of ASTM, DIN, BS or US Corps manual or equivalent International Standards acceptable to the Employer. The horizontal girders and wheels/guide shoe shall be so spaced that they carry equal load (approximately).

b) Loads to be considered for design:

   i. The gate shall be designed for the hydrostatic head corresponding to upstream maximum surge levels

   ii. The design of gates shall be checked for the combination of design head and earthquake effect in accordance with ASTM, DIN, BS or US Corps manual or other equivalent International Standards Criteria for Earthquake Resistant and the Building Code of Pakistan for Design of Structures. Allowable stresses in this case shall be increased by 33.3% subject to an upper limit of 85% of Y.P. No increase in allowable stress shall be permitted for any other load combinations unless specifically approved by the Employer.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

2.2.1.2 Stoplogs

a) The stoplogs for flushing and power intake shall be designed for head corresponding to Max. Water Level.

b) Various components of stoplog and embedded parts shall be designed in accordance with the provisions of ASTM, DIN, BS or US Corps manual or other equivalent International Standards.

c) The design of stoplog shall be checked for the combination of hydrostatic head and earthquake effect in accordance with DIN, BS or US Corps manual or other equivalent International Standards Criteria for Earthquake Resistant and the Building Code of Pakistan for Design of Structures. Allowable stresses in this case shall be increased by 33.3% subject to an upper limit of 85% of Y.P.

2.2.1.3 Trash rack

a) The trash racks for power intake shall be designed for head corresponding to Max. Water Level and as per turbine manufacturer.

b) Various components of trash rack and embedded parts shall be designed in accordance with the provisions of ASTM, DIN, BS or US Corps manual or other equivalent International Standards.

c) The design of trash rack shall be checked for the combination of hydrostatic head, vibration analysis and earthquake effect in accordance with DIN, BS or US Corps manual or other equivalent International Standards Criteria for Earthquake Resistant and the Building Code of Pakistan for Design of Structures. Allowable stresses in this case shall be increased by 33.3% subject to an upper limit of 85% of Y.P.

2.2.1.4 Hydraulic Servomotor Hoists

Various components of hydraulic hoist such as cylinder, piston, rod, shafts, keys, bearings and coupling etc. and their design shall meet the requirements of ASTM, DIN, BS or US Corps manual or other equivalent International Standards.

Bolts, nuts and screws used shall conform to relevant ASTM standards. Bolts and screws in rotating parts shall be locked. Bolts in tension shall be avoided as far as possible. Wherever necessary, net section of such bolts at the root shall be increased by 15%. These shall be of the size rated for the shafts to which these are connected and shall have torque rating suitable for the loads transmitted. These shall be of flanged type fully enclosed and dust proof with adequate protection against corrosion.

2.2.1.5 Gantry Cranes (For Stoplog and Gates)

Various components of this equipment shall be designed in accordance with provisions of ASTM, DIN, BS or US Corps manual, FEM, CMAA or other equivalent International Standards. Capacities of these shall be 125 percent of all the forces opposing the hoisting with loads intended to be handled.

2.2.1.6 Lifting Beams

The lifting beam for stoplogs, trash rack and draft tube gate shall be designed in accordance with provisions ASTM, DIN or US Corps manual or other equivalent International Standards and shall include appropriate factors of safety for lifting and handling operations.

2.2.2 Permissible Stresses

2.2.2.1.1 Gates (Power Intake, Flushing Intake and Draft tube)

The permissible stresses shall be taken those corresponding to wet inaccessible conditions as per ASTM, DIN, BS or US Corps manual or other equivalent International Standards approved by the Employer, and are given as under:

Structural Steel - Wet & Accessible condition

Type of Stress	Permissible Stress
i) Direct Compression/tension	0.45 Y.P.
ii) Compression/tension in bending	0.45 Y.P.
iii) Shear	0.35 Y.P.
iv) Combined	0.55 Y.P.
v) Bearing	0.45 Y.P.

2.2.2.2 Stoplogs (Power Intake, Flushing Intake)

As these shall be stored above water level and shall be occasionally used, permissible stresses shall be taken corresponding to Dry-accessible conditions as per ASTM, DIN, BS or US Corps manual or other equivalent International Standards and are given as under:

Structural Steel - Dry & Accessible conditions

Type of Stress	Permissible Stress
i) Direct Compression/tension	0.55 Y.P.
ii) Compression/tension in bending	0.55 Y.P.
iii) Shear	0.40 Y.P.
iv) Combined	0.75 Y.P.
v) Bearing	0.75 Y.P.
vi) Bearing Stress - Bronze on Steel	0.04 U.T.S.

2.2.3 Materials

All materials incorporated in the equipment shall be new, unused and of first-class quality, free from defects. Materials and Proprietary items shall be selected taking into consideration customary use for type and class of equipment having regard to strength, the durability and best engineering practice and suitability for the climatic and environmental conditions at Site.

As a general guidance, materials used for various items of gates and hoists are given as under:

2.2.3.1 Gates (Power Intake, Flushing Intake and Draft Tube)

Table 2-6: Gates Material Standards

Sr. No.	Component Part	Material	Material Standard (Latest)
(i)	Structural parts of gates i.e., skin plate, horizontal girders, end vertical girders, Vertical stiffeners, seal bases, seal clamps, guide shoes, etc.	Structural Steel	ASTM or DIN or BS

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Sr. No.	Component Part	Material	Material Standard (Latest)
(ii)	Wheel track bases, seal seat, bases, Sill beam base, guides, anchor bolts etc.	Structural Steel	ASTM or DIN or BS
(iii)	Guide Shoe	Structural Steel	ASTM or DIN or BS
(iv)	Seals - 44 mm dia. (Hollow)	EPDM rubber	DIN, BS or ASTM
	(a) Side	Music Note type	
	(b) Bottom	Wedge Type	
(v)	Wheel track and Seal Seats	Corrosion Resistant Steel	30 Cr 13 for Track 04 Cr 18 Ni 10 for seal seat

2.2.3.2 Stoplogs (Power Intake, Flushing Intake)

Table 2-7: Stoplog Material Standards

Sr. No.	Component Part	Material	Material Standard (Latest)
(i)	Structural parts of stoplogs i.e., skin plate, horizontal girders, end vertical girders, vertical stiffeners, seal bases, seal clamps, guide shoes, etc.	Structural Steel	ASTM or DIN or BS
(ii)	Track bases, seal seat bases, Sill base, guides, anchor bolts, etc.	Structural Steel	ASTM, AISI or DIN or BS
(iii)	Tracks, seal seats	Corrosion Resistant Steel	04 Cr 18 Ni 10 AISI
(iv)	Seals - 44 mm dia. (Hollow)	EPDM Rubber	ASTM
	(a) Side	Music Note Type	
	(b) Bottom	Wedge Type	
(v)	Thrust Pad	Structural Steel Cladded with Bronze (Min.10 mm thick)	ASTM

2.2.3.3 Hydraulic Hoists and Gantry Cranes

Materials for various components of the equipment shall conform to provisions of ASTM, AISI, DIN, BS or US Corps manual, FEM, CMAA or other equivalent International Standards.

2.2.4 Embedded Frames for Guides

Wheel paths, seal path and guide tracks shall be provided up to following heights:

Guide Tracks : Full range of gate/stoplog travel
Seal Paths : Sill level to one gate height or up to lintel seal.

For installations of embedded parts in 1st stage block-out, suitable and adequate number of anchor bolts welded to first stage anchor plate shall be provided to align and level embedded

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

parts and retain them during concreting. Necessary stainless-steel sealing faces and corrosion resistant roller/wheel paths machined accordingly shall be provided. The spacing of first stage embedded parts (anchor plate) shall be not more than 500 mm unless otherwise approved by the Employer based on structural justification.

2.2.5 2.1.24 Shop Assembly & Testing

All equipment fabrications and structures covered by the specifications shall be fully assembled in Manufacturer's shop for inspection by Purchaser to the extent necessary to demonstrate matching of structural components and operational integrity. All necessary adjustments shall be made in the shop to achieve the specified tolerances. Checks on dimensions and tolerances shall be recorded by Manufacturer and three (03) copies furnished to Purchaser within a week of shipment of the material.

Without limiting the foregoing, the following shop assemblies shall be carried out.

The gate components such as

- Wheel assemblies (in case of fixed wheel type gates);
- Hydraulic Servomotor Hoist
- The electrical control panels, starter, contactors, position indicators etc.

Prior to dismantling, each assembly shall be permanently and clearly match marked in the shop to facilitate site erection. Dismantling shall be done only to the point required for shipping. In particular there shall be minimum disconnection of electrical wiring.

Employer will inspect all equipment during fabrication and before shipment and witness the shop tests after final assembly.

2.2.5.1 Gate Frames

The metal work shall be shop assembled to the extent necessary to ensure that all parts are properly fitted and that the dimensional and tolerance requirements shown on the drawings have been obtained. All holes for field connections of parts furnished under these specifications shall be drilled or reamed as noted on the drawings, with the embodiments so assembled. Members to be shop-riveted shall have all parts well pinned up and drawn together with bolts before riveting is commenced.

2.2.5.2 Gates

Each component of gate and stoplog shall be assembled in the shop to the extent necessary for inspection and to ensure that all parts fit properly and that dimensions. Clearances and tolerances required in the specifications and drawing has been achieved. Holes for field connections shall be carefully drilled or reamed. Connections which have to be disassembled for shipment shall be made by the use of erection pins, one size less in diameter than the designed size or temporary machine bolts.

Proper functioning / operation of filling in valve and lifting beam, automatic engaging / disengaging shall be checked during shop assembly.

2.2.5.3 Hoists

All electrical and mechanical components shall be tested in accordance with the appropriate applicable standards at either the Maker’s or equipment manufacturer’s works or tests certificate provided.

The hoist shall be assembled in the shop to the extent necessary to ensure that all parts are properly fitted. Surfaces of metal which will be in contact shall be cleaned before the parts are assembled. The parts shall be adjusted to line and fit and shall be well pinned and bolted so that the surfaces are in close contact before reaming, drilling, riveting or welding is commenced. Drifting done during assembly shall be only that is necessary to bring the parts into position and not so much as to enlarge the holes or distort the member, if any, hole shall be enlarged to admit fastening, it shall be reamed. The field connections shall be fitted and checked in the shop to assure proper fit during field erection.

After shop assembly the hoist shall be tested at manufacturer's works in accordance with relevant Standards. The manufacturer shall supply all material equipment and labor required for shop assembly and tests and cost thereof shall be included in the Proposal price.

All shop tests shall be made in the presence of the Purchaser or his representative. The hoist shall be prepared for shipment in as large units as practicable. One print of a diagram of match marks shall be enclosed with the shipment and four prints shall be forwarded to the Employer.

2.2.5.4 Place of Manufacture and Inspection

The Contractor shall intimate the place of manufacturer, testing and inspection of the various portions of the work. Authorized representative of the Purchaser may be present at the time of any or all tests and the Manufacturer shall provide all necessary facilities for the same. Representatives of the Purchaser shall also be entitled to access to Manufacturer's Sub-Contractor’s work at any time during the working hours for the purpose of inspecting the manufacture of equipment and materials.

To satisfy himself that the materials and equipment comply with the Conditions of Contract, the Purchaser reserves to himself the right of having at his expense, any inspection or tests of a reasonable nature carried out in addition to the routine tests specified in the relevant Standards.

2.2.5.5 Inspection

All materials furnished shall be of tested quality and all work performed shall be subject to rigid inspection and no articles or materials or supplies shall be dispatched until all tests, analysis and shop inspection have been completed or certified copies of reports or results of tests and analysis shall have been accepted. Duplicate copies of manufacturers test certificate shall be submitted to the Purchaser as soon as the tests are completed. In case tests certificate are not available for any of the materials, the same may be got tested and only those materials which fulfill the requirements of the specifications shall be used.

From any part/item, it should be possible to locate its manufacturer Batch/Lot mark, which shall be achieved by transferring the batch mark before parting the materials.

All supplies (which include without limitation raw materials. components. intermediate assemblies and assemblies and end products) shall be subject to inspection and test by the Purchaser to the extent practicable at all times and places. If any inspection or test is made by the Purchaser in the premises of the Manufacturer or Sub-Contractor, the Manufacturer without additional charge shall provide all reasonable facilities and assistance and the safety and convenience of inspectors in the performance of their duties.

2.2.6 Site Testing & Commissioning

2.2.6.1 Operational Tests

a) The Manufacturer shall carry out in the presence of Purchaser such tests on the equipment to determine that the same will fulfill the functions for which they have been designed. The tests shall be carried out in accordance with applicable standards. Tests shall be repeated, if necessary, until successfully carried out to the satisfaction of the Purchaser. Leakage tests and operational tests shall be carried out after completion of other portions of the work at upstream maximum water level.
b) For hoists a proper testing procedure/ document shall be submitted for Employer approval before tests shall be carried at site after erection.

2.2.6.2 Dry Test

Operational tests in dry shall be carried out as soon as possible after completion of erection and all controls and permanent power supply have been connected. The tests shall include at-least two complete traverses from the maximum raised position to the full sealing position. All adjustments, clearances, brakes etc. shall be checked for proper and smooth operation.

2.2.6.3 Wet Test

These tests should simulate the actual operating conditions as closely as possible. At-least two complete traverses will be made from the fully closed position to the fully raised position as follows:

a) When gate is closed, raise gate to its fully open position in steps and observe the performance including vibration.
b) Lower the gate to the full closed position in steps and observe the performance of the gate vibration.
c) Checkup operation of limit switches.

2.2.6.4 Leakage Tests

Leakage tests shall be carried out with the gate resting on to the sill. Before measuring the leakage, the gate shall be raised and lowered several times by about 20 to 40 cm or so in order to dislodge any debris that may have lodged in the side seal seat. The leakage shall then be measured and recorded. The maximum leakage past the seals shall not be more than 15 liters per min. per meter length of seal under maximum head conditions.

2.2.6.5 Final Acceptance

Final acceptance of the equipment shall be based on the following:

a) Quality and workmanship of the equipment including dimensional accuracy.
b) Satisfactory operation of the equipment after erection as required under these specifications.
c) Acceptance of various tests or test certificates by the Purchase.

All tests may be witnessed by the Manufacturer or his authorized representative. On successful completion of all tests the equipment shall be accepted but all the responsibilities shall remain with the Manufacturer within the guarantee period.

The labor and material for the field tests shall be provided by the Contractor. The test load and necessary lifting tackles shall be provided by the Purchaser and Contractor respectively.

2.2.6.6 Guarantee

Within one year after issue of Certificate of Completion if any part of the gates, embedded parts, hoists etc. are found defective because of workmanship or material or otherwise the Manufacturer shall, at his own expense, furnish and install new parts and materials approved by the Purchaser.

2.2.7 Welding Procedure

2.2.7.1 Preparation

The edges of plates and shapes to be joined by welding shall be properly formed to suit the type of welding selected. Where plates and shapes have been sheared edges to be joined by welding shall be machined or chipped to sound metal. Plates and shapes to be field welded shall have their edges prepared in the shop for the type of weld selected.

Where bending or forming of plates or shapes is required, the plates or shapes shall be bent by cold forming. Heating and hammering to correct bends will not be permitted.

2.2.7.2 Welding

a) Members to be joined by welding shall be cut accurately to size, and where required, shall be rolled or pressed to proper curvature in accordance with the approved drawings. The dimensions and shape of edges to be joined shall be such as to allow thorough fusion and complete penetration and plates shall be planned, if necessary, to accomplish this result. Members to be welded together shall be in sufficiently intimate contact at the time of welding so that members will not be forced more closely together with the cooling of the weld, thus setting up additional strains and distortions in the weld and parent metal.

b) The surfaces of plates to be welded shall be free from rust, grease and scale for a distance of 12 mm back from the welding edge at the time of welding. Flame cutting may be used in the preparation of the various members provided the operation is performed carefully, and the edges so cut are cleaned thoroughly after being cut so as to expose clean metal.

Any contour irregularities at points of critical stress shall be removed by grinding.

c) Welding Technique Care shall be taken in designs that the welds when being made are well accessible. Overhead welding is to be avoided, if possible and flat position welding is to be strived for. Drawings should clearly indicate the joint position, or field welding, kind of welding, method of welding, welding sizes and other required information/data. Symbols to be shown on the drawing would conform to relevant Standards. All welding shall be done by the electric arc method by a process which will exclude the atmosphere from the molten metal, except where otherwise specifically permitted. All welding electrodes required shall be furnished by the Contractor. Correct selection of electrodes shall be done taking due care of welding method and base metals of components to be welded. The welding electrodes shall be of heavily coated type designed for all position welding. The make, type and size of all welding electrodes shall be subjected to the approval of the Purchaser. In assembling and during welding the component parts of built-up members shall be held in place by

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

sufficient clamps or other adequate means to keep all parts in proper alignment and position.

Radiographic tests shall be carried out for all critical full-strength butt welds as defined in the approved drawings and welding procedure specifications...

i. Butt joints

In principle, butt joints shall be made with back-run. Backing strap should be placed and welding should be so made that the molten metal fully penetrates and a full penetration is achieved. Dye-penetration test shall be carried out after each pass of the weld. Radiographic testing of butt welds shall be carried out to the extent required by the Purchaser.

ii. Fillet Joints

All fillet welds shall be continuous. For the main member, no fillet welding should be made on members whose thickness differs substantially. Fillet weld at T Joints should be made, as a rule, on each side of the joint unless it is otherwise agreed due to some practical reasons. Radiographic test is not normally required for fillet welds. All the fillet welds shall be checked by Dye Penetrant Test by the Manufacturer in the shop. However, 20% to 30% of fillet welds shall be checked by dye-penetrant test in presence of Purchaser to check soundness of weld.

At Welded butt joints, where the weld material is required to be deposited on both sides of the joints, the weld shall be chipped or melted to obtain a clean surface prior the application of the first head of the welding on the opposite side of the joint. Where fillet welds are used, the lapsed sections shall fit closely and shall be held together during the welding operation. When weld metal is deposited in two or more layers, each layer shall be brushed with a wire brush or otherwise cleaned before subsequent layer is deposited. In welding, precautions shall be taken to minimize stresses due to expansion or contraction either by preening the welds while hot, or by other satisfactory methods and also by using the proper sequence in welding. Correction of distortion by blows after welding is completed and the place is cold will not be permitted. Upon completion, the welds shall be brushed with wire brushes and shall show uniform section, smoothness of weld metal, feather edges without excessive overlaps and freedom from porosity and clinkers. Visual inspection at edges and ends of fillets and butt joints welds shall indicate good fusion and penetration into base metals.

d) Welding Process

All specification of the welding process that is proposed to be used shall be established and recorded and if required, a copy of such specification together with a certified copy of report for results of tests made in accordance with the process and specifications shall be furnished. The qualification of the welding process shall be at least equal to that required by 'Standard Qualification Procedure' of the ASME Standards and the minimum requirement of the tests shall be at least as stated in the said 'Standard Qualification Procedure':

e) Qualification of Welders

The Manufacturer shall be responsible for the quality of the work performed by his welding staff. All welders assigned to the work shall have passed qualification tests for welders. If at any time the work of any welder appears questionable, welder shall be

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

required to pass additional qualification tests to determine his ability to perform the type of work on which he is engaged.

2.2.8 Surface Preparation & Painting

2.2.8.1 General

a) The Manufacturer shall provide as part of his supply the surface treatment, priming, corrosion protection and painting of the equipment furnished. Such work shall include the coating and painting work at the workshop and at the site up to and including the finish painting. Unless otherwise specified the coating and painting shall be carried out in accordance with provisions of DIN, BS and ASME Standards. All paints, painting material and accessories for painting shall be included in the price Proposal. All finished and unfinished surfaces of metal work (other than of aluminum brass, bronze or stainless steel) except screw threads, mating surfaces, sliding surfaces, rolling surfaces shall be cleaned and protective coatings applied as specified in the above-mentioned Standard. Paint systems shall be suitable for long-term service life under aggressive hydropower environmental conditions.

b) All paints and painting material shall satisfactorily fulfill the requirements imposed by the site conditions, as well as the stresses to which the respective equipment is subjected during operation of the works. Shades of the finishing coatings shall be as approved by the Purchaser or his representative. Coating systems shall be selected considering humidity, temperature variation, UV exposure and potential water immersion where applicable.

c) The paints and shades of the finished coatings proposed by the Manufacturer shall be got approved by the Purchaser before application of the same. The analysis in respect of paint properties, paint composition and performance requirements of the paints shall be submitted by the Manufacturer for check and approval. All painting material shall conform to relevant Indian Standards.

   Each coat of printer and paint shall be compatible with the previous and subsequent coats. All pigmented primers and paints which will be used for priming and painting at the site shall be delivered in original and sealed containers packed by the manufacturer Paint shelf life and storage conditions shall be clearly stated by the manufacturer.

d) The Manufacturer shall supply full details regarding the extent to which sand-blasting, priming and painting will be carried out in his workshops (or his Sub-Contractors, as the case may be) at the site and after erection. A properly equipped paint shop shall be set up at the site using a specialist organization, experienced and skilled in the preparation and application of protective coatings at the conditions prevailing at the site. Quality control procedures shall be submitted for approval prior to commencement of painting works.

2.2.8.2 Surface Preparation

After the equipment has been fabricated, it is essential that before any prr and coat of paint is applied, the surface is properly prepared. Such preparation shall include through cleaning, smoothing, drying and similar operation that may be required to ensure that the primer and/or paint is applied on suitable surfaces. Clean cloths and clean fluids shall be used to avoid greasy film or greasy residue on the surfaces being cleaned. The procedure for surface preparation shall be as follows:

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

a) Weld spatters or any other surface irregularities shall be removed by any suitable means before cleaning. b) All oil grease and dirt shall be removed from the surface by the use of clean mineral spirits, white gasoline (lead free) and clean wiping materials.

b) Following the solvent cleaning, the surfaces, to be painted shall be cleaned of all rust, mill scale, and other tightly adhering objectionable substances by sand blasting or grit blasting to uniform bright base metal. Average surface roughness for sand blasted area shall not exceed 40 microns. Any grit or dust remaining after the cleaning operation shall be completely removed from the surface by wire brushing; air blowing, suction or other effective means before the surface is painted.

c) Surfaces of stainless steel, nickel, bronze and machined surface adjacent to metal work being cleaned or painted shall be protected by masking tape or by other suitable means during the cleaning and painting operations.

d) Primers shall be applied as soon as the surface preparation is complete and prior to be development of surface rusting. In case there is considerable time gap, the surface shall be re-cleaned prior to priming.

2.2.8.3 Measures during Painting

a) Any bare spots or holidays shall be recoated with additional application of primer.

b) All runs, sags, floods, or dips shall be removed by scrapping and cleaning, the cleaned area shall be retouched or all such defects shall be remedied by re-blasting or re-priming.

c) Special attention shall be given to obtaining good coverage on rivets, welds and sharp edges and corners. Stripe coating shall be applied on edges, welds and corners prior to full coating where required.

d) Suitable measures shall be taken to protect applied primer from contact with rain, fog, mist, dust or other foreign matter until completely hardened and next coat applied.

e) The air temperature at the time of application shall not be below 10°C and relative humidity shall not be above 60%.

2.2.9 Installation, Operation & Maintenance Manuals

For guidance during the installation of the work and subsequently for guidance of the plant operating and maintenance staff, Manufacturer shall prepare requisite manuals.

The manuals shall include a separate and complete section describing the normal and emergency operating procedures for the gates and control equipment and shall include easily read diagrammatic drawings of the equipment to facilitate understanding of the descriptive information.

The manuals shall describe and illustrate the Procedure for assembling, adjusting, operating and dismantling of each component and control system. The maintenance of each component shall be described, including the recommended frequency of inspection and lubrication.

Manuals shall also describe and illustrate procedures for installation, storage, handling, unloading, reloading, unpacking and upkeep of each component and of the system.

Three (03) copies of the manuals shall be submitted in English in draft form for approval of Purchaser three months prior to the time the information is at site. Six (06) suitably bound copies shall be provided to Purchaser not later than days after receipt of approval.

If revision of the manuals becomes necessary, as a result of information gained during installation and initial operation, Manufacturer shall make the necessary revisions and furnish six (06) copies of the revised sections.

The manuals shall include a complete list of all drawings prepared by Manufacturer, a list of spare parts and a list of parts for each component or item of equipment. The parts list shall include manufacturer's name and serial numbers and source of their procurement.

Manufacturer shall ensure that his Erection, Installation Supervisor has a copy of all approved drawings and the manuals in his site office.

2.3 GENERAL ELECTRICAL REQUIREMENTS

2.3.1 General

The Works shall be designed to ensure continuity of operation under all working conditions pertaining at the site as the first consideration and to facilitate inspection, maintenance and repairs. All reasonable precautions shall be taken in the design of equipment and of the works, to ensure the safety of personnel concerned with the operation and maintenance of the works in accordance with applicable IEC standards and national safety regulations.

Outdoor equipment shall be designed so that water cannot collect at any point. The undersides of all tanks shall be ventilated in an approved manner to prevent corrosion.

Cast iron shall not be used for the chambers of oil filled apparatus or for any parts subject to mechanical stress.

Mechanisms shall be constructed to prevent sticking due to rust and corrosion, and the bearings of exposed operating shafts shall be designed to prevent moisture seeping along shafts into the interior of equipment.

No welding, plugging or filling of defective parts shall be carried out without prior sanction of the Employer in writing.

Corresponding parts of similar equipment, and equipment liable to renewal, shall be fully interchangeable and the Contractor will be required to demonstrate this.

All equipment shall operate without undue vibration and with the least practical amount of noise.

All equipment shall be designed to minimize corona or other electrical discharges, to comply with local electromagnetic compatibility (EMC) standards and IEC 60801 and IEC 61000.

All electrical components shall be adequately rated for their most onerous duty and the specified ambient temperature. When equipment is mounted in panels, cubicles etc., due account shall be taken of any heat generated by the equipment therein and the components shall be appropriately selected, rated or de-rated as necessary to suit the most onerous operating temperatures within the enclosure.

2.3.2 Service Conditions

- Altitude — A height above sea level not exceeding 2500m.
- Temperature range — Not below -7 degrees centigrade
Not above +40 degrees centigrade
- Seismic Conditions — As per value provided in other relevant Section of Tender Documents

2.3.3 Equipment Enclosure Classification

Unless otherwise specified, the minimum equipment enclosure classifications for non-rotating electrical equipment shall be as follows:

Indoors only in totally enclosed rooms with provision for limiting ingress of dust: IP31

Indoors, except as noted otherwise: IP54

Outdoors, and indoors in areas subject to water spray, or heavy condensation: IP65

2.3.4 Current Ratings

Current ratings in accordance with IEC 60059 shall be adopted, unless otherwise approved. Every current carrying part of the equipment shall can carry its site rated current continuously under the site ambient conditions as specified and shall not be rated based on air-conditioned rooms even when these are specified. Air conditioning shall only be installed for comfort of operational personnel.

The maximum temperature attained by components under the most onerous service conditions shall not cause damage or deterioration to the equipment or to any associated or adjacent components or reduction in service life.

Electrical equipment shall be adequately supported and braced to withstand the forces associated with the maximum short-circuit currents specified or pertaining, whichever is the greater, and if the inception of the short-circuit is at such a time that gives maximum peak currents.

Equipment shall be so constructed as to withstand the specified maximum short-circuit currents for a duration of 3 seconds, unless otherwise specified, without the temperature exceeding the specified maximum short-time temperature or value stated in the relevant standard, under these conditions and without permanent deformation.

2.3.5 Voltage Rating

Standard voltage levels in accordance with IEC 60038 shall be adopted, unless otherwise approved.

All electrical equipment shall, except where otherwise specified, be capable of continuous operation at a voltage in the range of 90% to 110% of the nominal A.C voltage and at a frequency in the range of 50±6% (94% to 106%) of the nominal frequency coincidentally without deterioration. DC voltage in the range of 80% to 115% in accordance with IEEE 421.4, section 8.8.

The temperature rises of electrical equipment continuously operating at the specified extreme voltage and frequency shall not exceed the temperature rise when operating at nominal voltage and frequency by more than 5 K.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

All electrical equipment shall be so designed and tested such as to withstand abnormal system voltages as required by the applicable IEC Standard.

2.3.6 Busbar and Connections

Bus bars and connections shall comply with BS 159 and shall be electrolytic copper, unless otherwise approved.

The bus bars, assemblies and connections of metal-enclosed or metal-clad switchgear shall be of a type, which does not rely solely on air for insulation purposes. The conductor temperature during short circuit shall not exceed the temperature limit of the insulation material and the insulation shall have such thickness as is required to withstand rated line to line voltage between a bus bar and a conducting object on the exterior of the insulation material for a period of not less than 1 minute.

The bus bars shall carry the full rated current continuously without exceeding the maximum temperature specified in IEC 61439 or IEC 62271, as applicable, under site ambient conditions.

Bus bars shall be of uniform cross-sectional area throughout the length of a switchboard and shall not be of a varying (tapered) section.

2.3.7 Insulators and Bushings

Porcelain or glass insulators and bushings shall comply with the requirements of IEC 60137, IEC 60168, IEC 60273, IEC 60305, IEC 60433 and IEC 60591, as applicable. Porcelain for insulating purposes shall comply with the requirements of IEC 60672.

Insulators and bushings shall satisfy the test requirements of IEC 60168, IEC 60233 or IEC 60383, as applicable. The design of insulators shall be such as to minimize radio Frequency Interference (RFI) and tests shall be made in accordance with IEC 60437, or equivalent, to limit RFI to CISPR (International Special Committee on Radio Interference) or ITU-T (Telecommunication Standardization Sector of the International Telecommunications Union) recommended limits, or equivalent National Standards or Regulations.

Insulators and bushings of organic molded or resin-bonded material shall comply with the requirements of IEC 60660 as appropriate.

Insulators and bushings of molded, or resin bonded material shall be identified with the manufacturers mark and batch identification. Such marking shall not impair the electrical properties of the surface finish.

2.3.8 Electrical Insultations

The insulation of all machine windings, solenoids, etc. other than those immersed in oil or compound, shall be of Class F materials, unless otherwise specified elsewhere.

Linseed oil and untreated materials of fiber, leatheroid, presspahn, asbestos or other similar hygroscopic types of materials shall not be used for insulation purposes. Untreated leatheroid and presspahn may be used for mechanical protection of winding insulation.

Polychlorinated Biphenyl (PCB) type materials shall not be used anywhere in the equipment or in any component.

Insulating oil shall comply with the requirements of IEC 60296.

2.3.9 Fuses and Links

Fuses shall be of the non-deteriorating HRC (High Rupturing Capacity) cartridge type complying with IEC 60269, IEC 60282 or IEC 60644 as applicable. Fuse holders shall be so designed as to permit detection of fuse-rupturing without removing the bridge. "Zed" and screw-in type fuses shall not be permitted.

Test links in current transformer circuits shall be of the bolted or plug-in type and shall be clearly labelled.

2.3.10 Fuse Switches

Fuse switches shall comply with IEC 60947-3, and the operating mechanism shall be of the spring-loaded type, such that the speed of operation cannot be controlled by the operator. Full closing or opening of the switch shall not depend upon the operator pushing the operating handle fully home. In the event of a spring failure, it shall be possible to open the switch without endangering the operator.

2.3.11 Molded Case Circuit Breaker and Miniature Circuit Breaker

All miniature circuit breakers (MCB's) shall be of the high-speed fault limiting thermal/magnetic type to IEC 60898.

All molded case circuit breakers (MCCB's) shall be of the high speed, fault limiting thermal/magnetic type to IEC 60947-2. Circuit breakers used in combination type motor starters and contactors shall be interlocked with the panel enclosure. The panel enclosure/cover cannot be opened unless circuit breaker is open.

2.3.12 Distribution Boards and Isolators

Distribution boards shall be provided throughout the plant for local distribution of lighting, small power and welding supplies as required for safe and reliable operation.

LV distribution boards shall conform to IEC 61439. All distribution boards shall be of the weatherproof enclosure type to IP54 and shall be arranged so that the door or cover can be locked in the closed position.

Distribution boards shall be capable of withstanding without injury the mechanical and electrical stresses set up by the maximum prospective fault current for twice the period required to disconnect such fault on any circuit.

Indoor distribution boards shall be of galvanized or enameled sheet steel with a paint finish. The finished color of all indoor distribution boards shall be chosen to match the adjacent switchboards.

The current rating of the bus bars in each distribution board shall not be less than the sum of the maximum current rating of all outgoing circuits. The neutral connection for each circuit is to be direct to the neutral bus bar.

Cabling to distribution boards shall generally be bottom entry. However, for indoor boards top entry maybe permitted subject to the approval of the Employer.

2.3.13 Current Transformers

Current transformers shall comply with IEC 61869-2 as amended and supplemented by the following requirements and shall be suitable for continuous operation under site ambient conditions.

Separate cores of current transformer (CT) shall be used for each protection, metering and instrumentation. Minimum of One (01) core shall be provided as spare for each CT for future expansion and redundancy.

For measuring current transformers, the following accuracy classes shall apply:

- 0.1 for generator output for the purposes of acceptance testing, and for tariff metering of large supplies, unless otherwise specified
- 0.2 for plant record metering, and for other acceptance testing purposes
- 0.5 for automatic voltage regulators (AVRs)
- 1.0 for indicating instruments.

Current transformers for protective and protective/indication purposes shall be designed to suit the requirements of the associated protection which, in general, shall be in accordance with the recommendation given in IEC 61869-2 and protection coordination philosophy of the Project.

Class 5P current transformers shall be used for combined over current and earth fault protection of the inverse time over current type. The rated accuracy limit with actual burden connected shall be equivalent to the ultimate maximum symmetrical three phase fault current or earth fault current of the protected circuit. The current transformers shall meet the 5P error classification at rated accuracy limit current over the full range of relay settings.

Current transformers for combined purposes e.g., inverse time relays and indicating meters, shall have a dual Class 5P/Class 1 performance and where necessary the secondary circuits shall have an approved means of protecting the meters and reducing their burden under system fault conditions.

Current transformers for protection using high impedance relays shall be of the low reactance type and their performance shall be stated in terms of the Class TPS, TPX, TPY and TPZ parameters of IEC 61869-2 (low reactance current transformers are preferred for all forms of protection), or equivalent approved standard.

The rated volt-amp output of each current transformer shall not be less than the connected burden, as installed in service, the burden of cable connections being considered.

Current transformers shall be capable of withstanding without damage the peak and rated short-time currents of their associated equipment.

The secondary windings of each set of current transformers shall be earthed at one point only, via a bolted disconnecting link. The current transformer core, where accessible, shall be separately earthed and clearly identified.

When multiple ratio secondary windings are specified, a label shall be provided at the secondary terminals of the current transformer, indicating clearly the connections required for each tap. The connections and the ratio in use shall be indicated on all connection diagrams.

Design magnetization curves and DC resistance values shall be submitted before manufacture for each current transformer used for protective purposes and shall be subsequently verified by works routine tests.

For metal-clad switchgear, all current transformers shall be located on the outgoing circuit side of the circuit breaker. Current transformers may also be provided on the bus bar side of the circuit breaker to permit protection zone overlap. The primary conductors of all current transformers shall be readily accessible for primary injection testing on site without dismantling major equipment.

Where current transformers shall be mounted on apparatus provided under other contracts, the Contractor shall be responsible for ensuring compatibility with the other Contractors' apparatus.

Current transformers incorporated in equipment which are spare or for future use, shall (if not connected to associated relays, instruments etc.) be provided with a suitably rated shorting link mounted at a convenient terminal block to avoid the current transformer being energized with its secondary connections open circuited during service or testing.

Bushing type current transformers shall be provided with taps to measure capacitance and loss factor (tan delta) where applicable.

2.3.14 Voltage Transformers

All voltage transformers shall comply with the requirements of IEC 61869-3 as amended and supplemented by this specification. They shall have outputs 50% more than the present requirements unless otherwise specified to allow for future extension.

Separate cores of voltage transformer (VT) shall be used for each protection, metering and instrumentation. Minimum of One (01) core shall be provided as spare for each VT for redundancy.

Voltage transformers shall have the following accuracy classes unless otherwise specified:

- 0.2 For plant record metering, AVRs and indicating instruments
- 3P for protection

The voltage transformer secondary circuits shall be complete in themselves and shall be earthed at one point only. Metal cases shall be separately earthed. The transformer core, where accessible, shall be separately earthed. All voltage transformers at the same voltage level shall be earthed in the same manner.

Where it is required to earth the primary neutral of a metal clad voltage transformer, the neutral earthing connection shall be insulated from the tank and brought out separately from the secondary earthing connection for redundancy.

Primary windings shall be connected through fuses with current limiting resistances or having current limiting features. However, such fuses may be omitted when the voltage transformer is located within the overall protection zone of the main circuit.

Secondary main protection fuses or miniature circuit breakers shall be provided as close as possible to, and preferably mounted on, each voltage transformer, within a lockable or bolted enclosure. Secondary main protection fuses or miniature circuit breakers shall be labelled to show their function and phase color. It shall not be necessary to de-energize the primary circuit or remove the voltage transformer of metal clad switchgear to gain access to the fuses or

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

miniature circuit breaker. Auxiliary contacts shall be provided for alarm purposes in the event of loss of supply.

Voltage transformers shall be so designed that saturation of their cores does not occur when 1.732 times normal voltage is applied to each winding.

Magnetization curves shall be submitted for approval for each type of voltage transformer prior to Works Tests.

The standard secondary voltage between phases shall be 110 V unless special circumstances dictate otherwise.

Secondary circuits of different voltage transformers shall not be connected in parallel.

Voltage transformers shall preferably be mounted on the outgoing circuit side of circuit breakers.

Three phase voltage transformers having an earthed - star primary winding shall have cores with five limbs, the outer two of which shall be unwound.

2.3.15 Protection Equipment and Auxiliary Services Relays

Protective relays shall comply generally with the requirements of IEC 60255. They shall be contained in dustproof flush mounted cases with glass fronts and semi-gloss black bezels and shall be provided with breathers. They shall be of the withdrawable type unless otherwise approved. All relays shall have a provision for testing without withdrawing the relay from its case; this shall take the form of an adjacent test block, unless a test plug can be inserted between the contact fingers of the relay and the relay case. This requirement shall be in addition to any permanently connected injection test scheme.

Two test plugs to suit each different type of relay case or test socket shall be provided for each switchboard or suite of relay panels. The test plugs shall have terminals for both the relay and wiring side connections, which will accept both wires and plug connections and be complete with lengths of flexible cable for connection to a portable relay test set.

Schemes of protection shall be relatively straightforward to commission and shall not require unique test equipment. Each relay or scheme which initiates tripping shall be provided with trip isolation links or other means of isolating outgoing trip signals to permit testing of the scheme, preferably mounted on the front of the associated relay panel or switchboard.

All relays shall be so arranged that, providing reasonable care is taken, any dust, which may have collected in or upon the case, shall not fall on the relay mechanism when opening the case.

Auxiliary relays shall also be mounted in dustproof cases.

All protective relays shall be provided with a name and data plate.

Any relay mounted on a panel associated with a circuit breaker and which initiates tripping of any other circuit breaker shall, in addition to the required trip isolation link, bear a distinctively colored warning label.

All metal bases and frames of relays shall be earthed, except where the latter shall be insulated for special requirements.

Relay equipment incorporating electronic devices shall be arranged to jack-in and have positive means of retaining them correctly in the service position. Equipment incorporating telephone type relays shall preferably have similar facilities.

Rectifiers used in, or in association with, protective relays shall be suitable for the climatic conditions pertaining to the site of installation.

Relay contacts shall be suitable for making and breaking the maximum currents which, they may be required to control in normal service but where contacts of the protective relays are unable to deal directly with the tripping currents, approved auxiliary contactors, relays or auxiliary switches shall be provided. Separate contacts shall be provided for alarm and tripping functions. Relay contacts shall make firmly without bounce and the whole of the relay mechanisms shall be as far as possible unaffected by vibration or external magnetic fields. Switching of contacts in AC/DC control circuits shall not produce harmful over voltages.

Where relays rely for their operation on an external dc supply, (e.g., from a supply provided by others or a supply different to all other relays), this supply shall be monitored and an alarm provided in the event of failure.

All relays shall be provided with clearly inscribed labels describing their application and rating in addition to the general-purpose labels.

The maximum AC voltage across any two points of a current circuit shall not exceed 3 kV peak and non-linear resistors shall be provided if necessary to achieve this limitation.

AC operated control relays and timers shall operate correctly between 85 % and 110 % of the rated voltage and shall remain energized without chatter at 75% supply voltage, measured at the bus bars.

All relays which are connected to complete either the tripping circuit of a circuit breaker, or to the current coil of an auxiliary tripping relay, shall be provided with approved operation indicators which, whenever possible, shall be of the mechanically operated type, or non-volatile LED type. Indicators shall also be provided on such additional relay elements as will enable the phase of the fault condition to be identified. Each indicator, whether of the electrically operated or mechanically operated kind, shall be capable of being reset by hand without opening the relay case and it shall not be possible to operate the relay when resetting the operation indicator. Each indicator shall be so designed that it cannot move before the relay has completed its operation. Indicators shall not reset during a failure of auxiliary power to the relay.

All relays which are of the hand reset type shall be capable of being reset without opening the case.

It shall not be possible to operate any relay by hand without opening the case.

Where relays are required to operate with a fixed time delay, the time delay shall not be of the dashpot type.

DC operated control relays and timers shall operate correctly between 80 % and 110 % of the rated voltage and the drop out voltage shall not be less than 40% of the rated voltage. They shall be impervious to the effects of induced AC voltages and shall not be caused to operate by such effects. DC operated relays and timers shall be fitted with a free-wheel (quenching) diode across the coil of sufficient voltage and current rating.

All possible precautions shall be taken to ensure that direct current operated relays which perform a tripping function are not liable to mal-operation. For this reason, the total

capacitance to earth of all connections to the either pole of the tripping battery shall not exceed 10 microfarads.

To minimize the effects of electrolysis, operation indicator coils and DC relay operating coils shall be so placed in the circuit that they are not connected to the positive pole of the battery, except through contacts which are normally open.

If bolts or nuts are so placed as to be inaccessible with an ordinary spanner, not less than two special tools shall be provided.

The Contractor shall provide relay setting details for all relays within his supply. Where information is required to determine settings on equipment not supplied by the supplier, the Contractor shall request the information.

Settings for protective relays which require discriminative time and/or current grading with protection schemes shall be determined by the Contractor. The Contractor shall request any relay settings required and demonstrate by submitting for approval grading curves, etc. that correct grading has been achieved.

All calculations to determine relay settings and CT and VT requirements shall be submitted for approval.

The Contractor shall arrange for the supplier of the relaying equipment to do site tests required for the determination of correct relay settings irrespective of supply of primary circuit plant, pilot cables or signaling channels and the Contractor shall co-ordinate all such site testing.

2.3.16 Panels, Desk and Cubicles

Unless otherwise specified, panels, desks and cubicles, shall be of floor-mounted and free-standing construction and be in accordance with the enclosure classification specified elsewhere. All control and instrumentation panels in any one location shall be identical in appearance and construction.

Panels shall be rigidly constructed from folded sheet steel of adequate thickness to support the equipment mounted thereon, above a channel base frame to provide a toe recess. Alternatively, a separate kicking plate shall be provided.

Overall height, excluding cable boxes, shall not exceed 2.5 m. Operating handles and locking devices shall be located within the operating limits of 0.95 m and 1.8 m above floor level. The minimum height for indicating instruments and meters shall be 1.5 m unless otherwise specified.

Panels shall be mounted on an approved form of anti-vibration mounting, whenever necessary.

All panels, desks and cubicles shall be vermin-proof. All cable entries to equipment shall be sealed against vermin as soon as possible after installation and connecting-up of the cables.

All panels, desks and cubicles shall be provided with a natural air circulation, ventilation system. All control equipment shall be designed to operate without forced ventilation. Where required and typical for outdoor installation, panels shall be equipped with attachable and detachable internal filters to prevent dust from entering through ventholes/ventilating openings used for ventilation purposes.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

For outdoor equipment, metal to metal joints shall not be permitted and all external bolts or screws shall be provided with blind tapped holes where a through hole would permit the ingress of moisture. For harsh environments, all nuts, bolts and washers shall be plated.

Door sealing materials shall be provided suitable for the specified site conditions. Doors shall be fitted with handles and locks. Where walk-in type panels are supplied the door shall be capable of being opened from inside the panel without the aid of a key after they have been locked from the outside. Hinges shall be of the lift-off type.

The bottom and/or top of all panels shall be sealed by means of removable gasketed steel gland plates. Gland plates for bottom entry shall be at least 250 mm above the floor of the cubicle.

Panels shall be suitably designed to permit future extension wherever appropriate or specified.

Each panel shall include rear access doors, internal power socket and door-operated internal lighting, and be clearly labelled with the circuit title at front and rear, with an additional label inside the panel. Panel sections accommodating equipment at voltages higher than 125 V (nominal) shall be partitioned off and the voltage clearly labelled. Each relay and electronic card within panels shall be identified by labels permanently attached to the panel and adjacent to the equipment concerned. Where instruments are terminated in a plug and socket type connection both the plug and the socket shall have permanently attached identifying labels.

Instrument and control devices shall be easily accessible and capable of being removed from the panels for maintenance purposes.

Terminations, wiring and cabling shall be in accordance with the requirements of applicable IEC standard.

For suites of panels, inter-panel bus wiring shall be routed through apertures in the sides of panels and not via external multi core cabling looped between the panels.

All panels, whether individually mounted or forming part of a suite, shall incorporate a common internal copper earthing bar onto which all panel earth connections shall be made. Approved studs or holes shall be left at each end of the bar for connection to the main station earthing system and possible future extension.

Earth connection between adjacent panels shall be achieved by extending the bar through the panel sides and not by interconnecting external cabling.

Where intrinsically safe circuitry is routed from a hazardous area to a safe area instrument panel, it shall be connected through Zener Barriers located in the safe area (instrument panel). The Zener Barriers shall be of suitable rating and mounted on an insulated, earthing bus bar, having facilities for connection of a separate, dedicated outgoing cable to a "clean earth" system.

Control supplies in desks, panels and cubicles shall be derived from a duplicate standby/UPS system, except if specified otherwise in this specification. The following alarms shall be provided to monitor the systems: voltage high, voltage low, no volts and earth fault. These alarms shall be signaled to the plant control system.

Cubicles and cubicle doors shall be rigidly constructed such that, for example, door mounted emergency trip contacts can be set so that mal-operation will not be possible due to any vibrations or impacts as may reasonably be expected under normal working conditions.

Indoor cubicles, desks and panels shall be of galvanized or enameled sheet steel with a paint finish. The external finished color of all indoor cubicles, desks and panels shall be agreed. A wear strip of polished stainless steel shall be applied to the leading edge of control desks. The internal surface of all cubicles, desks and panels shall be painted matt white.

Outdoor cubicles and panels shall be of galvanized sheet steel with a paint finish. The external finished color of all outdoor cubicles, desks and panels shall be subject to approval of the Employer.

All outdoor kiosks, cubicles and panels shall be provided with sun/rain shades.

All cubicles, or panels mounted external to control and apparatus rooms shall be filled with anti-condensation heaters.

2.3.17 Indicating Lamps and Fittings

All indicating lamps shall be adequately ventilated and as far as practicable, lamps of a common type and manufacture shall be used throughout the contract.

Lamps shall be easily removed and replaced where possible from the front of the panel by manual means preferably not requiring the use of extractors.

Where specified every circuit breaker panel shall be equipped with one red and one green indicating lamp, indicating respectively circuit closed and circuit open and an amber lamp for indicating 'auto-trip'. Where specified for in the lines of mimic diagrams, indicating lamps may be of the three-lamp single-aspect type.

The variety of indicating lamps provided shall be rationalized to reduce maintenance and spares requirements.

The lamps shall be clear and shall fit into a lamp holder. The rated lamp voltage shall be at least 20% more than nominal supply voltage, whether AC or DC. The lamps shall have an operating life of at least 10,000 hours, under site conditions. If other indicating devices, such as light emitting diodes, are used in place of lamps, then these shall have the same life expectancy and performance capability as the lamps they replace or better.

The lamp glasses shall comply with International Commission on Illumination (CIE) 2.2 and IEC 60073 and be in the standard colors, red, green, blue, white and amber. The color shall be in the glass and not an applied coating.

Where illuminated pushbuttons are used for control purposes, the illuminated pushbuttons shall be engraved with a clear instruction such as 'push to open' or 'push to close', and the lamp shall illuminate in accordance with the following color code after the instruction has been carried out and the device has operated.

Unless otherwise approved, all lamp colors shall conform to the following practice:

- Red — Energized or operative position
- Green — De-energized or inoperative position
- Amber — Fault or abnormal condition
- White — Healthy or normal condition
- Blue — Other purposes, to be used with descriptive label

Lamp test facilities shall be provided for all switchboards, control panels etc. to enable all lamps to be tested whilst the equipment is in service. Operation of the lamp test facility shall not cause any other device to operate.

Indication circuits shall be fused or protected by miniature circuit breakers.

2.3.18 Anti-Condensation Heaters

All switchboards, panels, cubicles and the like shall incorporate electric heaters capable of providing movement of sufficient heated air to avoid condensation under all site ambient and humidity conditions.

A thermostat shall be provided which shall switch the anti-condensation heater off automatically when the panel upper air temperature limit has been reached and will switch the heater on automatically when the panel air temperature falls below the set point.

The switchboard anti-condensation heaters shall be fed from an LV single phase and neutral supply, manually switched by a two-pole switch with red lamp, mounted on the back of the board, panel or cubicle and bus wired through the board. Labels shall be provided on the switch stating, "Heater Supply". Heater terminals shall be shrouded and labelled "Heater".

Motor anti-condensation heaters where fitted shall be fed from an LV single phase and neutral supply bus wired through the associated switchboard. The heater supplies shall be individually fused and shall be switched by auxiliary contacts on the contactor and isolated by auxiliary contacts on the contactor disconnector.

2.3.19 Panel Wiring

The wiring shall generally comply with BS 7671 or applicable IEC standard. All wiring shall be of adequate cross-sectional area to carry prospective short-circuit currents without risk of damage to conductors, insulation or joints.

The following classes of copper conductor, as defined in IEC 60228, shall be used for panel wiring:

- Class 1 conductors up to a maximum of 0.9 mm diameter where necessary for wire-wrapped terminations and similar techniques,
- Class 2 conductors except where specified otherwise,
- Class 5 and Class 6 conductors between points subject to relative movement.

The following minimum conductor sizes shall be used:

- 2.5 mm² for current transformer secondary circuits with a rated secondary current of 0.5 A or greater,
- 1.5 mm² except where specified otherwise,
- 0.5 mm² for alarm and indication circuits with a continuous or intermittent load current not exceeding 1 A.

2.3.20 Identification of Wires

All wiring and cores in control and instrument cables shall be identified in accordance with the associated schematic and/or wiring diagrams either by means of discrete wire numbers or wire colors, except when an automatic or proprietary system of wiring is used, e.g., point-to-point wiring on a mother board.

When a wire numbering system is used, it should be in accordance with one of the main marking systems described in IEC 60391 or with a functional marking system.

Both ends of every wire and core in control and instrument cables shall be fitted with interlocking ring ferrules of white insulating material indelibly marked with black characters complying with BS 3858.

2.3.21 Terminal and Terminal Boards

Terminal boards shall have separate terminals for internal and external connections, and not more than one wire shall be connected to each terminal.

Adjacent terminals to which wires of different voltage, polarity or phase are connected, shall be separated by a protruding insulating barrier. This requirement also applies to terminals carrying wires of the same voltage but originating from different sources.

Trip circuit wiring and instrument transformer secondary wiring shall be connected using hook type crimped terminations in screw clamp, spring loaded insertion type terminals.

Where clamp type terminals are used, Class 1 and Class 2 conductors may be terminated without lugs. Crimp lugs shall be used for Class 5 and Class 6 conductors. Means shall be provided for retaining the identifying ferrules of the wire end when it is disconnected. Pinch screw type terminals shall not be permitted.

Subject to approval of the Employer, "wire-wrap", "termi-point" or equivalent methods of terminations of single strand conductors may be used.

Wires shall be grouped on the terminal boards according to their functions.

All terminal blocks shall provide a degree of protection of not less than IP2X when correctly installed, either inherently or by provision of insulating covers.

Cage clamp type terminal block shall be used for applications that are sensitive to vibration.

Terminal boards shall be mounted vertically, not less than 150 mm above the gland plates, and spaced not less than 100 mm apart, on the side of the enclosure and set obliquely towards the rear doors.

Sufficient terminals shall be provided to permit all cores on multi core cables to be terminated. Terminals for spare cores shall be numbered and be located at such position as will provide the maximum length of spare core. At least 10 % spare terminals shall be provided in all cases for future extension.

The tails of multi core cables shall be bound and routed so that each tail may be traced without difficulty to its associated cable. All spare cores shall be made off to terminals.

When two lengths of screened cable are to be connected at a terminal block (i.e., junction box) a separate terminal shall be provided to maintain screen continuity.

In the main and local control and equipment rooms, means shall be provided on the terminal blocks of panels, desks, cubicles, etc., for testing all the instrument circuits without the need to remove the internal or external wiring from the block.

The Contractor shall submit full details and specification for approval of the proposed means of termination where wire wrapping, soldering and similar methods are used. The Contractor shall identify all special tools, such as wire wrapping tools required for termination, and shall make provision for their supply in sufficient numbers.

The use of pre-formed factory tested cable connections to field mounted marshalling boxes shall be subject to approval of the Employer.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

2.3.22 Cable Boxes and Glands

Electrical equipment shall be provided with all necessary cable boxes, which shall be complete with all required fittings. All cable boxes shall be of adequate size to allow for the correct termination of the cable sizes required or specified, considering the crossing of cores to achieve the correct phasing, and to accommodate all cable fittings, including stress cones or other means of cable insulation grading, if required. All cable boxes shall be designed in such a manner that they can be opened for inspection without disturbing the gland plate or incoming cable to facilitate maintenance.

Cable lugs and terminations for the receipt of all power, control and instrumentation cable cores shall be provided.

Cable glands for extruded solid dielectric insulated cables (PE, XLPE) shall be of the compression type and as specified in BS 6121 Part 1.

All glands shall be provided with an earthing tag or equal facility. For cables having conductors not larger than 4 mm² serrated washers may be used in place of earthing tags to provide earth continuity.

2.3.23 Conduits and Accessories

Conduit installations shall comply with IEC 60364, IEC 60621, IEC 60981 and IEC 61035, unless otherwise approved.

All conduit and conduit fittings shall comply with IEC 60423 and IEC 60614. Unless otherwise approved, all conduit and conduit fittings, shall be thread able steel conduit with enclosure classification IP55, at least heavy mechanical protection and high resistance to corrosion inside and outside.

No conduit smaller than 20 mm diameter shall be used.

Standard circular boxes or machined face heavy-duty steel adaptable boxes with machined heavy type lids shall be used throughout. For outdoor mounting all boxes shall be galvanized, weatherproof and fitted with external fixing lugs.

Where conduit is terminated so that the bare end of the conduit is exposed the conduit end shall be fitted with a brass bush.

The use of running threads, solid elbows and solid tees will not be permitted.

Conduit ends shall be carefully reamed to remove burrs. Draw-in boxes shall be provided at intervals not exceeding 10 m in straight-through runs.

Conduit runs shall be in either the vertical or horizontal direction unless otherwise approved and shall be arranged to minimize accumulation of moisture. Provision for drainage shall be made at the lowest points of each run.

Conduits shall be supported on heavy galvanized spacer saddles to stand off at least 6mm from the fixing surface.

All conduits run in any circuit are to be completed before any cables are pulled in.

Flexible metallic conduit shall be used where relative movement is required between the conduit and connected apparatus, and a separate earth continuity conductor shall be provided. For outdoor installation, liquid tight flexible metallic conduit shall be used.

The maximum number of cables in any conduit shall be in accordance with IEC 60364.

2.3.24 Cable Ladders and Trays System

Cable ladder and tray system shall meet the requirement of IEC 61537. Independent cable ladder and tray systems shall be provided for Cables of different voltages, and for power and control cables with adequate separation.

Where available space is restricted such that requirement of use of independent cable ladder and tray cannot be met, use of cable separators with adequate separation between different voltages and power & control cables are permitted following applicable International Standard.

The width of the cable ladder/tray shall be chosen to accommodate all the cables in one tier, plus 30 to 50% additional width for future expansion. This additional width shall be minimum 100mm. The overall width of one cable ladder/tray shall be limited to 800mm.

2.3.24.1 Galvanized Cable Trays

All hot-dip galvanized Cable Trays shall be manufactured from pre-galvanized mild steel, to BS EN 10142 and BS EN 10143 with a minimum coating weight of 275g/m². Cable tray and cable fittings shall be fully perforated.

Cable trays shall be installed using factory formed bends and tees. Where cut sections are used for sets, they shall be free from sharp edges and joined by means of fish plates or couplers bolted to each section in accordance with the manufacturer's recommendations. Cable trays shall be painted with zinc rich paint to BS.4652 where cuts have been made.

Earth continuity connectors shall be fitted between each length of cable tray to ensure compliance with BS.7671. The earth continuity connectors shall be manufactured from copper braid to BS EN. 13602 complete with copper lugs to BS EN. 1976, BS EN 1978 and BS EN. 13600 or copper earth links with a minimum conductor area of 4mm² and with an electro-tinned finish. The connectors shall be fastened by M6 x 12mm roofing nuts and bolts. The connectors shall be fixed in accordance with the cable tray manufacturer's recommendations.

Ventilated cable tray covers shall be provided to all external trays. The covers shall provide an adequate gap along either side through which air can circulate. Ventilated cable tray covers shall be secured using proprietary clips and fixings in accordance with manufacturer's recommendations. All straight covers shall be supplied in lengths of 1.5m or 3m.

Cables shall be fixed to the tray by means of proprietary forms of LSZH or copper cable clips, hot dip galvanized cleats, saddles or straps with zinc plated or serrated bolts or nuts and washers at intervals of not more than 1200mm. Plastic tie wraps shall not be permitted. Cables on inverted or vertical cable trays shall be fixed using fire resistant cleats etc.

2.3.24.2 Galvanized Cable Ladders

All hot-dip galvanized Cable Ladder shall be manufactured from either mild steel to BS EN ISO 1461 Part 1, hot dip galvanized after manufacture to BS EN ISO 1461 or, for certain internal application, from pre-galvanized mild steel to BS EN 10142 and BS EN 10143 with a minimum coating weight of 275g/m². Rungs shall be of shallow channel profile and shall be located at the bottom of the cable ladder side to maximize the loading depth.

Galvanized cable ladders shall be extra heavy-duty, general-purpose cable ladder with minimum flange height 150mm, material gauge 2.0mm and rungs at 300mm centers. Rungs shall be of shallow channel profile with slot pattern to suit cable ties and straps.

Cable ladders shall carry without undue deflection, the total weight of cable likely to be carried on the ladder regardless of the location of the joints.

Cable ladders shall be installed using factory formed bends and tees. Where cut sections are used for vertical or horizontal offsets, they shall be free from sharp edges, and joined by means of couplers bolted to each section in accordance with the manufacturer's recommendations.

Cable ladders shall be supported on purpose-made suitably treated mild steel supports which shall permit easy adjustment and modification or by suitable channel, brackets, and accessories to BS.6946 at intervals necessary to provide a rigid fixing in accordance with the manufacturers recommended fixing centers. Channels to BS.6946 shall be manufactured from 2.5mm material conforming to BS.1449 Part 1, hot dip galvanized after manufacture to BS EN ISO 1461. Brackets to BS.6946 shall be manufactured from 6mm mild steel, 40mm wide, hot dip galvanized after manufacture to BSEN ISO 1461 and shall have a minimum hole size of 14mm diameter holes to accept M12 setscrews.

Cable ladders shall be painted with zinc rich paint to BS.4652 where cuts have been made.

Earth continuity connectors shall be fitted between each length of cable ladder to ensure compliance with BS.7671. The earth continuity connectors shall be manufactured from copper braid to BS.4109 complete with copper lugs to BSEN 1976, BSEN 1978 and BS EN 13600 or from copper strip. The conductor area shall be a minimum of 10mm² and shall have an electro-tinned finish. The connectors shall be fixed in accordance with the cable ladder manufacturer's recommendations.

Ventilated cable ladder covers shall be provided for all external cable ladders. The covers shall provide an adequate gap along either side through which air can circulate. Ventilated cable ladder covers shall be secured using proprietary fixings in accordance with the cable ladder manufacturer's recommendations. All straight covers shall be supplied in lengths of 1.5m or 3m.

Cables shall be fixed to the ladders by means of proprietary hot dipped galvanized cleats with zinc plated or serrated bolts or nuts and washers. Plastic tie wraps shall not be permitted.

2.3.24.3 Fire Barriers

When electrical services pass through fire compartment walls or floors great care shall be taken to ensure that the gaps between the services and structure are properly sealed for acoustic and fire rating properties. The gaps shall be filled to the full thickness of the structure with mineral fiber having a minimum density of 150 Kg/m². Both faces of the mineral fiber shall be coated with a fire-resistant ablative mastic to dry film thickness of at least 1mm. Fire barriers shall only be installed where services pass through pre-determined fire compartments which shall be highlighted by the Contractor. It shall be the responsibility of the Contractor to ensure that all holes surrounding are filled for both acoustic and fire rating properties. It is the Contractor's responsibility to fill all trucking internal spaces/voids with mineral fiber as detailed above.

2.3.25 Electric Variable Speed Drive Systems

2.3.25.1 General

Electric Variable Speed Drive Systems (VSDS) shall comply with all the international standards applicable for the VSDS components.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

VSDS shall be of well-proven, high reliability design backed by long site operational experience in environmental conditions compatible with the plant. It shall comprise the complete drive system including motor and typically, static converters, dc link reactor, and associated control equipment.

If necessary, converter supply transformers may be included. Motor supply transformers shall not be used.

2.3.25.2 Converters

The Converters shall be of the variable voltage/variable frequency type utilizing power semiconductor technology to supply power to the VSDS motors. Each converter shall include a rectifier stage, dc. link with smoothing reactor and an inverter. The inverter shall be of the voltage source type using PWM ac. waveform generation.

The scope of supply of the converters shall include all necessary controls, auxiliary supplies, protection, alarm and measuring equipment required for operation of complete VSDS.

2.3.25.3 Motors

VSDS motors shall be cage induction motors. Where VSDS, using brushless synchronous motors, are economically competitive and/or are advantageous for the application, these may be offered as alternatives.

2.3.25.4 Harmonic Distortion

The total harmonic distortion under the most adverse operating conditions shall not exceed the limits laid down in the UK Engineering Association's Engineering Recommendation G5 (current version), or other approved standard; these limits shall apply both at the point of common coupling and at other switchboards within the plant's distribution system.

If the calculated levels of distortion exceed the limits laid down above, the Contractor shall provide one or more harmonic filters to reduce the harmonic distortion to a level to be approved. The harmonic filter(s) may include power factor correction, where required or specified.

Calculated levels of distortion shall be submitted with the Proposal, considering individual VSDS and the effect of the maximum number of VSDS running on a common supply system.

2.3.25.5 Critical Speeds

Critical speeds of the VSDS motor and driven equipment shall not lie within the operational speed range.

2.3.25.6 Miscellaneous Technical Requirements

Full technical details shall be provided in the Proposal including but not limited to:

- Transient Torque Performance
- Torque Pulsations
- Control Linearity
- Radio Interference
- Protection

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

The VSDS shall be designed to withstand the mechanical, electrical and thermal stress which may arise from short circuits or other fault conditions, and to limit the damage caused by faults to the component concerned. Injury to personnel shall be completely prevented.

2.3.26 Motor Starters and Contactors for Separate Mounting

In special cases for motors below 30 kW, and non-essential non-plant auxiliaries, such as roller shutter doors, and where approved, separately mounted starters for motors may be provided. Each such motor starter shall be equipped with two or three pole control gear, as appropriate, for direct-on-line starting and shall be complete with a fully shrouded lockable isolating switch mechanically interlocked with the means of access.

All starters shall be supplied by one manufacturer, except where otherwise approved.

Contactors shall be of robust design and shall comply with IEC 60947.

All contactors and their associated apparatus for minor motors shall operate without overheating for all specified motor operating conditions and including for a period of five minutes at normal frequency if the supply voltage falls to 80% of nominal voltage.

For motors, up to 30 kW rating, motor starters shall be provided with direct connected thermal overload and phase failure industrial pattern protection tripping devices integral with the motor contactor. Phase failure protection shall operate with out-of-balance currents not exceeding 85% of motor full load current. Separate contacts for a remote trip alarm shall be provided and connected if required.

For motors above 30 kW, starters shall not be wall mounted but included in a switchboard unless specifically approved. For such circuits motor protection relays with a more accurate and easily adjustable overload setting shall be used, which are sensitive to out-of-balance currents not exceeding 20 % of full load and shall include instantaneous earth fault elements. Alternatively, instantaneous earth fault protection may be incorporated in the motor circuit breaker. The earth fault protection shall not operate for unbalanced current surges during motor starting.

2.3.27 Motors

Motors shall comply with the requirements of IEC 60034 and IEC 60072 as amended and supplemented by this specification.

To minimize condensation in all motors, above 11 kW, when out of service, heaters of an approved type and rating, suitable for operation from the plant's LV ac single phase supply, shall be fitted inside the lower half of the stator frame.

The control of anti-condensation heaters shall be so arranged that they are normally energized when the motor is not running and automatically de-energized during motor operation.

All motors shall be provided with a means of earthing the frame.

All AC motors shall be capable of direct on-line starting and of continuous operation at rated output under abnormal frequency conditions and shall also be capable of operation for a period of not less than 5 minutes, with a voltage 25% below nominal voltage, at nominal frequency, without injurious overheating.

Motors shall be capable of withstanding the electrodynamic stresses and heating imposed if it is started at a voltage of 110% of the rated value.

All hardware associated with the motors shall be made of corrosion resistant materials.

The terminal box shall be weatherproof and firmly fixed to the motor frame.

The arrangement of the terminal box shall be such as to facilitate installation of cables, and allow interchanging of any two-phase leads, without 1 disturbing the sealing compound if this is used at cable terminations.

Where practicable, the motor end cover remote from the driving end shall have a removable plug to allow the speed to be checked by means of a portable tachometer.

Motors, where installed outdoors, shall be weatherproof and protected by a sun canopy.

2.3.28 Motors Test

Type tests shall be made on one unit of each type of different equipment at the Contractor's expense in presence of the Employer and the actual type test report shall be submitted to the Employer for approval. Instead of carrying out the type tests, the Contractor may submit duly certified and complete type test reports for tests carried out by an independent, accredited authority on similar equipment of the same type. However, the Employer reserves the right of accepting these certificates or to reject them partially or totally.

One motor of each type and rating shall be type tested and all motors shall be routine tested in accordance with the tests specified in IEC 60034, NEMA MG1, IEEE 112, 114, 115 and 85. These shall include, but not be limited to, the following:

- Winding resistance measurement (cold)
- Winding insulation resistance measurement (1-minute test)
- Winding temperature rise test
- Losses measurement
- No load tests
- Efficiency at 100, 75, 50 percent full load
- Power factor at 100, 75, 50 percent full load
- Locked rotor test
- Speed, torque/current curve
- Slip measurement
- Over-speed test
- Noise level test
- Bearings/lube. oil temperature measurement

Each motor shall be tested after installation and prior to commissioning as follows:

- Winding resistance measurements
- Insulation resistance test
- Air gap and alignment check (motor assembled on site)
- Direction of rotation check
- Start time running test uncoupled

2.3.29 Pushbuttons

Pushbuttons, which may be of the illuminated or non-illuminated type, shall be shrouded or well recessed in their housings in such a way as to minimize the risk of inadvertent operation.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

In instances where "enable" pushbuttons are required they shall be electrically interlocked with the normal control such that deliberate operation of the "enable" push-button is required before the normal control can take place.

The color of pushbuttons shall be as follows:

- When mounted on pushbutton stations adjacent to running plant the stop button shall be colored red and the start button colored green
- When mounted on the front of the contactor panel the stop button shall be colored red and the start button colored green.
- When mounted on panels or desks with adjacent indication lights both buttons shall be colored black, unless required otherwise.

Loose pushbutton stations unless supplied as weatherproof free-standing enclosures shall be of the metal-clad weatherproof type suitable for wall or bracket mounting with a minimum enclosure classification of IP54. All outdoor mounted pushbutton stations shall incorporate a protective cover or guard (e.g., toughened glass door) to prevent inadvertent operation.

Control stations shall be clearly labelled showing the duty or drive to which they are applicable. Location of ammeters shall be subject to approval of the Employer.

Pushbuttons used on desks, panels etc. many of necessity required to be of special types (e.g., miniature, illuminated). The Specifications and requirements for these special pushbuttons shall be subject to approval of the Employer.

Emergency stop pushbuttons shall be provided adjacent to all motors and machinery with exposed moving parts, couplings etc. to prevent danger, and on main and local control panels. These pushbuttons shall have a large "mushroom" head, be colored red and incorporate a protective cover or guard to avoid accidental operation. These buttons shall automatically lock in the depressed position, requiring twist or key resetting. Contacts shall be provided to cause tripping of the associated circuit, prevent restart of the circuit and bring up an alarm.

Stop pushbuttons mounted local to motors shall trip the associated circuit breaker or contactor regardless of the control position selected.

The contacts of all pushbuttons shall be shrouded to minimize the ingress of dust, and accidental contact, and shall be amply rated for voltage and current for the circuits in which they are used.

2.3.30 Earthing and Bonding

The main earthing conductors for connection to all electrical equipment, cables, motors, panels, etc., shall be provided for connection to the main earthing system.

All non-current carrying metal parts of electrical equipment shall be bonded to an earth terminal or terminals mounted on the equipment and readily accessible.

All equipment terminals provided for an external earth connection shall be identified by indelible means unless such terminals are directly and visibly mounted on metallic equipment frames or earth bars, when such marking may be omitted.

Identification marks for earth terminals shall comprise the colors green/yellow in combination or a reproduction of the symbol no. 5019 in IEC 60417.

Assemblies containing electrical equipment, including switchboards, control boards and control desks, shall be provided with a separate copper earth bar running the length of the

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

assembly. All metal parts and the earth terminal or terminals shall be bonded to this earth bar. Earthing connections shall not depend upon the bolting of steel/steel joints between adjacent panels or cubicles.

Earth bars shall be of adequate size and suitably supported and braced to carry the rated short circuit current for the associated electrical circuits for the rated short-circuit current duration, without damage or excessive heating likely to damage joints, associated or adjacent components.

Switchgear and control gear assemblies shall be provided with two or more earth terminals unless otherwise specified. The copper earth bar shall be sized to withstand the maximum system earth fault current for three seconds without deterioration.

The size of the copper earth bar in control panels, control desks or similar enclosures containing low voltage apparatus shall be such as to comply with the specified requirements for withstanding prospective short-circuit currents. The size of this bar shall be a minimum of 120 mm² cross-sectional area, providing that sufficient mechanical integrity is provided by adequate supports and terminals, and providing this size is not less than the size of the largest incoming power supply conductor.

The metal cases of all instruments, relays and the like shall be connected to the panel earth bars by copper conductors of not less than 1.5 mm² cross-sectional area, or by other approved means.

2.3.31 Testing Equipment

Contractor shall provide at his own cost the valid and traceable calibrated testing equipment required for all the site tests and commissioning free of charge and shall take back after testing and commissioning is completed.

2.4 GENERAL CONTROL AND INSTRUMENTATION REQUIREMENTS

2.4.1 Introduction

This section provides general requirements for controls, instrumentation and associated equipment. This section shall be applied in conjunction with the specific requirements sections, which specify aspects of the plant and equipment particular to the Contract. In the event of conflict between the specific requirements and the general requirements stated in this specification the specific requirements shall take precedence.

The requirements stated in this specification shall be deemed to apply throughout the plant including all auxiliary, common, and balance of plant systems whether explicitly mentioned or not.

2.4.2 Scope

The Contractor shall supply, install and commission all instrumentation required for the control, alarm and protection of his equipment and interfaces with other systems, taking account of the requirements of the specifications and ensuring safe, reliable and continuous operation of the plant under all operating conditions.

Equipment covered by the control and instrumentation specifications shall be designed, specified, selected, installed, commissioned or operated in accordance with relevant and recognized international design standards or codes of practice.

The latest issue of any standard including formal amendments at the time of Contract award shall be applicable. The Contractor shall maintain an index of standards and codes used throughout the Contract as part of the control and instrumentation documentation. Where multiple parts or sections of a standard or code exist, the Contractor shall determine, and comply with, the relevant part or section.

All electrical equipment supplied shall be in accordance with the relevant clauses in the General Electrical Design Requirements and shall be suitable for the site environmental conditions, seismic requirements and statutory regulations applicable in Pakistan.

2.4.3 Design Requirements

2.4.3.1 General

The requirements of these Specifications shall be strictly observed. In the event of contradictions, the Contractor is responsible for writing to the Employer to obtain written clarifications and approval.

All requirements are minimum requirements. The rules of good engineering practice and the relevant approved standards and regulations shall be observed.

The Contractor shall, where possible, use the same make and type of Control and Instrumentation equipment for similar applications throughout the entire power plant.

A consistent supply policy shall apply throughout the Plant and shall be implemented in terms of a range of equipment exhibiting a minimum diversity of type and manufacture. The objective shall be to standardize measurement and control equipment throughout the Plant to the maximum feasible extent in order to rationalize operation and maintenance skills required and to reduce the spares holding and lifecycle costs.

Generally, equipment of each type shall be supplied from one product range of a reputable manufacturer of international standing.

The systems shall be so designed that in the event of subsequent modifications to the controls and associated signal processing, expansion of the system is convenient and straightforward without replacement of major hardware components.

A minimum of 20% spare capacity shall be provided in all main signal cabling, junction box terminations, cables, input and output signals (including input/output (I/O) modules, interposing relays, internal wiring and terminations), instrument power supply miniature circuit breakers (MCBs) and fuses. A further 20% spare physical space shall be provided within panels and instrument racks and on cable routes.

The equipment covered by the control and instrumentation specifications shall have high electromagnetic and radio frequency interference immunity to an international standard and shall not be affected by portable communication equipment operated in its vicinity including mobile phones and hand-held radios used by plant personnel.

All electronic devices shall be protected against transient voltage levels. Surge protection, lightning protection and susceptibility to electrostatic discharge shall be in accordance with international standards.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

2.4.3.2 Safety and Reliability

The installed control and instrumentation equipment shall ensure that the Plant is always operated within safe limits of any measured process variable under all operating modes including start-up, shutdown, normal, abnormal and emergency conditions. Equipment supplied shall have proven reliability in similar previous power plant applications.

The Contractor's design intent shall be to ensure the safety and protection of all personnel and equipment while achieving a high level of Plant availability.

Where a safety system is required, the Contractor shall be responsible for carrying out the safety integrity level assessment for the safety functions and thereafter demonstrate how the required integrity of the safety system design is achieved, in accordance with recognized international standard. This requires that sensors and actuators selected by the Contractor for safety related duties have demonstrable manufacturer's data for failure rates, failure modes, diagnostic facilities, etc., as required to carry out the safety integrity analysis.

2.4.3.3 Plant Identification

A plant identification system shall be applied to all equipment within the Contractor's scope of supply.

Following Contract award and prior to issuing the initial design documentation the Contractor shall submit a detailed, Project specific plant identification system manual for approval to the Employer, this manual shall be maintained and updated as necessary throughout the Project.

The plant identification system manual shall include details of the following aspects of the system:

- Symbols, identifiers and numbering principles used on design documentation such as piping and instrumentation diagrams and electrical single line diagrams;
- Designation of instrument and control devices;
- Method of identifying different types of valves and instruments from the tag number;
- Numbering principles applied to cables, cable cores and junction boxes;
- Method of identifying piping breaks and piping functions;
- Identification of control signals, control functions, controller (within hardware and software);
- Incorporation of system or equipment numbers into the Project document numbering system.

2.4.3.4 Basic Interfacing

2.4.3.4.1 Binary signals

Potential free contacts shall be provided for status signals. Mechanically operated switches shall have snap action, the switch contacts shall be change over type and interrogated at +48 V dc.

Control signals shall be a pulsed square wave type output at either +24 or +48 V dc and maintained for a time period that is variable up to 1 second.

Where interposing relays are required to operate equipment, these shall be supplied by the equipment supplier and installed in his cabinets. These interposing relay coils shall not require more than 100 mA to operate.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Pulsed signals shall be available as either a single pulse or pulse stream.

Contacts used on all circuits which interface with the plant control system (PCS) shall be gold plated and suitable for low voltage and current operation. Wherever possible they should be hermetically sealed.

2.4.3.4.2 Analogue signals

Analogue signals shall be in the 4 to 20 mA range at 24 V dc.

A 0 to 20 mA signal shall be acceptable for electrical transducers only if 4 to 20 mA is not available.

Where an analogue signal has more than one destination, signal isolators shall be used to provide galvanic isolation between the two circuits.

2.4.3.4.3 Wiring

For standard applications the field cabling requirements are given in General Electrical Requirements section of the specifications. Additionally, the conductor size multi-core control cables and multi-pair control cables shall not be less than 1.5 mm2 (7/0.53).

Cable used for external wiring for analogue signals shall be twisted pair, individually screened, poly vinyl chloride (PVC) with low smoke zero halogen (LSZH) sheath overall screened multi-pair cable with a copper drain wire.

For special applications, e.g., thermocouple, resistance temperature device (RTD), vibration sensing circuits, data etc. other cable types may be used, subject to approval from the Employer.

2.4.4 Local Control Systems

2.4.4.1 General Requirements

Certain specialized, packaged equipment shall be supplied with a local control system provided by the equipment manufacturer.

The control and instrumentation requirements stated in this specification shall be deemed to be applicable to any equipment supplied as part of a package.

Where local control systems are provided these shall be suitably interfaced with or integrated into the PCS, to enable the supervisory control and monitoring of the local control system by the operators via the PCS HMI in the Central Control Room (CCR).

The signal exchange between the local control systems and the PCS shall be finalized during the design phase

The inputs and outputs associated with each local control system shall include: start/stop commands; trip, alarm, permissive and interlock signals; operational status and diagnostic data; condition monitoring data; all sufficient to allow safe and efficient operation of the Plant and for the purposes of performance monitoring and reliability centered maintenance.

Serial data communication may be adopted for bulk data exchange with the PCS, except for safety related signals and critical control commands and measurements, which shall be hardwired.

Where safety and reliability in operation of certain packages is critical the local control systems shall be subject to redundancy of communication, power supplies, processors and critical process measurements. Where redundant communication with the PCS cannot be implemented, the use of remote PCS I/O with redundant communication and/or hard-wired backup of the serial data link shall be considered.

All local control systems shall be synchronized to the master clock system used for the PCS and all events are time stamped at source on the same basis.

It shall be possible to operate all local control systems independent of the PCS in both manual and automatic modes. Local operations shall include start up, continuous operation and shut down of the packaged equipment and its associated auxiliaries. During such operation the equipment shall be interlocked with other areas as necessary to prevent any unsafe condition.

In general, loss of communication with the PCS should not cause the system to failure of the local control system or the associated plant.

2.4.4.2 Mimic Panels

Process or electrical one-line mimic diagrams shall be installed on panels where specified or alternatively where their presence would assist plant operators in assimilating the operational state of the Plant. Mimic diagrams shall meet the following general requirements:

- Different and distinctive colors shall be used for the different media around the plant or for different voltage levels on electrical mimics. The assignment of colors shall be subject to approval by the Employer.
- The position of valves, switchgear and other controlling devices shall be indicated by continuous position indicators. The position of isolating valves, dampers or switchgear shall be indicated by high intensity light emitting diodes (LEDs).
- Operation of isolating valves, isolating dampers or switchgear from the mimic shall be by means of discrepancy switches, rotary switches or push-buttons designed to perform in a similar manner.

Mimic panels that are not located in a secure control room are required to have a means of securing the controls from unauthorized use.

2.4.5 Emergency Stop Push Buttons

Red, mushroom pattern, mechanically latching push buttons, with key-switch reset and hinged protective hoods, hard wired to the plant control circuit, shall be adopted for emergency stop push buttons throughout the plant and in control rooms in accordance with applicable safety standards and hazard studies.

2.4.6 Programmable Logic Controllers (PLCS)

2.4.6.1 General

Where local control systems are of significant size or complexity, they shall utilize PLCs. These shall be selected from the same product range, designed, manufactured and configured in accordance with recognized international standards and with proven prior applications in the power generation industry.

The PLC product range shall be scalable so that each installed system is suited to its application in terms of memory size, I/O capacity and I/O type. Selection of the PLC product range shall also consider the communication protocols and media supported by the range to ensure the PLCs can be seamlessly integrated with the PCS.

The PLCs shall be back plane mounted and of modular construction. Any of the modules shall be replaceable while the PLC is under power without disruption of any other modules within the system.

As well as the installed spare I/O capacity specified, the PLC systems shall allow for the addition of I/O modules wherever this is required for future system expansion.

Programming languages and techniques shall conform to a recognized international standard.

2.4.6.2 PLC Configuration

Redundant PLC processors shall be installed for local control systems, the processors shall be synchronized such that switching over to a standby processor does not result in any disturbance to the PLC outputs and is transparent to the PCS operators.

The PLC systems shall be supplied complete with portable computers, programming software, licenses, connecting leads, etc. sufficient to allow maintenance, testing and reconfiguration of any of the installed PLC systems.

Configuration of the installed application software shall be protected by means of key-switch and password security to prevent unauthorized modification of the software.

The configuration tools shall include a facility for forcing I/O points for testing, commissioning and maintenance purposes.

Where redundancy exists in the equipment being controlled, I/O signals shall be segregated and configured such that failure of a single I/O module shall not jeopardize continued operation of that equipment.

Failure of any module shall be alarmed at the PCS.

The failure modes of the PLC modules and communication interfaces shall be configured specifically for each application, the failed state of any PLC output shall depend upon the equipment being controlled, its criticality with respect to continued power generation and the implementation of safety functions related to that equipment.

2.4.6.3 PLC Documentation

Application programs shall be designed and documented to facilitate user understanding and future modification by maintenance staff. Textual remarks shall be included throughout the program to explain or clarify the control logic.

As-built copies of the application programs shall be provided in hard copy and electronic formats. During the design and implementation phase, however, program listings shall not be required for review.

The PLC system design documentation to be submitted for review shall take the form of a functional design specification (FDS), which shall include the following:

- System overview;
- Functional block diagrams and descriptions of the controls, sequences, safety functions, etc.;
- Hardware to be supplied;
- Instruction on system hardware settings, software files and versions used, application files and how they are installed;
- Operational procedures and system set points;

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- Interfaces: HMI, plant and system interfaces, communication protocol definitions, I/O lists;
- Availability data;
- Acceptance testing procedure;
- Training Proposals.

2.4.7 Field Equipment

2.4.7.1 General Requirements

Plant protection functions shall be implemented using redundant measurements, regardless of where the logic element of the safety function is implemented. This redundancy shall be in the form of multiple sensors with suitable signal processing and voting installed in the control and protection system. The turbine control systems shall be provided with the manufacturer's recommended protection functions.

In general, transmitters shall be employed for deriving process switching functions.

All instruments shall be protected by cases and positioned for ease of access and viewing. Cases shall have a minimum IP enclosure classification in accordance with the relevant international standards.

Electronic instruments shall not be located in locations liable to dripping or draining of water. Ambient temperature up to 55 °C shall not result in calibration difficulties or rapid deterioration of electronic components. For locations in direct sunlight, appropriate sunshades shall be provided.

Analogue signals shall be standardized at 4 to 20 mA DC in the field. Plant status and alarm signals shall be standardized to a DC voltage level between 22 to 50 volts. Pneumatic transmission and control signals where offered shall be of the 0.2 to 1.0 bar (3 to 15 psi) standard range.

Measurement and control instrumentation shall have high electro-magnetic and radio frequency interference immunity and low emission radiation to the appropriate international standards and shall not be affected by portable radio transmitters operated in the vicinity of the equipment.

All instruments whether for local indication or remote transmission shall be of good quality and shall have an accuracy and repeatability appropriate to their duty. The Contractor shall state the accuracy and repeatability of each instrument in the documentation.

The ranges of all instruments shall be arranged, where practicable, so that normal working indication is at approximately 60 % of full-scale deflection, with the exception of devices based on a square root relationship which shall normally work at 75 %.

Measurement and control instrumentation equipment shall be matched to the main plant equipment ratings in all respects. Installation codes of practice and precautionary measures for safety of the Plant and the operating and maintenance personnel shall be followed.

Each field mounted instrument or device shall be properly labelled as detailed elsewhere in the Specification. All instruments shall be identified by appropriate tag numbers; permanent, non-perishable, nameplates attached to each instrument shall be used for this purpose. Nameplates shall be attached by permanent mechanical fasteners.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Further, every such instrument or device incorporating an indicator shall also be labelled with its duty description.

2.4.7.2 Electronic Transmitters

All transmitters shall be fitted with an output indicator. Transmitters for process variables such as pressure or temperature shall be dedicated devices. Slave transmitter devices, driven from gauge mechanisms are unacceptable.

Transmitters shall be provided with all necessary isolating, vent and blowdown valves, thermometer pockets and interconnecting pipe work. Interconnecting pipe work shall be stainless steel. Transmitters subjected to high pressure (above 40 bars unless otherwise agreed) shall be provided with double isolation valves to all services.

All transmitters shall be supported in a vibration free manner independently of the plant connections and shall be mounted in the correct attitude. No stress shall be imposed through the connections between the plant and the transmitter.

Where practicable, transmitters shall be grouped together into enclosed racks or panels for easy access. Mechanical and electrical sections of these panels shall be segregated.

Facilities shall be provided for the connection of test instruments to the input and output of each transmitter to enable in-situ calibration to be carried out.

Bodies, primary elements and wetted parts shall be of a material that is corrosion resistant to the process fluid and the environmental conditions.

Differential pressure (DP) and DP flow transmitters shall be furnished with a close coupled equalizing five-valve manifold.

Variable area type flow transmitters shall be of all metal construction with an appropriate means of analogue signal transmission.

To maintain minimum spares holding, the range of transmitters used for general pressure and differential pressure applications shall have facilities for simple in-situ range changing without changing of components. Each type of transmitter within the range shall exhibit a minimum of 4:1 between maximum and minimum spans, but preferably 6:1. In addition each transmitter shall incorporate means of zero suppression or elevation allowing zero shifts equivalent to 100% of maximum transmitter span.

All differential pressure transmitters shall be capable of withstanding, without damage or calibration change, full rated line pressure as a differential input. Pressure transmitters shall withstand at least 150% of nominal input range without damage or calibration change.

Transmitters for use with electrical input signals such as thermocouples or resistance temperature detectors shall allow range changing in-situ. They shall incorporate electrical isolation between input and output.

2.4.7.3 Smart Transmitters

Smart transmitters that allow interrogation of transmitters by handheld communicators may be employed for all general-purpose duties such as flow, level, temperature, pressure etc. Additionally, these transmitters may be used for direct digital communication with the PCS, defining the communication protocol proposed.

The transmitters shall have been in operational service for a minimum of Three (03) years and shall be sourced from a single manufacturer of international standing.

The number of portable communicators shall be subject to the approval from Employer; however, it shall not be less than One (01) communicator per 50 smart transmitters or part thereof and shall include all necessary software licenses.

SMART transmitters shall have the following features:

- Transmitters using the HART protocol are preferred
- All types shall be configured and re-ranged by a common communicator.
- The output shall be 4 to 20 mA linear.
- Digital output shall be available as an option.
- Self-diagnostics shall be provided.
- Self-tagging and identification.
- Protection shall be provided against radio frequency interference (RFI), voltage surges and reverse polarity.
- Input/output isolation.
- An integral output indicator shall be provided scaled 0 to100 %.
- Zero elevation or suppression.
- Microprocessor based electronics.
- Accuracy shall be better than 0.2% of span for 4 to 20 mA outputs.
- Built in ambient pressure and temperature compensation.

Other requirements shall conform to the table of minimum requirements for electronic transmitters and relevant international standards.

2.4.7.4 Temperature Measurement

Mercury-in-glass thermometers are not permitted under any circumstances.

2.4.7.4.1 Electrical Temperature Measurement

Temperature measurement shall be carried out using resistance temperature detectors, (RTDs) unless conditions dictate RTDs are unsuitable, then thermocouples shall be used.

RTDs shall be Platinum Pt100 three wire type and all RTDs and thermocouples shall be duplex.

Temperature readings required for the calculation of performance data should have an accuracy of ±0.2 % in their normal operating range.

Where a temperature measurement is to be used for control purposes, head mounted transmitters with 4 to 20 mA output signals and local indication shall be provided. In other cases, the use of signal converters is allowable provided the length of cable run does not exceed 50 m.

In all cases a length of flexible cable of 1.5 m shall be connected between the head of the temperature sensor and a local junction box to allow for the withdrawal of the sensor from its pocket without disconnection of the cable and without disturbing adjacent wiring.

Where thermocouple extension leads are provided these shall have the same conductor materials as those of the thermocouple. Wherever practicable thermocouple extension leads

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

shall be terminated locally to the plant in groups and the Contractor shall state the method of cold junction compensation on the schematic diagram for each application.

Thermocouple compensating cable shall be appropriate to the thermocouple, right up to the point of cold junction compensation.

Resistance Thermocouple Detectors (RTD's) shall conform to IEC 60751 "Industrial platinum resistance thermometer sensors". They shall have a resistance of 10 ohms at 25°C.

Thermocouples shall comply with IEC 60584 "Thermocouples". Extension leads for all thermocouple devices shall run in compensating cable up to the point of the cold junction compensation.

High speed response pockets shall be provided for all applications involving control of critical process temperatures and where rapid temperature transients are expected.

2.4.7.4.2 Dial Type Temperature Measurement

Filled system dial thermometers fitted with over-temperature alarm and trip contacts shall be used where specified for critical temperature measurement and shut down of plant. The dials shall be panel-mounted.

Additionally, filled system and bi-metallic type dial thermometers shall be used as appropriate for local indications in the field. The minimum dial size shall be 100mm diameter. The use of mercury as a fill material shall not be permitted in any device.

The capillaries of filled system thermometers shall be armored, the material of capillary, armoring, fitting and case shall be 316 stainless steel.

2.4.7.5 Pressure Measurement

This clause applies to pressure, differential pressure and head-type level instruments.

All pressure instruments shall be capable of continuous operation at the maximum pressure indicated on the chart or scale. All pressure instruments shall have suitable over-range protection.

A pressure instrument installed for measurement of steady pressure shall normally operate at 75 % of its maximum range under normal operating conditions.

All local mounted pressure gauges shall comply with the appropriate international standard and shall have a dial size of 150 mm diameter.

In locations with high humidity all pressure and differential pressure gauge case materials shall be 316 stainless steel.

All pressure gauges shall be provided with instrument isolation vent and test (two-way) valve assembly. All wetted materials shall be 316 stainless steel. The assembly shall be additional to the primary isolation valve. All pressure gauges shall be of the heavy-duty process type and shall be liquid filled.

All differential pressure gauges shall be provided with five valve (five-way) manifolds. All wetted materials shall be 316 stainless steel. Liquid-in-glass manometers shall not be used for pressure and differential pressure gauges. Three-way valve assemblies shall not be used.

All pressure and differential pressure switches and transmitters shall be generally separate from and independent to gauges. Integral local gauge and switch/transmitter units shall not be

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

used and separate devices shall be provided for the separate functions of local observation and of remote monitoring and of interlocking.

Not more than two pressure measuring devices shall be supplied from one tapping point. Each pressure measuring device shall have its own isolating valve(s) close at the tapping point. Where pressure signals are used for control and/or interlocking systems each device shall have a dedicated tapping point.

2.4.7.6 Flow Measurement

Flow shall be measured in mass or volume rate according to the units of measurement normally associated with each type of service.

The accuracy of flow measurements shall be appropriate to the duty concerned and shall be subject to the Employer approval in cases where fiscal and critical control measurements are concerned.

Where flow meters are used with totalizers to provide total consumption for efficiency or fiscal purposes, then such flow meter circuits shall be provided with low flow cut-offs so that when the line is out of service or shutdown, the flow integrators do not increment due to instrument zero drift.

Differential pressure meters in conjunction with square edged concentric orifice plates (or flow nozzles) shall normally be used for the measurement of fluid flow in pipes except in the following cases:

- Where the requirement of accuracy cannot be met.
- Where wide ranges of flow rate exist.
- Where there are limitations of system pressure drop.
- Where piping configurations are restrictive, e.g., fully welded construction.
- Lines subject to pulsation.

Magnetic type flow meters, flow nozzles and venturi tubes may be considered as alternatives.

Eccentric or segmental orifice plates shall be used for measurement of fluids carrying suspended matter that might tend to cause build-up.

Orifice plates and flow nozzles shall be manufactured in 316 stainless steel unless otherwise specified or required by the nature of the process fluid.

Manufacturing tolerances and installation details for orifice plates and flow nozzles shall comply with ISO standards.

Positive displacement type or turbine type meters may be used as an alternative providing their use for such purposes is within the acceptable limits of the measurement requirements and approved by the Employer.

Ultrasonic, vortex, Coriolis, averaging pitot or other types of flow meters may be used under special circumstances subject to approval from the Employer.

Where the in-line portion of the flow meter is removable, upstream and downstream isolation valves, drains, vents and purge points shall be provided as necessary to enable dismantling and removal of the flow meter assembly. The location of such isolation points, drains and vents and the upstream and downstream piping layout shall conform to the requirements for ensuring best accuracy of the flow meter.

Flow straighteners and minimum upstream and downstream straight piping lengths shall comply with the ISO requirements for "zero additional uncertainty" in the flow coefficient; this applies to the criteria for the first upstream length between the meter and the first upstream fitting and the second upstream length between the first and second upstream fittings, as well as the downstream length.

Metering runs shall be kept to a minimum and shall conform to the appropriate international standard.

Meter run piping and isolation valves shall conform to not less than the main pipeline rating to which they are connected.

Tags on orifice plates shall be stamped with the basic design information (i.e., flow rate and direction, pressure and temperature of the passing fluid, the orifice diameter and the pressure differential generated). The tag shall indicate the upstream side of the orifice plate.

In general, orifice plates shall be designed for flange taps. Other tapping arrangements may be used, after approval from the Employer.

2.4.7.7 Level Measurement

Level measurement shall generally be made by either displacement or differential pressure measurement. However, for special applications techniques such as ultrasonic beams, capacitance probes, radar, etc., shall be considered, provided that suitable signal conditioning is supplied to generate the standard signal range.

Where the use of level switches has been specifically approved, simple float operated switches should be adopted. Switches shall have a snap action with limited hysteresis to prevent contact bounce caused by small fluctuations in level. Switches shall be fitted within external chambers provided with isolation valves, drains and vents. These chambers shall be in accordance with the mechanical piping specification. It shall be possible to isolate all level switches and to drain the chamber and to test the mechanical and electrical operation of the switch without its removal from the process and without shutdown of the process.

It shall be possible with both the displacer type and differential pressure type of transmitter to isolate the transmitter from the process by suitable tight shut-off valves conforming to the pressure rating of the vessel to which they are connected and allow removal of the transmitter for maintenance without causing shutdown of the process.

Switches that are operated by magnetic coupling by attachment of the switch to gauge tubes shall not be used for tripping but may be used for alarm only.

It shall be possible with both the displacer type and differential pressure type of transmitter to isolate the transmitter from the process by suitable tight shut-off valves conforming to the pressure rating of the vessel to which they are connected and allow removal of the transmitter for maintenance without causing shutdown of the process.

For measurement of large storage tanks, the level indication and where possible the sensing device and transmitting mechanism shall be located at the base of the tank to allow the system to be observed and maintained from ground level.

Tank gauging systems of suspended float type shall have all components of 316L stainless steel, unless otherwise specified or required by the nature of the process fluid; this includes the materials for wire, pipe, fittings, sheave, elbows, etc.

On differential pressure types of measurement where a reference leg of process fluid is used, the design of the system shall ensure that the reference leg is fully maintained at its prescribed height during all conditions of process level change and changes in process conditions and that the density of the reference leg does not vary from that of the process fluid because of temperature changes or other reasons.

For local indication of level, gauge glasses may be used providing they conform to the rated design criteria for the vessel, are equipped with quick closing isolation valves, lever handles and replaceable sets. Isolating valves for gauge glasses shall be fitted with ball checks.

Transparent or reflex type gauge glasses shall be used as and where service conditions allow.

All tubular glass type gauges shall be furnished with safety protective shields.

Connections shall be provided at the top and bottom of the gauge glass for draining and flushing purposes.

All types of level device shall be installed so that removal of the device is possible with the tank or vessel full and/or with the process in operation. This requirement applies to all types of storage tanks and process vessels.

2.4.7.8 Actuators

2.4.7.8.1 General

Actuators for valves shall be electrically operated. Self-contained hydraulic units may be considered where high thrusts or high speeds of operation are required.

Actuators for ON/OFF duty or manually positioned units shall generally be electric motor driven; however, the use of solenoid types on small valves shall be allowed, depending on the duty.

The various types and sizes of actuators shall be rationalized and as far as possible each type shall be from a common manufacturer to facilitate inter-changeability and to minimize spares holdings.

The operation of all actuators, control valves and driven units, shall be so arranged as to ensure the safety of the Plant under failure of control or actuating supplies.

Unless otherwise specified, the failure of a control signal or actuator power supply shall result in one of the following:

- Cause the actuator to move to a safe position.
- Freeze the actuator in its last operating position.
- Cause driven equipment to stop.

In any case the failure mode shall be suitably monitored and the operators informed by an alarm and the failure mode shall be selected to comply with the design and operational requirements of the Plant.

Where the type of actuator offered does not have the appropriate fail-safe facilities described above then the valve or damper shall have a second valve or damper in series or in parallel with it as appropriate to provide the correct failure response.

When an actuator freezes or moves to a safe position on failure detection, it shall not be possible to return to automatic control without resetting action by the operator after restoration

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

of the power supply or control signal. Similarly, remote manual control should not be possible if this would allow the possibility of large disturbances to operating plant.

Each actuator shall be fitted with a position transmitter for indication of actuator position. This requirement applies irrespective of the operating mechanism, whether electric or hydraulic.

Where control requirements call for split range operation, the computing of the split range shall be carried out externally from the actuator such that standard signal inputs to the actuator are maintained.

All actuators shall incorporate a mechanical device to show the true position of the operating mechanism.

All actuators shall have a hand wheel or lever for direct manual operation. The diameter of the hand wheel and geared effort shall be such that they are reasonably operable by one operator. A lockable mechanical clutch mechanism shall be provided to inhibit power control of the actuators when the hand wheel is operated. The disengagement for hand control shall signal remotely to indicate that the normal operation of the actuator is inhibited.

For electric actuators two classes are covered in the sections below: actuators for ON/OFF, isolating duties and open loop control; and actuators of the switched type and continuous control type required for modulating, closed loop control. Unless otherwise agreed fully integrated or self-contained units shall be provided for all electrical actuators so that all components are located on the valve, within the actuator enclosure.

2.4.7.8.2 Electric Actuators for Isolating Duties

In addition to general actuator features specified above, the following features shall be provided for each actuator:

- DC interposing relays for open and close (raise and lower) commands.
- Open and close travel limit switches (each with change-over contacts) for status feedback to the control system.
- Open and close indicating lamps.
- Open and close push buttons for local control.
- Power supply failure monitoring and alarm.
- Key switch for local/remote control mode selection.
- Analogue actuator position output signal.
- Thermal overload protection and thermal winding protection.
- The DC interposing relays shall operate at the normal control system I/O binary control voltage level.

2.4.7.8.3 Electric Actuators for Modulating Duties

Two principal types are recognized:

- Switched Actuators - Each actuator shall be driven by a duration modulated switched power signal at the full AC supply voltage. The actuator shall feature either electromagnetic or mechanical braking. However, the latter shall only be accepted on low power single phase actuators and a brake life in excess of 107 operations shall be guaranteed by the Contractor. They shall not be used when full travel times of less than 15 seconds are required.

- Continuous Control Actuators - For each actuator the drive voltage and current or frequency of the AC power source shall be continuously varied to regulate the rate of operation. Each shall be capable of slow creep operations as well as rapid stroke

action and the operating torque shall be sensibly independent of the speed of operation. Continuous control actuators shall be provided for all demanding modulating control applications in which high torque, a wide range of stroke rate and frequent correction is anticipated.

Static power amplifiers or switch units shall be provided for either type of modulating actuator.

The actuator and associated power amplifier unit shall be manufactured as a composite system; this configuration shall have a minimum of Three (03) years of proven service reliability. The actuator and drive unit shall be rated continuously for the stalled condition and three phase motors shall be provided for all actuators with ratings above 250 watts.

The following features shall be provided for each actuator:

- The drive unit shall accept an analogue 4-20 mA actuator position demand signal or pulsed raise and lower signals if an external position loop is provided.
- An analogue actuator position feedback signal.
- A test facility.
- An override facility for stroking the actuator in either direction for binary control interventions.
- Monitoring of common fault conditions such as thyristor drive fault, motor temperature high, AC power supply failure, circuit continuity fault, etc.
- All necessary protection devices to protect the actuator and drive unit against abnormal operating conditions.

The Employer approval shall be required where different types of actuators are offered to those specified above or where the drive unit and actuator are selected from different ranges or manufactures. Additionally, these shall be subject to a type test to prove their satisfactory performance under equivalent operation conditions.

2.4.7.8.4 Electro-Hydraulic Actuators

Generally, these actuators shall only be used where high thrusts are required, combined with fast operating times, and the application requirements cannot be met by the standard range of actuators used in the Project.

The units offered shall be of the self-contained, fully sealed types which allow removal of the complete unit to a clean room for any maintenance requirements.

Units accepting either 4-20 mA signals or pulsed input signals shall be acceptable.

Failure of the internal hydraulic supply shall result in the actuator locking in its last operating position or stroking to its fail-safe position and a suitable alarm shall be given to the operator.

2.4.7.9 Instrument Piping

Instrument piping shall be of copper or stainless steel.

2.4.7.10 Electrical Meters

All electrical meters shall comply with IEC 62052 and 62053 "Class 0.5, 1 and 2 alternating-current watt-hour meters", and shall be of industrial grade accuracy. Three phase power measuring instruments shall be of the 3-phase unbalanced load pattern wherever the current and voltage references permit. Volt meters shall be provided with selector switches.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

2.4.7.11 Junction Boxes

Junction boxes shall be used for routing of control related signals and shall be constructed from sheet steel. Stainless steel shall be used for outdoor applications and where damp conditions may be expected.

Separate junction boxes shall be provided for the following circuits:

- AC and DC circuits.
- Instrumentation signals.
- Protection/safety circuits.
- Electrical power circuits.
- Intrinsically safe circuits.

All terminals and junction boxes used on intrinsically safe circuits shall be colored light blue.

Terminals within junction boxes shall preferably be mounted vertically and arranged to provide ease of core termination and adequate routing space. The blocks shall be individually referenced and the terminals numbered according to the wiring diagrams. Terminals for power circuits shall be shrouded. Sufficient terminals shall be provided to terminate all signal wires (including spare wires) and for connecting the cable screens where appropriate.

All electrical interface connections such as instruments, pushbutton stations, etc. shall be terminated in a junction box.

No package wiring shall be connected to the field wiring side of the terminal blocks.

Terminations shall comply with the requirements stipulated for Control Panels.

2.4.8 Nameplates

Each field mounted instrument or device shall be properly labelled and identified by appropriate tag numbers; permanent, non-perishable, nameplates attached to each instrument or device shall be used for this purpose. Nameplates shall be attached by permanent mechanical fasteners.

Name plates on orifice plates shall be stamped with the basic design information: flow rate and direction, pressure and temperature of the process fluid, the orifice diameter and the pressure differential generated. The name plate shall indicate the upstream side of the orifice plate.

2.4.9 Earthing

The Contractor shall submit his proposed earthing arrangements for approval by the Employer.

The Contractor shall be responsible for ensuring compatibility and continuity of control system earthing across the entire plant. All earth connections for the control system shall be made via a single path to the station earth. Earths separate from the station system shall not be permitted for safety reasons.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

SECTION 3 BASIC DESIGN CRITERIA

3.1 GENERAL

The design of all structures shall be carried out based on current internationally recognized standards and / or guidelines widely accepted and adopted by the hydropower engineering professionals. The design standards adopted should as far as possible, be from a single authority and be available in the language of EPC Contract. The design of the Project will be submitted by the Contractor to the Employer for review and approval by the Employer without relieving the Contractor of full responsibility for the design.

The complete standards and design codes that will be proposed by the Contractor shall be subject to review of the Employer. A complete set of such standards and codes shall be kept on the Site for the use of the Project.

3.1.1 Design Criteria and Requirements

The detailed design shall be based upon the design criteria stated herein, the Design Memoranda submitted with Contractor's Proposal, and additional Design Memoranda and design analysis as necessary to complete the design of the works.

The permanent works shall be designed according to the latest version of international standards relevant to the particular section of works such as ACI-318-01 and allied codes. Temporary works shall be designed to be safe, reliable, and adequate for all loads and uses, and where they are to be incorporated into the permanent works temporary works shall be designed in strict compliance with the criteria adopted for the permanent works.

3.1.2 Compliance with Local Regulations

In addition to the Basic design criteria, the design shall also conform to the requirements of all relevant local, state and federal authorities where approvals for that section of works is needed from the relevant authorities.

3.1.3 Economic Life of Works

The design shall be based upon a useful economic life of Fifty (50) years for all elements of permanent structural facilities assuming the Employer will perform normal routine maintenance; and not less than Twenty-Five (25) years for equipment, assuming the Employer will operate the works and perform normal routine maintenance in accordance with the works operation and maintenance manuals.

3.1.4 References and Standards

a. Except where specified, all design and construction work, including the materials used and methods applied, shall be in accordance with internationally recognized standards of practice as mentioned in Table 2-1.
b. The Contractor must make available two copies of such standards in English language.
c. Where there are differences between the various standards; the most stringent standards shall be adopted so that the completed work shall be safe, durable and adequate for intended purpose under most severe loading conditions
d. Should the standards referenced herein not be applicable, other relevant standards may be used subject to Employer's approval. The Contractor may propose alternative standards where desired, provided that standards prepared by internationally recognized organizations are proposed. Differences between the standards specified

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

and the proposed alternative standards must be fully described in writing by the Contractor and submitted to the Employer for review and acceptance.

e. If other standards are chosen, the Contractor shall supply copies of those standards in English language only, clearly identifying or referring to the particular chapters or sections that shall be applied.

f. Where ever the term "or equivalent International Standards" is mentioned in the bidding documents; that is subject to approval of the Employer and valid for successful Proposer only after award of the contract.

g. Unless otherwise specified, all equipment in the Complex, including Electro-Mechanical and Hydromechanical equipment and systems shall be designed, built/fabricated, installed, tested, and commissioned in accordance with the latest editions and amendments of Standards and Codes of the following institutions.

Table 3-1: Reference Standards

DIN	Deutsche Industrie Normen
ASTM	American Society for Testing and Materials
AISI	American Iron and Steel Institute
EN	European Standard
ASME	American Society of Mechanical Engineers, Boiler and Pressure Vessel Code
IEC	International Electro Technical Commission
AISC	American Institute of Steel Construction
AWS	American Welding Society
AGMA	American Gear Manufacturers Association

38. American Society for Testing Materials and Standards (ASTM).

l. Occupational Safety and Health Administration (OSHA) Standards such as OSHA 29 CFR 1926 Standard and others.

3.1.5 Functional Requirements

The Attabad Lake HPP shall be designed to operate as run-of-river Project with an installed capacity of 55.68 MW (at generator terminals) using the design discharge of 60 m3/s and rated gross head of 110.14 m. The Project shall be designed for local manual and automatic operations.

3.1.6 Design Documents and Construction Drawings

All construction drawings shall be presented in a format compatible with AutoCAD version as advised.

The Contractor shall have staff at the Site to make revisions of drawings and documents during construction as needed to document of “as-built” conditions.

All documents provided shall be in the English language.

3.1.7 Units and Systems of Measurement

The system of measurement to be used in the Project shall be in SI units. When required, conversion of units and site data shall be the responsibility of the Contractor. Angles shall be given in the 360-degree system.

The coordinate reference system to be used for all Works in the Project shall be defined by a quadrant grid system. Each drawing shall contain a scale reflecting the appropriate meter spacing.

3.1.8 Future Inspections and Maintenance

Provisions shall be made to permit inspection and maintenance of all Works. Easy access and safety shall be provided for these operations.

3.1.9 Seismic Design Requirements

The design of the Permanent Works shall incorporate seismic loads appropriate to the Project's location and geological conditions. The Civil Works EPC Contractor shall be responsible for the structural seismic design of all permanent civil structures, including the powerhouse, foundations, and embedded structures, ensuring compliance with the required seismic performance criteria.

The E&M Contractor shall be responsible for ensuring that all Electro-Mechanical equipment, auxiliary systems, and supporting structures are designed, installed, and anchored in accordance with the specified seismic requirements. The E&M Contractor shall coordinate with the Civil Works Contractor to obtain relevant structural response data, including dynamic characteristics, load transfer mechanisms, and anchoring provisions, to ensure seamless integration of equipment within the seismic-resistant civil structures.

Seismic design of critical structures shall be based on dynamic analyses, considering both Operational Basis Earthquake (OBE) and Maximum Credible Earthquake (MCE) events. The OBE and MCE shall be determined using internationally accepted probabilistic and deterministic earthquake analysis methods.

The E&M Contractor shall provide analytical verification and structural interaction assessments for critical components to demonstrate compliance with seismic design requirements. Both EPC Contractors shall ensure that all seismic-related design, installation, and mitigation measures are aligned to maintain the structural and operational integrity of the Project under seismic loading conditions.

SECTION 4 USE OF SITE AND ENVIRONMENTAL ASPECTS

4.1 USE OF SITE

4.1.1 General

The Contractor shall be responsible for ensuring that, during all the Project activities on site, there should be no adverse impact on the operations of any structures owned by government of Pakistan and Gilgit Baltistan and Private sector.

4.1.2 Boundary of the Site

The Site includes areas for site installations, residential colony, offices. Contractor's camp and warehouses, storage yards, etc.

The Contractor shall make his own arrangements for any required areas outside the land provided by the Employer at his own cost and risk.

Areas outside the boundaries shown on the drawings that are used for quarries, borrow pits and disposal areas or where work is carried out or materials are stored shall not be part of the Site but shall remain subject to all ESHS requirements of this Contract.

4.1.3 Setting Out of Site Installation

Setting out of site installation shall be carried out in accordance with the detail design drawings.

Should in any instance discrepancies occur between the drawings and the actual conditions at Site (topography, geology, etc.) the Contractor shall immediately notify the Employer and prepare an Alternative Proposal for approval prior to implementation.

4.1.4 Regular Maintenance and Cleaning of Site Installation

During the entire construction period and until the end of the Contractor has cleared Site after the Completion Date, the Contractor shall provide a daily refuse collection and disposal service including loading, transportation and dumping at areas, where prior permission from the concerned authority has been obtained, in order to keep the Site in a proper, clean and safe condition.

4.1.5 Permanent & Temporary Access

The construction and maintenance of permanent & temporary access roads from public roads to the Site (including crossings) as well as temporary roads within the site boundaries and permanent site roads used as temporary access shall be included in the site installation. The Contractor shall undertake proper construction & maintenance of all roads used by him during the entire construction period, both permanent and existing roads, as well as all temporary roads.

Maintenance and cleaning of all roads used during construction to minimize danger, enhance use and reduce breakdown, including existing public roads, and bridges, shall be performed promptly upon notification by the Employer and shall include removal of slides, road surface repair and drainage system cleaning and upgrading, over the total construction period.

The design and construction or modification of access roads shall be according to Pakistani Standards for both, temporary or permanent roads. These roads will be triple surface treated, designed and constructed in accordance with the AASHTO specifications.

The work shall include the, provision of such traffic control signals, lighting and signs as the Contractor may require or as requested by public authorities. All roads shall also be for the use by the Employer and relevant authorities without restriction.

4.1.6 Car Park Areas

Site installation shall include the construction, maintenance and removal of the temporary car park areas for the site transport of the Contractor, Employer.

4.1.7 Storage Areas

The Contractor's site installation shall include the construction, maintenance and removal of temporary storage areas at the Site and at off-site locations chosen by the Contractor. They shall be indicated in the general layout drawings, inclusive of any additional temporary storage areas in or about the Site required in connection with the construction works. Temporary storage area shall include drainage facilities, sumps, oil traps, separators and isolation in case of storing chemicals and oil. Any land not located within the Site which the Contractor considers necessary for his site installation, shall be acquired by the Contractor at his own expense.

Storage areas and all other areas which be used for any Project's construction activity shall, as a minimum, be furnished with a drainage layer of sand and gravel with a minimum thickness of 8 inches.

4.1.8 Project Sign Boards

The Contractor shall design, supply, erect and maintain one signboard, approximately 2 m wide by 1.5 m high, at the entrance of the Site or at a location to be agreed by the. The Employer shall review and agree the Contractor's design. The Contractor shall employ an experienced sign-writer to prepare the signboard.

The Contractor shall remove the signboard and associated footings on completion of the Works and leave the site in the specified condition.

The Contractor shall not display any advertisements within or around the Site without the prior written approval of the Employer.

4.1.9 Site Clearance at Completion

After completion of the Works, the Contractor, with prior approval of the Employer shall:

- Remove all Contractor’s buildings, installation and temporary facilities,
- Shall fill with earth all basements and underground areas, clean up and restore the terrain to its original condition, and
- Treat the excavations executed for his own convenience, such as temporary roads, in a way acceptable to the Employer.

If the Contractor shall fail to remove the buildings, plant, equipment and installations or if the operation shall not be made as specified within two (2) months from completion of the Works, such buildings, plant, equipment and installations may be removed by the Employer and the removal costs shall be deducted from the Contractor's final payment.

The Employer shall have the right to take-over a part or all of such buildings and installations at no extra cost. All buildings and installations shall be handed over in good condition.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Prior to Taking-Over of the Works, permanent roads used by the Contractor during the execution of the Works shall be left in good condition. With regard to temporary roads constructed for the Contractor's use, the Employer shall indicate in which condition the areas shall be left, and the Contractor shall establish this condition at his own cost.

4.2 ENVIRONMENT, SOCIAL, HEALTH AND SAFETY REQUIREMENTS

In addition to the responsibilities mentioned in section 1.11.13, the Contractor shall be responsible for the following.

4.2.1 Legal Requirements

The Contractor shall comply with all legal duties and obligations regarding the protection of the environment as laid down Laws and Regulation of Governments of Pakistan and Gilgit Baltistan.

4.2.2 ESHS Policy and Objectives

Contractor shall have in place OHS and Environmental and Social (E&S) policy including assurance framework. The policy shall pay due regard to the accountability of individuals, environmental protection, incident reporting, safety meetings and training. Contractor shall also have established arrangements for monitoring this policy.

Contractor shall have in place a formal management system that demonstrates commitment to continuous improvement and excellence in ESHS issues and which follows the ESHS applicable Regulations.

Contractor shall review its management system at least annually and update it as necessary.

Certain activities pose a higher risk to the safety of personnel, property and the environment. Higher risk activities will accordingly demand a higher level of ESHS commitment from Contractor’s management. Where the use of a Sub-Contractor involves the importation of higher risk activity, Contractor must be able to demonstrate appropriate higher level of ESHS commitment.

Risk can vary from location to location and, where the Work is being performed at more than one location, Contractor shall observe and comply with all relevant and current Proponent directives.

4.2.3 Organization and Responsibility

The Contractor shall be responsible for managing the ESHS aspects during the construction phase of the Projects in accordance with the requirements set forth in the EMP provided in the EIA Report of the proposed Project. The Contractor shall be responsible to comply with all the requirements mentioned in this section.

The detailed questionnaire for the selection of Proposers is attached as Annex-A in this Section 4 of Special Provisions. The following Table 4-1 illustrates the requisite deployment of Contractor’s staff for Environment Social Health and Safety (ESHS) during construction phase of the Project.

Table 4-1: Contractor's Staff for ESHS

Sr. No.	Contractor Staff Designation	Number of Personnel	Duration	Duties
1	Environmental Expert	01	Whole Construction Phase	• Coordinate with Top Management to ensure the implementation of Environmental Provisions at site. • To ensure the use of SOPs during every working activity. • Ensure the record maintenance of each environment related occurrences and communicate with their authority on regular basis. • Responsible for preparation of monthly, quarterly and completion reports (and other if any). • Responsible for implementation of EMP, NOC and other contractual as well as regulatory requirements triggered during the Project execution. • Responsible for supervision/ monitoring of all the waste management operations and the associated staff.
2	Health and Safety Expert	01	Whole Construction Phase	• Coordinate with Top Management to ensure the implementation of Occupational Health Safety (OHS) Provisions at site. • To ensure the use of Standard Operating Procedures (SOPs) during every working activity. • Ensure availability and maintained of Personal Protective Equipment (PPE) to each and every worker at workplace. • Ensure the record maintenance of each OHS related occurrences and communicate with their authority on regular

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Sr. No.	Contractor Staff Designation	Number of Personnel	Duration	Duties
				basis. • Responsible for preparation of monthly, quarterly and completion reports (and other if any). • Responsible for implementation of EMP, NOC and other contractual as well as regulatory requirements triggered during the Project execution.
3	Social Expert	01	Whole Construction Phase	• Review and validate the monitoring reports. • Status of redressal of community complaints and time spent to resolve the community grievances. • Carry out the consultations with local community, officials of Project management and other concerned departments to share the feedback/ lessons learnt.

Note: For disposal of Construction and Demolition (C&D) waste, it is the responsibility of Contractor to engage licensed district level waste Contractor for disposal of C&D waste after consultation with Local Authority. The proposed Contractor staff will be selected in collaboration with the Employer after the prior approval.

4.2.4 Risk Management

Unless otherwise agreed, Contractor shall submit a formal report quarterly and present in the Performance Review (PR) for the Work, Contractor's ESHS performance in the preceding reporting period and accumulated year to date. Following are the metrics for ESHS performance progress reports and regular reporting:

a. Environmental incidents or non-compliances with contract requirements, including contamination, pollution or damage to ground or water supplies;
b. Health and safety incidents, accidents, injuries and all fatalities that require treatment;
c. Interactions with regulators: identify agency, dates, subjects, outcomes (report the negative if none);
d. Status of all permits and agreements:

    i. Work permits: number required, number received, actions taken for those not received;
    ii. List areas/facilities with permits required, dates of application, dates issued (actions to follow up if not issued), dates submitted to resident engineer (or

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

equivalent), status of area (waiting for permits, working, abandoned without reclamation, decommissioning plan being implemented, etc.);

iii. List areas with landowner agreements required (borrow and spoil areas, camp sites), dates of agreements, dates submitted to resident engineer (or equivalent);

e. Identify major activities undertaken in each area this month and highlights of environmental and social protection (land clearing, boundary marking, topsoil salvage, traffic management, decommissioning planning and implementation);

f. For quarries: status of relocation and compensation (completed, or details of monthly activities and current status).

g. Health and safety supervision:

i. Safety officer: number days worked, number of full inspections & partial inspections, reports to construction/project management; and

ii. Number of workers, work hours, metric of Personal Protection Equipment (PPE) use (percentage of workers with full PPE, partial, etc.), worker violations observed (by type of violation, PPE or otherwise), warnings given, repeat warnings given, follow-up actions taken (if any);

h. Worker accommodations:

i. Number of expats housed in accommodations, number of locals;

ii. Date of last inspection, and highlights of inspection including status of accommodations' compliance with national and local law and good practice, including sanitation, space, etc.; and

iii. Actions taken to recommend/require improved conditions, or to improve conditions.

i. HIV/AIDS and COVID-19: provider of health services, information and/or training, location of clinic, number of non-safety disease or illness treatments and diagnoses (no names to be provided);

j. Gender (for expats and locals separately): number of female workers, percentage of workforce, gender issues raised and dealt with;

k. Training:

i. Number of new workers, number receiving induction training, dates of induction training; Number and dates of toolbox talks, number of workers receiving Occupational Health and Safety (OHS), environmental and social training; and

ii. Number and dates of Human Immunodeficiency Virus Infection and Acquired Immune Deficiency Syndrome HIV/AIDS and COVID-19 sensitization training, no. of Workers receiving training (this month and in the past); same questions for gender sensitization, flag lady/flag man training.

l. Environmental and social supervision:

i. Environmentalist: days worked, areas inspected and numbers of inspections of each site, highlights of activities/findings (including violations of Environmental and/or Social best practices, actions taken), reports to Environmental and/or Social Specialist / Construction / Site Management;

ii. Sociologist: days worked, number of partial and full site inspections, highlights of activities (including violations of Environmental and/or Social requirements observed, actions taken), reports to Environmental and/or Social

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Specialist/Construction/Site Management; and number of people met, highlights of activities (issues raised, etc.), reports to Environmental Specialist/Construction/Site Management.

m. Grievances: list these months and unresolved past grievances by date received, complainant, how received, to whom referred to for action, resolution and date (if completed), data resolution reported to complainant, any required follow-up of:

   i. Worker grievances; and
   ii. Community grievances.

n. Traffic and vehicles/equipment:

   i. Traffic accidents involving Project vehicles & equipment: provide date, location, damage, cause, follow-up;
   ii. Accidents involving Non-Project vehicles or property (also reported under immediate metrics): provide date, location, damage, cause, follow-up; and
   iii. Overall condition of vehicles/equipment (subjective judgment by environmentalist); non-routine repairs and maintenance needed to improve safety and/or environmental performance (to control smoke, etc.).

o. Environmental issues and mitigations

p. Spill clean-ups, if any: material spilled, location, amount, actions taken, material disposal (report all spills that result in water or soil contamination;

q. Waste management: types and quantities generated and managed, including amount taken offsite (and by whom) or reused/recycled/disposed on-site;

r. Details of tree plantings and other mitigations required undertaken this month; and

s. Details of water and swamp protection mitigations required undertaken this month.

t. Compliance:

   i. Compliance status for conditions of all relevant consents/permits, for the Work, including quarries, etc.): statement of compliance or listing of issues and actions taken (or to be taken) to reach compliance;
   ii. Compliance status of EMP and NOC requirements: statement of compliance or listing of issues and actions taken (or to be taken) to reach compliance

Other unresolved issues from previous months related to environmental and social: continued violations, continued failure of equipment, continued lack of vehicle covers, spills not dealt with, continued compensation or blasting issues, etc. Cross-reference other sections as needed.

4.2.5 Construction and Control

Employer reserves the right to audit Contractor(s) to assure itself that ESHS matters and Management Systems are being managed and controlled in accordance with the declared requirements of these ESHS provisions and Contractor(s) Management System.

Contractor(s) should allow Employer auditors for full access to the Work in progress, Personnel, records and documentation for the purpose of conducting audits.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

ESHS inspections may be undertaken by Employer on Contractor's systems, as and when deemed necessary by Employer, and may be carried out without any prior notice to Contractor(s).

4.2.6 Water Quality

The Contractor shall submit Proposals for the Employer's approval for all waste water and foul effluent from offices, workshops and site accommodation to be collected and treated at a waste water treatment plant prior to discharge into open water courses or into ground water.

4.2.7 Waste Management

The Contractor is fully responsible for the day-to-day management on waste collection and disposal. The Contractor must make arrangements for waste management for the collection and the disposal of domestic and industrial refuse, by handling, transport or storage of schedules wastes outside the premises and its safe disposal at a location approved

by the Employer.

The Contractor must ensure that all the necessary utensils such as proper storage containers or bins for refuse and kitchen wastes, special storage containers for scheduled wastes, temporary sewerage plants or toilet facilities are provided at the premises.

The Contractor must also comply with the following environmental conditions throughout the construction stage:

a. All effluents produced must be treated to comply Law and Regulation of Government of Pakistan before discharge into area approved by the Employer. The effluent shall never be discharged into river/canal without treatment;
b. Temporary sewage treatment for toilet facilities in accordance with the specifications as prescribe by the Law and Regulation must be provided at the Contractor's site office and worker's camps before the commencement of any works;
c. Open burning of solid wastes including biomass waste and construction debris is strictly not permitted;
d. Handling and disposal of scheduled wastes must comply with the requirements of the Law and Regulation of Government of Pakistan;
e. Waste oil and grease arising from the earthworks and construction activities must not be disposed into any nearby watercourse. These wastes must be stored in proper drums/containers and either reused or disposed at the site as approved/licensed by the Director General of Environmental Quality.

4.2.8 Avoidance of Nuisance

The Contractor shall take all reasonable precautions to avoid causing a nuisance with dust noise or vibrations arising from his operations. This provision is in addition to but not in substitution for the provisions of the Conditions of Contract.

The Contractor shall not obstruct, as far as possible, the normal rights of way of the users of the public roads and where this is necessary and unavoidable, he shall provide barriers, roads signs, warning lights, etc. required for proper traffic control including getting the necessary permits from the Police Department and other local authorities and paying all fees in connection therewith.

The Contractor shall be responsible for clearing and cleaning all existing streets, roads, drains, etc. at regular intervals, or when directed by the Employer and keep the approaches to the site clear of mud and obstruction.

The Contractor shall be liable and shall indemnify the Employer in respect of any claims or proceedings arising out of his neglect in taking care to avoid creating a nuisance when carrying out the Works.

4.2.9 Notice to Service Authorities

The Contractor shall make at his own expense all necessary arrangements for notifying the service authorities of required connections, removals and relocations of all public utilities and services affected by the Works.

Sufficient time shall be allowed for such notification as may be required by the relevant authorities so that appropriate action can be taken regarding the execution of the removals and relocation.

4.2.10 Utilities and Other Services

The Contractor shall be responsible for locating the position of all utilities, including mains, overhead and underground cables, pipes, sewers and drains, and where necessary shall adopt such methods of excavation as may be required by the appropriate authorities or Employer to ensure that no damage is caused to them.

The Contractor shall make good, at his own expense, any damage what so ever to existing utilities to the complete satisfaction of and in accordance with the instructions of the relevant authority or Owner concerned, and shall keep the Employer indemnified at all times from all claims, costs and expenses which may be brought against or incurred by the Employer for or on account of any damage (whether permanent, temporary or recurring) to the said utilities. All utilities, which are encountered in the course of the Works, shall be adequately supported, slung up, strutted or otherwise protected from damage to the satisfaction of the persons or authority in which they may be vested.

Due allowance shall be made by the Contractor for the effect on the phasing of the Works of relocations to existing public and private mains and utilities necessitated by the Works. The Contractor shall ensure that such existing mains and utilities are not interrupted without the written consent of the relevant authority or the owner of the utilities concerned.

If any privately-owned utilities for water, electricity, telephone, drainage. etc., passing through the Site are affected by the Works, the Contractor shall provide an approved equivalent alternative service in full working order to the satisfaction of the owner of the utility and the Employer, before the cutting of the existing utility, and until the completion of the permanent replacement of the utility.

4.2.11 Prohibition of Advertising

The Contractor shall treat the Contract and everything written as private and confidential. In particular, the Contractor shall not publish any information, advertisement, drawing or photograph relating to the Works and shall not use the Site for advertising purposes, except with the written consent of the Employer and subject to such conditions as prescribe.

4.2.12 Training, Awareness and Competence

a. Contractor shall ensure that electrical safety training shall be recommended, including necessary refresher courses;
b. Contractor shall ensure that Personnel have passed the required ESHS training before going at workplace as defined by Employer. This course requirement shall include Personnel provided by Contractor;
c. Contractor shall be responsible for ensuring that Personnel possess all required safety qualifications described by Employer;
d. Personnel shall be available at all times for periodic drills, instructions on survival, lifesaving and fire-fighting as requested and conducted by Employer at the Worksite;
e. Contractor's management and relevant Personnel shall attend ESHS training and courses as required; and
f. All costs, including but not limited to travel, accommodation, per diem, course fees, salary, related to training of all Personnel shall be borne by Contractor.

Contractor must be able to demonstrate competence and assurance of Personnel, the scope of which will cover as a minimum training within relevant Company ESHS directives including, without limitation, safe working practices, permit-to-work systems and risk assessment including risk to the environment.

Employer has the right to remove from the performance of the Work, any Personnel who do not fulfil expected ESHS performance, which, in the opinion of Employer, misconduct themselves or are incompetent or negligent in the proper performance of their duties and such Personnel shall not be again employed upon the Work without Employer's Approval.

4.2.13 Workers Health and Safety

a. Contractor shall ensure access to an Occupational Health Service for follow up of sick leave, occupational illness/injury and other focus areas within occupational health and working environment;
b. The Contractor shall at all times take all reasonable precautions to maintain the health and safety of its Personnel. In collaboration with local health authorities, the Contractor shall ensure that medical staff, first aid facilities, sick bay and ambulance service are available at all times at the Site and at any accommodation for Contractor and Employer Personnel, and that suitable arrangements are made for all necessary welfare and hygiene requirements and for the prevention of epidemics;
c. The Contractor shall conduct an HIV-AIDS, Sexually Transmitted Diseases (STD) or Sexually Transmitted Infections (STI) and COVID-19 awareness programme via an approved service provider, and shall undertake precautionary measures to reduce the risk of the transfer of the HIV, STD/STI and COVID-19 virus between and among the Contractor's Personnel and the local community, to promote early diagnosis and to assist affected individuals; and
d. Contractor shall present periodic checks of basic medical such as hearing, eyesight etc. on all staff working under controlled environmental conditions.

4.2.14 Health and Safety Measures Specifications for Each Project Activity

The Contractor health and safety measures shall comply with the following sections:

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

4.2.14.1 Engineering and Design

a. Contractor shall have a system to ensure that Risk, Emergency Preparedness, Environmental and Working Environment Analysis are carried out as an integrated part of the design and engineering process;
b. Contractor shall ensure that design; test and acceptance criteria are defined and documented;
c. Contractor shall adopt full life cycle perspective; and
d. Contractor shall apply inherently safer design principles.

4.2.14.2 Environment

a. Contractor shall have implemented EMP described in main EIA report of proposed Project through an effective Environmental and Social Management System. If a system is not in place, a commitment to comply with the standard in the future is required; and
b. Contractor shall monitor amount and type of discharges according to National Environmental Quality Standards (NEQS), such as accidental, planned and permitted discharges.

4.2.14.3 Chemicals

a. Contractor shall submit Material Safety Data Sheets (MSDS) for all chemicals included in the Contract and or used in the Contract period. The MSDS shall be quality checked in accordance with the ESHS regulations;
b. If the product is evaluated not to be classified according to Health Risk Classification, the label “Not required to be classified, shall be used. The label shall be of a size and color that is readable for the user. Reference is made to Regulation concerning labelling of hazardous chemicals;
c. Contractor shall supply Employer with relevant information for Evaluating, Purchasing and Handling Chemicals; and
d. Contractor shall submit a complete list of all the chemicals to be used for the Construction. The chemicals must be categorized in accordance with the applicable system of color coding.

4.2.14.4 Dangerous Goods

Contractor shall have a Dangerous Goods handling system that ensures compliance with the Hazardous Substance Rule 2003, Factory Act 1934 and local applicable laws for transportation on road and railroad.

4.2.14.5 Management System for Construction related activities

a. Contractor shall compile an interface document, as part of the Contractor Execution Plan, documenting that Contractor has an implemented and documented Management System in compliance with the existing regulations;
b. Contractor shall point out non-conformance’s / deviations related to the requirements as described above and demonstrate that the significance of the individual non-conformance’s / deviations have been assessed from a safety standpoint;

c. Contractor shall give necessary training in the understanding of the philosophy behind the applicable Acts, Regulations and Provisions;

d. Contractor shall identify Employer's ESHS directives relevant to the Work. Personnel shall be trained in order to achieve necessary working competence within the identified Employer's ESHS directives. Contractor shall keep records of the training Personnel have received; and

e. Contractor shall have put in place objectives, actions and measurements encompassing all organizational levels at Contractor in order to ensure that a sound health, environment and safety culture is established and maintained for the Work.

f. Fall protection or fall restriction devices shall be used when working at heights over 6 feet with the exception of ladder use.

4.2.14.6 Radioactive Sources

Contractor shall have a documented system to ensure that the activity is in compliance with regulations and provisions stipulated by the Country's Radiation Protection Authority for the use of radioactive material.

4.2.14.7 Reporting

a. Contractor shall immediately inform of organizational changes relevant for the Contractor and/or the Work;

b. Contractor shall immediately forward internal and external audit reports conducted by the Contractor relevant to the Work;

c. On a monthly basis Contractor shall provide deviation permits applied for and nonconformity status; and

d. Contractor shall report to the Employer on a quarterly basis amount and type of chemicals supplied, used, discharged and re-injected. The report shall be made in the format as specified by Employer. Contractor shall assure that total annual use and discharge of chemicals supplied are within specified discharge permit.

4.2.14.8 Security

a. Contractor shall comply with the Employer guidelines for Security Control. Alcohol concentration is not allowed;

b. Contractor shall be able to verify the identity of Personnel who shall perform Work at construction site, camps and offices, on installations and in premises employed by the Employer. When Contractor uses hired Personnel references from earlier employment shall be verified;

c. Contractor shall maintain prudent office security for office areas used for Projects/activities and/or staff; including access control, ID badge usage, and burglar alarm / guard arrangement;

d. Contractor shall maintain information security regarding Employer and Project information; including clear desk policy, sensitive documents control and confidentiality measurements; and

e. Contractor shall maintain computer and communications security for any computer system and network being used for handling Project information; including controlled computer access, virus protection, security updates, Firewalls and backup routines.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

4.2.14.9 Lifting Operations

a. Contractor shall have a system established to ensure that Personnel who are responsible for, or are involved in, maintenance/inspection of lifting equipment and execution of lifting operations;

b. Contractor shall have a system implemented for systematic inspection and maintenance of lifting appliances and lifting gear in accordance with statutory requirements; and

c. Contractor shall ensure that all Plant and/or Equipment being supplied to any Worksite is to be either, placed and operated at height or placed and operated over an area where Persons are working below shall have:

   i. In place a Dropped Objective Survey or Inspection Procedure for the Plant;

   ii. Identified those items of Plant or Equipment or other components that, if fail, have a potential to injure Persons; and

   iii. In place a method for securing primary components or parts such that should failure occur of the all Equipment and their parts are not able to fall and injure Persons. This may be primary suitable means of security or secondary retention methods. Both should be in accordance with the manufacturer's recommendations and accompanied by a Hazard / Risk Assessment.

4.2.14.10 Waste Handling and Tracking

a. Contractor shall ensure use of Authority approved waste treatment or disposal sites. Employer reserves the right to request Contractor to submit supporting documentation of approved sites. Employer reserves the right to reject the use of sites not found acceptable; and

b. Contractor shall have implemented a system for identifying, classifying and handling of waste. Hazardous waste shall be handled according to Authority regulations and household waste and production waste shall be source segregated for recycling purpose.

4.2.14.11 First Aid

Contractor shall be responsible for the provision of first aid services for their workers, and for providing transport for injured persons to hospital or other appropriate destination as and when required. Vehicles that are generally used for site work shall carry a first aid kit complying with OHS regulations.

4.2.14.12 Working Environment

a. Contractor shall undergo particular training with regard to relevant working environment factors related to implementation of Work, the use of work equipment & signaling and safety sign posting at the workplace shall be given to the individual employee and supervisor;

b. Contractor shall actively take part in the working environmental activities that are carried out at the Worksite; and

c. Contractor shall advise and assist Employer in a pro-active manner in the implementation of the annual working environment program and provide input for the subsequent year program.

4.2.15 Specific PPE to be used during construction Phase

PPEs are equipment worn to minimize exposure to a variety of hazards which cannot be avoided due to engineering measure (residual impact). It includes gloves, foot and eye protection, protective hearing devices (earplugs, muffs) hard hats, respirators, full body suits etc. Contractor shall be responsible to provide PPEs to his working staff the Employer's staff and ensure its use. Contractor shall adhere to Employer's OHS requirements related to "Personal Protective Equipment (PPEs)" in respect of PPE. Contractor shall, at its own expense, provide Personnel for duty staff with all necessary protective clothing and equipment suitable for working conditions.

Table 4-2 Recommended Personal Protective Equipment According to Hazard

Sr. No.	Type of Protection	Workplace Hazard	Suggested PPEs
1	Over All, Exterior garments	Entanglement, chemical spill safeguard etc.	Long pants, shirt with sleeves (no tank tops or shorts)
2	High Visibility Vests	Accidental hazard etc.	A reflective vest will be worn outside of any other garments
3	Foot protection	Falling or rolling objects, pointed objects. Corrosive or hot liquids	Safety toed footwear / boots/ shoes
4	Eye and Face Protection	Flying particles, molten metal, liquid chemicals, gases or vapors, light radiation	Safety Glasses, Spectacles and Goggles. Spectacles with side shield. Prescription Lenses. Sun Glasses. Special Helmets or shields/ Face shields.
5	Head Protection	Falling objects, inadequate height clearance, and overhead power cords.	Hard hats with top and side impact protection. Hard hats shall be worn with the brim pointed forward.
6	Hearing protection	Noise, ultra-sound	Earplugs, muffs
7	Hand Protection	Hazardous materials, cuts or lacerations, vibrations, extreme temperature	Gloves (Plastic, leather, fireproof and rubber)
8	Breathing Protection	Dusts, fogs, fumes, mists, gases, smokes, vapors	Facemasks
9	Falling Hazard Protection	Injury and death etc.	Safety Belt/Chains, Locks

Source: General Guidelines by International Finance Corporation- Environmental, Health, and Safety (EHS)

In order to highlight the risk and identify potential hazards at workplace, Contractor shall be responsible for manage the following (not limited to) set of Safety Sign Posts and Markings in the working zones for the dual purpose of safety of workers as well as visitor/community.

- Authorized entry only (workplace hazards);

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- Caution;
- Climb with caution;
- Work personnel only;
- Contractor's gate;
- Danger;
- Dangerous conditions;
- Falling hazard;
- Hard hats;
- Hazardous area;
- Men at work;
- Moving equipment;
- Risk of serious injury;
- Emergency assembly point;
- Shock hazard;
- Trip hazard (wet/slippery surface);
- Visitors;
- Warning;
- Transport control signs; and
- Security barriers.

Contractor shall make arrangements for marking/signs of hazardous goods/materials which should be posted on the boxes for haulage. Tentative list is attached as "Annex B" in this section 4 of Specific Provisions but Contractor shall not limit to these only.

4.2.16 Emergency Response and Preparedness

Contractor shall ensure duty numbers to contact Persons are available at any time by means of a phone answering service in case of an emergency. The Contractor must have in place a process to identify internal and external resources that may be required to respond to an emergency at site.

PROCUREMENT REGULATORY AUTHORITY PUBLIC (PPRA) EPADS

Annex A to Section 4.2: Proposer HSE Management System Questionnaire

This sample questionnaire is a guideline questionnaire which will be a part of the bidding document and involved in evaluation process. The questionnaire is to be completed by the Proposer and submitted with their Proposal offer. The objective of the questionnaire is to provide an overview of the status of the EPC Contractor's HSE management system. EPC Contractor s will be required to verify their responses noted in their questionnaire by providing evidence of their ability and capacity in relevant matters.

Please be advised that if your Proposal is successful, you may be required to provide:

- A Risk Assessment for the Project;
- A Site Safety and Security Plan;
- Occupational Health and Safety Plan; and
- Job Safety Assessments or Safe Work Method Statements for individual activities that have a medium to high hazard level.

Certification: The information provided in this questionnaire is an accurate summary of the company's occupational health and safety management.

N/A = Not applicable or relevant to this contract

Management Element	Proposer's Response to Clarification	Evidence/ Company's Clarification
1. Leadership and Commitment		
a) What is the commitment of top management towards ESHS at workplace?		
b) How does top management actively endorse a positive ESHS culture in the workplace?		
c) What does top management do to ensure the health and welfare of employees is established, maintained and given priority like accommodation, meals, rotation, medical care, recreation facilities etc.?		
2. Policy and Strategic Objectives		

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Management Element	Proposer's Response to Clarification	Evidence/ Company's Clarification
2.1 ESHS Policy Documents		
a) Has the organization's top management documented, authorized and issued an OHS and E&S Policy?		
b) Does the policy address legal requirements for ESHS, commitment to the prevention of accidents and provide a framework for setting and reviewing OHS objectives?		
c) Who has been identified and appointed in the organization for overall responsibility and accountability for ESHS?		
2.2 Availability of ESHS Policy Statements to employees?		
a) How do you communicate your policies requirements or any amendments thereof to your employees?		
2.3 ESHS contract strategic objectives?		
a) How are ESHS objectives set?		
b) How are these objectives communicated?		
c) How is accomplishment of these objectives tracked and monitored?		
3. Organization, Responsibilities, Resources, Standards and Procedures		
3.1 Organization, structure to manage ESHS		
a) How is the organization structured and resourced to manage ESHS?		
b) How are lines of reporting structured and roles and responsibilities defined?		
c) How do you ensure the managers and supervisors understand their ESHS duties and responsibilities?		
d) How have you made provision for ESHS communication meetings?		

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Management Element	Proposer's Response to Clarification	Evidence/ Company's Clarification
3.2 Training		
a) How do you identify training needs including training for high-risk activities and specialized training?		
b) How do you ensure all employees have received appropriate ESHS training and that it is recorded and monitored?		
3.3 ESHS Competence		
a) What arrangements do you have to ensure new employees have the required knowledge of ESHS, and how is this knowledge kept up to date?		
b) How are employees informed of the specific hazards arising out of the nature of their work?		
c) How do you ensure people are competent to perform a job that involves hazards and risks?		
d) How do you ensure ESHS advisors are competent in presentation skills?		
3.4 ESHS Standards (ISO14001 and ISO 45001)		
a) How do you identify, obtain, review and communicate ESHS legislation, regulations, external standards and other requirements affecting the organization?		
b) How the company is assured that these requirements are met and verified?		
3.5 Assessment of suitability of Sub-Contractors/ other Companies		
a) How do you assess the? i) ESHS competence of Sub-Contractors?		
ii) ESHS performance record of the Sub-Contractors and companies with whom you place contracts?		

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Management Element	Proposer's Response to Clarification	Evidence/ Company's Clarification
b) Where do you spell out the ESHS requirements you require your EPC Contractor s to meet? (What standards apply?)		
c) What are the ESHS terms and conditions dictated in your sub contract agreements?		
d) How do you ensure these requirements are met and verified?		.
4. Hazards and Effects Management		
4.1 Hazards and effects assessment		
a) How do you identify and document risk?		
b) How do you ensure the proper controls are in place, applied and complied with?		
4.2 Occupational health exposure		
a) What occupational health monitoring do you do?		
b) In which areas of your business do you focus this occupational health monitoring?		
c) What health exposures do you measure and record?		
d) How do you manage occupational health exposures?		
4.3 Handling of chemicals, noise, asbestos, and radiation and other occupational health hazards		
a) How do you evaluate the health risks presented by the transport, storage, handling and disposal of chemicals?		
b) How do you evaluate the health risks presented by noise, radiation and/or asbestos where applicable?		
c) How do you ensure that minimal use is made of chemicals which are potentially harmful to the environment?		

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Management Element	Proposer's Response to Clarification	Evidence/ Company's Clarification
d) How do you ensure the quality of the material safety data sheets (MSD)?		
4.4 Personal protective equipment		
a) How do you manage PPE requirements?		
4.5 Waste management		
a) How have you identified your waste streams?		
b) How do you manage your hazardous waste?		
4.6 Drugs and alcohol		
a) How do you manage alcohol and drug abuse?		
b) Explain how you manage the health and wellbeing of your workforce?		
5. Planning and Procedures		
5.1 ESHS Operations manuals		
a) Please attach an electronic copy of your ESHS manual and ESHS plan?		
b) How do you implement these requirements?		
c) What are the company arrangements for managing safe systems of work?		
d) How are you assured that the ESHS system is fit for purpose?		
e) How are safety rules communicated and compliance monitored in the work place?		
f) How are safety behaviors applied and monitored in the work place?		
5.2 Equipment control and maintenance		
a) Describe the ESHS Critical equipment specifically identified?		
b) How do you ensure plant and equipment is inspected, certified, valid and safe for use?		

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Management Element	Proposer's Response to Clarification	Evidence/ Company's Clarification
c) Do you have a preventive maintenance system?		
d) Explain your equipment inspection regime!		
5.3 Road Safety Management		
a) How do you manage road safety for all company vehicles?		
b) How do you manage commuting to and from work?		
c) What standards are applied to your road safety management program?		
d) How often do you audit against the applied standard?		
e) How do you monitor non-compliance with road safety standards and rules in the company?		
f) What actions are taken by management when violations are identified or reported?		
g) How many drivers of vehicles are trained in defensive driving?		
h) How do you manage vehicle load restraining where applicable?		
i) How many Motor Vehicle incidents have you had in the last two years?		
6. Implementation and Performance Monitoring		
6.1 Implementation and active performance monitoring of work activities		
a) How do you monitor ESHS performance in the work place?		
b) What types of ESHS performance indicators/measures are used in your company? Give examples!		
c) Provide examples of trending of your key ESHS performance indicators!		

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Management Element	Proposer's Response to Clarification	Evidence/ Company's Clarification
d) How is health performance recorded?		
e) What arrangements do you have to ensure personnel are fit to work in their designated role?		
f) How is environmental performance recorded?		
6.2 Statutory notifiable incidents		
a) How many reportable accidents have you had in the last five years? (Provide annual figures)		
6.3 Improvement or prohibition notices (in accordance with the regulations pertaining to safety and occupational health procedures)		
a) Provide details of any work prohibitions from government or Employer imposed on the company?		
b) Have you ever had a contract cancelled due to poor ESHS performance?		
6.4 Incident investigation and reporting		
a) How do you identify the critical factors, immediate causes, underlying causes and latent (hidden) management system failures?		
b) Who normally conducts incident investigations?		
c) How do you determine who should lead the investigation?		
d) How do you ensure that the learning's from all incidents, including near misses, are communicated?		
7. Auditing		
7.1 Auditing		
a) How do you plan and schedule audits and what range of auditing is covered?		
b) How are audit findings tracked and closed out?		
c) Who in your organization is trained and certified to conduct		

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Management Element	Proposer's Response to Clarification	Evidence/ Company's Clarification
internal management system audits?		
8. ESHS Management Performance Reviews		
a) How often are board level management performance reviews conducted?		
g) How do you communicate corporate ESHS performance findings to workers?		

9. Insurances: Please provide copy of Certificate of Currency

SECTION 1 HYDRO-MECHANICAL EQUIPMENT

1.1 TURBINES

1.1.1 General

This section specifies the requirements for design, engineering, manufacture, transportation, storage, erection, shop testing, site testing, commissioning and supply of spare parts of the turbines to be furnished. General arrangement of the turbines is shown in the attached powerhouse layout drawings.

1.1.2 Applicable Standards

The turbines shall conform to the applicable requirements of the latest edition of the following Standards:

Table 1-1: Standards

Description	Standard
Hydraulic turbines, storage pumps and pump - turbines - Model acceptance tests	IEC 60193
Field acceptance tests to determine the hydraulic performance of hydraulic turbines, storage pumps and pump-turbines	IEC 60041
Guide for Commissioning, Operation, and Maintenance of Hydraulic Turbines	IEC 60545
Cavitation, Pitting Evaluation in Hydraulic Turbines, Storage Pumps and Pump-Turbines	IEC 60609-1
Guide for field measurement of vibrations and pulsations in hydraulic machines (turbines, storage pumps, and pump turbines)	IEC 60994
Standard for Hydraulic Turbine and Generator Integrally Forged Shaft Coupling and Shaft Runout Tolerances	IEEE 810
Mechanical Vibration-Evaluation of machine vibration by measurements on rotating shafts	ISO 7919 (Parts 1-5)
Standard Specification for Castings, Iron- Chromium, Iron-Chromium-Nickel, Corrosion Resistant, for General Application	ASTM A743M
Standard Specification for Pressure Vessel Plates, Carbon Steel for Moderate- and Lower-Temperature Service	ASTM A516
Standard Specification for Pipe, Steel, Black and Hot-Dipped, Zinc-Coated, Welded and Seamless	ASTM A53M
Specification for Chromium and Chromium-Nickel Stainless Steel Plate, Sheet, and Strip for Pressure Vessels and for General Applications	ASTM A240
Standard for Welding	AWS (D1.2, D1.3, D1.6, A 2.4, A 3.0)

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Description	Standard
Standard for Coupling Bolts tolerance system	ASME B 4.1
Standard for pressure vessel and piping system	ASME Boiler and Pressure Vessel Code Section IX

1.1.3 Operating Conditions

Vertical Francis turbines shall be manufactured for run-of-river and peaking / base load continuously between the guaranteed minimum and maximum output and within the head range specified, without exceeding the permissible stresses and bearing temperatures and without undue cavitation.

Loss of metal due to cavitation shall be within the specified limits. The working stresses, under the worst transient conditions, shall be moderate. No undue deformation shall occur and smooth running, without harmful vibration, shall be considered and the most unfavorable alternative shall be used as design parameters for the various components.

The Contractor shall be required to carry out his own water quality, petrographic and sedimentation analysis where necessary for verification and confirmation of contractual guarantees. The Contractor is required to take sedimentation into consideration in the design.

1.1.4 Key Technical Parameters of Turbines

Table 1-2: Parameters

Description	Unit	Quantity
No of Units	no.	3
Type of Turbine	type	Vertical Shaft Francis Turbines
Rated Turbine Output at Shaft	MW	18.94
Rated Net Head	m	104.0
Rated Turbine Speed (n)	rpm	375
Turbine Runaway Speed (n_r)	rpm	655
Unit Discharge (Q_{unit})	m^3/sec	20.0
Runner Diameter	m	1.68
Min. Turbine Efficiency (η)	%	93

1.1.5 Life of Plant, Maintenance Cycles and Reliability

The Plant shall be designed for a service life of not less than fifty (50) years, considering daily start-ups and shutdowns during operations. Maintenance on each unit will be done annually on a rotational basis. Between annual maintenance periods, the units will be expected to operate with 100% availability.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

The design shall be such that dismantling shall not be necessary in the first ten (10) years of operation.

Starting reliability shall be at least 99% as logged by the Control and Indication System. If “Failure to Start" events in excess of 1% due to defective components or systems supplied by the Contractor occur during the defects liability period, the components shall be replaced with more reliable equipment, at no cost to the Employer.

1.1.6 Speed and Balance

The synchronous speed shall be 375 rpm. The direction of rotation shall be clockwise when viewed from generator side.

The complete rotating assembly (turbine and generator) shall be designed to accommodate the maximum runaway speed, which can occur under any steady or transient condition. Such conditions shall include the failure of the guide vanes and the Main Inlet Valve to close on load rejection. Friction and wind losses of the generator shall be allowed for in the calculation of runaway speed.

The first critical speed of generator and turbine combined shall be at least 30% above the maximum runaway speed. The Contractor shall check the critical speed and torsional vibration characteristics of the combined turbine and generator rotating system. In the calculations, higher harmonics and combined critical speeds shall be considered. Calculations shall be presented in an easily understandable and concise manner. Amplitudes of vibration as measured on the turbine or generator bearing housings shall be in accordance with ISO 10816 and ISO 7919.

The number of guide vanes, stay vanes, and runner blades shall be such as to ensure vibration-free operation.

1.1.7 Resonance

Based upon the results of the hydraulic model tests and the Contractor's experience of similar units in size, operating head range and output, the Contractor shall conduct resonance studies covering the complete range of normal operation of the turbines up to and including full load rejection. These studies shall include but not be limited to:

a. Penstock hydraulic resonance due to excitation from part load and full load draft tube pressure pulsations.
b. Power swings due to excitation from part load and full load draft tube pressure pulsations and governor oscillations coupled with the generator natural frequency.
c. Resonances due to unfavorable coupling of the passing frequencies of runner blades, guide vanes and stay vanes.
d. Resonance caused by rotating pressure waves in the vaneless space between runner and guide vanes.
e. Resonance of the stay vanes and runner blades due to Karman vortex shedding from the blade trailing edges.
f. Resonances caused by wearing ring pumping.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

1.1.8 Regulation

The total stored energy of the combined turbine and generator shall be the minimum necessary for stable governing and the attainment of the specified and guaranteed pressure and speed regulation.

Speed Rise: The maximum transient speed, which can occur during a power station load rejection at any head and output, shall not exceed 150% of synchronous speed.

Pressure Rise: Under all conditions of normal and transient operation, the maximum permissible pressure rise, which can occur in the waterway system during any transient event, shall not exceed 30% at the spiral case inlet.

1.1.9 Noise

Maximum noise level resulting from any of the operating conditions shall not exceed 85 dB (A) at any place 1.0 m away from operating equipment in the machine hall.

1.1.10 Oil Type and Grade

The same type of oil shall be used in lubrication of the turbine-generator bearings and in the governor hydraulic oil system. As a general specification, all lubricating oil shall typically be to either ISO VG46 or ISO VG68 at 40ºC according to ISO 3448 and shall be readily available in Pakistan.

1.1.11 Stresses and Materials

Liberal factors of safety shall be used throughout the design and especially in the design of all parts subject to alternating stresses or shock. The design of equipment shall include an allowance for the earthquake loading stipulated in the Employer Requirements. Under the most severe loading conditions expected in normal operation (including load rejection), stresses in the materials shall not exceed the values listed in the following Table 1-3.

Table 1-3: Stresses

Material	Tension	Compression	Shear
Cast Iron	10% of ultimate strength	70 MN/m²	21 MN/m²
Cast Mild Steel	83 MN/m²	83 MN/m²	50 MN/m²
Alloy Cast Steel	20% of the ultimate strength or 33% of the yield point, whichever is less	20% of the ultimate strength or 33% of the yield point whichever is less	60% of the allowable tensile stress
Plate Steel for Spiral Case or Other Principal Parts	25% of the ultimate strength but not to exceed 100 MN/m²	25% of ultimate strength but not to exceed 100 MN/m²	60% of the allowable tensile stress

For materials not listed in the table the maximum stresses in tension or compression under the most severe normal and transient operating conditions shall not exceed 33.3% Yield or 20% Ultimate Tensile Strength (UTS).

Maximum shear stresses in other ferrous materials shall not exceed 60% of the allowable stresses in tension, except that the maximum torsional shear stresses in the turbine main shaft shall not exceed 50% of the allowable stress in tension in normal operation including

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

load rejection. Maximum combined stresses in the shaft under generator short circuit conditions shall not exceed 50% of the material yield stresses.

Under maximum runaway speed or under the hydrostatic test conditions, stresses shall not exceed 66.67% of yield stress.

Stresses at the junction of the runner vanes and crown shall not exceed 25% Yield under any operating condition. To the calculated thickness for this condition shall be added an allowance of 3 mm for attrition.

Stresses in the guide vanes, guide vane stems and guide vanes stem levers at the breaking point of the shear pin friction device combination shall not exceed 66.67% Yield.

The exception to the above will be pre-tensioned bolts. These shall be stressed to the extent necessary to ensure that the joint face remains closed under all operating conditions.

Calculations shall be presented by the Contractor to prove their proposed pre-tensioning for all pre-tensioned bolts and means shall be provided for monitoring and verification of the pre-tensioning.

Finite element calculations shall be submitted to show compliance with the above requirements for all major components.

The material for all important stressed parts including stay ring, spiral case, front and rear covers, shaft, and runner shall have adequate impact value and the Contractor shall submit details of such critical components for approval by the Employer. All steel plates for these items shall be ultrasonically tested at the mill.

1.1.12 Turbine Model Tests

The Contractor shall use and provide the results of an appropriate existing model test, homologous to the prototype turbine of Attabad Lake HPP, to determine the operational characteristics of the prototype and prove that guarantees can be met. The model test should have been conducted in accordance with IEC 60193 standard.

Whenever the reference model requires modifications to eliminate cavitation over the whole operating range, modifications to the profiles based on CFD analysis shall ensure that runner will not be damaged by cavitation.

The Proposer shall together with his Proposal supply documents demonstrating a satisfactory design and validity of the guarantees given by providing test results based on site tests on homologous, or nearly homologous, turbines. The site tests should have been conducted in accordance with IEC 60041 and related standards.

The Proposal shall contain all relevant technical information about any such previous model or prototype tests that is used for demonstrating the validity of the guarantees and technical information given. The performance of the model tests shall be as per IEC 60193 in all aspects. Hydraulic performance tests shall be made at various gate openings to determine machine characteristics including regimes of safe operation, zones of cavitation and vibration, etc. Prototype efficiencies shall be derived from model tests as per procedure contained in IEC 60193 for Francis turbines. The prototype efficiency shall be taken equal to model efficiency and no scaling up of efficiency shall be applied. Model tests shall simulate all possible normal operating conditions of the prototype for entire range of heads.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

1.1.12.1 Existing Model or Field Test Report

The test report shall be submitted to the Employer and shall comprise of at least following information on model or field performance tests:

- Place of model or field tests,
- Year of model or field tests,
- Designed rated turbine output,
- Rated net head,
- Rated speed.

The test report shall comprise but shall not be limited to the following:

i. Model drawings of hydraulic passages and photographs;
ii. Test-stand description, including systematic and random error evaluation at best efficiency;
iii. Dimensional control of the reference model including runner seal clearances;
iv. Efficiency tests and determination of the best efficiency;
v. Model turbine hill charts;
vi. Transposition of model test results to Attabad prototype performances;
vii. Sigma break curves, cavitation observations and margin evaluation;
viii. Entrance cavitation observation;
ix. Hydraulic stability tests;
x. Runaway tests under cavitation-free conditions and at plant sigma;
xi. Hydraulic thrust tests;
xii. Wicket gate hydraulic torques;
xiii. Runner and wicket gate finite element analyses

1.1.13 Model Characteristics Curves (Hill Charts)

The reference model hill chart shall be plotted with discharge factor Q_{11} as the vertical axis and speed factor n_{11} as the horizontal axis with a plot of:

i. Original curves of constant efficiencies;
ii. The curves of constant wicket gate opening;
iii. Original entrance cavitation limits;
iv. Vortex-free zone (specify corresponding plant sigma used to establish it);

1.1.13.1 Prototype Characteristics Curves (Hill Charts)

The prototype hill charts shall be derived from the model hill chart using the step-up formula given in the IEC 60193 standard and CFD adjustments, for homology deviations and performance transposition from Model to Prototype in accordance with IEC 62097-2019. Turbine (prototype) design must demonstrate stable operation at all operating conditions between full load to part load (i.e., 40% of rated capacity) according to prevailing changes in head/discharge due to seasonal variations, load variations and combinations of Unit operation (single/parallel) at Attabad Lake HPP.

A chart shall be plotted for calculating net head from gross head. Similarly, one hill chart shall be plotted with unit discharge in m^3/s as the vertical axis and the net head in meters, as the horizontal axis. Another hill chart shall be plotted with the shaft output at generator coupling

in MW or in Brake Horse Power (BHP) as the vertical axis and the net head in meters as the horizontal axis.

The total thrust bearing losses will pertain to the generator, whatever the hydraulic thrust and turbine rotor weight. Turbine efficiency shall only include estimated mechanical losses at the turbine guide bearing.

Both hill charts shall include plots of:

i. The curves of constant turbine efficiencies
ii. The curves of constant wicket gate opening
iii. Operating limits of the turbine
iv. Runaway speed
v. Entrance Cavitation Results
vi. Hydraulic Torque on Wicket Gates

The Employer will have the right to request any additional documentation or clarification that he deems necessary to his satisfaction.

1.1.14 Re-Model Tests

Should the prototype exhibit any unacceptable vibrations, resonance or operational characteristic, which necessitates a modification to the hydraulic passage of the turbine, which is outside the dimensional tolerances specified in IEC 60193, then the model shall be modified accordingly and retested. The retest of the model shall be done before the prototype is modified and shall cover all parameters measured in the original model test. Modifications to the prototype shall only be accepted if the performance of the retested modified model is totally within all the guaranteed values.

All modifications of the model and prototype and re-testing of the model shall be at no cost to the Employer.

1.1.15 Efficiency

In addition to pure hydraulic losses, turbine efficiency shall include mechanical and volumetric losses attributed to the turbine supply.

For the bearings the distribution of losses attributed to the generator and to the turbine will be proportioned in accordance with IEC 60041. Calculations of guide bearing losses will initially be in accordance with IEC 60041 and subsequently measured at site in accordance with IEC 60034.

Turbine efficiency shall be subject to performance guarantees for the entire turbine operating range and shall be verified by site efficiency tests in accordance with IEC 60041 by the acoustic or thermodynamic method. The test method shall be subject to the prior Employer approval.

The following weighting factors shall be applied to evaluate the site efficiency tests:

Turbine Power (% of maximum attainable power at prevailing reservoir levels)	100%	80%	60%	40%
Weighting Factor	59	20	12	9

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

The guaranteed turbine weighted average efficiency shall be calculated by applying the weighting factors given above to the respective guaranteed efficiency values (i.e., A, B, C and D).

$$= 0.01(59xA + 20xB + 12xC + 9xD)$$

The turbine efficiency for each such turbine power value shall be determined by measurement and computation in accordance with IEC 60041, but without any tolerance or uncertainty. The measured turbine weighted efficiency shall be determined by applying the weighting factors to the efficiency values determined by the site tests.

The guaranteed turbine efficiency for each of the turbine power values nominated in the above table shall be determined from the guaranteed turbine prototype performance diagrams (Hill Chart), for the net head conditions applying at the time of the site efficiency tests.

The guaranteed turbine weighted efficiency shall be determined by applying the weighting factors nominated above to the respective guaranteed efficiency values.

The measured turbine weighted efficiency shall be compared to the guaranteed turbine weighted efficiency, and the amount that the measured value is less than the guaranteed value, if any, shall be the Turbine Weighted Efficiency Shortfall, and shall be subject to liquidated damages pursuant to Schedule of Performance Guarantees.

If the Weighted Efficiency Shortfall exceeds 2% points, then the Employer may reject the associated turbine runner; in which case the Contractor shall design, model test, construct, supply and install a replacement runner free of charge to the Employer a new runner with satisfactory performance. Further, in this case the Contractor shall carry out site efficiency tests of all units.

1.1.16 Guarantees

1.1.16.1 General

Guarantees for each turbine shall be given for prototype conditions as given in the Schedule of Performance Guarantees and Technical Plant Data, and shall be based upon the levels, heads and turbine settings specified herein. Possible deviations and the reason hereof shall be clearly stated by the Contractor in his Proposal.

The guarantees for efficiency, maximum load and cavitation as well as axial hydraulic load, runaway speed, guide vane torque, vibration levels etc., shall be verified by site commissioning tests according to IEC 60041 and related standards.

The Contractor shall together with the Proposal supply documents demonstrating a satisfactory design and the validity of the guarantees given by providing test results based on site tests on homologous, or nearly homologous, turbines. The tests should be conducted in accordance with IEC 60041 and related standards.

Numerical simulations can demonstrate the effect of deviations/ improvements from the reference turbines.

The Contractor may as an alternative or additionally carry out model tests on a turbine model to demonstrate a satisfactory design and the validity of the guarantees given. The tests shall be conducted in accordance with IEC Publication no 60193, latest revision including amendments and supplements.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

The Proposal shall contain all relevant technical information about any such previous model or prototype tests that is used for demonstrating the validity of the guarantees and technical information given.

The Employer will have the right to request additional documentation, which he deems necessary to demonstrate to his satisfaction the Contractor's compliance with the pertinent parts of the Specifications.

1.1.16.2 Turbine Output Guarantees

The prototype turbine output / maximum flow shall be guaranteed in the sense that the Contractor shall be bound to modify the turbine within a period of six months after the site completion test, in order to achieve the guaranteed output, if the measured turbine output is below the corresponding guaranteed output value. If, after modifications have been carried out, the turbine still fails to achieve the guaranteed output, or if it is mutually agreed to waive the modifications or if modifications are not possible, a sum equal to that stated in the Schedule of Performance Guarantees shall be deducted from the Contract Price.

The output test results shall be converted to the design net head values and compared with the guaranteed value. All measurements shall be conducted in accordance with IEC Publication no 60041 "Code for Field Acceptance Test of Hydraulic Turbines" (latest revision). Output values shall be stipulated on basis of net heads measured at the downstream side of the inlet valve and at tailrace level measured in the draft tube.

1.1.16.3 Cavitation Guarantees

The Contractor shall guarantee the runners and discharge rings against cavitation pitting or erosion due to suspended solids for 8,000 operating hours from the date each unit is placed in commercial operation. Testing will be undertaken in accordance with IEC 60609-1.

Excessive pitting shall be defined as the removal of metal from the turbine runner resulting from the impact of cavitation at a rate in excess of the amount as given in IEC 60609-1. The method of measuring the loss of material due to cavitation shall be volumetric as determined by above IEC Code.

If cavitation pitting exceeds the guarantees, the Contractor shall repair and rectify by welding, grinding and polishing. If after a further period of 8,000 operating hours the cavitation pitting exceeds permissible limits, the runner may be rejected in which case the Contractor shall redesign, model test, construct and supply free of charge to the Employer a new runner with satisfactory cavitation performance. In addition, the Contractor shall also be liable to bear the cost of revenue loss to the Employer due to loss of generation.

In case of delay, through no fault of the Contractor, in placing a turbine in commercial operation, the period of the cavitation warranty shall terminate not later than 60 months from the date of final delivery of each unit.

1.1.16.4 Cracking Guarantees

The Contractor shall guarantee the runners and discharge rings against crack formation for a period of not less than 8,000 operating hours from the date each unit is placed in commercial operation. The Contractor's guarantee shall be based on operation for not more than 50 hours at output greater than the guaranteed maximum output at a given head.

Cracks will be detected by ultrasonic magnetic particle and/or dye penetrant inspection. The acceptance standard will be the same as used for the manufacture of the runner and

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

discharge ring. The Contractor will repair the damaged area in situ. Any repairs required under the cracking guarantee shall be performed entirely at the expense of the Contractor.

On completion of the rectification work the guarantee period will recommence. If cracks requiring repair are still found in the runner after 24,000 operating hours, then the Employer reserves the right to reject the runner in which case the Contractor shall supply and install a new runner free of charge to the Employer in place of the rejected runner.

The Contractor will investigate causes of the cracking and propose modifications to the turbine which will be implemented entirely at the Contractor's expense.

1.1.17 General Arrangement and Construction of Turbines

The turbine shall be of the spiral casing type so constructed as to allow all the removable parts to be dismantled conveniently. The turbine will be vertical shaft installed and connected with the generator. Rotation of the unit shall be clockwise when viewed down from the top.

The main shaft, runner, head cover, bearing, shaft seal and guide vane etc. shall be able to remove from the generator stator inner hole by the powerhouse crane. The runner, bottom ring, draft tube and guide vane etc. shall be able to remove from the bottom through draft tube cone.

1.1.17.1 Runner

The Francis turbine runner shall be of martensitic stainless-steel grade CA6NM to ASTM A743M standard, one-piece design, either cast or made of a combination of plate steel and cast components accurately assembled and welded together in the shop with a material content of at least 13% chromium and 4% nickel. All shop welds shall be stress relieved. Material and the method of construction shall be to the approval of the Employer. The welding filler for runner blades with crown and bands shall be Martensitic. CNC milling machines shall be used for the turbine runner manufacturing.

The Proposal shall contain all relevant information of the make, grade and properties of the proposed material and runner manufacturing, testing and installation requirements.

The runner shall be designed to withstand the forces encountered during all normal and abnormal conditions up to and including the guaranteed runaway speed. It shall also be designed to support its own weight and that of the turbine rotating parts including the shaft when resting on the shoulder of the discharge ring.

The runner of the first unit shall be strain-gauged and the dynamic stresses measured. Should the stresses thus measured be above those for infinite fatigue life (allowing for measuring tolerances as agreed with the Employer) then the Employer reserves the right for modifications to be made to this and the runners of all subsequent units. Such modifications shall be made by the Contractor entirely at no cost to the Employer.

All surfaces exposed to the flow of water shall be finished smooth over the entire plane by grinding or other means so as to be free from hollows, depressions, cracks and projections. The average surface finish shall be 4 microns or finer in areas subject to possible cavitation as shown in the model tests. All other areas shall be finished to 10 microns or less.

The runner shall be statically balanced in the shop to a precision of at least 100 kg-m. Lead filled boxes shall not be used for balancing purposes. The balancing method shall be submitted for approval of the Employer.

All runners shall be interchangeable among all the units covered by these Specifications.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

1.1.17.2 Turbine - Generator Shafts and Coupling

The turbine - generator shafts shall be of forged steel conforming to ASTM A668 Class D standard properly heat-treated with flange at both ends. The complete shaft assembly shall be designed to operate safely at any speed up to the maximum runaway speed without detrimental vibration or distortion. The maximum torsional shear stress shall not exceed 50% of the allowable stress in tension.

The amount of shaft-runout shall be checked by rotating the finished shaft in a lathe or aligning device in the Manufacturers shop, and shall not exceed the tolerances recommended for shafts in the IEEE 810 Standard. Shaft coupling shall conform to ANSI Standard B-49-1 “Shaft Couplings integrally forged type for hydraulic units”.

The Proposal shall contain details of fabrication, testing and installation requirements.

1.1.17.3 Turbine Guide Bearing

The turbine guide bearing shall be of the multi-shoe babbitt-lined, self-aligned and self-contained lubricating type shall be located above the runner and shall consist of removable bearing segments and a bearing support. The design shall permit ready access for maintenance and replacement.

Bearing and bearing housing shall be designed to support the radial loads at any conditions of operation including runaway speed. The bearing shall be capable of continuous operation without injury at any speed between 50 and 110% of normal speed, and for at least 30 minutes at any speed from 110% of normal speed to the maximum runaway speed, and for at least 30 minutes at any speed between 1 rpm and 50% of nominal speed.

The same type of oil shall be used in lubrication of the bearing and in the governor oil system. Final selection of oil type will be coordinated with the generator manufacturer to have the same type of oil in the generator bearings.

The Contractor shall specify in his Proposal the lubrication and oil cooling arrangement and equipment required there.

1.1.17.4 Shaft Seal

The shaft seal shall prevent the entering of water from the turbine housing into the guide bearing or into the turbine pit above the guide bearing. The shaft seal shall be of the axial sliding ring type or preferably a combination of labyrinth type and axial sliding ring type.

A pneumatically inflatable seal shall be provided below the turbine shaft seal to facilitate dismantling and servicing of shaft seal without dewatering the Unit. The system shall be complete with instrumentation and valved piping for air supply from the station compressed air system available outside the turbine pit.

The shaft seal shall be supplied by water from the raw water-cooling loops cleaned by twin strainer hydro cyclone micro filter. The filter set shall be equipped with flow controls, including alarm contacts. The flow detector shall be installed on the inlet side.

The seal shall be equipped with a wear indicator.

1.1.17.5 Head Cover

The head cover shall be of cast steel or of welded construction of suitable stainless steel (ASTM A240 UNS S41500). It shall be provided with replaceable stationary wearing rings of stainless-steel plate within the range of the guide vanes and be fitted with self-lubricating

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

metal bushings and collars at the guide vane stems. The collars can be arranged alternatively on the Bottom Ring.

The cast cover shall be normalized. The plate material for the welded cover shall be normalized and the cover stress relieved before machining.

The water side of the head cover shall be designed so as to minimize friction and eddy losses and to provide a flow of water to the runner free and uniformly streamlined as far as practicable.

The cover shall be sufficiently rigid to withstand all extreme operational pressures and forces.

The space between head cover and runner shall be drained by means of a drainage pipe with throttles to prevent excessive pressure, i.e., hydraulic axial thrust.

At the place where the turbine shaft passes through the head cover, a shaft seal shall be provided as described above.

The necessary fittings for the guide vane bearings and equipment for operation as well as arrangement of the regulating ring shall be provided in the head cover.

The stationary labyrinth seal rings on the upper and lower turbine cover shall be of multi-part design and replaceable without dismantling of the generator rotor. Via the same way the counter labyrinth rings attached on the runner shall be replaceable. The stationary labyrinth ring seals shall be provided with connections for supply of cooling water in view of a possible synchronous condenser operation.

Four (04) sockets for connection of pressure gauges, measuring pressure fluctuations between guide vanes and runner shall be provided.

Shaft seal leakage water shall be conveyed to the powerhouse drainage by gravity with a suitable pipe passing through the closed section of the spiral case or through the stay vanes.

Drainage of the top cover shall be by gravity through the holes in two stay vanes. The cover shall be designed such that water cannot collect in pockets. If impractical to discharge all the collected water by gravity, the top cover shall be equipped with collected water two automatically operating supplementary electric motor driven pumps located in a sump to which all such water shall be directed.

In any case the head cover drainage system shall be sufficient to remove twice the leakage resulting from the complete removal of seals in the shaft seal, under the worst operating conditions, without flooding the head cover.

1.1.17.6 Bottom Ring

The bottom ring shall be of cast steel or of welded construction of suitable stainless steel (ASTM A240 UNS S41500) and shall be provided with replaceable stationary wearing rings of stainless-steel plate within the range of the guide vanes. It shall be designed by the same criteria regarding stiffness, deformations, splitting etc. as specified for the head cover.

Special arrangements shall be provided to enable assembly and dismantling of the self-lubricating bushings for the guide vane stems without dismantling of the guide vanes. For this, an inspection gallery shall be provided below and around the bottom ring.

The section between the runner and the guide vanes shall be drained properly to reduce motoring power demand during synchronous condenser operation.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

The casted bottom ring shall be normalized. The plate material for the welded bottom ring shall be normalized and the bottom ring stress relieved before machining.

1.1.17.7 Discharge Ring

The discharge ring made of stainless steel shall have a minimum thickness of 20 mm and a minimum length of 500 mm; it shall be inserted in the first part of the draft tube directly below the runner. Easy replacing of the discharge ring is required.

The ring shall be bolted to the draft tube cone and dismantlable to facilitate removal of runner for repair and maintenance and replacement of workout rings.

The discharge ring shall be provided for admission of air for stabilization in zones of unstable flow later on, if required.

The discharge ring shall be cast steel or of welded design. The cast discharge ring shall be normalized. The plate material for the welded design shall be normalized and the discharge ring stress relieved before machining.

1.1.17.8 Wearing Rings

A set of replaceable stationary labyrinth seal rings of stainless material shall be securely fastened and placed to the head cover and bottom ring by approved means. Wearing rings shall be made of suitable corrosion and wear resistant metals with sufficiently dissimilar characteristics of the stationary and moving parts as to prevent galling or tearing of the metal in case of accidental rubbing. The material to be selected shall have a hardness of at least 50 Brinell lower than the rotating rings of the runner.

Provisions shall be made to enable renewal of the stationary labyrinth seal rings without dismantling the generator rotor. There shall be two sets of wearing rings per turbine, one upper and one lower, designed for minimal leakage and long service life.

1.1.17.9 Draft Tube

The draft tube of the turbine shall consist of two (02) sections; included in the scope of supply for this Part:

- exposed steel plate conical section in the inspection gallery,
- steel lined section embedded in concrete.

a) Exposed Steel Plate Section

The exposed steel plate conical section shall be fixed in a suitable manner to the steel lined section and the turbine bottom ring. The construction shall be of such type, that no undue vibration and jarring occur under all operating and transient conditions. Provisions shall be made to enable renewal of the lower fixed and rotating labyrinth seal rings without dismantling the bottom ring and to support the turbine rotor by disengaged intermediate shaft during maintenance. The lower part of the conical exposed steel plate section shall be provided with a flanged type connection joint for the connection to the draft tube steel lined section.

The following welded arrangements shall be provided:

- One manhole at least 800 mm diameter with flush mounted cover opening into the inspection gallery. Hand holds shall be fixed above the manhole to facilitate entry. Manhole cover shall be of hinged design and flush shaped with the internal shape of the draft tube.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- One check cock per manhole shall be arranged below the manholes for water level check before opening the manhole.
- Provisions for attachment of a maintenance platform in the draft tube, below the turbine runner shall be arranged. These provisions shall be provided with flush mounted inside covers, easy dismantlable from outside.
- Maintenance platform to be installed into the draft tube below runner. For easy handling, they shall be made of aluminum, capable of withstanding a specific load of 5000 N/m².
- All necessary connections, piping and valves for the admission of stabilization air to the draft tube inlet.
- All necessary connections, piping and valves for water level depression and for devices to monitor the water level below the runner.

b) Steel Lined Section

The draft tube shall be steel-lined from the turbine centerline in a vertical downstream direction to a section with a water flow velocity lower than 6.00 m/s under rated conditions.

The liner and anchorage shall be designed for the external hydrostatic pressure from water seepage equivalent to the maximum tailwater level. All welded seams shall be watertight. In addition, it shall be designed to ensure a proper rigidity against vibrations.

The liner shall be reinforced strongly on the outside by suitable structural steel and provided with adequate means for securely anchoring it to the surrounding concrete of the powerhouse structure to prevent deformation during concreting and operation.

The reinforcement shall be strong enough to ensure, that the shape of the lining remains rigid with a reasonable amount of sharing support on the inside, whilst placing the surrounding concrete.

The draft tube shall be completely assembled and match marked in the shop and shall be shipped in as few units as practicable to facilitate field erection and dimensional accuracy.

A sufficient number of levelling screws and holding-down bolts with turn-buckles shall be provided to permit centering, levelling and securely maintaining the lining in alignment during embedding until concrete has achieved the specified strength.

Grouting and vent holes with closing plugs tapped for pipe connections shall be provided as required to facilitate the placing of concrete under the lining and for air release.

The steel lined section and draft tube concrete section shall be provided with the following welded arrangements and equipment:

- Connection flange to the exposed draft tube steel plate conical section, ring box type, half embedded into the bottom of the inspection gallery.
- A sufficient number of pipes for statical pressure measurement in the draft tube outlet, in accordance with the requirements of the relevant IEC Standards. The stainless-steel measuring sockets shall be separately connected via piping to a common pressure header securely installed on the turbine floor.
- Draft tube dewatering pipe at the deepest point of the draft tube to be fed into the corresponding pump sump, equipped with removable flush mounted screen made of stainless steel, a manually operated valve and a float operated throttling valve to prevent submerging of the drainage gallery under all operating conditions.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

1.1.17.10 Spiral Casing with Stay Ring

The spiral casing and stay ring shall be designed for design pressure considering maximum static head and maximum pressure ris including water hammer effects. The horizontal thrust of the spiral case on the spiral case inlet area shall be transferred to the concrete structure via circumferential collar, attached to the connection pipe.

Pressure vessel steel shall be used for spiral case and connection pipe. The spiral casing shall be manufactured from steel plate sections as a welded construction. The number of sections shall be suitably chosen so that the water does not abruptly change its flow direction. The stay vanes and stay rings may be of cast steel or welded steel plate design. The stay vanes shall have a favorable hydraulic profile.

Four equally spaced stainless-steel taps 25 mm in diameter shall be provided for head measurement and two taps provided for Winter Kennedy flow measurement. Pipes from each tapping shall be led to an easily accessible location and terminated by stainless steel valves of the globe type.

A manhole of 600 mm clear diameter with flush mounted cover and thrust screws will be provided at an appropriate location in the connection pipe with access from the turbine floor.

i) Design

The design, construction and non-destructive testing shall conform to the applicable requirements of the ASME Boiler and Pressure Vessel Code, Section VIII, Division 2 or latest approved edition.

ii) Fabrication

All welds shall be 100% radiographed except at locations which do not lend themselves to radiographic examination where they shall be ultrasonically examined. The efficiency of the welds shall be assumed to be 100%. The spiral case shall be furnace stress relieved after welding and before machining.

Welding of spiral casing shall conform to ASME Boiler and Pressure Vessel Code Section IX for procedure and welder qualification. For structural joints, AWS D1.1 will be preferred. All welding shall be carried out using approved WPS and PQRs. Weld quality shall be verified through NDT as per agreed ITP. Only qualified welders and operators shall be employed.

iii) Pressure Test

Before encasing in concrete, the complete spiral case shall be pressure tested under a pressure of 1.5 times the maximum design pressure at site. The pressure test head together with all required tools, seals, jacks, bolts and nuts shall be provided. The hydraulic pressure pumping equipment, gauges, valves and piping shall be supplied to perform the test.

During the test, stress gauges shall be fastened to prove that no stresses exist beyond the permissible limits. In particular gauges shall be fixed at the top and bottom flanges of the stay ring, at the baffle vane of the spiral case, and at locations to be stipulated during future negotiations.

The pressure test is a proof of water tightness as well as of stability of the spiral case, and successfully performed pressure test shall be recorded in writing.

Water for the pressure test will be supplied by the Contractor for Civil Works who will also drain the casing after embedment.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

1.1.17.11 Guide Vanes and Regulating Mechanism

Guide vane bearings, the bearings of the regulating gear, bearing strips for the regulating ring and guide bearing up thrust rings shall be self-lubricating. The self-lubricating element of the bearings shall be of the sintered metal matrix type in which the graphite lubricant is contained within a bronze alloy matrix.

The guide vanes shall be of cast or forged stainless steel, with a content of 13% chromium and 4% nickel, and thereby resistant to cavitation and corrosion. They shall be designed to form a single unit, consisting of guide vane and vane stems. The guide vanes shall be normalized. All guide vanes shall be interchangeable.

The surface of guide vanes shall be finished to 12 microns or finer and surface undulations shall not cause S/L to exceed 0.01 where S is deviation from design form measured normal to the surface and L is the distance along the surface over which S occurs.

Each guide vane shall be provided with three self-lubricated bushes, one located in the bottom ring and the other two in the top cover. Shrunk-on stainless steel sleeves shall be provided on the guide vane stems where they pass through the bushes. The sleeves shall be seal welded around their circumference. The upper stems of guide vanes shall be provided with bolted thrust blocks to prevent their upward movement. The thrust blocks shall rotate with the guide vanes against a machined surface on the upper section of head cover.

The guide vane regulating ring shall be guided and supported by renewable self-lubricated strips. The bearing strips shall also be designed to prevent lifting of the guide vane regulating ring under all operating conditions. A guide vane indicator plate shall be provided on the regulating ring scribed in 5% steps of guide vane opening up to 110% opening (100% corresponding to rated output).

All parts of the guide vane mechanism having relative motion shall be provided with self-lubricated bushes.

Each guide vane shall be connected to the regulating ring by means of a link and lever system incorporating a shear pin and eccentric pin to facilitate guide vane adjustment and a friction device or slipping clutch mechanism. In the event of blocked guide vane and failure of the shear pin the friction device will permit movement of the operating mechanism but shall limit the movement of the free vane. The design capacity of the shear pin/friction device combination shall be based upon the results of the turbine model test and shall be such as to limit movement of the free vane under all misaligned vane positions under both opening and closing conditions. The shear pin/friction device combination shall be shop tested and means shall, be provided for adjusting and checking the friction device setting on site. This device shall remain with the Employer for periodic checking as necessary. End stops beyond the guide vane fully open and fully closed position shall also be provided on the head cover.

An electrical or pneumatically operated detector system shall be provided for each turbine to indicate failure or cracking of the shear pins.

The guide vanes and the guide vane mechanism shall be designed for operating forces up to and including full runaway speed. They shall also be designed for forces resulting from an obstacle preventing closure or opening of the vanes up to the combined resistance of the shear pin/friction device. For stressing of the guide vanes, the obstacle shall be assumed to be in the most unfavorable position along the length of the vane.

The entire control mechanism regulating the guide vanes shall be designed so, as to be easily accessible for maintenance inspection and repair as well as to enable the safety elements to

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

be easily reset and the entire regulating mechanism dismantled. It shall be carefully executed and assembled to prevent excessive play. All joints of the regulating apparatus shall be of the self-lubricating metal type.

The vane opening or the regulating ring position shall be indicated by a pointer as a percentage on a dial.

1.1.17.12 Servomotors

The regulating ring shall be actuated by two (02) double-acting servomotors arranged suitably to achieve a simple oil piping layout and accessibility.

The servomotors shall be equipped with adjustable slow-closing devices to retard the rate of closure between the approximate speed-no-load position and the closed position so as to minimize pressure rising in the penstock during load rejections and shock loads in the regulating ring mechanism when the guide vane bodies contact each other.

The servomotors shall be provided with screw type mechanical locking devices to securely hold the guide vanes in the open and closed position, and they shall be arranged to also serve as a stroke limiting device against the maximum hydraulic torque that the vanes can experience plus the force that can be transferred to the locking device through the servomotors with the maximum governor oil operating pressure. The combination locking device and stroke limiter shall be manually operated with ease and shall be designed to prevent accidental position change. The guide vane stroke limiting arrangement shall have provisions to be locked in its position to positively limit the vane opening.

The servomotor shall be amply dimensioned for the maximum regulating forces occurring. The base plate shall be fixed to the steel platform. The servomotor shall be supported to avoid unnecessary wear on the piston rod.

The servomotor shall be equipped with a linear (mm) scale indicating the servomotor stroke conveniently legible when the turbine operates.

An orifice built in the servomotor cylinder wall shall determine the maximum closing rate of the guide vanes. Once adjusted to the correct diameter and installed, it shall be secured properly so that it cannot be removed unintentionally during overhauls, neither shall it become loose if the pipe coupling is broken.

The servomotor shall have pressure tapings for venting or measuring the pressure on both sides of the piston during operation. The Contractor shall provide the pressure measuring equipment, not being a part of the supply, during commissioning.

The stroke of the servomotor, including the guide vane apparatus, shall mechanically be designed for a 10% higher opening than the theoretical opening corresponding to rate conditions.

Leakage oil from the servomotors shall be collected and directed to a sump from where it will be pumped back to the governor pumping set sump.

1.1.17.13 Turbine Flow Meter

Each turbine shall be provided with a flow metering equipment of the acoustic type for local indication and recording at the unit local and remote-control panels in the control room. The flow meter shall be capable of measuring instantaneous flow in cubic meter per second from 10 to 125 percent of maximum turbine discharge with error not exceeding 0.5 percent. The instrument shall be calibrated during field acceptance tests and serve as index test.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

The Contractor shall submit for approval of the Employer, detailed arrangement drawings of flow meters at each penstock in consultation with their designer and equipment manufacturer to identify suitable location of the flow meters (the location of flow meters as shown in the Conceptual Drawings are indicative). Schematic diagram of the turbine flow measurement system shall also be submitted for approval of the Employer.

1.1.17.14 Interface with Penstock

The penstock will be supplied by the Contractor for Civil Works and will be left over-length where it enters the powerhouse. The Contractor shall supply a loose flange sized and drilled to suit the Main Inlet Valve upstream flange. The Contractor shall cut back the over-length penstock pipe, and weld the loose flange to the penstock such the penstock and MIV flanges are aligned. A comprehensive weld procedure document shall be submitted for approval by the Project Manager.

1.1.18 Painting Schedule and Piping Materials

1.1.18.1 Painting Schedule turbine & Auxiliaries

Painting of the turbine and auxiliaries shall be generally in accordance with General Mechanical Requirements and the following paint Schedule.

Table 1-4:Paint Schedule

Surface	Surface Preparation	Treatment
Exterior surface of the draft tube, spiral case, and all surfaces to be embedded in concrete	Mechanical cleaning as required (SSPC SP-2 or 3)	None
Wetted surfaces of the spiral case and draft tube	Mechanical cleaning SSP SP-2 or 3) and commercial blast cleaning (SSPC SP-6) as required	2 coats of coal tar epoxy SSPC Paint 16 each coat to have 200 microns dry film thickness
All non-mating surfaces of removable parts exposed to water	Near white blast cleaning (SSPC SP-10)	2 coats of coal tar epoxy SSPC Paint 16 each coat to have 200 microns dry film thickness
Edge preparations for field welding and/or prefabrication priming of parts to be field welded and painted	As required	One coat of zinc chromate vinyl butyral wash primer. SSPC Paint 27 or similar protective coating
All finished surfaces of ferrous metals. including screw threads that will be exposed during shipment or while awaiting installation	Solvent cleaning (SSPC SP-1)	Heavy coating of rust preventing compound removable with solvent

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Surface	Surface Preparation	Treatment
All parts exposed to atmosphere except machine surfaces	Near white blast cleaning (SSPC SP-10) or pickling (SSPC SP-8)	Zinc rich primer undercoat minimum dry film thickness 80 microns followed by 2 gloss finish coats of water base epoxy or acrylic dry film thickness each coat 50 to 80 microns. Total dry film thickness not less than 220 microns
Interior of bearing and parts in contact with oil	Near white blast cleaning (SSPC SP-10) or pickling (SSPC SP-8)	4 coats of white oil resistant vinyl paint total dry film thickness 150 microns
Exterior surfaces of Electrical cubicles. control and instrument cubicles and excitation cubicle etc.	Near white blast cleaning (SSPC SP-10) or pickling (SSPC SP-8)	Treatment 4 coats of vinyl paint SSPC- Paint 9, for total of 150 microns dry film thickness. finish color as directed
Interior surfaces control cubicles of cabinets. etc.	Commercial blast cleaning (SSPC SP-6)	Manufacturer's standard
Auxiliary items of equipment such as compressors, air receivers. pumps etc.	Standard commercial cleaning	Manufacturer's standard finish with finish colors at site as directed
Walkways and stairs	Commercial blast cleaning (SSPC SP-6)	Galvanize
Platforms and walkways	Commercial blast cleaning (SSPC SP-6)	Galvanize then 1 coat etch primer. 2 coats zinc rich primer total dry film thickness 100 microns then 1 coat non-skid epoxy paint dry film thickness 30 microns

1.1.19 Piping Materials for Mechanical Auxiliary systems:

Piping materials for turbines, auxiliaries and mechanical auxiliary systems shall be generally in accordance with the following schedule:

Table 1-5: Piping Schedule

Service	Piping Material	Schedule & Finish
Cooling Water piping in sizes 150 mm and smaller	Stainless Steel. ASTM A312/A312M, Type 304L, seamless	Schedule 40
Cooling Water piping in sizes greater than 150 mm	Steel. ASTM A53, Grade B. seamless	Schedule 40
Drainage piping in sizes 150 mm and smaller	Stainless Steel. ASTM A312/A312M, Type 304L, seamless	Schedule 40

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Service	Piping Material	Schedule & Finish
Drainage piping in sizes greater than 150 mm	Steel. ASTM A53, Grade B. seamless	Schedule 40
Lubricating oil piping	Stainless Steel. ASTM A312/A312M, Type 304L, seamless	Schedule 40
High pressure oil piping	Stainless Steel. ASTM A312/A312M, Type 304L, seamless	Schedule 80
High pressure compressed air piping	Stainless Steel. ASTM A312/A312M, Type 304L, seamless	Schedule 80

1.1.20 Spare Parts

1.1.20.1 Recommended Spare Parts

The Proposer shall recommend additional spare parts required for five (5) years of plant operation.

Prices for recommended spare parts shall not be included in the Total Proposal Price.

1.1.20.2 Mandatory Spare Parts

The Proposer shall provide the following mandatory spares for turbine and include its cost in the Price schedule:

Table 1-6: Spare Parts

Sr. No.	Description	Qty.
1	Spare Runner	01 No.
2	Guide vanes	02 sets
3	Complete sets of all other packing, gaskets, O-rings and seals	03 sets
4	Guide bearing pads with Babbitt metal	03 sets
5	Complete set of stuffing box seals	01 set
6	Complete set of spare parts for the shaft seal	02 sets
7	Servomotor Complete	02 No.
8	Complete set of seals for the servomotors	01 set
9	Self-lubricated bushes / bearing (complete set for one unit); for regulating mechanism	02 set
10	Guide vane levers	01 set
11	Link for guide vane	01 set
12	Shear Pin	02 set
13	Complete set of oil coolers for generator, turbine bearing, generator bearing	01 set

1.1.21 Tests

The Contractor shall submit a detailed testing and commissioning plan / protocol including factory acceptance tests (FATs), site testing & commissioning procedures in accordance with

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

following requirement and latest applicable international standards for approval of the Employer. Testing shall be carried out as per the approved plan.

1.1.21.1 Assembly and Tests in The Workshop

Assembly, inspections and tests in the workshop shall be performed in accordance with the following observations.

Inspection and testing of the runner shall be performed at the foundry and at the turbine manufacturer's workshop.

Inspection and testing of the shafts shall include the following:

- Chemical analysis including hydrogen content measurement
- Thermal treatment inspection (including stress-relieving)
- Tensile tests (yield point, strength, elongation, reduction of area)
- Charpy V-notch impact test
- Ultrasonic inspection on finished surface
- Baroscopic examination (no indication of segregations, inclusions or cracks)
- Surface roughness inspection
- Magnetic particle testing (liquid or dry method) at coupling flanges

The shafts will be subject to rejection in case of traveling indications or any other indications which have complete loss or back reflection (ultrasonic inspection). Porosity indications will not be allowed beyond a level to be stated after common agreement with the Employer.

Shop assembly shall comprise the whole turbine including pit lining, manifold, runner, complete operating mechanism, etc.

Hydrostatic pressure testing shall be performed on the spiral case. Welding seams of the manifold shall be tested 100% ultrasonically. In addition, 100% of these welds including all intersection points shall be tested radiographically.

1.1.21.2 Field Installation and Tests at Site

Installation, commissioning and testing at site shall be performed according to specifications and requirements mentioned hereafter.

The Contractor will inform the Employer in writing and in due time about the tests which are intended to be carried out.

a) Installation

The turbine spiral case / manifold shall be aligned and welded. Welding seams shall be tested 100% ultrasonically and radiographically. The turbine parts shall be embedded in concrete in accordance with a method statement agreed among the Contractor, Civil Contractor and Employer.

All permanent materials required for anchoring and supporting of the embedded turbine parts during concreting shall be delivered on time in order to be embedded in the first stage concrete.

The jacks, tie rods, turnbuckles, anchor loops, leveling screws, supporting columns, sole plates, etc. shall be designed to withstand the uplift of the manifold in liquid concrete of a density of not less than 2,400 kg/m³, during embedment.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

The permissible tolerances of straightness and verticality of the turbine shaft/generator shaft assembly shall be in accordance with IEEE Std 1095; IEEE Guide for Installation of Vertical Generators and Generator Motors for Hydroelectric Applications.

b) Commissioning Tests

Load rejection and load acceptance tests shall be performed during commissioning. These tests shall verify that pressure and speed rises, as well as pressure drops and speed drops are within the guaranteed range.

If requested by the Employer, load rejection or load acceptance tests shall be repeated or completed, without extra payment, during the turbine acceptance tests.

c) Trial Operation

After successful completion of all commissioning tests, the turbines and associated equipment shall be subject to a Trial Operation. The Trial Operation shall be carried out under the supervision and responsibility of the Contractor. During the Trial Run period, the Employer's staff shall be made fully familiar with the operation and routine maintenance of the hydraulic turbines.

d) Acceptance Tests

Field acceptance tests shall be carried out according to the international code for the Field Acceptance Tests of Hydraulic Turbines, IEC Publication no. 60041. The purpose of these tests is to determine whether or not the Contractor's guarantees have been fulfilled.

All accessories for the turbines, necessary to perform the tests, shall be supplied by the Contractor at no extra cost. The tests will be performed on all three units.

The field acceptance tests shall be carried out within or shortly after the trial run period. The tests shall be performed using the "Thermodynamic Method". Measurement of the pressure at the turbine inlet shall be made by precision pressure gauges with continuous automatic recording of the pressure. The Contract documents shall include a description regarding the tests, specifying the measuring methods and instruments to be applied. All provisions required for other parts of the plant and equipment which are not included in the Contract shall be stated clearly (e.g., provision for determination of generator losses, generator output, etc.).

All technical details of the tests shall be agreed between the Contractor and the Employer, not later than six months after Commencement Date. Preliminary notice of the date for the acceptance tests shall be given by the Employer three (3) months in advance and final notice three (3) weeks in advance.

The Employer reserves the right to order the field acceptance tests to an independent Expert experienced in performing measurements of that kind. The whole costs shall be borne by the Contractor, but limited to the costs, included in the Contract. In case the turbines do not fulfill the guaranteed output and efficiency values, the costs of these tests shall be borne by the contractor.

1.2 GOVERNORS AND AUXILIARIES

This specifies the requirements for design, engineering, manufacture, transport, storage, erection, shop and site testing and commissioning and spare parts of the speed governing units and their auxiliaries to be furnished for the Francis type turbines.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

The supply and services for each of the three governor systems shall include the following scope:

- Digital governor

  Complete dual redundancy in the electronic circuitry of the governor, with standby PLC coming into operation on failure of the prime circuit.

- Sensing equipment

  Speed measuring and power measuring.

- Electric feedback transmitters

  For all injector servomotors and the deflector servomotors.

- Governor actuator

  For electro-hydraulic interface and hydraulic amplification.

- Pressure oil system

  Oil tank with pump sets and air/oil or Nitrogen/oil accumulator.

- Mechanical-type over-speed device, directly acting on the governor hydraulic circuits.

- Shop testing, site testing and commissioning of the governor equipment.

  The following supply and services shall be provided for the governors:

- Preparation of block diagrams, schematic diagrams, logic diagrams and component arrangement drawings of the oil hydraulic equipment and control equipment for review / approval by the Employer before manufacturing.
- Supply of complete component list(s) with technical data and product description of electric devices. Supply of cross-sectional drawings of main control valves.

1.2.1 Type and Description

The governors shall be of digital electro-hydraulic type. Each governor system will be composed of a digital governor, governor actuator, pressure oil system and associated control instruments.

The main components shall be arranged on the following floor elevations:

- Turbine floor: governor actuator and pressure oil unit
- Machine Hall floor: digital governor panel

The speed signals shall be obtained from a voltage transformer located on the output terminals of the generator and from a toothed wheel on the turbine shaft operating with proximity transducers.

The signal for power control shall be obtained from the generator instrumentation.

Flow control signals shall be obtained from matrices in the digital governor derived from model test results.

The digital governor shall allow the following control modes:

- speed control (PID)
- power-frequency control (PI)
- opening control (PID)

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

In speed control mode three sets of PID parameters shall be provided: one set for no-load, one set for isolated operation and one set for network operation.

In power-frequency control mode a linear network frequency stabilization function (power-frequency droop) shall be implemented.

Opening control mode (without frequency influence) shall be locally selectable at the governor panel for test and maintenance purposes.

Interfacing with the supervisory and control system (SCS) as well as with application software shall be provided for joint control of the turbines.

The digital governor panel shall be equipped with the necessary control components and instrumentation for the relevant safety aspects.

Speed signal from generator frequency. The generator voltage metering transformer shall be used as the signal source for measuring the frequency. Inductive proximity switches with toothed wheel on the turbine shaft for speed control during starting and stopping, for speed signal display, and back-up of the frequency measurement.

Speed switches, adjustable in the speed range of 0 to 200 %, shall signal the speed criteria to control the generator brakes, excitation “on”, etc., and shall also signal over-speed, stand-still, etc.

1.2.2 Applicable Standards

The governors shall conform to the applicable requirements of the latest edition of the following Standards:

- IEC 60308 International Code for Testing of control system for Hydraulic Turbines.
- ASME PTC 29 Speed Governing Systems for Hydraulic Turbine Generator Units.
- IEEE 125 Recommended Practice for Preparation of Equipment Specifications for Speed-Governing of Hydraulic Turbines Intended to Drive Electric Generators.
- IEEE 1207 Guide for the Application of Turbine Governing Systems for Hydroelectric Generating Units.
- IEC 61362 Guide to Specification of Hydraulic Turbine Control Systems.

1.2.3 Operating Conditions

All equipment shall be provided for fully automatic operation. An automatic start-up control system shall enable start-up and synchronizing of the generating sets in less than one (1) minute counting from the start command up to parallel switching under the condition of frequency fluctuations of 1% in the grid. For this purpose, two (2) head-dependent start-up openings shall be provided. Digital governor’s frequency response shall conform to Pakistan Grid Code.

The positioning times for the set points of speed, power, turbine wicket gate positions of the governor shall be adjustable during commissioning in accordance with governor settings and requirements due to hydraulic transients at power changes. In order to attain a satisfactory optimization of the governor, the amplification and integral action time shall be as smoothly adjustable as possible over a large range.

The governor shall ensure stable operation under all operating conditions. Therefore, a distinction shall be made between parallel operation with the system (parallel operation with the other machines in the system) and isolated operation.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

If the speed band is violated the digital governor shall switch automatically to the speed control mode using the isolated mode parameters. The PID parameter setting shall be optimized during commissioning.

Bump-free switch-over from one control mode (speed, power-frequency, opening) to another control mode and vice versa shall be guaranteed. The power shall be controlled at an accuracy of 1%.

The speed controller shall respond to deviations in frequency less than 0.01 Hz. In addition to the set-point adjuster, it shall be possible for a superimposed device to transfer binary signals of speed, power, wicket gate positions. The set points of speed, wicket gate positions, and power shall not be affected by alterations of the speed droop.

1.2.4 Functional Requirements

The governing system shall be capable to fulfil the following functions as a minimum:

- Speed control at no load operation.
- Automatic start and stop sequences, including automatic synchronization.
- Power output control; operation at output limitation with power feed-back.
- Frequency regulation.
- Flow control
- Load sharing between the units in “joint control” mode.
- Quick shutdown in case of mechanical failures.
- Emergency shutdown on electrical failures.
- Pressure oil unit will be of air/oil or Nitrogen/oil accumulator and piping system

1.2.5 Technical Parameters

- Servomotor dead time (Less than) 0.2 (s)
- Speed dead band (Less than) 0.02 (%)
- Permanent speed droop bp 0 ~ 10 (%)
- Temporary speed drop bt 1 ~ 200 (%)
- Integral time constant Td 2 ~ 20 (s)
- Derivative time constant Tn 0 ~ 2.0 (s)

1.2.6 Pressure Oil System

The operating pressure of the Pressure Oil System will not be greater than 160 bar. Pressure oil unit and accumulator shall be arranged on the turbine floor near the governor actuator.

The Pressure Oil System for each governing unit comprises but not limited to following Parts:

Pressure oil unit, air/oil or Nitrogen/oil accumulator and piping system. The pressure oil unit shall be composed of oil sump tank, governor oil pumps, filters and cooler (if required).

1.2.7 Piping

All piping, tubing, flanges, fittings, valves, hangers, brackets, fasteners, and all necessary items for a complete, self-contained hydraulic pressure and actuator system shall be designed, manufactured and installed by the Contractor. All the piping and fittings will be manufactured from stainless steel material suitable for high-pressure hydraulic service, with minimum corrosion allowance.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

1.2.8 Spare Parts

1.2.8.1 Recommended Spare Parts

The Proposer shall recommend additional spare parts required for five (5) years of plant operation.

Prices for recommended spare parts shall not be included in the Total Proposal Price.

1.2.8.2 Mandatory Spare Parts

The Proposer shall provide the following Mandatory Spares given for Governor System and include its cost in the Price Schedule:

Table 1-7: Spare Parts

Sr. No.	Description	Qty.
1	Electrical cabinet	1 No.
2	Proximity Switch with disk and speed switches Magnetic pickup	1 No.
3	Auxiliary relays	1 No. for each type
4	Speed Setting device P.C.B./Speed sensor	1 No. each
5	Displacement Sensors (Governor & Operating Ring)	04 Nos. each
6	PLC along with modules	01 set
7	Electronic card/modules of each type	02 Nos.
8	Complete set of oil cooler for governor	01 set
OIL PRESSURE UNIT AND PUMPS		
5	Oil screw pump with motor for pressure oil supply	03 Nos.
6	Seals / Packing (all types)	03 sets
7	Twin filter for oil	03 Nos.
8	Solenoids / coils	03 sets
9	Springs (all types)	03 sets
10	Limit switches	03 sets
11	Micro switches	03 sets
12	Level relays	03 sets
13	Pressure switches	03 sets
14	Ball bearings (all types)	03 sets
15	Safety relief valve together with pump Un-loader valve.	03 sets
16	Guide metal for oil distribution head	03 sets

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Sr. No.	Description	Qty.
17	Gate position Transmitter	06 pcs
INSTRUMENTS AND SAFETY DEVICES		
18	Resistance type temperature detectors	06 Nos.
19	Flow relays	03 Nos. of each type
20	Level Switches	03 Nos. of each type
21	Dial type thermometers	03 Nos. of each type
22	Coils / Contacts / Springs for auxiliary Relays solenoids and switches etc.	03 Nos. of each type
23	Float switches	03 Sets of each type
24	Pressure Gauges	03 for each type
25	Site gauge glass for pressure oil tank, Sump tank	03 for each type

1.2.9 Tests

The Contractor shall submit detailed testing and commissioning plan / protocol including factory acceptance tests (FATs), site testing & commissioning in accordance with following requirement and latest applicable international standards for approval of the Employer. Testing shall be carried out as per the approved plan.

1.2.9.1 Assembly and Tests in the Workshop

The inspections and tests shall be performed in accordance with these Technical Specifications. The Contractor shall prepare a table, listing all components to be tested and the tests to be performed. Requirements outlined in IEC Publication 60308 and other publications shall be adequately included in the tests. The Employer reserves the right to request additional tests if necessary. Test certificates for materials and equipment shall be provided in triplicate to the Employer. This shall include the following:

- Material tests and chemical analysis of steel and other principal metals used.
- Plate steel for oil accumulators shall be ultrasonically tested.
- Welds shall be physically inspected, and radiographically and/or ultrasonically tested as specified.
- Hydraulic pressure tests on oil accumulators, safety valves and pressure pipes. The test pressure shall be not less than 1.5 times the design pressure.
- Insulation tests, operating tests, heating tests, load tests, etc. on electric motors in accordance with IEC standards.

All equipment shall be assembled for the inspection of functional tests. Exceptions may be permitted only if approved by the Employer. All. parts shall be correctly dowelled and matchmarked to facilitate assembly at the Site. The Contractor shall intimate the Employer in writing of the date and place of inspection and testing not less than two weeks before the parts are ready, and give the Employer full facilities for conducting or witnessing the tests. Three copies of the test reports shall be provided to the Employer.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

At least the following components shall be assembled and presented to the Employer:

- Digital governor
- Governor actuators including at least one servomotor of each type with feedback system.

The governor assemblies and components shall be inspected and tested in the workshop.

Function check of:

- digital governor panels and control functions with start-/stop simulation
- electro-hydraulic converters
- feedback transmitter
- pump motors
- oil pumps

Inspection of:

- speed sensing device
- mechanical over-speed device
- equipment to oil-hydraulic actuator cabinet.

The Contractor shall submit for approval a detailed list of tests based on the above descriptions, considering IEC-Publication No. 60308 and other applicable IEC recommendations.

The tests shall include the following:

- Pump performance tests
- Opening and closing functions
- Electrical check of correct internal wiring and cabling continuity.
- Measurement of insulation level of electrical equipment using a calibrated Megger.

Checking the governor system characteristics by means of simulation. The governor shall be tested and at least the following data recorded, preferably using a multi-channel chart recorder:

- Speed
- Servomotor positions
- Transducer position
- Dead band, dead time, inaccuracy
- Checking range and influences of governor parameters
- Checking of all signals, instruments, relays and operating times
- Checking of following-up behavior from speed to power controller and vice versa
- Checking the harmonic response and transfer functions for different settings of P, D and I values
- Checking of behavior by load rejections and load acceptance during power and speed control mode
- Checking the set-points

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

1.2.9.2 Tests on Completion

Installation, testing and commissioning at site shall be performed according to with these Technical Specifications. The Contractor shall inform the Employer in due time about the tests to be carried out.

a) Pre-Commissioning Tests (Dry Tests)

The governor shall be tested and at least the under-noted recorded, if practicable by using a multichannel chart recorder.

The Contractor shall submit for approval a detailed list of tests based on the IEC Publication No. 60308 and the technical specifications before start of the tests. The following parameters shall be tested:

- Speed signal,
- Servomotor position.
- Transducer position,
- Dead band, dead time, inaccuracy,
- Checking range and influences of governor parameters,
- Checking of all signals, instruments, relays and operating times,
- Checking of follow-up behavior from speed to power controller to opening controller
- in different sequences and vice versa,
- Checking the harmonic response and transfer functions for different settings of P, 0
- and I value,
- Checking of behavior by load rejections and load acceptance during opening,
- Power and speed
- Control mode,
- Checking the set-points of starting up procedure (step one and step two setting).

The functions of oil pressure units, air/oil pressure vessels and oil sump tanks shall be checked in detail. Each pump shall run continuously for at least six (6) hours.

During this operation test calibration of valves, checking of oil leakage through pilot and control valve at steady conditions, checking the change-over procedure from one cooler or filter element to the other, and adjustments for the closing and opening times of the servomotors shall be performed.

All functions shall be checked regarding movement of servomotors, electrical feedback devices, adjustment of set-points, automatic replenishment of oil and air in the air/oil pressure vessel, function of switch points for the un-loader valves and pumps, closing and opening times for injectors and deflectors, function of locking systems and hydraulically-actuated main oil valve at the inlet / outlet from the air/oil pressure vessel; switch-over behavior from pumps as well as filters and coolers.

The Contractor's supervisor shall carry out the correction of any malfunctions or deviations from the Specifications before receiving the permission to start the commissioning tests.

b) Commissioning Tests (Wet Tests)

The commissioning tests shall be carried out in conjunction with the turbine tests, in accordance with the requirements given in turbines section. However, the Contractor shall

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

submit a detailed test program for demonstrating at site that the governors meet the stipulated requirements.

1.2.10 Trial Operation

After successful completion of all commissioning tests, the governors and associated equipment shall be subject to a Trial Operation. The Trial Operation shall be carried out under the supervision and responsibility of the Contractor.

1.3 TURBINE MAIN INLET VALVES (MIV)

This specifies the requirements for design, engineering, manufacture, transport, storage, erection, shop and site testing and commissioning and spare parts of three (3) inlet valves of butterfly type and their auxiliaries to be furnished for the Francis turbines.

The scope of supply for each inlet valve shall include the following:

- Butterfly Valve (Internal Diameter 1.8m)
- Bypass Valves Assembly
- Extension Pipes
- Dismantling Joint
- Counter Weight
- Hydraulic Operator
- Associated Piping

1.3.1 Location

Turbine main inlet valves will be provided in the powerhouse upstream of each turbine spiral case intake as indicated in the powerhouse general arrangement drawings.

1.3.2 Operation

The inlet valves shall be capable of closing against the maximum flow that can occur under any turbine operating condition including runaway. The inlet valves shall be operated in the opening direction by an oil pressure servomotor whereas closure shall be by counterweight. In the closed position the counterweights shall not restrict access on the valve floor.

The inlet valves opening and closing times shall be independently adjustable but the adjustments shall be of a form that cannot be readily or inadvertently altered. In the interests of minimizing the time necessary to shut down in an emergency, the closing times shall be the minimum consistent with safe operation. The valves shall be opened under balanced conditions provided by opening of their bypass valves.

The MIV shall close after each turbine shut down and its operation shall be controlled by the normal start up and shut down sequences of the generating units.

The oil pressure accumulator system shall be dimensioned to handle three (3) full strokes of the valve (close-open-close) with the remaining pressure during the last stroke sufficient to close the valve.

1.3.3 Guarantee

1.3.3.1 Performances

A. Leakage

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

There shall be zero visible leakage when the valve is new and fully closed under rated pressure.

B. Pressure surge

The Contractor shall guarantee that, turbine MIV closure under any discharge condition shall not generate a transient head higher than its maximum design pressure.

1.3.3.2 Rejection

If the guarantee is not met, the Contractor shall modify the valve within thirty (30) days of the test. The Employer reserves the right to reject a valve should the Contractor fail to meet the guarantee within 45 days following completion of the test.

1.3.4 Valve Type

The Main Inlet Valves shall be of lattice disc butterfly type.

1.3.5 Thrust Forces

The downstream end of the penstock shall be located within a thrust block that shall provide axial restraint against hydraulic forces. The main inlet valve foundation and its dismantling joint shall accommodate any residual axial movement of the penstock part exists between the thrust block and the MIV.

1.3.6 Bypass Valve and Piping Assembly

A by-pass line assembly of 200 mm nominal pipe diameter shall be provided across each Inlet Valve and designed against maximum applicable pressure. The assembly shall be complete with a 200 mm electrically / hydraulically operated by-pass needle valve and one 200 mm manually gear operated maintenance gate valve including slip joint upstream of the bypass valve suitable for pressure conditions. The bypass line will be used to fill the conduit and spiral case downstream of the main inlet valves. All piping, bolts, nuts, gaskets and a suitable dismantling coupling for a complete installation shall be furnished.

The bypass valve shall be motorized to allow automatic operation by the control system, alternatively the bypass valve can be actuated by the governor hydraulic system. Manual operation provision shall also be provided.

The bypass valve discharge shall be suitably angled so that a cushion of water shall minimize the effects of erosion on surfaces within the spiral casing.

All wearing parts of the bypass valve(s), including those susceptible to erosion or cavitation, shall be renewable, and those in contact with water shall be of stainless steel or bronze. The bypass shall be formed to avoid cavitation damage to the valve and piping.

The bypass valve shall have two (2) limit switches to operate in the closed position and one (1) for 100% opening.

1.3.7 Dismantling Joint

A flanged dismantling joint complete with nuts, bolts and jointing shall be provided, located immediately on the turbine side of the valve. The dismantling joint shall permit installation and removal of the valve and, when in position, shall form a positive connection which shall allow sliding movement of the valve relative to the spiral casing.

The dismantling joint shall be provided with lifting lugs to facilitate removal and installation.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

1.3.8 Upstream and Downstream Connection Pipes (Extension Sections)

Upstream and downstream connection pipes shall be furnished with each main inlet valve. Upstream connection pipe will be provided between the end of steel penstock and the loose flange of main inlet valve. The connection pipe end at steel penstock side will have a length with margin to adjust and prepare the joint with steel penstock.

Downstream connection pipe will be provided between the inlet of spiral casing and loose flange of dismantling joint.

Upstream and downstream connection pipes shall be provided with suitable flange connections for the by-pass line. Drain valves of DN200 will be provided on both the connection pipes.

Each downstream connection pipe section shall be provided with one (1) 150 mm air-vacuum valves and also supplied with a shutoff manually gear operated gate valve. The valves shall be suitable for operation at the maximum applicable pressure. The gate valve shall be capable of being locked in the open position.

Four pressure taps of stainless steel shall be furnished and equally spaced around the upstream extension on diameters at 45 degrees to tile vertical, for net head measurements and for connections to a pressure gauge to be mounted on the control cabinet. All required piezometer piping, manifolds, and fittings shall be furnished.

1.3.9 Foundation Plates

The foundation plates shall be provided with the necessary devices to facilitate level and position adjustment. The sliding faces shall preferably be equipped with self-lubricating bearing surfaces but if appropriate materials are not available then they shall be provided with grease grooves and greasing nipples.

1.3.10 Valve Body

The valve body shall be cast steel or fabricated in boiler plate quality steel. It shall be rigidly built and adequately ribbed to minimize distortions. The valve body shall be provided with flanges for bolted connection with upstream and downstream mating flanges as indicated on the valve chamber general arrangement drawings.

Cast or welded valve body parts shall be normalized before machining. The body shall include two horizontal trunnion bearings. The bearing housings shall be integral with the valve body.

The supporting feet shall be designed, machined and surface treated to allow movement of the valve within the elastic extension of the upstream manifold pipe.

1.3.11 Valve Disk and Seal

The valve disc shall be of the lattice or “through flow” type designed for minimum head losses. The valve disk shall be of cast steel or welded construction, equipped with bolted-on trunnions (with locked screws) and replaceable trunnions (with locked screws). The disk shall be of lattice construction.

The design of the disk shall be to minimize head losses. The rotor position shall be indicated on a scale of reasonable size. Rotor position shall also be indicated to the control system.

The disc sealing elements shall be of natural rubber, or other suitable elastomeric, sealing against corrosion-resistant metal seat. The seal retaining fastening devices shall all be made of suitable corrosion resistant metal. The adjusting may be accomplished either in the seal

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

retaining element or the seal seating element. The seals shall also be removable and replaceable without removing the valve.

1.3.12 Trunnions and Bearings

The trunnions shall be made of forged steel, horizontally arranged, and designed for bolted connection to the valve disk. The sealing areas of the trunnions shall be of stainless steel.

The bearings shall permit the necessary adjustments from outside of the bearing housing. The trunnions shall be hydraulically balanced. The replaceable bearing bushes, supporting the radial and residual axial loads shall be of corrosion resistant material, and shall be replaceable without dismantling the valve. The bearings shall be of self-lubricating metal. The trunnion seals shall prevent water from entering the bearings and shall be optimized for operation in silty water conditions.

1.3.13 Operating Servomotors

The servomotors shall be sufficiently sized to ensure that valve opening / closure can be obtained at the minimum guaranteed operating pressure under worst-case conditions. The piston rods shall be forged steel having hard chrome plated surface.

The servomotors and their mountings, pressure piping and control valves shall be adequate for the pressure produced in the servomotor with the most adverse conditions of unbalanced closure against maximum flow, including emergency and runaway conditions.

A manually operated mechanical lock for securing the main inlet valve in the closed or open position shall be provided and shall be of adequate strength to resist both the thrust of the servomotor in the opening direction and the force from the weights in the closing direction. The locks shall embody provision for padlocking in the inserted and withdrawn positions to ensure operational safety during maintenance.

The initiation of opening of the inlet valve shall be interlocked with the establishment of a pressure in the spiral casing substantially equal to penstock pressure.

The inlet valve is not required to be latched open. The piping arrangement shall be such that the servomotor cannot empty under any operating conditions, including loss of power or control signal failure.

1.3.13.1 Operating Mechanism

The operation of valves shall be through servomotors which use hydraulic oil at pressure not greater than 160 bar. The pressurized oil shall be taken from the pressure oil system. The pressure oil system design and equipment shall be similar to those for the hydraulic governor pressure oil system given in Section 4 of this Volume including redundancy, alarms and safety devices.

Inlet valve closing shall be counter weight actuated and opening shall be by oil pressure actuated hydraulic cylinder connected to the counterweight lever assembly. By means of orifices, the same hydraulic cylinder shall also restrict the closing velocity of the valve.

Each valve control panel shall also be provided to allow local control of the valve, bypass, as well as indication of system oil and Nitrogen pressures.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

1.3.14 Pressure Oil System and Control Equipment

Each valve shall have its dedicated oil pressure system / equipment. The pressure oil supply system and the control equipment shall be accommodated in one cabinet located adjacent to each MIV. Each oil pressure system comprises of the following:

i. Oil reservoir tank
ii. Two oil pumps
iii. One hand operated piston oil pump for emergency operation
iv. Control instruments and limit switches, including pressure switches and alarms
v. Oil pressure accumulator system
vi. Connecting tube between valve, pumps and control cabinet
vii. Internal electrical wiring of the control panel, complete with terminal blocks and labeling

1.3.15 Instrumentation

The valve shall be provided with the limit switches or other devices to provide the control system with information on the valve position.

A pressure gauge with an isolating tap shall be provided on the valve upstream flange, suitable for the maximum design pressure of the penstock.

1.3.16 Spare Parts

1.3.16.1 Recommended Spare Parts

The Proposer shall recommend additional spare parts required for five (5) years of plant operation.

Prices for recommended spare parts shall not be included in the Total Proposal Price.

1.3.16.2 Mandatory Spare Parts

The Proposer shall provide the following Mandatory Spares given for turbine main inlet valve and include its cost in the Price Schedule:

Table 1-8: Spare Parts

Sr. No.	Description	Qty.
1	Complete sets of disk seals	01 set
2	Sets of screws and plates for the seals	01 set
3	Complete set of gaskets, “O” rings and packings	01 set
4	Valve of each size	01 set
5	By pass valve assembly	01 set
6	Air release valve assembly	01 set
7	Pressure switch, Limit switch and relays	01 set
8	Self-lubricating trunnion bearing	01 No.
9	Sets of piston seals for the cylinders	01 set
10	Sets of each solenoid valves	02 set
11	Sets of each no-return valve and flow control valve and manual valve	01 set

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Sr. No.	Description	Qty.
12	Complete set of pump and motor	01 set
13	Complete assembly of valve lock for open position	01 No.

1.3.17 Tests

The Contractor shall submit detailed testing and commissioning plan / protocol including factory acceptance tests (FATs), site testing & commissioning in accordance with following requirement and latest applicable international standards for approval of the Employer. Testing shall be carried out as per the approved plan.

1.3.17.1 Assembly and Tests in the Workshop

a) Material Tests

Based on these requirements, the Contractor shall prepare a list showing all components of the supply to be tested and the corresponding tests to be performed.

The Employer, however, reserves the right to request further tests without additional cost, if he deems such tests necessary.

b) Workshop Assembly and Workshop Tests

All parts of the supply shall generally be assembled in the Contractor's factory to the extent necessary for the purpose of inspection, testing and otherwise, to ensure that the equipment will function satisfactorily. Exceptions may be permitted, if approved by the Employer. All parts shall be correctly doweled and match marked to facilitate the assembly at site.

At least, the following parts of each spherical valve shall be assembled at the Contractor's workshop and be presented to the Employer:

- Complete assembly of butterfly valve with operating mechanism, including attachment of upstream transition pipe
- Complete assembly of by-pass system
- Complete assembly of oil accumulator, pressure oil system and local control panel
- Assembly of control piping as far as practicable.

In the above-mentioned assembled condition, the following shop tests shall be performed on the valve by the Contractor in the presence of the Employer:

- Pressure test of 150% of applicable design pressure shall be applied on completely assembled butterfly valve. The pressure shall be applied for an hour at least.
- Pressure test of 150% of applicable design pressure shall be applied on the upstream transition pipe, the pressure shall be applied for an hour at least.
- Pressure test with 150% of the applied working pressure of closing and opening cylinder of the operating servomotors. On each cylinder, the pressure shall be applied for an hour at least.
- Functional test of the butterfly valve with performance of opening and closing movements as well as application of the seals.
- Pressure and tightness test of the entire by-pass system with the same pressures and times as indicated above for the main inlet valve.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- Pressure test of the hydraulic part of the control cabinet, including piston accumulator, with double the normal working pressure; pressure to be applied during one hour at least.
- Hydraulic and electrical function tests of the control panel under maximum and minimum working pressure.

Pressure test of the control piping at double the normal working pressure as far as practicable.

c) Required Performance

The valve and operating mechanism shall be free of abnormal friction or other power consuming deficiencies. All seals shall be drip tight.

1.3.17.2 Field Installation and Tests at Site

a) Installation Requirements

The following particular requirements shall apply for the installation of the butterfly valves:

The valves shall be brought to the final installation place by means of the powerhouse bridge crane. There the valves shall be placed, perfectly aligned and prepared for embedment of the base plates and for field welding of the upstream transition pipe to the penstock branch pipe, and connection of the dismantling pipe to the turbine manifold. Making-up and welding of the upstream field joint shall be done by the Contractor.

After final placement of the butterfly valve the complete installation of the control equipment and piping, including welding of the pipe work, shall be performed. The scope of installation activities comprises also the supervision of the embedment of the base plates and site painting. For the issue of the "Complete and Ready for Commissioning Certificate", the following checks shall be performed:

- Verification of all parts of the supply.
- Verification of perfect alignment of the butterfly valve and dismantling pipe.
- Check of all important clearances with particular view to the dismantling flange system.
- Non-destructive testing of the field welding and material testing shall be in accordance with specified standards. The field welding shall be checked by radiographic examination on its total length, i.e., 100%.
- TIG welding (tungsten inert gas welding) shall be carried out
- Performance of pressure testing of the control piping with double the normal working pressure.
- Check the pre-stressing, perfect locking and securing of all nuts.

b) Commissioning Tests

The Contractor shall supervise and direct the following commissioning tests, as applicable to ensure that the equipment has been correctly installed, all necessary adjustments and settings are made, and that it is in sound condition to operate. The tests listed hereafter are divided into preliminary tests, operation and performance tests. Commissioning of the equipment shall take place, together with the corresponding generating unit according to the commissioning program agreed by the Employer.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

i. Preliminary Tests (Dry Tests)

- Electrical control of correct wiring and cabling of all control, alarm and auxiliary power circuits.
- Testing and setting of all relays, limit switches, etc.
- Function test of the Butterfly valve control system in local and remote control modes.
- Dry check of automatic start and stop sequences in conjunction with the Francis turbine.
- Dry check of opening and closing movements, preliminary adjustment of opening and closing time of spherical valve rotor and bypass valve in accordance with approved setting values.

ii. Operation and Performance Tests

- Filling of penstock manifold and upstream conduit in a controlled manner. Subsequent filling and deaeration of all control pipes and control valves.
- Tightness test of the valve seal at pressurized penstock.
- Performance of various opening and closing sequences of the by-pass valve under automatic and manual control.
- Checking of opening and closing time of butterfly valve rotor and automatic by-pass valve under dead water conditions.
- Various opening and closing movements under dead water conditions in order to check the correct functioning of the control system, butterfly valve and bypass system in local and remote control.
- Definite adjustment of limit switches and verification of the correct functioning of the various pressure measuring instruments.
- Any additional tests required by the Employer to ensure the completeness and safety of the equipment when operated without additional cost to the Employer.

Following the tests listed above, the subsequent performance tests shall be carried out:

- Closing of the butterfly valve under 25, 50, 75 and 100% of the maximum turbine discharge, in order to prove the vibration-free and safe closing of the valve.

For each closing, the closing time and the corresponding pressure rise shall be measured and recorded. The details of the measurement methods, the conditions and performance of the tests at site shall be agreed upon between Employer and Contractor, and laid down in a separate program, defining the sequence of the tests, the equipment preparation and the corresponding operation procedure prior to commencement of the tests.

After successful termination of all tests on completion the butterfly valves shall be subject to a trial run operation period.

Should by mutual agreement between the Employer and the Contractor one or several performance tests be postponed, this should not prevent beginning of the trial operation.

1.3.18 Trial Operation

Trial operation shall be carried out under the supervision and responsibility of the Contractor, in accordance with the Contract Conditions. During this period, the Employer's staff shall be made fully familiar with the operation and the routine maintenance of the plant.

Within one month after commencement of trial operation the valve shall be tested to determine its ability to close tightly against the maximum specified flow and head or maximum flow and head obtainable, if less than specified and the results shall be documented and submitted to the Employer.

1.4 POWERHOUSE CRANE

1.4.1 General

This specifies the requirements for design, engineering, manufacture, transport, storage, erection, shop and site testing and commissioning and spare parts of the Powerhouse Electric Overhead Traveling EOT Crane to be furnished complete including all accessories and auxiliary systems in accordance with these Specifications.

1.4.2 General Requirements

The powerhouse crane will be used for unloading, assembly, erection and future maintenance of the turbines, generators, inlet valves and other mechanical and electrical equipment throughout the service life of the plant. The crane shall travel within the powerhouse serving all three units and erection bay. It shall be operated from an open cabin hanging under the bridge at the downstream wall. In addition, it shall be possible to operate the crane from any location in the powerhouse by means of a portable radio control panel.

The tentative capacity of crane (main hook) is 70 tons. However, Contractor shall determine the actual capacity of the Crane during his basic design which shall be subject to the Employer approval. The capacity of the crane (main hook) shall be appropriate to handle the heaviest assembly including dynamic factors and erection tolerances.

The crane shall be of the overhead travelling type with hook, rails for the runway, and each shall be equipped with one hoist with gear and one auxiliary hoist travelling under one of the girders. The crane will run on a set of rails extending throughout the length of the powerhouse. The crane shall be provided with a cabin of simple, open design for one person, and shall be equipped with chair, controllers and electric socket for 230 V, lighting and fan, and a foot operated horn/bell.

The bridge crane shall be designed and tested in accordance with the requirements of Federation Europeenne De La Manutention (FEM).

FEM classes for the cranes shall be as follows:

Crane structure design

Crane	Class
Powerhouse EOT Crane	A3

Crane mechanisms design

Crane	Class
Powerhouse EOT Crane	1 Bm

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

1.4.3 Extent of Supply

The scope of supply shall include but not be limited to:

i. One (01) top running, double girder electric overhead travelling crane for powerhouse with main hook tentative lifting capacity is 70 ton appropriate to handle the heaviest assembly with appropriate lifting height and factor of safety.
ii. One (01) 10 ton. auxiliary hoist.
iii. One (01) complete set of crane rails for the crane including rail fasteners and buffers.
iv. One (01) open operator's cabin with access ladders and safety handrails.
v. One (01) set of electrical control equipment.
vi. All necessary anchors, bolts, screws, framing, pipes, handrails, oil, grease, temporary and permanent devices for alignment and fixing.
vii. All components, accessories, items and equipment not specifically mentioned above, but necessary for the safe and proper manufacture, transportation, testing, commissioning operation and maintenance of the supply.

1.4.4 Technical Requirements

The design and principles for the design shall be in accordance with the General Mechanical Requirements and the requirements given in this Chapter. Reference is also made to General Mechanical Requirements regarding seismic loads applicable to the Project location.

1.4.5 Space Requirements

In general, the hook approach distances from the lateral and end walls as well as the space requirements above the crane beams should be kept as small as possible, to obtain maximum working area for the crane.

The Proposer shall submit information about space requirements, hook approaches, lifting heights, etc., as stated in Technical Schedules of Tender Documents.

1.4.6 Adjustments

If, for some reason, the length or width of the powerhouse will be adjusted during final design, the length of the crane runways and crane girders will be adjusted correspondingly. No price adjustments will be made for changes of crane span or runway length.

1.4.7 Major Components of Crane

1.4.7.1 Crane Girders

The crane girders shall be strong, welded steel construction. Standard size girder rails and trolley stops shall be provided on each girder. Bumpers shall be provided on the trolley. The crane girder shall be provided with the necessary walkways with hard rails, platforms etc., to permit easy access for lubrications, inspection and maintenance. Access to the walkway and the powerhouse crane operator's cabin shall be allowed by ladders as shown on Drawings.

1.4.7.2 Crane Drive

The crane traveling drives shall be variable frequency drive type, and the number of driving wheels shall be in accordance with FEM Standards. The driving and control mechanisms shall be designed and constructed so that the crane travel will be steady and free from undue noise, vibration or rocking in any parts of the structure at rated speed and load. An electrical

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

release, spring-set, friction shoe brake with a capacity of at least 150% of the full load torque of the crane drive motor shall be provided.

The brake shall operate immediately after the power of the driver motor is cut off and shall be equally effective in both directions of travel.

1.4.7.3 Trolley Frame

The trolley frame shall be of rigid welded steel construction and shall provide equal load on all wheels without undue deflection. Bumpers shall be placed at the ends of the trolley frame. The frame shall be equipped with supports allowing maximum sag of 20 mm in the event of any wheel assembly breaking.

1.4.7.4 Trolley Drive

The trolley drive shall be designed so that the travel under all operating conditions will be steady and free from undue noise, vibration or rocking in any part. At least one wheel on each rail shall be connected to the trolley drive. An electrically released, spring-set, friction shoe type brake, having the same characteristics as stipulated for the crane drive, shall be provided.

1.4.7.5 Hoist and Gear

The hoist and gear shall be mounted on the trolley frame and be driven by suitable electric motors to obtain the required hoisting speeds. Drums and sheaves shall be designed according to approved standards. The reduction gear shall be fitted with ball/roller bearings, running in oil baths within an oil and dust-tight gearbox, equipped with level sight glasses.

All rotating and moving parts shall be protected by sheet metal guards or other convenient protection devices. Limit switches shall be provided to prevent the hook traveling beyond the predetermined highest and lowest positions.

The hoist shall be equipped with an electrical release, spring-set friction shoe type holding brake with a capacity not less than 150% of the full load torque of the motor.

The load blocks shall be designed to protect the hoisting ropes and prevent them from leaving the sheaves under operating conditions.

1.4.7.6 Auxiliary Hoist

The auxiliary hoist shall be driven by a suitable electric motor and gears to obtain the required speeds. Drums and sheaves shall be designed according to approved standards. The reduction gear shall be fitted with ball/roller bearings, running in oil baths within an oil and dust-tight gearbox.

All rotating and moving parts shall be suitably protected by sheet metal guards or other convenient protection devices Limit switches shall be provided to prevent the hook and carriage traveling beyond the predetermined limits of position. The carriage shall be provided with suitable end bumpers.

The hoist shall be equipped with an electrical release, spring-set friction type holding brake with a capacity not less than 150% of the full load torque of the motor.

The load block shall be designed to protect the hoisting ropes and prevent them from leaving the sheaves under operating conditions.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

1.4.7.7 Crane Tracks

The crane tracks shall be mounted on the concrete beams along the powerhouse.

The columns will be provided with brackets for support and attachment of the girders. Bolts and accessories for fixing the girders to the columns as well as alignment and erection of the girders is part of this Contract.

The complete track with rails, rail fixtures, backplates, end buffers, bolts and nuts shall be included in the supply. The design shall allow for future adjustment of the lateral position of each rail by using clamps for fixing the rails to the concrete beam as shown on drawings or by other approved means.

1.4.7.8 Lighting and Power Points

Four mercury vapor lamps complete with reflectors shall be furnished for crane. These shall be conveniently located and be adjusted from the gangway. The lamp capacity shall be 400 Watts. A power supply with three sockets shall be provided in convenient places along the crane gangway for light, hand tools etc.

1.4.7.9 Hooks and Wires Ropes

The hooks shall be made of forged annealed alloy or carbon steel in accordance with the General Mechanical Requirements. The hooks shall swivel freely on grease lubricated ball or roller bearings. The bearings shall be totally enclosed, dust-tight and constructed to prevent grease leakage.

The wire ropes shall have sufficient length to provide three turns of each end on the drums with the hook at the lowest position. The wire ropes shall be galvanized, permanently lubricated and of heavy duty, fiber core, twist-free design.

The main hook of the powerhouse crane shall have a perfect, vertical lift.

1.4.7.10 Motors

The motors shall be of the slip-ring or squirrel cage type with sufficiently smooth start characteristics and with sufficient capacity to handle the maximum loads They shall be rated for at least 40% relative duty factor and shall have class B or better insulation. Motors of relatively low speed will be preferred. The motor protection shall correspond to IP 54, IEC 144.

The Proposer shall offer thyristor based variable speed motors for crane and trolley drive and/or hoisting machinery.

1.4.8 Power Supply and Electrical Wiring

The power supply is 400 V AC, 50 Hz. Connection boxes will be situated next to the crane rail. For the powerhouse this connection box will be located at the top floor of the service bay.

Power shall be supplied to the EOT and monorail cranes hoists through flexible suspended cables.

All wiring shall be furnished and shall be installed in galvanized steel conduits.

Separate conduit systems shall be provided for power and control circuits. All wiring, unless otherwise specified, shall be of the stranded conductor type and shall be brought to terminal

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

blocks to facilitate external power connection. All wires shall be tagged or marked for permanent identification to facilitate erection and maintenance.

1.4.9 Control Equipment

All functions of the main and auxiliary crane hoists of the powerhouse crane shall be controlled from the operator's cabin specified above.

Additionally, the crane shall have a radio control panel for control from the machine hall.

The electrical equipment and installation shall be complete and comprise all control and protective devices, particularly:

i. Limit switches controlling the end travel of hoist hooks.
ii. Limit switches controlling the end travel of traveling carriages.
iii. Limit switches controlling the end travel of cranes and trolleys.
iv. Load switches that cut the power supply in the event of overloading the hoists.

Emergency stop switch shall be provided at the machine hall floor near the generating units.

The control cubicle for the crane/hoist shall include all necessary fuses, circuit breakers, relays, switches, etc., as required for the proper and safe operation of the equipment. The supply shall also include all necessary limit switches, motor protection devices, cables, cable racks, etc.

1.4.10 Spare Parts

1.4.10.1 Recommended Spare Parts

The Proposer shall recommend additional spare parts required for five (5) years of plant operation.

Prices for recommended spare parts shall not be included in the Total Proposal Price.

1.4.10.2 Mandatory Spare Parts

The Proposer shall provide the following Mandatory Spares given for Powerhouse machine hall EOT crane and include its cost in the Price Schedule:

Table 1-9: Spare Parts

Sr. No.	Description	Qty
1	Motor of each type used for the crane to be supplied	01 No.
2	Bearings, bearing bushes, wear pins, etc., of each type used	01 set
3	Brake shoe liners for each brake used	01 set
4	Set of gaskets and packing for each type used	01 set
5	Set of limit switches of each type used	02 sets
6	Set of flexible couplings of each type for main and auxiliary hoist drive motors	01 set
7	Set of electric control coils, controllers, contractors of each type used	01 set
8	Sets of lamps, fuses, etc. of each type used (A set consist of 50 Nos.)	01 set

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Sr. No.	Description	Qty
9	Complete crane PLC along with modules	01 No.
10	Electronic module of each type	01 No.

1.4.11 Tests

The Contractor shall submit detailed testing and commissioning plan / protocol including factory acceptance tests (FATs), site testing & commissioning in accordance with following requirement and latest applicable international standards for approval of the Employer. Testing shall be carried out as per the approved plan.

1.4.11.1 Assembly and Tests in the Workshop

The Contractor shall prepare a table, listing all components to be tested and the tests to be performed. The Employer reserves the right to request additional tests necessary. Tests certificates for materials and equipment shall be provided in triplicate to the Employer.

This shall include the following:

- Material tests and chemical analysis of steel and other principal metals used.
- Welds shall be physically and radiographically or ultrasonically tested as specified.
- Routine tests on purchased equipment.
- Insulation tests, operating tests, heating tests, load tests, etc. on electric motors,
- starters, transformers, and other electrical and mechanical components.
- Load rope breaking tests
- Crane static rigidity
- Static test
- Dynamic test

The material test shall include the following:

- Plates or rolled sections of 2 tensile tests and 3 notched bar the main girders impact test on specimens from each kind of plate of each kind of rolled section.
- Shafts rope drum, gear wheels, traveling roller tests: 2 tensile tests and 3 notched bar impact tests of each component according to contractor's test list.
- Hooks: 2 tensile tests and 3 notched bar examinations, in accordance with DIN 15404.
- All plant shall be assembled for the inspection of functional tests. Exceptions may be permitted if approved by the Employer. All parts shall be correctly doweled and matchmarked to facilitate assembly at the Site. The Contractor shall intimate the Employer Requirements in writing of the date and place of inspection and testing not less than two weeks before the parts are ready, and give the Employer full facilities for conducting or witnessing the tests. Three copies of the test reports shall be provided to the Employer.

1.4.11.2 Tests at Site

a) No-load Test

During the testing maneuvers, the following items shall be checked:

- Correct operation and efficiency of brakes and limit switches,

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- Vertical and horizontal traveling distances and approach measurement,
- Synchronization of pulley operation when several hoists are used,
- Operating speeds,
- Operation and characteristics of manual and emergency control,
- Examination of paintwork.

b) Commissioning

As far as possible, the Contractor shall carry out the load tests under the worst operating conditions under which the hoisting equipment will be operated. All measuring equipment, including test loads, test load carrying structures, ropes etc. shall be provided by the Contractor.

i. Static test

With the handling mechanism in a fixed position, the hoisting equipment shall be tested under an overload 40%: greater than its rated load. This load shall be maintained for one hour. The load shall then be relieved gradually. No defect or permanent deformation shall remain after complete removal of the load.

ii. Dynamic test

Overload tests: After satisfactory completion of the static test, the testing load shall be decreased to a value 20% greater than that of the rated load of the hoisting equipment. Under these conditions, all the lifting and lowering operations shall be carried out successively for a period of fifteen minutes of effective operation, without vibration, deformation or detrimental temperature rise. Transverse movements of the handling mechanism shall be tested under the same conditions as above. During these maneuvers the following shall be checked:

- Correct behavior of the handling mechanism along its rolling track: the framework shall remain perpendicular to the track and shall under no circumstances give evidence of any defect or deformation;
- Correct operation and efficiency of the brakes and limit switches;
- Adjustment of the starting equipment, adherence of rollers on starting and braking;
- Correct operation of the overload safety system for a load slightly exceeding 120% of the rated load.
- Rated load tests: The crane shall be loaded to its rated load and the following shall be checked:
- The deflection;
- The horizontal and vertical travel distances;
- Correct general operation of the safety mechanisms and accessories;
- The operating speeds;
- The lifting and lowering movements, which shall be made in a continuous smooth manner so that all maneuvers shall be possible with adequate accuracy;
- Brakes and stopping distance: The hoist brakes shall be capable of stopping the rated load operating at a normal slow speed with a maximum slip of 4 mm and maintaining this load in a stationary position without slipping.
- The bearings and other mechanical parts shall also be checked for temperature rise.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Final inspection

After the dynamic test, suspect components shall be dismantled and cleaned. Bearing surfaces shall be inspected for wear and lack of lubrication. Defective components shall be replaced at the Contractor's expense.

1.4.12 Trial Operation

After successful completion of all commissioning tests, the bridge crane and the associated equipment shall be subject to a Trial Operation Period. The Trial Operation shall be carried out under supervision and responsibility of the Contractor.

1.5 MECHANICALAUXILIARY SYSTEMS

Mechanical auxiliary systems to be provided shall include but not be limited to the following complete, integrated and fully functional systems:

- Cooling water system
- Dewatering and drainage systems
- Compressed air system,
- Oil purification systems.

1.5.1 Cooling Water System

1.5.1.1 General

This specifies the requirements for the design, engineering, manufacture, works testing, packing, transport, storage at site, install, test and commission, acceptance testing, warranty and other services specified or required in these specifications for the supply of cooling water system for the turbine and generator units.

The P&ID, system description, detailed arrangement and specifications of cooling water equipment shall be submitted by the Contractor for Employer approval.

1.5.1.2 Description

The cooling water system shall be provided for the following components:

- Generator air coolers.
- Oil coolers of turbine and generator bearings.
- Turbine shaft seal (if applicable).
- Governor oil cooler (if applicable).

Open loop cooling system is foreseen; however, the Contractor shall be required to carry out his own water, petrographic and sedimentation analysis where necessary for verification and confirmation of contractual guarantees. The Contractor is required to take sedimentation into consideration in the design of the cooling water system.

Based on the requirements, the Proposer shall develop and detail the cooling water system in his Proposal.

Cooling clean water connections shall be such that refilling can be provided through direct couplings to the water supply storage tank provided by the civil works Contractor using fixed pipes.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

1.5.1.3 Tests

The Contractor shall submit detailed testing and commissioning plan / protocol including factory acceptance tests (FATs), site testing & commissioning in accordance with following requirement and latest applicable international standards for approval of the Employer. Testing shall be carried out as per the approved plan.

a) Assembly and Tests in the Workshop

The Contractor shell prepare a table, listing all components to be tested and the tests to be performed. The Employer reserves the right to request additional tests if necessary. Test certificates for materials and equipment shall be provided in triplicate to the Employer.

Shop tests shall include the following:

- Hydraulic pressure tests on all components under internal pressure. The test pressure shall be 1.5 of the design pressures.
- Routine tests on purchased equipment.
- Insulation tests, operating tests, heating tests, load tests, etc. on electric motors, and other electrical and mechanical components.

All plant shall be assembled for the inspection of functional tests. Exceptions may be permitted if approved by the Employer. All parts shall be correctly doweled and matchmarked to facilitate assembly at the Site. The Contractor shall intimate the Employer Requirements in writing of the date and place of inspection and testing not less than two weeks before the parts are ready, and give the Employer full facilities for conducting or witnessing the tests. Three copies of the test reports shall be provided to the Employer.

At least the following components shall be assembled and presented to the Employer:

- Pump sets.
- Automatic strainers.
- Control valves.
- Non-return valves.
- Safety valves.
- Local control board.
- Heat exchangers.

The tests shall include the following:

- Check of conformity with approved documents.
- Operation of electric motors, limit switches, etc.
- Hydraulic pressure test.
- Setting and calibration of safety valves.
- Seal leakage check.

When the plant has passed the tests to the Employer satisfaction, he will confirm that it is satisfactory, and that it can be disassembled, painted and packed for shipment.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

b) Tests at Site

i. Commissioning Tests

The Contractor shall conduct the following commissioning tests to ensure that the equipment has been correctly installed, all necessary adjustments and settings been made, and that it is in sound condition to operate. The site tests are subdivided in preliminary tests, and operation and performance tests.

ii. Preliminary Tests

- Electrical check of correct wiring and cabling
- Testing and setting of pressure switches, pressure transmitters and limit switches
- Measuring of insulation level on electrical plant
- Functional tests of the valves
- Ultrasonic testing of cooling water pipelines

iii. Operation and Performance Tests

- Leakage test
- Final adjustment of pressure switches, indication instruments and interlocking devices.
- Pump performance tests

1.5.1.4 Trial Operation

After successful completion of all commissioning tests, the cooling water systems shall be subject to a Trial Run. Trial Run Operation shall be carried out under the supervision and responsibility of the Contractor.

1.5.2 Drainage and Dewatering System

1.5.2.1 General

This specifies the requirements for the design, engineering, manufacture, works testing, packing, transport, storage at site, installation, test and commission, acceptance testing, warranty and other services specified or required in these specifications for the powerhouse drainage and dewatering systems.

The P&ID, system description, detailed arrangement and specifications of drainage and dewatering equipment shall be submitted by the Contractor for Employer approval prior to commencement of manufacture.

1.5.2.2 Description

The powerhouse drainage system shall be designed to drain water leakages from turbine components, auxiliary equipment and power station floors, galleries and pits, and shall be designed for automatic operation with the provision of local manual control of individual pumps from the local control boards. Provision for oil-water separation shall be provided for the drainage system with means to safely collect separated oil in some suitable container for proper disposal in accordance with environmental regulations.

The dewatering system shall be designed to dewater water passages including tunnel, penstock, spiral case, draft tube tailrace pond etc., when these water passageways are under repair or maintenance.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Based on the requirements, the Proposer shall develop and detail the drainage and dewatering system in his Proposal.

1.5.2.3 Tests

The Contractor shall submit detailed testing and commissioning plan / protocol including factory acceptance tests (FATs), site testing & commissioning in accordance with the following requirements and latest applicable international standards for approval of the Employer. Testing shall be carried out as per the approved plan.

a) Assembly & Tests in the Workshop

The Contractor shall prepare a table, listing all components to be tested and the tests to be performed. The Employer reserves the right to request additional tests, if necessary. Test certificates for materials and equipment shall be provided in triplicate to the Employer.

Shop tests shall include the following:

- Hydraulic pressure tests on all components under internal water pressure. The test pressure shall be 1.5 times the design pressure.
- Routine tests on purchased equipment.
- Insulation tests, operating tests, heating tests, load tests, etc. on electric motors and other electrical and mechanical components.

All equipment shall be assembled for the inspection of functional tests. Exceptions may be permitted if approved by the Employer. All parts shall be correctly doweled and matchmarked to facilitate assembly at the Site. The Contractor shall intimate the Employer Requirements in writing of the date and place of inspection and testing not less than two weeks before the parts are ready, and give the Employer full facilities for conducting or witnessing the tests. Three copies of the test reports shall be provided to the Employer.

At least the following components shall be assembled and presented to the Employer:

- Pump sets.
- Control valves.
- Non-return valves.
- Local control switchboards.

The tests shall include the following:

- Check of conformity with approved documents.
- Operation of electric motors, float switches, etc.
- Hydraulic pressure test.
- Seal leakage check.

When the equipment has passed the tests to the Employer satisfaction, he will confirm that it is satisfactory, and that it can be disassembled, painted and packed for shipment.

b) Tests at Site

i. Commissioning Tests

The Contractor shall conduct the following commissioning tests to ensure that the equipment has been correctly installed, all necessary adjustments and settings have been made, and

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

that it is in sound condition to operate. The Site tests are subdivided into preliminary tests, and operation and performance tests.

ii. Preliminary Tests (Dry Tests)

The electrical check of correct wiring and cabling of all control, alarm and auxiliary power circuits. Testing and setting of all relays, float switches, etc. Measuring of insulation level on electrical equipment with megger. Functioning test of the valves.

iii. Operation and Performance Tests

- Tightness test of seals.
- Adjustment of float switches.
- Final adjustment of pressure switches, indication instruments and interlocking devices.
- Pump performance test.

1.5.2.4 Trial Operation

After successful completion of all commissioning tests, the Drainage Systems and the associated equipment shall be subject to a Trial Run for a minimum period to be specified in the Contract. Trial Run operation shall be carried out under the supervision and responsibility of the Contractor.

1.5.3 Compressed Air System

1.5.3.1 General

This specifies the requirements for the design, engineering, manufacture, works testing, packing, transport, storage at site, installation, test and commission, acceptance testing, warranty and other services specified or required in these specifications for the powerhouse compressed air systems.

The P&ID, system description, detailed arrangement and specifications of compressed air equipment shall be submitted by the Contractor for Employer approval.

1.5.3.2 Description

Two compressed air systems shall be provided in the powerhouse:

a) A high-pressure system to charge the oil accumulators of the governors (the design pressure of the high-pressure system shall be at least 130% of the maximum operating oil pressure of the oil/air accumulators of the governors).

b) A low pressure compressed air system (10 bar) shall be provided in the powerhouse for air supply to the following:
   - to operate the mechanical generator brakes;
   - to provide service air to required points in the Powerhouse and Transformer Deck

In case the Proposer opts to use Nitrogen/oil accumulator for governor oil pressure system, then high pressure compressed air system will not be required.

Based on the requirements, the Proposer shall develop and detail the compressed air systems in his Proposal including compressor capacity, redundancy and air quality class.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

1.5.3.3 Tests

The Contractor shall submit detailed testing and commissioning plan / protocol including factory acceptance tests (FATs), site testing & commissioning in accordance with the following requirements and latest applicable international standards for approval of the Employer. Testing shall be carried out as per the approved plan.

a) Assembly and Tests in the Workshop

The Contractor shall prepare a table, listing all components to be tested and the tests to be performed. The Employer reserves the right to request additional tests if necessary. Test certificates for materials and equipment shall be provided in triplicate to the Employer.

Shop tests shall include the following:

- Hydraulic pressure tests on all components under internal pressure. The test pressure shall be 1.5 of the design pressures.
- Routine tests on purchased equipment.
- Insulation tests, operating tests, heating tests, load tests, etc. on electric motors, and other electrical and mechanical components.

All plant shall be assembled for the inspection of functional tests. Exceptions may be permitted if approved by the Employer. All parts shall be correctly doweled and matchmarked to facilitate assembly at the Site. The Contractor shall intimate the Employer Requirements in writing of the date and place of inspection and testing not less than two weeks before the parts are ready, and give the Employer full facilities for conducting or witnessing the tests. Three copies of the test reports shall be provided to the Employer.

At least the following components shall be assembled and presented to the Employer:

- Compressor sets.
- Control valves
- Non-return valves
- Safety valves
- Local control switchboard

The tests shall include the following:

- Proof of conformity with approved documents.
- Operation of electric motors, limit switches, etc.
- Hydraulic pressure test.
- Setting and calibration of safety valves.
- Seal leakage check.

When the plant has passed the tests to the Employer satisfaction, he will confirm that it is satisfactory and that it can be disassembled, painted and packed for shipment.

b) Tests at Site

i. Commissioning Tests

The Contractor shall conduct the following commissioning tests to ensure that the equipment has been correctly installed, all necessary adjustments and settings been made, and that it

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

is in sound condition to operate. The site tests are subdivided in preliminary tests, operation and performance tests.

ii. Preliminary Tests

- Electrical check of correct wiring and cabling
- Testing and setting of pressure switches, and pressure transmitters
- Measuring of insulation level on electrical plant
- Functional tests of the valves

iii. Operation and Performance Tests

- Leakage test
- Final adjustment of pressure switches, indication instruments and interlocking devices.
- Compressor performance tests

1.5.3.4 Trial Operation

After successful completion of all commissioning tests, the compressed air systems shall be subject to a Trial Run. Trial Run Operation shall be carried out under the supervision and responsibility of the Contractor.

1.5.4 Oil Purification Systems

1.5.4.1 General

This specifies the requirements for the design, engineering, manufacture, works testing, packing, transport, storage at site, installation, test and commission, acceptance testing, warranty and other services specified or required in these specifications for the oil purification systems.

A. Transformer oil purification system

B. Governor and lubricating oil purification system.

The P&ID, system description, detailed arrangement and specifications of oil purification equipment for both the above systems shall be submitted by the Contractor for Employer approval.

1.5.4.2 Description

Transformer oil purification system shall comprise but not be limited to the following:

- One (01) Oil Purifier (trolley mounted mobile type; capacity not less than 4,000 l/h)
- One (01) Vacuum Pump
- One (01) clean and One (01) dirty oil transfer pump (Mobile type)
- One (01) set of oil drums in enough quantities to drain One (01) transformer completely
- One (01) Oil testing device for BDV and moisture measurement
- Two (02) sets of rubber hose pipes with connectors at both ends for connecting the purification plant / transformer pump with the transformers.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Governor and lubricating oil purification system shall comprise but not be limited to the following:

- One (01) Oil Purifier (trolley mounted mobile type; capacity not less than 4,000 l/h)
- Oil storage drums of sufficient capacity
- Two (02) sets of rubber hose pipes with connectors

Based on the requirements, the Proposer shall develop and detail the oil purification systems in his Proposal including oil quality limits to be achieved.

1.5.4.3 Tests

The Contractor shall submit detailed testing and commissioning plan / protocol including factory acceptance tests (FATs), site testing & commissioning in accordance with the following requirements and latest applicable international standards for approval of the Employer. Testing shall be carried out as per the approved plan.

a) Assembly and Tests in the Workshop

The Contractor shall prepare a table, listing all components to be tested and the tests to be performed. The Employer reserves the right to request additional tests, if necessary. Test certificates for materials and equipment shall be provided in triplicate to the Employer.

Shop tests shall include the following:

- Hydraulic pressure tests on all components under internal pressure. The test pressure shall be two (2) times the design pressure.
- Routine tests on purchased equipment.
- Insulation tests, operating tests, heating tests, load tests, etc. on electric motors, starters, and other electrical and mechanical components.

All plant shall be assembled for the inspection of functional tests. Exceptions may be permitted if approved by the Employer. All parts shall be correctly doweled and match marked to facilitate assembly at the Site. The Contractor shall intimate the Employer in writing of the date and place of inspection and testing not less than two weeks before the parts are ready, and give the Employer full facilities for conducting or witnessing the tests. Three copies of the test reports shall be provided to the Employer.

At least the following components shall be assembled and presented to the Employer:

- Pump sets,
- Purifier
- Power and Control board

The tests shall include the following:

- Check of conformity with approved documents
- Operating of electric motors, starters, safety valves, etc.,
- Hydraulic pressure test,
- Operating test of purifier. This shall include the treatment of a minimum of 200 l oil. This test may be conducted as site test, subject to Employer approval, if the equipment is the standard product of a reputable, specialized manufacturer.

When the plant has passed the tests to the Employer satisfaction, he will confirm that it is satisfactory, and that it can be disassembled, painted and packed for shipment.

b) Tests at Site

i. Commissioning Tests

The Contractor shall conduct the following commissioning tests to ensure that the plant has been correctly installed, all necessary adjustments and settings have been made, and that it is in sound condition to operate.

- Electrical check of correct wiring and cabling.
- Testing and setting of all relays, pressure switches, etc.
- Measuring of insulation level on electrical equipment with Megger.
- Performance test of pump sets at rated operating conditions.

1.5.4.4 Trial Operation

After successful completion of all commissioning tests, the oil purification/handling system and the associated equipment shall be subjected to a Trial Run for the period specified in the Contract Conditions. Trial Operation shall be carried out under the supervision and responsibility of the Contractor.

1.6 MECHANICAL WORKSHOP EQUIPMENT

1.6.1 Location and Layout

The workshop will be located adjacent to machine hall at El. 2313.3 m. Layout of machine tools and other equipment in the workshop shall be submitted by the Contractor for Employer approval prior to installation.

1.6.2 Machine Tools and Equipment

The equipment shall be new, of latest design and shall be of standard commercial quality from reputable manufacturers. Individual motor drives shall be provided to all machine tools. Lathe, drilling machine, and grinder shall be provided with work-lights. Motors shall be squirrel cage, full voltage start for operation on 400 V, three-phase, 50 Hz or 230 V, single-phase supply.

All machine tools with electric drives shall be provided with individual control and protection panels including emergency stop facilities. The accuracy of machine tools shall be in accordance with relevant ISO Standards.

1.6.3 Subcontract Orders

Should some parts of the equipment be supplied by a subcontractor, the Contractor shall provide the Employer with references of the subcontractor on similar works for Employer approval.

1.6.4 Particular Requirements

In case of standard equipment not being available to the exact dimensions and characteristics specified, or if maintenance requirements lead to modified data and sizes, the next larger standard size will be acceptable subject to Employer approval, provided the specified performance data will be fulfilled.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Equipment for mechanical workshop is mentioned in the succeeding clauses:

1.6.5 High Precision Bench Lathe

The precision bench lathe shall be quick-change gear-type, light duty, general purpose bench lathe. The accuracy of the lathe shall be in accordance with ISO Standard 1708. The dimensions and facilities of the lathe shall be approximately as follows:

Table 1-10 : Bench Lathe Facilities

Description	Value
Swing over cross-slide	190 mm
Swing over bed	380 mm
Height of centers	180 mm
Bed length between centers	1000 mm
Spindle bore	56 mm
Spindle speeds	25-2000 rev/min.
Thread cutting facilities	Metric

1.6.5.1 Equipment to be provided with the Lathe:

a. 200 mm, 03 jaw, self-centring chuck.
b. Coolant equipment and splash guard.
c. Two (02) tapered centres No. 3 Morse or equivalent.
d. Emergency stop button.
e. One (1) square tool post, one pair of dead centres, one taper sleeve.
f. Set of spanners and keys, instructions and spares manual, accuracy chart.
g. 250 mm diameter, 04 jaw independent, direct or spindle mounting chuck.
h. Low voltage machine lighting for standard ac supply.
i. Chip guard.
j. Large faceplate, manufacturer's standard.
k. Ten (10) assorted cutting tools complete with a selection of cutting bits and tips.
l. Collet chuck with a set of collets, manufacturer's standard.

1.6.6 Drill Stand

The drill stand shall be of floor-standing type with pulley drive, adjustable depth stops, graduated in metric calibrations and fitted with safety foot switch. The dimensions and facilities shall be approximately as follows:

a.	Drilling capacity	15 mm
b.	Spindle travel	100 mm
c.	Worktable size	350 x 290 mm
d.	Spindle speeds	480-3800 rev/min.
e.	Spindle size	No. 2 Morse taper or equivalent
f.	Motor	3-Phase, 400 V, 50 Hz

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

1.6.6.1 Equipment to be provided with the Drill:

a. 15 mm drill chuck and Arbor.
b. One (01) set of high-speed straight shank twist drills from 5 mm diameter to 15 mm in 0.25 mm steps.

1.6.7 Bench Mounted Grinder

Bench grinder shall be heavy duty industrial type with pushbutton starter, shatter proof wheel guards and robust work-rests. The approximate sizes and dimensions shall be as follows:

a.	Wheel size	200 x 25 x 20 mm
b.	Wheel centers	350 mm
c.	Motor speed	3000 rev/min.
d.	Motor	3-phase, 400 V, 50 Hz

1.6.7.1 Equipment to be provided with Grinder:

Twelve (12) 200 x 25 x 20 mm grinding wheels, comprising 3 sets of 4 wheels, each set having different grit sizes.

1.6.8 Electric Welding Machines

Each portable arc welding machine shall be of multi process GTAW/GMAW/SMAW/TIG inverter type sets suitable for industrial maintenance use. At least one large for the workshop and one small portable one shall be supplied. Each unit shall be equipped with an overload protection. The entire assembly shall be attached to a steel platform and shall be mounted on four mould-on rubber wheels. The following standard accessories shall be furnished with each unit:

a. 10 m of extra flexible rubber covered electrode cable with electrode holder attached.
b. 10 m of extra flexible rubber covered ground cable, with ground clamp.
c. One (1) head shield with lens and cover glass
d. One (1) wire scratch brush
e. One (1) cone and chisel head hammer

Each welding unit shall be furnished complete with 12 m of four (04) conductor rubber covered power cable.

In addition, a triple panel, vinyl coated fibre glass, green colored screen having each panel 2m wide and 2m high shall be provided. The unit shall include three (03) connected steel frames, platform legs, a single curtain that covers all three (03) frames and ties.

1.6.8.1 Electrode Ovens

Two (02) portable electrode ovens, of capacities approx. 7 kg and 25 kg, shall be provided. Ovens shall be suitably insulated capable to heat up to 135°C and to hold about 46 cm long electrodes. Units shall have handles for ease of handling for transportation, supplied with 3m length of cables and rated at 220 volts ac.

1.6.8.2 Oxy-Acetylene Welding Equipment

The oxy-acetylene combination welding and cutting outfit shall consist of:

a. One (1) welding blow-pipe with 5 tips, lighter and wrench

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

b. One (1) oxygen regulator with 0.7 to 21.0 MPa gauges and wrench

c. One (1) acetylene regulator with 2 to 2.5 MPa gauges

d. 8 m of 5 mm green oxygen hose.

e. 8 m of 5 mm red acetylene hose.

f. Four (4) 5 mm hose ferrules

g. One (1) cutting attachment with 2 nozzles

h. One (1) pair no. 16 goggles

i. One (1) instruction manual

1.6.9 Tool Cabinets

Tool storage cabinets shall be of steel construction and each shall be approximately 600 mm deep and 1,000 mm wide. Each shall be complete with shelves and drawers and lockable doors as required for most efficient storage.

1.6.9.1 Tool Room Racks

The metallic racking and shelving for hand tools, air operated tools and precision instruments normally used in station workshops, shall be approximately 1.8 m high and 600 mm deep. The metallic racking shall consist of shelves vertically adjustable. The racks shall be supplied for assembly at Site.

1.6.9.2 Lockers

Five (5) lockers shall be supplied, and each shall have approximate dimensions of 450 x 500 x 1,800 mm and shall have shelves, drawers and hanging space to accommodate the personal effects of workshop and maintenance personnel.

1.6.10 Metal Working Benches

Two (2) metal-working benches shall be approximately 800 mm wide by 4,000 mm long, each with a 1,000 mm diameter welder's bench. The legs of the benches shall be designed so that the benches can be attached to the floor by means of expansion bolts. Each workbench shall be complete with a strong clamping base for four 200 mm swivel bench vices furnished with the benches.

1.6.10.1 Electrical-Working Bench

The wooden-topped bench for electrical work shall be supplied approximately 800 mm wide by 2,500 mm long. The legs shall be designed so that the bench can be attached to the floor by means of expansion bolts. The bench shall be complete with strong clamping bases for two 200 mm swivel bench vices furnished with the bench.

1.6.11 Hand Tools

a) General

The following basic hand tools and gauges shall be supplied of industrial grade quality:

a. One (01) cased set of metric hand taps and dies - range 6 to 24 mm.

b. One (01) boxed set of BSP taps and dies - range 1/8 inch to 1¼ inch.

c. One (01) boxed set of BSP high speed steel taps - range 1/8 inch to 1¼ inch.

d. One (01) LCD digital external micrometre to read 0-25 mm and one to read 0-1 inch, both shall be fitted with friction thimble.

e. One (01) external micrometre with extension rods and setting gauge to read 0 - 150 mm with accuracy of 0.01 mm.

f. One (01) external micrometre with range of anvils and setting gauge to read 150-300 mm.

g. One (01) cased set of internal micrometres reading 25-50 mm.

h. One (01) cased set of internal micrometres reading 50-300 mm.

i. Two (02) sets of socket wrenches 6 mm to 60 mm.

j. Two (02) sets of end wrenches from 6 mm to 42 mm.

k. One (01) pipe wrench.

l. Pliers

m. One (01) set of screw drivers

n. One (01) set of small files

o. Hammers

p. One (01) set of medium size files

q. Two (02) standard dial gauges with magnetic bases and cross bar assembly to suit reading 0.01 mm over a total travel of 12 mm.

r. 300 mm engineer's level with main, cross and plumb facilities and sensitive to 0.1 mm over 300 mm.

s. One (01) micrometre depth gauge, range 0-150 mm, with six measuring rods.

t. Three (03) inside callipers, sizes 100, 150 and 200 mm.

u. Three (03) outside callipers, sizes 100, 150 and 200 mm

v. One (01) dial calliper, range 0-150 mm, accuracy 0.01 mm.

w. Two (02) electric drilling machines, suitable for 230 V, 50 Hz electric supply, different size from 08 mm to 16mm. One (01) Drill machine shall be supplied suitable for concrete and One (01) suitable for steel.

b) Air operated tools

The following air operated tools and appliances shall be supplied:

a. One (01) worm drive nut-runner suitable for bolts up to 12 mm dia.

b. One (01) ratchet wrench for nuts in the range 10-15 mm across flats.

c. Two (02) straight grinders suitable for 75 x 25 mm wheel.

d. One (01) surface grinder with 15 mm spindle with metric thread.

e. One (01) spray gun suitable for low and medium viscosity fluids, e.g., water, solvents, paints etc.

f. Three (03) 10 m lengths of hose suitable for use with above items along with couplings and fittings.

1.6.11.1 Standard of Accuracy

All machine tools supplied under this section shall conform to the standards of straightness, flatness, parallelism, squareness and rotation laid down in the latest edition of ISO 230-1: Acceptance Code for Machine Tools.

1.6.12 Motors Control Panels, Motors and Starters

The motor control panels supplied by the Contractor shall have all the necessary contactors for starting the motors and be complete with motor protection. Motor duty switching shall be integral within the Contractor's supply. Local panels as indicated herein shall be supplied complete with terminal strips for connection by others as indicated in the attached Control and Indication Schedule. All electrical equipment supplied shall be in accordance with the relevant clauses of Electrical requirements of these Specifications.

Motors and starters shall conform to the Electrical requirements of these Specifications. Full load operation of the motor shall not, under any circumstances, exceed its nameplate kW rating.

Wherever possible, three-phase, 400 V, 50 Hz motors shall be supplied with the machine tools specified.

Loose starters complying with the requirements of Electrical requirements shall be supplied under this section for those machine tools which do not embody starters in their structure. Loose starters shall be to the approval of the Employer and shall be equipped with a suitable starter stand.

1.6.13 Painting

Painting shall be the manufacturer's standard system.

1.6.14 Tests

The Contractor shall submit detailed testing and commissioning plan including factory acceptance tests (FATs) and site testing and commissioning and trial operation in accordance with latest applicable international standards for approval of the Employer. Testing shall be carried out as per the approved plan.

1.6.14.1 Tests in the Workshop

The Contractor shall prepare a table, listing all components to be tested and the tests to be performed. The Employer reserves the right to request additional tests, if necessary.

The accuracy of the machine tools shall be checked in accordance with the "Reference Book for Machine Tools" by G. Schlesinger, published by G.W. den Boer, Middelburg, Germany, or equivalent reference information. Test certificates for materials and equipment shall be provided in triplicate to the Employer.

Shop tests shall include the following:

- Check of conformity with approved documents
- Operating of electric motors, starters, etc.
- Accuracy checks and functional test of machine tools
- Functional test of air compressor

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

When the equipment has passed the tests to the Employer satisfaction, he will confirm that it is satisfactory, and can be packed for shipment.

1.6.14.2 Tests at Site

The Contractor shall conduct the following commissioning tests to ensure that the equipment has been correctly installed, all necessary adjustments and settings been made and that it is in sound condition to operate:

- Electrical check of correct wiring and cabling.
- Measuring of insulation level on electrical equipment.
- Performance check of air compressor.
- Load tests of chain blocks.
- Repetition of accuracy check and functional test of machine tools in conjunction with the training of the Employer's personnel.
- Functional check of welding equipment

After successful completion of all commissioning tests, the equipment shall be subject to a Trial operation Period as defined in the Contract Conditions. Trial Operation shall be carried out under supervision and responsibility of the Contractor.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

SECTION 2 HYDRAULIC STEEL STRUCTURES

2.1 GENERAL

This section specifies the requirements for design, engineering, manufacture, inspection, paint, shop test, transport, storage, erection, spare parts, testing and commissioning of the hydraulic steel structures works (comprising gates, stoplogs, trash racks & trash rake, hoisting equipment etc.) to be furnished. General arrangement and location of the hydraulic steel structures are shown in the attached drawings and shall be read in conjunction with these specifications.

2.1.1 Applicable Standards

Gates, Stoplogs, Trash racks:

- DIN Standard 19704, "Recommendations for the Design, Construction and Installation of Hydraulic Steel Structure Equipment" (or other equivalent standards, subject to approval by the Employer).
- USACE Manuals.

Gantry Crane:

- DIN Standards
- FEM Standards
- ASME Standards
- CMAA Standards
- ASTM Standards

Trash rack Cleaning Machine:

- DIN Standards
- FEM Standards
- ASME Standards
- ASTM Standards

In case of conflict between standards, the more stringent requirement shall govern, subject to Employer approval.

2.1.2 Mandatory Spare Parts

The Proposer shall provide the following Mandatory Spares given for Power intake Gantry crane and Hydraulic hoisting equipment of power and flushing tunnels intake gates and include its cost in the Price Schedule:

2.1.2.1 Power Intake Gantry Crane

Table 2-1*: Spare Parts*

Sr. No.	Description of the Item	Qty
1	Motor of each type used for the crane to be supplied	01 No.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Sr. No.	Description of the Item	Qty
2	Bearings, bearing bushes, wear pins, etc., of each type used	01 set
3	Brake shoe liners for each brake used	01 set
4	Set of gaskets and packing for each type used	01 set
5	Set of limit switches of each type used	01 set
6	PLC with all modules	01 set
7	Electronic card/module of each type	01 set

2.1.2.2 Hydraulic Hoisting Equipment of Power and Flushing Tunnels Intake Gates

Table 2-2: Spare Parts

Sr. No.	Description	Qty.
1	Complete pressure oil pump with motor	01 No.
2	Seals / Packing (all types)	02 sets
3	Twin filter for oil	01 no.
4	Limit switches	01 set
5	Pressure switches	01 set
6	Ball bearings (all types)	01 sets

2.1.3 Testing

For all the hydraulic steel structures mentioned in these specifications, the Contractor shall submit detailed testing and commissioning plan including factory acceptance tests (FATs) and site testing and commissioning and trial operation, in accordance with latest applicable international standards for approval of the Employer. Testing shall be carried out as per the approved plan.

2.2 POWER TUNNEL INTAKE

Equipment to be furnished at the power intake:

- Two (02) emergency intake gates (vertical lift fixed wheel type)
- One (01) set of stoplogs
- Four (04) sets of trash racks
- One (01) moving electric gantry crane
- One (01) moving, electrically operated trash rack cleaning machine

2.2.1 Power Tunnel Intake Emergency Gates

2.2.1.1 Gate Equipment

The intakes of power tunnel shall be equipped with two intake emergency gates of vertical fixed wheel type to protect the turbine in an emergency situation. One hydraulic power unit for the operation of both gates shall be provided and located at the intake deck.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

The fixed wheel gate equipment shall be complete with all parts and components required for installation and operation in accordance with these specifications:

The fixed wheel gate equipment shall include but not to be limited to the following major items:

- Two (02) fixed wheel gates complete with wheels, self-lubricating spherical bearings, guide rollers & seals etc.;
- Two (02) set of embedded parts (first and second stage) for side, bottom & top sealing, guidance and support;
- Two (02) hydraulic hoisting systems comprising of hydraulic servomotors with connecting rods, hydraulic power unit, gate dogging mechanism necessary for maintenance and service, interconnecting pipes, control panels etc.;
- Any other equipment not mentioned above, but necessary to make it fully functional for safe & proper operation and maintenance.

2.2.1.2 Gate Arrangement

Each intake gate shall be designed by the Contractor to close against unbalanced head conditions in emergency with maximum specified discharge through the tunnel at maximum reservoir water level, and also to withstand the maximum reservoir water level with the tunnel empty without permanent deformation.

The gate shall be required to open under balanced head conditions with no flow through the tunnels. The tunnel shall be flooded and heads balanced before opening the gate. The gate shall also be closed under balanced head conditions for routine inspection and maintenance of the tunnel.

The gate will normally remain either fully open or fully closed and will not be used to control the discharge of water into the tunnel. When fully open the gate will normally remain on the intake blocks just above the gate opening.

The gate shall be raised and its rate of closure shall be controlled by a separate oil hydraulic double-acting servomotor. The length of each gate connecting rods shall be sufficient for making gate connection with the servomotor to be installed at intake deck level. The servomotor shall be energized from a single central pumping unit installed in the gate control building located at operating platform level. The servomotor shall have both local and remote controls and the gate shall have both local and remote position indicator. The servomotors shall be amply sized to ensure that gate opening / closure can be obtained at the minimum operating pressure. The piston rods shall be foraged steel having chrome plated surface.

The servomotors and their mountings, pressure piping and control valves shall be adequate for the pressure produced in the servomotor with the most adverse conditions of unbalanced closure against maximum flow.

The oil commonly used in the hydraulic systems is mineral oil, which should have good resistance to the formation of rust, oxidation and foam and shall be suitable for ambient temperature conditions at site. Oils having a viscosity of 150 SSU at 38^{o}C and a minimum viscosity index equal to 90 are used.

Pipes used in the hydraulic systems are usually black seamless steel pipe conforming to ASTM A53 or A106 standards. Pipe sizing is determined according to the maximum oil speed. Generally, the following speed limitations are observed in pipe design according to the DIN 19704:

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

– in suction and filling lines,	0.6 m/s
– in pilot line return and leakage lines,	DN≤40: 1.0 m/s
	DN≥40: 1.5 m/s
– in pressure lines,	DN≤40: 3.0 m/s
	DN≥40: 5.0 m/s.

The gate shall close under its own weight but the servomotor shall be reversible so that in the event of an obstruction being lodged on the gate tracks or in the guides, a positive downward thrust may be exerted on the gate to ensure complete closure.

2.2.1.3 Shop Painting

The non-stainless-steel parts of the supply shall be shop-primed and painted before being transported from works to site as per the painting schedule provided in these specifications.

Main Data

i)	Type of Gate	Fixed wheel type
ii)	No. of Bays	Two (2)
iii)	No. of gate	Two (2)
iv)	Embedded metal works	Two (2)
v)	Clear width of opening	4 m
vi)	Clear height of opening	5 m
vii)	Sill level	El. 2402.5 m.a.s.l
viii)	Max. Operation level	El. 2412.0 m.a.s.l
ix)	Max. Flood Water level	El. 2421.0 m.a.s.l
x)	Design head at sill	~21 m (Contract will confirm)
xi)	Type of side & top seals	Music note / double stem EPDM
xii)	Type of bottom seal	EPDM, wedge
xii)	Operation	Lowering / raising under un-balanced head conditions by hydraulic servomotor.

2.2.2 Stoplogs

2.2.2.1 Stoplog Equipment

The Stoplog equipment shall include but not to be limited to the following major items:

- One (1) set of Stoplogs with guide shoe and seals
- Two (2) sets of embedded parts (first and second stage) for side, bottom & top sealing
- One (1) semi-automatic lifting / grappling beam

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- Any other equipment not mentioned above, but necessary to make it fully functional for safe & proper operation and maintenance

2.2.2.2 Arrangement

The stoplogs will be comprised of suitable number of sections to be installed one above the other to form a set of stoplogs for closing the waterway for maintenance of power intake gate and other civil works.

The stoplogs will be of vertical-lift type with skin plate and seals on downstream side as shown in the layout drawings. The structure shall be of welded steel construction. The skin-plate shall be reinforced by vertical and horizontal members welded to the skin-plate.

The stoplogs shall be provided with J-type side and wedge-type bottom rubber seals. The seals shall be fastened to the stoplogs by steel clamp bars. The top most section of the stoplogs shall be provided with J-type top seal to completely seal the opening.

Pair of guide shoes on each side of each stoplogs shall be arranged to engage with embedded guides bars. Moreover, each set of embedded metalwork for stoplogs shall consist of two side-seal and one top seal and one sill beam bearing and guide plates. All seal bearing plates shall be of corrosion-resisting steel. The guide plates shall be provided from the bottom to the deck level. The embedded metalwork shall be installed in the block outs and adjusted by means of alignment screws attached to welding pads embedded in the first stage concrete. After the alignment of the embedded metalwork, the block outs shall be filled with second stage concrete.

Main Data

i)	Type of Stoplogs	Vertical lift, slide type with guide rollers/shoe
ii)	No. of Bays	Two (2) No.
iii)	No. of stoplogs	One (1) set
iv)	Embedded metalworks	Two (2) sets
v)	Clear width of opening	4 m
vi)	Clear Height of stoplog	5 m
vii)	Sill level	2402.5 m.a.s.l
viii)	Max. Flood Level	2421.0 m
ix)	Max. Operation Level	2412.0 m.a.s.l
x)	Design head	~21 m (Contractor will confirm)
xi)	Type of side seals	EPDM, Music Note Type
xii)	Type of bottom seal	EPDM, wedge Type
xiii)	Operation	Lowering / rising under balanced had conditions by gantry crane with Lifting Beam of adequate capacity

2.2.2.3 Grappling / Lifting Beam

One lifting beam for lowering/lifting of the stoplogs shall be provided. The lifting beam shall be of welded construction. The beam shall be equipped with two semi-automatic engaging and disengaging hooks. Two guide rollers on each side of the lifting beam shall use the same guide bars/rails provided for the stoplogs. The semi-automatic hooks and guide rollers shall be mounted on corrosion-resisting steel pins with self-lubricating bushings.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

2.2.2.4 Shop Painting

The non-stainless-steel parts of the supply shall be shop-primed and painted before being transported from works to site as per the painting schedule provided in these specifications.

2.2.3 Trash racks

2.2.3.1 Trash rack Equipment

Trash racks will be provided to protect the power tunnel from entry of trash / floating debris. The trash rack equipment shall include but not to be limited to the following major items:

- Four (04) sets of Trash racks
- Four (04) sets of side and bottom embedded parts for the trash racks
- One (01) semi-automatic lifting / grappling beam;
- Any other equipment not mentioned above, but necessary to make it fully functional for safe & proper operation and maintenance

2.2.3.2 Arrangement

The trash rack shall be of welded steel construction and of rectangular sections as shown on the specification drawings for power intake structure. Each set of trash rack shall consist of dismantlable sections. Trash rack sections shall be slide into inclined channel with the help of guide rollers and shoe and removable for inspection and maintenance.

The rack bars spacings shall be set in consultation with turbine manufacturer. Trash racks shall be designed to safely avoid resonant vibration under normal operating conditions of maximum operation flow through each trash rack. However, the fundamental frequency of the rack-bars and the lateral plates / beams shall not be less than 2.5 times the frequency of flow induced vibration of the trash rack at normal flow velocity. The trash racks shall be structurally designed for a differential head of 6 m acting on surface area of the trash racks.

The rack bars of power intake trash rack shall facilitate an active cleaning of all parts of the rack area by the trash rack cleaner. There shall be no openings or gaps of any kind which may obstruct the wire ropes or the rake itself. The horizontal bars shall allow the teeth of the rack cleaner to enter at least 25 mm in between the vertical bars of the trash racks.

Each set of trash racks embedded parts shall consist of integral side guide and side bearing plates, and sill bearing plates. The embedded parts shall be installed in block-outs and shall be adjusted by means of erection studs attached to the welding pads embedded in the first stage concrete.

Trash racks integral side guide and side bearing plates shall extend from the sill to deck elevation above top water level and the guide bearing plates to the top of the trash racks. The trash rack embedded parts shall be installed in block-outs and adjusted by means of erection studs attached to welding pads embedded in the concrete.

Trash racks shall be equipped with differential pressure gauge for detection of trash rack clogging. The cleaning of trash racks shall be done with the help of trash rack cleaning machine provided at deck elevation of 2425.0m.

Main Data

i)	Clear width of opening	:	4.0 m
ii)	Clear height of opening	:	5 m
iii)	No. of trash racks	:	Four (04) sets

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

iv)	Sill level	:	El. 2404.0 m.a.s.l
v)	Max. operation Level	:	El. 2412.0 m.a.s.l
vi)	Operating deck level	:	El. 2425.0 m
vii)	Clear spacing between trash rack bars	:	Set in agreement with turbine manufacturer
viii)	Differential head for design	:	6 m W_c
ix)	Flow velocity through the trash rack	:	Less than 1m/s.
x)	Vertical Inclination	:	Approx. 15º

2.2.3.3 Grappling / Lifting Beam

One lifting beam for lowering/lifting of the trash racks shall be provided. The lifting beam shall be of welded construction. The beam shall be equipped with two semi-automatic engaging and disengaging hooks. Two guide rollers on each side of the lifting beam shall use the same guide bars/rails provided for the trash racks. The semi-automatic hooks and guide rollers shall be mounted on corrosion-resisting steel pins with self-lubricating bushings.

2.2.3.4 Shop Painting

The non-stainless-steel parts of the supply shall be galvanized before being transported from works to site as per the painting schedule provided in these specifications.

2.2.4 Moving Gantry Cranes

2.2.4.1 General

i. As hoist equipment for both the power and flushing intakes hydraulic steel structures one rail mounted gantry crane will be provided.
ii. One rail mounted gantry crane will be provided for handling of the draft tube gates.

2.2.4.2 Extent of Supply for Gantry Crane of Power and Flushing Intakes HSS

The supply shall include but not to be limited to the following major items:

- One (1) gantry crane complete with electrical equipment;
- One (1) set of rails for movement of gantry crane (from power intake to flushing intake complete);
- All components, devices, items and equipment not mentioned above, but necessary for the safe and proper manufacture, transport, testing, operation and maintenance of the supply.

Main Data

- Span (centre to centre of runway rails) approx. 11 m
- Length of crane runway approx. 90 m
- Maximum lift approx. 52 m

Crane required capacity shall be determined considering the final lifting load of the heaviest gate assembly including grappling beam and adding 30% safety margin.

2.2.4.3 Extent of Supply for Gantry Crane Draft Tube Gates

The supply shall include but not to be limited to the following major items:

- One (1) gantry crane complete with electrical equipment;

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- One (1) set of rails for movement of gantry crane;
- All components, devices, items and equipment not mentioned above, but necessary for the safe and proper manufacture, transport, testing, operation and maintenance of the supply.

Main Data

- Span (centre to centre of runway rails) approx. 3 m
- Length of crane runway approx. 45 m
- Maximum lift approx. 20 m

Crane required capacity shall be determined considering the final lifting load of the heaviest gate assembly including grappling beam and adding 30% safety margin.

2.2.4.4 Operating Conditions

The crane shall be an electrically driven platform controlled, outdoor travelling gantry type.

The crane will be used to for erection, handling and maintenance of hydraulic steel structures provided at both the power and flushing tunnels. The gantry crane will move between both the intakes runway using curved rails.

Regarding the outward appearance, the crane shall be pleasant from an aesthetic point of view, and the mechanical and electrical equipment shall be fully protected from the influence of dust and high air humidity at the Site.

The crane shall be designed to require a minimum of space while optimizing the accessible working area. Furthermore, the design shall provide easy accessibility to all important parts which require regular maintenance and inspection.

2.2.4.4.1 Crane Runway

The runway rails with supporting and fixing elements shall be installed within the allowable erection tolerances as stipulated in the applicable standards. Four (4) bumper stops at the ends of the runway shall be provided.

2.2.4.4.2 Gantry

The gantry shall consist of structural steel box sections of welded construction. Special care shall be taken in the design in order to achieve an aesthetic appearance of the crane. The design for fastening the hoist elements to the portal shall allow adjustment of the lateral distance between the runway rails.

Suitable means shall be provided to fix the lifted gate/stoplog in both longitudinal directions in order to prevent unallowable longitudinal oscillations of the bulkhead gate, caused by starting or stopping the crane.

2.2.4.4.3 Gantry Drive

The casings for the wheels and drive mechanism shall have a box type construction. The design of the casings shall permit easy removal of the wheels, bearings, etc.

The portal shall be provided with suitable track sweeps on both sides. Furthermore, safety cams shall be attached to limit the maximum sag of the crane to 20 (twenty) millimetres if any shaft or wheel breaks. Additional safety grips shall be attached to the sides of the wheel casings and shall reach down below the top edge of the rail to prevent the crane from leaving the rails in case of derailment.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

The wheel frames shall be fitted with rubber bumpers to absorb the impact arising at stoppage of the gantry travel under nominal load and at rated speed with the current switched-off.

The gantry shall be supported by at least four wheels. Gantry travel shall be affected by driving one wheel on each track. The driving wheels on each track shall be synchronized electrically.

2.2.4.4.4 Hoist

The hoist shall preferably be of standard design with weather-proof cover, selected under consideration of the requirements specified hereunder.

2.2.4.4.5 Ropes

The wire rope shall have sufficient length to provide three extra turns of each part on the drums with the hook at the lowest position. The wire rope shall be galvanised, permanently lubricated and of heavy duty, fibre core, twist-free design. They shall be dispatched to the site wound on reels which are adequately protected against damage and shall be identified with metal tags firmly fixed to each end. The ends shall be wire bound.

The ropes shall be fixed to the drum in such way, that for their adjustment and replacement only a minimum number of parts need to be removed.

2.2.4.4.6 Drums

The hoisting drums of all hoists shall be made of cast or welded steel of sufficient strength to sustain the combined crushing and bending loads of the rope pulls. Allowance shall be made for fabrication and machining tolerances to ensure that the drum shell thickness under the machined groove shall be at least equal to one diameter of rope. All drums shall be arranged to carry the hooks on the middle of the cranes. All drums shall comply with the requirements of FEM Section 1. Grooves shall be smooth and well-rounded and shall have a minimum depth of 0.35 times the rope diameter. The minimum groove pitch shall be the rope diameter plus 3 mm. Double layer of rope winding shall not be allowed when the hook is at highest position.

2.2.4.4.7 Sheaves and Blocks

The rope sheaves shall be of cast steel or welded structural steel, with machined grooves to minimize wear on the rope.

The sheave pins shall be fabricated of annealed carbon steel or steel alloy, having an ample bearing surface. All moving sheaves shall be equipped with roller bearings, suitable for force feed lubrication.

2.2.4.4.8 Hooks

The load hooks shall be of forged steel of Ramshorn type, subject to the approval of the Employer. The yield point shall be approximately two thirds of the tensile strength. The hooks shall be load tested with 150% of rated load and x-rayed after testing in accordance with applicable standards.

The hooks shall be ground finish and rotate freely on anti-friction bearings. The bearings shall be dust tight and properly sealed to avoid grease leakage.

2.2.4.4.9 Brakes

The hoist shall be equipped with two independent brakes, one each for holding the load and control of lowering speed.

The holding brake shall be of the automatic spring set type, respectively, electrically or electro-hydraulically released double-shoe type. The brake capacity shall not be less than 200% of

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

the torque caused by rated load including dynamic effects. The brake shall prevent the load from descending.

The control brake shall be preferably an electrical brake of the frequency transformer-controlled type. An electrical brake of the eddy-current type or a combination of electrical and mechanical brakes can be tendered alternatively. Friction load braking will not be accepted.

2.2.4.4.10 Cabin

Each enclosed operator's cabin shall be mounted on one of the gantry legs and shall be positioned for good visibility of all crane operations. The cabin shall be designed and located to provide maximum visibility of the loaded hook during all operations of the crane. The cab shall be fully enclosed for outdoor service. Provision shall be made in the cab for mounting the manually operated master switches, main line disconnecting breakers, and all necessary wiring and fittings together with a tool box or cabinet containing maintenance tools and equipment to be supplied by the Supplier. The cabin shall be provided with a seat and a ventilation fan.

The cabin shall be located to afford a minimum of 75 mm clearance from all fixed structures and its height shall not be less than 2.2 m.

The cabin shall be constructed of structural steel and rigidly attached to the crane to avoid excessive swaying or vibration. The cab construction shall offer protection from falling objects. Each cabin shall be enclosed with safety type glass windows that can be opened for cleaning and to provide cross ventilation. All hatches, doors, and windows shall be water tight against windblown rain. Sufficient lighting shall be provided in the cabin to enable the operator to see clearly enough to perform his work.

A carbon-dioxide, dry-chemical or equivalent hand fire extinguisher shall be provided in the cabin.

2.2.4.4.11 Platform and Ladders

The gantry cranes shall be provided with walkways, stairways, and ladders from the boarding area to the bridge walkways, the cab and to permit access for lubrication, inspection and maintenance, as necessary. A walkway with guard railing shall be provided around the top of the gantry structure for the crab maintenance.

2.2.4.4.12 Motors

The motors to be provided shall be induction motors with adequate rating to cope with the load involved.

The motors shall have at least class F insulation and be rated for operating against maximum ambient temperature at site. Low speed motors shall be given preference.

2.2.4.4.13 Control Equipment

The crane control shall be of Siemens, ABB or equivalent subject to the approval of Employer and shall be of proven industrial application. All functions of the gantry crane shall be controlled from a lockable cabinet, protection class IP 65. The cabinet shall maintain protection class IP 65 when the crane is in use. The main and auxiliary hoist drives of the gantry cranes shall have stepless speed control between the maximum and minimum specified speeds for the loaded hook condition.

The main hoist drives of the gantry cranes shall also be capable of the fast unloaded speeds as provided in Design and Technical Requirements. The controls shall be arranged such that

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

in the unloaded condition it shall be possible to switch from the unloaded speeds to the loaded speeds, but it shall not be possible to switch to the unloaded speeds when loaded.

The electrical equipment and installations shall be complete and comprise all control and protective devices particularly:

a. Limit switches controlling the upper and lower position of the hook
b. Limit switches controlling the end travel of crane and trolley
c. Dual load switches that cut the power supply in the event of overloading the hoist, designed for the different load situations, the trolley operating in between the crane rails, or outside the crane rails.
d. Slack rope switch
e. Hook position display
f. Hoist load display for the power intake crane

All electrical equipment supplied shall be in accordance with the standards and requirements specified in the General Specifications and IEC standards where applicable.

The control unit for the crane/hoist shall include the necessary ammeters, fuses, circuit breakers, relays, switches, etc., as required for the proper and safe operation of the equipment. The supply shall also include all necessary limit switches, motor protection devices, cables, cable racks, etc.

2.2.4.4.14 Power Supply and Electrical Wiring

The power supply is 400 V AC, 50 Hz. The power shall mainly be supplied through a heavy-duty, corrosion-resistant insulated conductor, protection class IP 23. The terminal box, protection class IP 65, shall have an emergency switch in front and shall be provided with a socket for the flexible electrical cable.

Suspension brackets for the conductor shall be a part of the supply. The connectors shall be "low" above the concrete deck, and where the connectors pass the piers, steps or similar should be provided to allow passing by foot. Power shall be supplied to the trolley through flexible suspended cables.

All wiring shall be furnished and shall be installed in galvanised steel conduits. Separate conduit systems shall be provided for power and control circuits. All wiring, unless otherwise specified, shall be of the stranded conductor type and brought to terminal blocks to facilitate external power connection. All wires shall be tagged or marked for permanent identification to facilitate erection and maintenance.

2.2.4.4.15 Shop Painting

The non-stainless-steel parts of the supply shall be shop-primed and painted before being transported from works to site as per the painting schedule provided in these specifications and shall be suitable for aggressive outdoor and humid environmental conditions.

2.2.5 Trash rack Cleaning Machine

2.2.5.1 General

Trash collected on the power intake trash racks during operation of the power plant shall be removed by an electrically operated trash rack cleaner of outdoor travelling type. The cleaner shall travel along the trash racks on top of the intake structure. A trolley shall remove the trash

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

from the top of the intake deck.

The rake shall serve every intake trash rack, and shall be used without interrupting the power generation.

A hoisting boom with grab bucket hoist mounted on the trash rack cleaner frame, shall also be provided for the removal of heavy logs and floating debris.

2.2.5.2 Extent of Supply

The supply shall include but not to be limited to the following major items:

- One (01) Trash rack cleaner, complete with rake, rake hoist and controllers
- One (01) Hoist boom with electrical wire hoist
- One (01) Grab bucket, to be used with the hoist boom
- One (01) Control cabinet
- One (01) Trolley for the transportation of trash
- One (01) set of rails for movement of trash cleaning machine

All components, devices, items and equipment not mentioned above, but necessary for the safe and proper manufacture, transport, testing, operation and maintenance shall be part of the supply.

Main Data

Operating deck	2425 m
Raking width, approximately	4000 mm
Lowest rake position (El.)	2404 m
Trash racks, inclination	15°

2.2.5.3 Equipment Description

2.2.5.3.1 Trash rack Cleaner

The supply shall include a complete trash rack cleaning machine including hoist, rake and controllers etc.

The rake shall travel along the total height from top of the intake structure to the bottom sill of the intake trash racks on rails by steel operating ropes. No part of the structure shall interfere with the trash rack itself.

The rake shall have an effective rake width of about 4 m and shall travel along the whole width of the trash racks. For movement of the trash rack cleaning machine, rails shall be provided. Hoist and travelling mechanism shall be electrically operated, lateral positioning of the rake and the operation of the cleaner shall be manually controlled. The collected trash shall be dumped into a trolley running under the cleaner.

The cleaner design shall be rigidly dimensioned to carry the load of the hoist machinery and the maximum rake load. If the cleaner frame is subdivided during transportation, major joints shall be doweled and bolted with high-strength bolts.

The rake teeth shall protrude about 25 mm at least in between two bars and shall be so aligned to avoid any damage caused to the trash rack structure.

The rake shall have a clearance of approximately 25 mm to the concrete or steel face.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

The wheels shall have double flanges and the wheel carriages shall have buffers at the outer side as well as sturdy retainers to prevent the cleaner from tilting at adverse conditions, i.e., both maximum rake and hoist boom load.

The rake forming a bucket shall close automatically towards the trash rack when the rake reaches the lowest point of each run. Collected trash shall be firmly held by the rake bucket when the rake is running upwards. Special guide plates or bars shall be bolted to the front

wall of the intake structure, above the top of the trash racks. These shall be part of the supply. All hinged joints, wheel spindles, gears etc. shall be equipped with self-lubricating bushings/bearings. All spindles shall be made from stainless steel. The rake teeth shall be replaceable and made of hardened or abrasion resistant steel.

The main hoist of the cleaner shall be protected by a steel sheet cabinet and well ventilated. The cabinet shall contain all parts of the operating machinery, electrical components and ample room for inspection and maintenance. Electric light shall be included, as well as door locks.

The trash rack cleaner shall be operated from a platform with rails and a light roof at one side, giving a good view for the operator. The control cabinet, protection class IP 65, shall have easy operated controllers and an accurate and reliable indicator of the trash cleaning machine position. The tripping of the overload protection for the rake or auxiliary hoist, as well as at slack rake hoisting wire, shall be clearly indicated. The cabinet shall have a switch for automatic rake stopping at the bottom of the intake trash racks.

Electric power for the trash rack cleaner shall be supplied, which shall include a control cabinet with a terminal block with internal connections to all electrical contacts of the equipment, as well as to the limit switches. All signal outputs in the terminal block shall potential free type.

The control cabinet shall include all necessary fuses, circuit breakers, relays, switches, etc., as required for the proper and safe operation of the equipment. The supply shall also include motor protection devices, cables, cable racks, etc. All wires shall be tagged or marked for permanent identification to facilitate erection and maintenance.

2.2.5.3.2 Hoist and Hoisting Boom

A hosting boom shall be supported on the trash rack cleaner frame, being able to swivel nearly a full circle by an electrical motor.

The hoist shall have a hook, and shall be used for the following purposes:

a. With a sufficient capacity to handle a single trash panel and with an attachment of hydraulic operated grab, to remove larger logs and floating debris and similar in front of the intake.

b. For handling of trash rack panels with the help of grappling beam.

c. With the hook and slings assist the trash rack cleaner rake when required.

d. General maintenance purpose within the hoist boom capacity and operating area.

e. The hoist boom might also be used in assisting the erection of some of the other items at the intake structure

The hoist and the hoist boom shall be operated from the trash rack cleaner operating platform. The supply includes a suitable grab with operating mechanism. The hoist boom shall be provided with a flood light at the outer end.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

2.2.5.3.3 Trolley

The supply includes a trolley, designed for running between the gantry crane frame legs, below the trash rack cleaner raking board. The trolley shall have rubber tires with ball bearings, and shall have standard connections for pulling or pushing by a tractor, the latter not being a part of the supply. The trolley shall be designed to allow easy, manual emptying to both sides and one rear side.

2.2.5.3.4 Shop Painting

The supply shall as far as possible be shop primed and painted before being transported from works to site as per the painting schedule provided in these specifications.

2.3 FLUSHING TUNNEL INTAKE

Equipment to be furnished at the flushing intake:

- One flushing intake service gate (vertical lift fixed wheel type)
- One guard gate (fixed wheel type)
- One set of stoplogs required for removal of rock plug (optional)

2.3.1 Flushing Tunnel Intake Service Gate

2.3.1.1 Gate Equipment

The intake of flushing tunnel shall be provided with one (01) service gate of vertical lift fixed wheel type to flush out the sediments deposited in vicinity of the power intake. One hydraulic power unit for the operation of gate shall be provided and located at the intake deck level of 2425.0m.

The fixed wheel gate equipment shall be complete with all parts and components required for installation and operation in accordance with these specifications.

The fixed wheel gate equipment shall include but not to be limited to the following major items:

- One (01) fixed wheel gate complete with wheels, self-lubricating spherical bearings, guide rollers & seals etc.;
- One (01) set of embedded parts (first and second stage) for side, bottom & top sealing, guidance and support;
- One (01) hydraulic hoisting system comprising of hydraulic servomotors with connecting rods, hydraulic power unit, gate dogging mechanism necessary for maintenance and service, interconnecting pipes, control panels etc.;
- Any other equipment not mentioned above, but necessary to make it fully functional for safe & proper operation and maintenance.

2.3.1.2 Gate Arrangement

The flushing tunnel intake gate shall be designed by the Contractor to close against unbalanced head conditions in emergency with maximum specified discharge through the tunnel at maximum reservoir water level, and also to withstand the maximum reservoir water level with the tunnel empty.

The gate shall be required to open and close under un-balanced head conditions. The gate will normally remain closed and will be opened when deposited sediments are to be flushed

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

out through the flushing tunnel in to Hunza river. When fully open the gate will normally remain on the intake blocks just above the gate opening.

The gate shall be raised and its rate of closure shall be controlled by a separate oil hydraulic double-acting servomotor. The length of each gate connecting rods shall be sufficient for making gate connection with the servomotor to be installed at intake deck level. The servomotor shall be energized from a single central pumping unit installed in the gate control building located at operating platform level. The servomotor shall have both local and remote controls and the gate shall have both local and remote position indicator. The servomotors shall be amply sized to ensure that gate opening / closure can be obtained at the minimum operating pressure. The piston rods shall be foraged steel having chrome plated surface.

The servomotors and their mountings, pressure piping and control valves shall be adequate for the pressure produced in the servomotor with the most adverse conditions of unbalanced closure against maximum flow.

The oil commonly used in the hydraulic systems is mineral oil, which should have good resistance to the formation of rust, oxidation and foam. Oils having a viscosity of 150 SSU at 38°C and a minimum viscosity index equal to 90 are used.

Pipes used in the hydraulic systems are usually black seamless steel pipe conforming to ASTM A53 or A106 standards. Pipe sizing is determined according to the maximum oil speed. Speed limitations observed in pipe design according to the DIN 19704:

- in suction and filling lines, 0.6 m/s
- in pilot line return and leakage lines, DN≤40: 1.0 m/s
  DN≥40: 1.5 m/s
- in pressure lines, DN≤40: 3.0 m/s
  DN≥40: 5.0 m/s.

The gate shall close under its own weight but the servomotor shall be reversible so that in the event of an obstruction being lodged on the gate tracks or in the guides, a positive downward thrust may be exerted on the gate.

2.3.1.3 Shop Painting

The non-stainless steel parts of the supply shall be shop-primed and painted before being transported from works to site as per the painting schedule provided in these specifications.

Main Data

i)	Type of Gate	Vertical Fixed wheel
ii)	Embedded metal works	One (01) set
iii)	Clear width of opening	5.5 m
iv)	Clear height of opening	5.5 m
v)	Sill level	El. 2380.0 m.a.s.l
vi)	Max. Flood Water level	El. 2421.0 m.a.s.l
vii)	Design head at sill	~43.5 m (Contractor will confirm)
viii)	Type of side & top seals	Music Note / Double Stem EPDM
ix)	Type of bottom seal	EPDM, wedge

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

x)	Operation	Lowering / raising under un-balanced head conditions by hydraulic servomotor.

2.3.2 Flushing Tunnel Guard Gate

2.3.2.1 Gate Equipment

The intake of flushing tunnel shall be provided with one (01) guard gate at upstream of service gate for maintenance. The gate shall also be capable to close under unbalanced water condition under its own weight in case service gate stuck due to some problem. However, the gate will be raised under balanced head conditions.

The fixed wheel gate equipment shall be complete with all parts and components required for installation and operation in accordance with these specifications.

The fixed wheel gate equipment shall include but not to be limited to the following major items:

- One (01) fixed wheel gate complete with wheels, self-lubricating spherical bearings, guide rollers & seals etc.;
- Gate dogging mechanism;
- One (01) set of embedded parts (first and second stage) for side, bottom & top sealing, guidance and support;
- One (01) semi-automatic lifting beam;
- Any other equipment not mentioned above, but necessary to make it fully functional for safe & proper operation and maintenance.

2.3.2.2 Gate Arrangement

The Flushing tunnel guard gate shall be designed by the Contractor to close against unbalanced head conditions to restrict / block the water way in flushing tunnel for maintenance of service gate.

The guard gate will be of vertical lift fixed wheel type and will be operated through same gantry crane provided at power tunnel intake located at deck level of 2425.0 m.a.s.l. The gate, when not in use, shall be stored / Dogged in its slot in such a way that the top edge of gate will be flush with top surface of flushing intake tower deck. Top openings & grooves of the gate shall be provided with removeable protection steel gratings.

The gates will be of fixed wheel type having fabricated steel construction designed against maximum applicable loads. Gate shall have downstream skin plate and seals. Side seals shall be of EPDM rubber music note type and bottom seal of EPDM rubber wedge type. The seals shall be fastened to the gate using stainless steel fasteners. The guard gate will be handled using gantry crane (single gantry crane will be shared to serve at both power and flushing tunnels intake areas) and a semi-automatic grappling / lifting beam of adequate capacity. The grappling / lifting beam shall be attached to the gantry crane hook at single point.

Main Data

i)	Type of Gate	Vertical Fixed wheel
ii)	Embedded metal works	One (01) set
iii)	Clear width of opening	5.5 m
iv)	Clear height of opening	5.5 m
v)	Sill level	El. 2380.0 m.a.s.l

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

vi)	Max. Flood Water level	El. 2421.0 m.a.s.l
vii)	Design head at sill	~43.5 m (Contractor will confirm)
viii)	Type of side & top seals	Music Note / Double Stem EPDM
ix)	Type of bottom seal	EPDM, Wedge
x)	Operation	Lowering/raising under un-balanced head conditions by gantry crane.

2.3.2.3 Grappling / Lifting Beam

One lifting beam for lowering/lifting of the guard gate shall be provided. The lifting beam shall be of welded construction. The beam shall be equipped with two semi-automatic engaging and disengaging hooks. Two guide rollers on each side of the lifting beam shall use the same guide bars/rails provided for the guard gate. The semi-automatic hooks and guide rollers shall be mounted on corrosion-resisting steel pins with self-lubricating bushings.

2.3.2.4 Shop Painting

The non stainless steel parts of the supply shall be shop-primed and painted before being transported from works to site as per the painting schedule provided in these specifications.

2.3.3 Flushing Tunnel Stoplogs (OPTIONAL)

2.3.3.1 Stoplogs Equipment

The Stoplogs equipment shall include but not to be limited to the following major items:

- One (01) set of Stoplogs with guide rollers and seals;
- One (01) set of embedded parts (first and second stage) for side, bottom & top sealing;
- One (01) semi-automatic lifting / grappling beam;
- Any other equipment not mentioned above, but necessary to make it fully functional for safe & proper operation and maintenance.

2.3.3.2 Arrangement

The stoplogs will be comprised of suitable number of sections to be installed one above the other to form a set of stoplogs for closing the waterway for removal of rock plug and other civil works.

The stoplogs will be of vertical-lift type with skin plate and seals on downstream side as mentioned in the layout drawings. The structure shall be of welded steel construction. The skin-plate shall be reinforced by vertical and horizontal members welded to the skin-plate.

The stoplogs shall be provided with J-type side and wedge-type bottom rubber seals. The seals shall be fastened to the stoplogs by steel clamp bars. The top most section of the stoplogs shall be provided with J-type top seal to completely seal the opening.

Pair of guide shoes on each side of each stoplogs shall be arranged to engage with embedded guides bars. Moreover, each set of embedded metalwork for stoplogs shall consist of two side-seal and one top seal and one sill beam bearing and guide plates. All seal bearing plates shall be of corrosion-resisting steel. The guide plates shall be provided from the bottom to the deck level. The embedded metalwork shall be installed in the block outs and adjusted by means of alignment screws attached to welding pads embedded in the first stage concrete. After the alignment of the embedded metalwork, the block outs shall be filled with second stage concrete.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Main Data

i)	Type of Stoplogs	Vertical lift, slide type with guide rollers
ii)	No. of stoplogs	One (01) set
iii)	Embedded metalworks	One (01) set
iv)	Clear width of opening	5.5 m
v)	Clear Height of stoplog	5.5 m
vi)	Sill level	El. 2380.0 m.a.s.l
vii)	Max. Flood Water level	El. 2421.0 m.a.s.l
viii)	Design head at sill	~43.5 m (Contractor will confirm)
ix)	Type of side & top seals	Music Note / Double Stem EPDM
x)	Type of bottom seal	EPDM, Wedge

2.3.3.3 Grappling / Lifting Beam

One lifting beam for lowering/lifting of the stoplogs shall be provided. The lifting beam shall be of welded construction. The beam shall be equipped with two semi-automatic engaging and disengaging hooks. Two guide rollers on each side of the lifting beam shall use the same guide bars/rails provided for the stoplogs. The semi-automatic hooks and guide rollers shall be mounted on corrosion-resisting steel pins with self-lubricating bushings.

2.3.3.4 Shop Painting

The non stainless steel parts of the supply shall be shop-primed and painted before being transported from works to site as per the painting schedule provided in these specifications.

2.4 POWERHOUSE DRAFT TUBE OUTLET AREA

Equipment to be Furnished at the Draft Tube Outlet:

- Three draft tube bulkhead gates (vertical lift fixed wheel type)
- One moving electric gantry crane

2.4.1 Draft Tube Bulkhead Gates

2.4.1.1 Gate Equipment

Each draft tube outlet shall be provided with one vertical lift bulkhead gate to be used during inspection and maintenance work of the main turbine and the draft tube.

The gate equipment shall be complete with all parts and components required for installation and operation in accordance with these specifications.

The bulkhead gate equipment shall include but not to be limited to the following major items:

- Three (3) bulkhead gates complete with wheels, self-lubricating spherical bearings, guide rollers & seals etc.;
- Three (3) sets of embedded parts (first and second stage) for side, bottom & top sealing, guidance and support;
- Gate dogging mechanism;

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- One (1) semi-automatic lifting beam;
- Any other equipment not mentioned above, but necessary to make it fully functional for safe & proper operation and maintenance.

2.4.1.2 Gate Arrangement

The bulkhead gate shall be operated under balanced head conditions. The bulkhead gate will be of vertical lift fixed wheel type and will be operated through a moving gantry crane provided at powerhouse downstream deck at a level of 2313.3m. The gate, when not in use, shall be stored / Dogged in their slot in such a way that the top edge of gate will be flush with finish surface of deck. Top openings & grooves of the gate shall be provided with removeable protection steel gratings.

The gates will be having fabricated steel construction designed against maximum applicable loads. Gate shall have upstream skin plate and seals. Side seals shall be of EPDM rubber music note type and bottom seal of EPDM rubber wedge type. The seals shall be fastened to the gate using stainless steel fasteners. The gate will be handled using gantry crane and a semi-automatic grappling / lifting beam of adequate capacity. The grappling / lifting beam shall be attached to the gantry crane hook at single point.

Main Data

i)	Type of Gate	Vertical fixed wheel
ii)	No. of gates	Three no.
iv)	Embedded metal works	Three sets
v)	Clear width of opening	5 m
vi)	Clear height of opening	3 m
vii)	Sill level	El. 2294.25 m.a.s.l
ix)	Max. Flood Water level	El. 2301.86 m.a.s.l
x)	Design head at sill	~7.61 m (Contractor will confirm)
xi)	Type of side & top seals	Music note / double stem EPDM
xii)	Type of bottom seal	EPDM, wedge
xii)	Operation	Lowering / raising under balanced head conditions by gantry crane.

2.4.1.3 Grappling / Lifting Beam

One lifting beam for lowering/lifting of the bulkhead gate shall be provided. The lifting beam shall be of welded construction. The beam shall be equipped with two semi-automatic engaging and disengaging hooks. Two guide rollers on each side of the lifting beam shall use the same guide bars/rails provided for the gate. The semi-automatic hooks and guide rollers shall be mounted on corrosion-resisting steel pins with self-lubricating bushings.

2.4.1.4 Shop Painting

The non stainless-steel parts of the supply shall be shop-primed and painted before being transported from works to site as per the painting schedule provided in these specifications.

2.4.1.5 Gantry Crane for Draft Tube Gates

(Covered under “Moving Gantry Cranes” section above)

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

SECTION 3 ELECTRICAL PLANT EQUIPMENT

3.1 GENERATORS

The generators shall include the following components/systems:

- Synchronous generators
- Excitation Compartment with Carbon Brushes and Slip Rings
- Neutral grounding Cubicle
- Piping, fitting, valves, pressure gauges, thermometer, instruments for oil, water, air, and cooling water system as separately specified in these specifications.
- Bearings
- All necessary foundation plates and bolts.
- Braking equipment.
- Heaters for stand still.
- Control equipment and connections to the generator control cubicles.
- Fire Protection system
- Fire detection and alarm system

In addition, the following shall be supplied.

- Spare parts
- Maintenance equipment and Tools

Generator Inertia value shall be calculated and finalized by the Contractor , during detailed design phase, subject to review and approval by the Employer.

The generators shall be synchronous vertical shaft type, coupled to the turbine through shaft, provided with guide and thrust bearings.

Generator output shall be matched with the maximum output of the turbine. Generating voltage shall be 11 kV with power factor operating range of 0.8 lagging to 0.9 leading. The Rated Voltage of Generator shall be 11 kV$\pm$10 and Rated Frequency 50$\pm$6%.

3.1.1 Scope of Work

The scope of work covers the design, manufacture, delivery to site, storage, erection, testing and commissioning of three (3) Nos. alternating current vertical shaft synchronous generators complete with ancillary equipment including reliability and guaranteed performance tests.

3.1.2 Service Conditions

See Section “General Electrical Requirements”.

3.1.3 Standards and Codes

All equipment under these Technical Specifications shall be manufactured and tested in accordance with the latest revision of the following international standards.

In case there is contradiction between the contents of relevant clauses of any two standards, Contractor will proceed with the most applicable one with prior approval of the Employer.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

The commissioning and field acceptance tests of the generator equipment shall be carried out according to the IEC and ANSI Standards.

3.1.4 Key Technical Parameter

Table 3-2: Key Technical Parameters

Guaranteed rated capacity (MVA)	23.20 MVA with temperature rise less than 80^0C (operation at class B temperature rise)
Real Power (MW) at 0.8 pf lagging	18.56 MW

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Rated Voltage (kV)	11
Rated Frequency (Hz)	50
Rated Speed (rpm)	375
Power Factor	0.8 lagging to 0.9 leading
Stator/Rotor Winding Insulation	Class F/F
Duty Type	S1, Continuous
Efficiency (% Minimum)	98
Short Circuit Ratio	≥ 1.10
Telephone Hormonic Factor (THF)	≤1.5%
Cooling of stator and rotor	Air-cooled, self-ventilated with air/water heat exchangers with air leaving the coolers at not more than 40°C.

3.1.5 Generator Design Particular

The generators shall be designed in accordance with best modern practice & factors of safety and shall be suitable for operation under abnormal conditions. The generators shall be suitable and their appurtenances shall be designed for fully automatic start-stop, unattended supervisory-controlled operation.

The generator and its associated excitation system shall be designed to withstand multiple full load rejection over speeds, with a maximum speed rise of 150%. After runaway, the generator shall be returned to normal operation.

The rotating parts of the generators shall be able to withstand the stresses at runaway speed for a minimum duration of thirty (30) minutes. The maximum unit stresses for any rotating part of generator or other shaft driven auxiliary machine at runaway speed shall not exceed two-third (2/3) of the respective material yield strength.

The first critical speed of the combined turbine generator unit will be at least 25% higher than runaway speed. A “worst case” calculation shall be performed, considering unbalanced magnetic pull resulting from eccentricity between stator and rotor equal to 10% of the air gap.

Design calculations showing that technical requirements mentioned herein are satisfied shall be submitted to Employer for approval before manufacturing commences.

Following limits of temperature rise shall be applied to the generator, when the generator delivers the rated output continuously at the rated voltage, rated power factor and rated frequency, conforming that air temperature entering the generator through the air coolers does not exceed 40 °C.

Table 3-3: Temperature Rise Limits

Part of Generator	Method of Measurement	Temperature Rise Limit
Stator Winding	Embedded Temperature Detector	85 K
Field Winding	Resistance	80 K

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

The generator windings shall be insulated with Class F insulation using Vacuum Pressure Impregnation (VPI) technology.

All parts of the generators and the connections thereto shall be designed to withstand the mechanical and electrical forces due to a rated voltage 3-phase short circuit at the generator terminals, without incurring any damage.

The design of equipment shall include an allowance for earthquake loading in accordance with the seismic values of Project area as provided elsewhere in the Employer Requirement.

The generator shall be suitable for withstanding any un-balanced fault conditions without mechanical or electrical failure or permanent deformations.

The voltage withstand levels for the generator shall be in accordance with IEC 60071. Whereas, stator winding impulse voltage withstand level shall be as per IEC 60034-15 and following shall apply:

Table 3-4: Insulation Voltage withstand Levels

Factor	Value	Unit
System Maximum Voltage	12	kV
Rated Power Frequency Withstand Voltage (2xUn+1)	25	kV
Rated Lightning Impulse Withstand Voltage (4xUn+5)	55	kV

3.1.6 Efficiency and Losses

The generator efficiency when operating at the rated output, 0.8 pf lagging to 0.9 leading, 11 kV, 50 Hz, shall not be less than 98%.

Generator load and no-load losses at rated output shall be stated in the Technical Schedules as guarantee figures.

3.1.7 Line Charging Capability

Each generator shall provide a maximum continuous line charging capability of –16.55 MVAr, when connected to open-ended transmission lines, without becoming self-excited or unstable.

3.1.8 Stator Frame & Housing

The housing shall be furnished complete with all base supports, frames, foundation bolts, nuts etc.

The stator housing shall transfer all loads and torque to the generator foundations. Thrust forces, if any shall be transferred to the machine floor.

The stator frame shall be designed to keep the core in an isotropic cylindrical shape; to decrease the thermal stress under all generator operating conditions; and to provide adequate rigidity and strength against forces caused by out-of-phase synchronizing and short circuits, including short circuits of one-half of the field windings.

3.1.9 Stator Core

The stator core shall be designed in a manner to ensure smooth air flow to cool the core and other parts of stator evenly, efficiently and thoroughly, and to minimize air friction losses. The stator core shall be built with non-oriented grain, non-aging silicon steel lamination, and each

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

lamination shall be coated on both sides with an insulating varnish. The design of the core clamping system shall ensure a regular and uniformly tight core which can be maintained throughout the service life of the generator.

3.1.10 Stator Winding

The stator winding shall be wye connected, multi-turn or bar type, suitable for both grounded and ungrounded neutral operation.

The windings shall be insulated with Class “F” insulation.

The coil shall be protected against surface partial discharges (corona) inside the stator core by applying a semi conductive tape or varnish.

The end portions of the winding shall be rigidly supported to prevent movement and distortion under short-circuit conditions.

3.1.11 Rotor

The rotor shall be designed to withstand all overloads and other stresses encountered during normal operating or runaway speed condition.

Design shall take into account the correct distribution of ventilation air to minimize air friction losses.

3.1.12 Field and Damper Winding

The field winding shall be insulated with Class F insulation.

The field winding and their insulation shall be capable of withstanding vibration, thermal displacement and stresses at maximum runaway speed, and shall also be capable of withstanding short-circuit and unbalanced current without mechanical or electrical damage or permanent deformation.

The damper winding shall be adequately dimensioned such that the Generator can operate continuously on an unbalanced system in accordance with IEC 60034-1.

3.1.13 Generator Brakes

Each generator shall be provided with pneumatically operated mechanical brake with air to be supplied from station compressed air system.

The air receiver shall be of sufficient capacity for at least five (5) complete braking operations without make-up air.

Pneumatical brake shall be applied at 15% of rated speed. The brakes shall remain applied when the machine is stationary.

The braking system shall be electrically interlocked with the turbine guide-vane locks and the generator main circuit breaker so that the brakes cannot be applied either automatically or from the manual control switch, unless the guide-vanes are closed and the generator circuit breakers are open. Each brake pad shall be provided with at least two interlock and alarm position switches.

The brake linings shall be asbestos-free and suitable for not less than 25,000 braking operations before they require to be renewed.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

3.1.14 Fire Protection System

Generators shall be provided with a fire extinguishing system of inert gas and water spray type.

The water for the water spray system shall be taken from the powerhouse fire fighting water main supply.

The Contractor shall supply all equipment for the water fire extinguishing system inclusive of pipes, spray heads, valves, locks, key cabinet etc.

The fire protection system shall comply with NFPA 851 National Fire Protection Association (and additional NFPA regulations).

The Generators shall also be provided with fire detection and alarm system.

3.1.15 Cooling System

The generators shall be air-cooled, self-ventilated with air/water heat exchangers. All equipment and materials related to the cooling system of each generator such as valves, fittings, strainers, pipe-work etc. shall be provided by the Contractor.

With one complete heat exchanger out of service, the maximum continuous output shall be maintained without the stator and rotor winding temperatures exceeding Class B permissible temperature rise.

3.1.16 Condensation Prevention

Electric heaters shall be provided in each generator frame. Heaters shall be of sufficient capacity to prevent condensation when the generator is not working. Heaters shall be automatically controlled from the unit start/stop in conjunction with a thermostat. Heaters shall be arranged from the auxiliary 400/230V ac supply connected to form a balanced three phase load. A control switch, with "ON/OFF" indicating lamps for manual operation, shall be provided.

3.1.17 Bearings

Guide bearings shall be of the segmented multiple pad design, oil lubricated self-pumping type. Their design shall permit vertical movement of the shaft system for adjustment and removal of the thrust bearing shoes. Bearing pads shall be individually adjustable and shall be lined with high grade white metal, no less than 5mm thick, securely bonded to the pads. The bond shall be ultrasonically examined. Bearing pads shall be easily removable without the removal of any other major component. A portion of the bearing shall be continually immersed in oil to provide initial lubrication during a unit start.

All bearings shall be equipped with water-in-oil sensors with alarms. Each generator bearing housing shall be sealed and ventilated to ensure that oil vapor does not enter the generator, slip-ring housing or turbine pit. Vapor pipe work from each bearing housing shall be terminated in a convenient location in the turbine gallery, by condensate containers equipped with drain and level indicator. If necessary to completely eliminate vapor release from the bearing housings, an external vapor extraction and condensation system shall be provided for each unit.

3.1.17.1 Upper Guide Bearings

The bearing shall be of self-pumping design mounted in the upper bracket. Coolers shall be consistent with those on the lower guide. It shall be possible to remove the upper guide bearing pads without dismantling the brush gear or its enclosure.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

3.1.17.2 Thrust Bearings

The thrust bearing shall be self-pumping by rotation of the shaft. It shall be mounted in a lower bracket designed to transmit axial loads into the concrete foundations. The design shall be such as to limit thermal expansion forces whilst maintaining the bearing concentricity with the shaft. The thrust pads shall be supported so as to ensure uniform load distribution between pads and provide ease of adjustment for maintenance. The bearing shall be designed to accommodate repetitive restarts immediately after hot shut down. Removal of the pads shall be possible sideways by jacking the generator rotor. The Contractor shall supply all special tools and devices for this purpose.

The thrust bearing runner shall be a one-piece forging. Weld repair of the runner surface will not be accepted. The bond of the white metal to the bearing pads shall be inspected ultrasonically.

The thrust bearing shall be equipped with a high-pressure oil lift system which shall normally be operative during start up and shut down. However, it shall be possible (and demonstrated during commissioning) that the unit can be stopped without the pumps in operation without any appreciable temperature rise and any damage to thrust bearing pads. The results of this demonstration shall be visually verified by inspecting two thrust bearing pads at random. Each pad shall be equipped with non-return valve integral with the pad. The high-pressure system shall comprise two pumps (normal and standby) with all necessary starters and associated controls for automatic switching. The standby pump shall be dc motor driven which shall start automatically upon failure of ac motor driven main pump. The required oil film thickness shall be established in about five (5) seconds. Remote indication and local visual indication shall be provided for excess inlet and outlet filter pressure drop.

The high-pressure lift system shall be located external to the unit so that it can be easily inspected and maintained without entering the unit. Automatic drainage of any leakage oil shall be provided. Bearing oil coolers shall be mounted outside the bearing housings with isolating valves so that they can be removed for cleaning. There shall be indicating devices or visual aids to observe foaming of oil in the bearing.

3.1.17.3 Lower Guide Bearings

The lower guide bearing may share an oil reservoir with the thrust bearing. In this case oil supply to the lower guide bearing may be by the pumping action of the thrust bearing. Otherwise, the guide bearing shall be self-pumping.

If a separate oil reservoir is used, the coolers of the lower generator guide bearing shall be external to the guide bearing housing and shall be easily isolated and removable for cleaning and maintenance.

Alternatively, if self-pumping is proven to be impractical with external coolers, then coolers may be installed in flanged recesses in the bearing houses such that they can be removed without the necessity of dismantling any major component.

3.1.18 Control & Instrumentation

The Contractor shall supply and install all the necessary auxiliary transformers, pipework, tubing, fittings, orifice plates, flanges, pockets and other items to provide the complete control and instrumentation for each unit.

Generator shall be equipped with following monitoring systems;

i. Air-gap monitoring system

ii. Online Vibration detection system

iii. Online partial discharge monitoring system

iv. Cooling water pressure sensing and monitoring at different parts

v. Oil pressure sensing and monitoring at different parts

The vibration measuring system is designed to give alarm (1st stage) and unit trip (2nd stage) signals in the event of excessive vibration.

The bearings shall be equipped with necessary instrumentation i.e., flowmeters, oil level indicators, water level indicator, etc.

Temperature detectors shall be located in the area of maximum predicted temperature, in each component or part. Where limitations imposed by electrical safety or mechanical integrity at the measuring point dictate otherwise, measuring point locations shall be to the Employer approval.

Temperature detectors other than those in the windings and core shall be housed in suitable pockets, and in all cases a second pocket with a screwed protection cap shall be provided alongside to accommodate a liquid-in-glass thermometer for temperature detector calibration.

Resistance-type temperature detectors (PT-100) shall have a resistance of 100 ohms at 0°C and shall be permanently wired to a marshalling box outside the generator housing. The detector and bridge circuits shall be wholly insulated. Common point connections may be used in the detector circuit wiring for any one resistance thermometer, but there shall be no common point between separate resistance thermometers. The spare embedded temperature detectors in the core and windings shall be permanently wired to the above marshalling box.

3.1.19 Generator Connections and Neutral Earthing

Segregated phase bus shall be used for generator connections. The Contractor shall supply a separate phase and neutral enclosure, each complete with all conductors, resistor, insulators, current transformers and all ancillary equipment as required.

The neutral ends of the generator windings shall be star-connected and the neutral shall be earthed via a high resistance grounding method as described in standard IEEE C37.102. The Contractor shall provide the neutral grounding calculations for Employer review.

3.1.20 Testing and Commissioning

Testing and commissioning shall comprise type, routine/factory and site testing designed to verify the performance of the generator. Except as otherwise specified, all tests shall be performed in accordance with relevant standards from IEEE, IEC, ASME, ASTM, ANSI/NETA and ISO. Detailed Inspection Test protocols, Factory Tests Procedure and Site Acceptance Test Procedures following requirement of above quoted standards shall be prepared and submitted for review/approval.

3.1.20.1 Routine tests on all Generators in Workshop

Routine tests shall be carried out on rotor & stator windings, magnetic material, core laminations, winding insulation before assembly as per applicable IEC and IEEE standard.

3.1.20.2 Routine tests on all Generators at Site after Erection

All site tests as per IEC, IEEE, ANSI/NETA shall be carried out on the generators in assembled condition at site.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

3.1.20.3 Site test for each generator

After installation of the generator at site, following tests as a minimum but not limited to it shall be carried out during commissioning:

- Phase sequence and direction of rotation
- H.V dielectric test
- Measurement of stator and rotor winding insulation resistance test before and after dielectric test
- Stator and rotor winding resistance measurement
- Thermal Test
- Measurement of vibration and noise level
- Load acceptance and rejection tests at selected load from “no load” to “full load & maximum load”
- Synchronizing test
- Black start test
- Checking and commissioning test of all auxiliary equipment

3.1.20.4 Unit Reliability Run Test

- Stable and reliable operation for at least 24 hours at varying outputs between maximum possible and minimum possible allowable capacity of the unit without any failure or interruption and with no more than 2 start/stop cycles.
- Stable and reliable operation within a continuous 72 hours period, at least 10 successive cycles of starting (i.e., including synchronizing and loading to the dispatch level) and stopping (i.e., including unloading from the dispatch level down to no load and stopping to standstill).

3.1.20.5 Multiple Units Test

Following tests but not limited to these shall be performed on multiple units.

- Parallel operations, power (MW) and MVar sharing
- Multiple Units active power load rejection test (100% load)
- Plant capacity, efficiency and performance tests, to demonstrate compliance with the plant performances and guarantees.

3.1.20.6 Test Equipment

The Contractor shall provide all necessary labour, equipment and instruments to perform the tests on Plant. The test instruments shall be of the latest model and type available with the precision required to conduct the specified tests and their calibration shall be checked prior to use.

In the event repeated testing becomes necessary, the entire expenditure on such tests shall be borne by the Contractor.

3.1.20.7 Characteristics Curves

The generator characteristics values for determination of performance shall be arrived either through circle diagram method or equivalent circuit method after conducting all required tests on the generator even though they have not been specifically mentioned above.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

After testing the machine, the equivalent of circuit of the generator, phase diagram and performance characteristics like load versus efficiency; load versus power factor or load versus magnetizing kVAR, kVA and kW output and load current shall be determined and furnished to the Employer by the Contractor.

Tests on other equipment like auxiliaries, CTs, PTs, LAs shall comply with the routine tests etc. as per applicable international standards.

3.1.21 Spare Parts, Maintenance Equipment and Tools

Spare Parts, Maintenance Equipment and Tools mentioned herein are the minimum required. Any other necessary spare parts, maintenance equipment and tools required for maintenance of the equipment shall be provided by the Contractor.

Table 3-5: Spare Parts and Tools

Sr. No.	Description	Unit	Qty
Mandatory Spare Parts for Generators			
1	Spare Stator Windings, with required mounting material	Lot	1/3rd for stator and rotor winding
2	Poles, one of each polarity	complete	2
3	Linings for the guide bearings	Set	1
4	Pads for the thrust bearing	Set	1
5	Brake linings	Set	1
6	Brush holders	Set	2
7	Brushes	Set	10
8	Air heat exchanger element	No.	4
9	Bearing oil heat exchanger	No.	2
10	High pressure oil pump and motor of each type (AC and DC)	Set	1
11	Gaskets, screws, bolts and nuts of all types used	Lot	1
12	Maintenance tools with cabinet	Lot	1
Mandatory Spare Parts for Generator Control and Instrumentation			
1	Temperature detectors and thermometers	Lot	1
2	Flow indicators	Lot	1
3	Relays, limit switches etc.	Lot	1
4	I/O modules of each type	Set	1
5	Relays, limit switches etc.	Lot	1
6	Pressure sensors	Lot	1
7	Pressure Switches	Lot	1
8	Pressure Indicators	Lot	1
Maintenance Equipment

2	Laptop for testing, commissioning and setting of parameters	No.	1

3.2 EXCITATION SYSTEM

3.2.1 Scope of Work

Three (03) static excitation systems along with complete protection and three phase dry type transformers shall be supplied. The forced air-cooled thyristor bridge rectifier, shall be controlled by stabilized firing circuits fed from the excitation transformer output. A solid-state microprocessor based dual channel digital excitation controller with redundant controls shall be provided to maintain maximum reliability.

The excitation controller shall incorporate an Automatic Voltage Regulator (AVR) with backup Field Current Regulation mode and a Power System Stabilizer (PSS).

Local automatic, remote automatic and manual standby controls shall be provided along with indications and alarms. The excitation output shall be connected by cable to the generator slip rings through a field circuit breaker. The equipment shall be designed as an integrated suite.

3.2.2 Service Conditions

See Section “General Electrical Requirements”.

3.2.3 Standards and Codes

All equipment under these Technical Specifications shall be manufactured and tested in accordance with the latest revision of the following international standards.

In case there is contradiction between the contents of relevant clauses of any two standards, Contractor will proceed with the most applicable one with prior approval of the Employer.

3.2.4 Structure of Excitation System

The excitation control system shall be of fully static type and shall include:

A) Excitation Control Equipment, incorporating
   i. Automatic Voltage Regulator
   ii. Manual Field Current Regulation
   iii. Power System Stabiliser
   iv. Thyristor firing circuit output

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

v. Monitoring of Excitation Control System
vi. Interface with DCS
vii. Limiters and Protection System

B) Excitation Power Transformers
C) Full wave (Force Air cooled) Thyristor Convertor with Controller
D) Field Suppression Circuit and rotor overvoltage protection
E) Field Circuit Breaker

3.2.5 Excitation Design Particular

The excitation equipment shall meet the requirements of IEC 60034 based on 40°C ambient air temperature.

The equipment shall meet the following requirements:

- The equipment shall be continuously rated at 110% of the excitation required for rated generator output at 105% rated voltage.
- The ceiling excitation voltage shall be not less than 160% of the rated field voltage at Class B rotor temperature rise.
- The excitation equipment shall produce ceiling excitation output coupled to the rotor, for 5 seconds, following continuous operation at rated output, without exceeding component design temperatures.
- The nominal excitation response, as defined in IEC 60034-3, shall not be less than 2 per unit per second.
- The equipment shall be designed and protected so as to withstand a short circuit across the direct current output terminals without permanent damage.
- The equipment shall maintain generator voltage at set point value under load rejection conditions up to a nominal overspeed trip setting of 130%.
- The excitation system shall include parallel droop or parallel differential compensation such that the reactive load is shared between all units on the line.
- Provide field flashing from 220V dc unit auxiliary board for excitation initiation under “Black Start Conditions”.
- Suppress the generator field under fault conditions using thyristor inversion under automatic or manual control. The maximum induced rotor voltage shall be limited to prevent rotor inter turn damage.
- Suppress the field by circuit breaker operation whenever the 11kV breaker is tripped under fault conditions.
- Limit harmonic voltage distortion on the 11kV bus to less than 5%.
- Maintain voltage control at 70% of rated voltage during close-up faults on the 132kV side of the generator transformer.

3.2.6 Excitation Control Equipment

3.2.6.1 General

The excitation control equipment shall maintain stable generator voltage under all conditions of generator operation. The equipment shall consist of a proven AVR as specified below, with a Field Current Regulation system for manual follow-up in case of an AVR fault and for manual operation.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

The AVR shall be fitted with a PSS based on proven feed-back circuits to improve the machine stability under system fault conditions. A PSS based on an angular acceleration signal is preferred.

An under excited reactive power limiter, field current limiter, voltage setting control and generator transformer over-fluxing control device shall also be provided.

An annunciator shall be provided to indicate faulty conditions and to sound an alarm in the event of a fault.

3.2.6.2 Type

The excitation control equipment shall be a solid-state microprocessor based digital system suitable for operation over the full range of ambient conditions specified for the powerhouse. It shall be made to the highest equipment and manufacturing specifications and shall be of proven industrial application.

3.2.6.3 Automatic Voltage Regulator

A continuously acting, no "dead band", static dual channel type of AVR of proven design shall be provided.

AVR shall include Local auto, remote auto (through the PCS) and local manual switching inside the enclosure. During normal operation the AVR shall be automatically controlled by the PCS (Remote Auto). Additional controls shall be provided for Local Auto and Local Manual control of the AVR. AVR control modes shall be selected at the Excitation Control Panel.

Response to changes in voltage shall be characterized by adjustable proportional gain and integral and derivative time constants.

Parallel operation shall be afforded by adjustable parallel droop or cross compounding compensation and connections to ensure stable operation and sharing of reactive power with other generators in the station.

Voltage drop compensation for the generator main step-up transformer shall be incorporated into the AVR. The voltage drop shall be adjustable over the range 0 to 120% of the transformer impedance, the estimated value of which will be given to the Contractor.

Line drop compensation shall be provided to ensure satisfactory operation of the AVR for large voltage dips on the system.

The AVR shall include dual voltage transformer with a continuous voltage comparator to detect failure of either set of voltage transformers. In the event of failure of any voltage transformer, the AVR shall automatically transfer the sensing voltage to the secondary channel.

In the event of failure of both voltage transformers, the AVR fault control shall be automatically transferred to the manual FCR mode without interruption of excitation.

The AVR shall utilize automatic tracking between channels and between control modes so that no significant change of excitation shall occur when switching between channels or from AVR to FCR modes.

3.2.6.4 Performance Requirements

The AVR shall be capable of working over the complete load, voltage, and frequency range of the generator within the limits defined below:

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Under steady-state load conditions at rated power factor and frequency, and over the whole of the operating range of the excitation system, the generator voltage shall be maintained within ± 0.2% of the setting value without hunting.

Under steady-state open-circuit conditions, the generator terminal voltage rise shall be not more than ± 1% of the setting value for all speeds between rated speed and 150% of rated speed.

Under AVR control, the generator open-circuit voltage response shall be such that for a - 10% step-change, the time for the machine terminal voltage to return to within ± 0.5% of rated value shall not exceed 0.5 seconds.

For voltage variations exceeding ± 0.1% of the rated value, the AVR response time shall be less than 0.02 seconds.

3.2.6.5 Field Current Regulation

FCR mode shall be provided for manual operation of the excitation system and as a follow-up manual mode in case of failure of both voltage sensing channels or in case of an AVR faults.

The FCR field current set point shall automatically track the AVR set point such that for a manual changeover or failover changeover to FCR mode no significant variation in reactive power load or voltage output shall occur.

While operating in FCR mode the field current set point shall be adjustable from the ULCP or DCS or from local controls at the Excitation Control Panel. The control source for the field current set point shall be selectable at the Excitation Control Panel.

Manual control shall also be provided whereby the generator voltage shall be capable of being varied continuously from 80% to 115% of rated voltage under normal operation, but down to 10% voltage for commissioning and line charging.

A manual excitation range of 0 to 115% shall be allowed for commissioning.

3.2.6.6 Power System Stabiliser

A PSS circuit shall be provided to damp out voltage fluctuations following faults on the power system. The PSS shall be capable of damping out local mode, inter area and inter unit oscillations occurring in the frequency range of 0.1 to 5 Hz by adjustment of the excitation output to control rotor oscillations.

The PSS shall continuously operate and shall operate in conjunction with the AVR during transient oscillations. Parameters utilized in the PSS algorithm shall be adjustable at the Excitation Control Panel.

It is preferred that the PSS circuit algorithm is based on the integral of angular acceleration.

For the purpose of setting PSS system parameters, if power system simulation results are required the Contractor shall provide written notice outlining the required information at least six months prior to the required date.

3.2.6.7 Limiters

The excitation control equipment shall incorporate limiters to prevent unsafe operation of the generator. Limiters shall be set to avoid operation of protective devices. As a minimum the following limiters shall be provided:

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

i) An under-excitation (VAR) limiter with a setting dependent on MW loading. The limiter shall prevent the excitation being reduced to such a level that the machine becomes unstable. The limiter shall be adjustable so that the range of stability margin can be selected. The stiffness of the VAR-limiter control shall be independent of the rate of change of MVAR. When the limiter is in operation, the overshoot shall not exceed 5% of the VAR setting.

ii) A field current limiter. This control shall stop the follow-up from reducing the manual setting below safe limits, at any output load.

iii) An adjustable over fluxing control, to ensure the generator and generator transformer is not over fluxed.

All limiters shall be fully adjustable at the Excitation Control Panel.

3.2.6.8 Monitoring and Self Diagnostic Systems

At all times the Excitation Controller shall provide self-diagnostic facilities that monitor its internal systems and supplies to ensure that they are healthy. In the event of a voltage sensing failure or AVR fault the Excitation Controller shall provide an "Excitation Fault" alarm to the DCS and ULCP and shall automatically failover to the FCR mode.

Permanent monitoring devices shall be supplied or incorporated to provide comparative readings of component performance. Fault diagnostic and fault location equipment shall also be included for fault location and maintenance.

The following shall be included:

i. Voltage reference and reset circuits
ii. Limiters in accordance with section ‘limiters’
iii. AVR stabilising circuits
iv. Manual follow-up and restrictive circuits
v. Power output stage
vi. Over-excitation and under-excitation protection circuits
vii. Fuse failure protection
viii. Stator over current
ix. Generator under and over voltage
x. Transformer over-fluxing control circuit

3.2.7 Control and Indication

3.2.7.1 PCS Interface

During on-line operation, remote commands to the Excitation Control Equipment will be from the station PCS.

Therefore, start/stop command and set-point adjustments will either be from the ULCP (local manual/auto) or from the PCS (remote auto) depending on which mode has been selected at the ULCP or at the Excitation Control Panel.

The connection details and signals between the Excitation Control Equipment, ULCP and PCS will be subject to approval by the Employer.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

3.2.7.2 Normal Control and Indication Signals

For day-to-day operation of the Excitation Control System the following minimum Control and Indication facilities shall be available to the PCS and at the operator interface. The operator interface may either by a separate HMI or via the front fascia of an integrated Excitation Controller. The signals shall be supplemented as necessary by the Contractor to reflect the actual equipment supplied.

Control

1. Start/Stop Excitation
2. Local/remote operation select
3. AVR/FCR mode select
4. ACR set point raise/lower
5. FCR set point raise/lower
6. Voltage sensing channel select

Indication

1. Network frequency
2. Generator frequency
3. Network voltage
4. Generator terminal voltage
5. AVR/FCR mode selected
6. AVR Set point
7. FCR Set point
8. Voltage sensing channel selected
9. Excitation at under excitation limit
10. Excitation at over excitation limit
11. Excitation at field current limit
12. Loss of potential channel 1
13. Loss of potential channel 2
14. Voltage matching enabled
15. Generator under/overvoltage detected
16. Loss of field
17. Excitation at over fluxing limit
18. AVR fault
19. Field over temperature
20. Thyristor over current
21. Thyristor over temperature alarm
22. Thyristor failed alarm
23. Second thyristor failed in the same bridge arm alarm
24. Multiple thyristors failed trip
25. Rotor temperature
26. Rotor temperature alarm
27. Rotor earth fault alarm

3.2.7.3 Maintenance Control and Indication Signals

For maintenance operation of the Excitation Control System the following minimum necessary Control and Indication facilities shall be available at the operator interface via password protection. The operator interface may either by a separate HMI or via the front fascia of an integrated Excitation Controller. The signals shall be supplemented as necessary by the Contractor to reflect the actual equipment supplied.

1. Generator and system parameter input
2. P, I and D settings for AVR and FCR modes
3. Under and over-excitation limiter settings
4. Field current limiter settings
5. Over fluxing limiter settings
6. PSS algorithm parameters

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

7. Parallel droop/parallel differential droop compensation settings
8. Line drops compensation settings
9. Protective function settings

3.2.7.4 Software

It shall be possible to adjust all variable parameters via the operator interface.

Where proprietary programs are available for adjustment of the excitation controller settings the Contractor shall provide all necessary software including perpetual licenses, with ongoing support and updates that shall allow installation of software on multiple computers.

3.2.7.5 Power Supplies

Electrical supplies shall be in accordance with Section General Electrical Requirements. DC control supplies shall be redundant and where alternative power supplies are required redundant converters shall be used. Switch over between alternate power supplies shall be without interruption to the excitation function. In the event of failure and switch over an "Excitation System Fault" alarm shall be raised.

3.2.7.6 Excitation Reference Signals

Current and voltage transformers for AVR operation shall be supplied by the Contractor.

Each of the two AVR channels shall be provided with a set of three single-phase voltage transformers, fed from the generator terminals.

An additional three-phase isolating transformer shall be provided between the voltage transformer and the voltage comparator (voltage error detector) of the AVR. The reference voltage shall be unaffected by changes in the ambient temperature or fluctuations in supply voltage or frequency, including full load rejection or close-up faults on the 132kV system.

Unless otherwise agreed, the three-phase auxiliary power supplies for the AVR shall be taken from the low voltage winding of the excitation transformer via suitable interposing transformers.

Current transformers required for each automatic voltage control channel shall be supplied and installed in the generator neutral cubicle.

3.2.8 Excitation Transformers

Three-phase excitation transformers suitable for connection to segregated phase bus bars shall be supplied for each unit. The transformers shall be of the dry type, naturally cooled, and shall meet Class B temperature rise limits when carrying the design rating with the worst harmonic losses associated with the thyristor unit. The transformer shall meet the requirements of IEC 60076-11 and IEC 60726 with non-hydroscopic Class F insulation and insulation levels in accordance with Table 1 list 2 of IEC 60071-1 and thermal Class 200 to IEC 60085.

The flux density shall not exceed 1.65 Tesla at rated output condition. Noise levels shall not exceed 90 dB (A) at 1 meter from the cubicle.

3.2.8.1 Rating

The transformer shall be sufficiently rated to achieve the excitation system requirements. The Contractor shall conduct an insulation coordination study to ensure that the excitation transformers are suitable for continuous operation when subjected to the operating conditions

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

defined in these specifications.

3.2.8.2 Terminals

High voltage terminal bushings shall be supplied and spaced for bus duct connection. Low voltage connections to the thyristor equipment shall be either bus bar or cable provided by the Contractor. An earth connection, rated in accordance with the short circuit capability in IEC 60076, shall be provided near the base of the frame.

Current transformers for each excitation transformer shall be provided in the HV connections for overcurrent protection and the Contractor shall ensure that the relays and current transformers are compatible.

3.2.8.3 Protection

Current transformers for each excitation transformer shall be provided in the HV connections for instantaneous overcurrent protection (50) and Inverse time overcurrent protection (51). Each Excitation Transformer shall also to be provided with complete thermal overload protection (49), restricted earth fault protection (64REF) and other necessary protection and the Contractor shall ensure that the relays and current transformers are compatible.

3.2.8.4 Mechanical construction

The cores, framework, clamping arrangements and general structure of the transformers shall be of a design capable of withstanding any shocks to which they may be subjected during transportation, installation, service and under any severe fault condition.

Approved lifting arrangements shall be provided and arranged so that the core structures are not subjected to unacceptable stresses during lifting and handling operations.

Each transformer shall be fitted with omni-directional rollers which shall be capable of being locked in the direction of either of the two principal dimensions of the transformer.

All structural members of the assembled cores shall be steel except when conventional core-bolt clamping is replaced by an approved taping or banded-clamping technique.

Clamping of the core and coil assemblies shall be of approved material and be arranged to prevent deterioration of the core characteristics.

3.2.8.5 Enclosures

Each enclosure shall consist of a rigidly constructed steel framework which shall be completely clad in sheet steel and, if necessary, with screened openings to provide natural cooling.

The degree of enclosure protection shall be IP 54 and IEC 60529.

Internal access shall be by means of lockable hinged doors at the front of the enclosure and the arrangement shall ensure that the transformer can be withdrawn easily.

Termination chambers with bushings shall be provided on enclosure to interface the isolated phase bus bars supplied under this Contract.

Each enclosure shall be provided with anti-condensation heaters and rating plates.

Each transformer shall be fitted with indicators, alarm and trip facilities which shall be terminated at a junction box in the transformer enclosure.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

3.2.9 Forced Air Cooled Thyristor Converter

The converter shall comprise 3-phase bridge-connected, fully controlled, thyristors. The unit shall be made up of several sections connected in parallel and so rated as to provide an excess capacity of not less than 100% of that required for maximum continuous excitation. The equipment shall be designed to withstand the maximum voltage rise on load rejection on the ac side of the equipment (allowing for the fact that the field current could be reduced to zero under this condition by an overvoltage trip).

Thyristors shall be forced air cooled. Filtered air shall be circulated by fans and if necessary, shall be cooled using air/water heat exchangers. The cooling system shall be provided with 100% duplicate coolers and circulating fans, with automatic change-over and all necessary alarms and indications.

3.2.9.1 Converter Protection

The minimum protection for each converter shall be as follows:

- **Thyristor overcurrent.**

Approved overcurrent protection in the form of specially designed HRC fuses for each parallel circuit of all arms of the bridge shall be provided. The overcurrent protection shall protect each thyristor in the event of an internal thyristor short circuit and a short circuit at the dc load. Fuse failure indication shall be provided in the cubicle. The Contractor shall provide information regarding the operation of the fuses in the event of a short circuit on the output side of the transformer.

- Thyristor over temperature alarm.
- First thyristor failure (alarm)
- Second thyristor failure in the same bridge arm (alarm)
- Multiple thyristor failure trip.
- Voltage and current suppression.

Voltage and current surge suppressors shall be provided. The suppressors shall be designed and connected into the rectifier circuits in such a way that the highest values of rate of change of voltage and current with time, to which the thyristors may be subjected, will not endanger either the thyristors or any other components of the rectifier. The maximum voltage surge to which any thyristor may be subjected under any operating or fault condition shall not exceed 80% of the peak transient inverse rating of the thyristor.

- **Transient pole slip voltage protection**

The equipment shall withstand the maximum transient voltage pole slip conditions or be fitted with suitable equipment to provide protection in the form of a "crowbar" circuit which is self-resetting. In the event of extended slip operation, trip protection shall be initiated.

- **Thyristor replacement**

Thyristor replacement shall not affect current sharing, and shall not require more than 15 minutes to complete.

Normal field suppression shall be achieved by thyristor control.

- **Firing circuit controls**

Thyristor firing circuits shall be arranged so that, in the event of a component failure, a standby system comes into operation.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

The thyristor firing circuits shall be taken from the excitation supply terminals. They shall be so designed that stable voltage control is maintained under all normal and fault operation.

- **Converter bus-bars**

Bus-bars with phase isolating barriers shall be designed to avoid the possibility of short circuits. They shall have clearances and creepage distances to earth between phases of not less than 50 mm, be insulated for an operating voltage of at least 1.5 kV and withstand a 50 Hz 1 min use pressure test to earth of 5.5 kV. Phases not under test shall be connected to earth. All the insulating material shall be non-hygroscopic and the insulation surfaces shall be treated to minimize the risk of tracking.

3.2.9.2 Field Suppression Equipment

A field suppression device incorporating a non-inductive de-energizing resistor, with a field suppression switch shall be provided. This field suppression equipment shall be mounted in a sheet steel cubicle with a lockable door forming part of the excitation suite. The field switch shall be a double-pole air circuit breaker with arc chutes and shall interrupt the maximum field current of the generator under all conditions of service, including short-circuit conditions, without incurring damage which would require component maintenance. The field switch shall be capable of operation by hand at the field switch cubicle. Approved arrangements for locking-off shall also be supplied. The nominal closing and tripping voltage shall be 220 V dc, but the trip coil shall operate between 50 and 120% of nominal voltage.

In the event of a generator fault the master trip relay shall trip the field circuit breaker. Operation of the field circuit breaker over-current tripping device shall operate the generator protection. A non-inductive resistor shall be connected across the generator rotor before the main contacts break the rotor current. This resistor shall be not more than the hot rotor winding resistance.

Alternative proposals to supply a ‘crow bar’ circuit consisting of anti-parallel thyristors in series with the discharge resistor in place of the field switch may be considered. For these proposals a high-speed surge suppression device shall be installed in parallel for very short voltage transients. An ac circuit breaker shall be installed on the power supply side to the rectifier bridge.

Normally the field switch will remain closed, but remote trip and close operation shall be provided, for automatic restart after a fault.

Contacts shall be provided for remote status indication and interlock, and shall be connected to a terminal box in the cubicle by the Contractor.

3.2.9.3 Main Excitation Connections

The Contractor shall supply and install all heavy current connections between the excitation transformer, the converter, the field breaker and the generator slip rings.

Heavy power circuit connections shall consist of cables with XLPE insulation for, stranded copper conductors and protected overall with a chlorosulphonated polyethylene sheath. They shall be constructed in accordance with IEC 60502 and shall have a voltage designation of not less than 1000 V. All cables shall be armored.

Cable sizes shall be selected according to the maximum current in the circuit, without any allowance for diversity, load factor or cyclic loading. No cable shall be less than 2.5 mm^2 cross sectional area. The ambient temperature shall be taken as 40°C except for cables run within the generator enclosure.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

3.2.10 Excitation Auxiliary Equipment

3.2.10.1 Rotor Earth Fault Protection Equipment

Rotor earth fault protection equipment of an approved type shall be included in the excitation equipment. The protection relay shall provide continuous digital insulation resistance indication and alarm in the event of a single earth fault on the generator rotor winding whilst the machine is running or at rest. The device shall be of the type which continuously monitors the insulation resistance of the whole of the rotor winding. The level of insulation resistance at which operation occurs shall be as high as possible, preferably above 10,000 ohms. Operation of the relay shall be time delayed by 1 to 10 seconds.

The monitoring voltage injected into the generator rotor may be ac or dc. Any voltage produced by the excitation circuit, appearing across the relay circuit shall not cause operation. The protection equipment shall be designed to withstand continuously any voltage development by the excitation circuit in the event of a rotor earth fault. A second rotor earth fault device shall be arranged to trip the machine. Provision for testing the alarm and trip settings shall be incorporated without disconnecting the protection circuit.

3.2.10.2 Rotor Temperature Indicator

A rotor temperature indicator shall be supplied and installed in the excitation suite. The instrument shall be provided with remote indication and alarm facilities and be suitably damped to provide stable indication under normal operation and alarm suppression under field forcing conditions. The rotor earth fault equipment and temperature indicating instruments shall be indirectly connected to the main excitation circuits, through isolating transformers or transducers to avoid polarity reversing equipment. Their primaries shall be designed to be tested with the voltage appropriate to the main circuit, and their secondaries at not less than 2 kV.

3.2.10.3 Spare Parts, Maintenance Equipment and Tools

Spare Parts, Maintenance Equipment and Tools mentioned herein are the minimum required. Any other necessary spare parts, maintenance equipment and tools required for maintenance of the equipment shall be provided by the Contractor.

Table 3-7: Spare Parts and Tools

Sr. No.	Description	Unit	Qty
Mandatory Spare Parts for Excitation System			
1	Pole dismantling device, if required	No.	1
2	Electronic prints corresponding to a complete AVR	Set	2
3	Thyristors and thyristor fuses	Set	2
4	One complete excitation transformer plus two spare legs of coils	Set	1
5	Cubicle ventilation fan unit	No.	1
6	Spares for Excitation Circuit Breaker	Lot	1
7	Spares for measuring and protection circuits	Lot	1
Maintenance Equipment			
1	Insulation test set to cover the range of equipment	Sets	1
2	Resistance measurement test set to cover the range of equipment	Sets	1

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Tools			
1	All necessary tools required for complete maintenance	Lot	1
2	Laptop for testing, commissioning and setting of parameters	No.	1

3.3 SEGREGATED PHASE BUS (SPB)

The Contractor shall perform the detailed design of the segregated phase bus duct in accordance with the requirements of these specifications.

The connections shall withstand without injury the mechanical and electrical forces arising from maximum possible fault currents and from seismic forces.

The connections shall be capable of carrying continuously the maximum three-phase current rating of the generator without the temperature exceeding 105°C on the surface of the conductors and 65°C on the surface of the enclosures at a design ambient temperature of 40°C.

The housings and conductors shall be proportioned to avoid natural frequencies near to any natural frequencies of the turbine and generator.

The extreme climatic and other external conditions shall be taken as the basis for the design of the main connection system.

3.3.1 Basic Construction

The bus duct shall be of the Segregated Phase type with adequate air space between each phase and from phase to ground. An aluminum ground barrier shall be secured between the phases. Bus duct designed for outdoor installations shall be totally enclosed, non-ventilated, and weather resistant, with peaked top cover. Bus duct designed for indoor installations shall be totally enclosed, non-ventilated and drip proof.

3.3.2 Standards and Codes

The assemblies shall be constructed, wired and tested in accordance with all applicable sections of the following latest listed standards and codes.

- American National Standards Institute (IEEE-C37.23- 2015)
- National Electric Code (NEC) (NFPA No. 70)
- National Electrical Manufacturers Association (NEMA)
- It shall be the manufacturer’s responsibility to be knowledgeable of the requirements of the above Standards and Codes. Where standards or codes conflict, IEEE-C37.23-2015, shall be the governing document.

3.3.3 Service Conditions

See Section “General Electrical Requirements”.

3.3.4 Ratings

- Maximum voltage up to 15.5 kV
- Basic impulse insulation level up to 110 kV
- Rated frequency withstands up to 50 kV (1 min. dry) 50HZ
- Rated continuous current up to 1600 Amperes
- Rated short circuit withstand current 40 kA (3 sec.)

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- Conductor total temperature limit 105ºC for silver-plated surfaces, or equivalent bolted bus joints.
- Maximum voltage drops on entire length not exceeding 3%
- Enclosure total temperature limit 65ºC

3.3.5 Conductors

- Copper-ETP 110 ASTM Designation B187, or Aluminum 6101-T61 ASTM Designation 8236.
- Conductors shall not exceed specified temperature limit when operated at the rated current.
- Conductor supports shall be provided to withstand short circuit currents and remain functional after short circuit has been experienced.

3.3.6 Bus Joints

- Temperature rise of bus bar joint shall not exceed 65ºC above a maximum 40ºC ambient, or a total of 105ºC operating temperature.
- Hardware shall be high strength 304 stainless steel, including bolts, flat washers. Belleville spring washers are used for copper, aluminum bus bar and flexible link connections. Nuts shall be silicone bronze hardware.
- Conductor splices to be an overlap single row bolted joint. Joints with splice plates and filler putty are not acceptable.
- Contact surfaces of bolted copper joints shall be silver plated, to maintain low contact resistance without the use of joint compounds.

3.3.7 Bus Bar Insulation

- 15kV application shall have fully insulated conductors and conductor joints. Insulating materials shall be fluidized bed epoxy coating. The materials shall be non-hygroscopic and flame retardant, rated for continuous operation at 105ºC (Class 105). The insulation level of the combined system shall meet or exceed the requirements in Table 2 of IEEE Standard C37.23-2015.
- Insulation at bus joints shall be molded vinyl boots.
- All bolted joints to be taped shall be wrapped with a conductive mesh prior to insulation. This mesh serves as a corona suppressant.

3.3.8 Grounding

- The bus enclosure shall be designed to carry the system ground fault current without excessive temperature rise. As an option, a separate ground bus can be provided on the inside or outside of the bus enclosure. Separate ground bus may terminate to equipment, or a ground pad, for connection to the station ground.
- Flexible jumpers shall be provided at all expansion joints to ensure ground continuity.
- The housing ground continuity shall be maintained at the shipping splits by the use of housing ground splice plates.

3.3.9 Conductor Support System

- Bus conductors shall be rigidly supported within the enclosure and shall be braced to withstand the short circuit currents specified.
- 15kV systems shall be supported on insulators, which are non-hygroscopic, track

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

resistant and flame retardant. Insulators will be molded Cycloalephatic epoxy mounted on glass reinforced polyester blocks or wet process porcelain post type insulators.

3.3.10 Enclosure

- Enclosures shall be constructed of one-piece aluminum for the sides and bottoms to limit reduced current losses and circulating currents, which prevents magnetic heating.
- All exposed surfaces are to be finished as described below:
  - All surfaces shall be cleaned to prepare them for paint adhesion.
  - All surfaces shall have a primer coat applied to 0.2 mil minimum dry film thickness
  - Outside surfaces shall have a final finish coat of 1.5 mil minimum dry film thickness
- Enclosure shall be designed for a maximum temperature rise of 40°C when carrying rated current in a 40°C ambient.
- Removable covers shall be provided throughout the bus duct run, on the top, for access to bus joints and supports without the need for disassembling the bus duct. The bottom shall have removable parts at the splice joints only.

3.3.11 Outdoor weatherproof construction

- Top covers shall be peaked and have drip lips to shed and prevent entry of wind-blown rain.
- Outdoor exposed enclosure assembly hardware shall be 304 stainless steel.
- Top cover joints, and joints with end flanges, are to be flanged, gasketed, and protected with a metallic sealing strip.
- Screened breather/drains are required along bottom covers and at all low points of the installation

3.3.12 Indoor non-ventilated drip-proof construction

- Housing will include gasketed solid top and bottom splice covers, and solid sides to prevent entry of falling liquid or solid particles.
- Enclosure assembly hardware shall be stainless steel.
- Screened breather/drains are required along bottom covers and at all low points along the installation.
- Enclosure joints will provide adjustment to accommodate site variances and linear expansion of up to ¼ inch per joint.
- Enclosures are to be shipped in longest practical lengths to minimize field assembly labor.

3.3.13 Space Heaters

- Space heaters shall be completely factory wired inside the bus enclosure. Wiring shall be in a separate grounded metal shielding. Heaters shall be thermostatically controlled. Each phase shall have a separate heater circuit individually wired to operate independently. Each circuit shall be thermostatically controlled, total of three (3) circuits per bus run.
- Space heaters shall be rated 240 volts/1000 watts.
- Space heaters shall be operated at 120 volts/125 watts to maintain low heater surface temperature and prolong their life.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

3.3.14 Wall, Floor or Roof Entrances

- Bus duct will include an internal vapor/fire barrier for one half hour to three-hour fire rating, where specified, at all wall, floor and roof penetrations when required.
- A dress up plate shall be provided to seal between the outside of the bus enclosure, and the building opening. The fire rating material between the wall and outside of the bus duct enclosure to be supplied by the installing contractor.

3.3.15 Testing

- All equipment will be subjected to IEEE-C37.23 standard production tests.
- Manufacturer may be requested to submit test reports showing compliance with the following IEEE-C37.23 design tests, or may submit design tests performed on similar ratings along with technical data to substantiate compliance of the equipment being furnished:
  - Temperature Rise
  - Insulation Withstand
  - Impulse
  - Wet and Dry Withstand
  - Insulation Flame Retardance
  - Water Tightness

3.3.16 Equipment Connections

- All transition parts for connection to mating equipment terminals shall be provided by the bus manufacturer. The Purchaser will provide the Manufacturer with the necessary interfacing details from other equipment manufacturers, to allow the bus duct manufacturer to design the connections.
- Equipment connections will include bolting hardware, bus adapters (where required), insulating materials and assembly drawings.
- Where connection to porcelain bushing of transformers, generators, or reactors is required, flexible connectors having a continuous current rating equal to or greater than the main conductors will be furnished.

3.3.17 Expansion Joints (For enclosures and conductors)

- Expansion joints are required for straight runs exceeding 60 feet on copper or aluminum conductors. This applies to indoor or outdoor bus duct construction.
- Expansion joints may be factory or field assembled. Full assembly instructions shall be furnished when field installation is required.
- Only outdoor expansion joints shall be used in seismic zones 3 or 4, or equivalent, as earthquake joints, indoors or outdoors, and when equipment being connected are on different pads or foundations.

3.4 GENERATOR STEP-UP TRANSFORMERS

3.4.1 Scope of Work

The scope of work covers design, engineering, manufacture, factory (works) testing, delivery, erection, installation, site tests and commissioning of four (4) number of three-phase generator step up transformers including one (1) spare transformer complete with their accessories. The

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

LV Side of transformers shall be connected to generator circuit breakers through segregated phase bus duct system.

These shall be three-phase units, each rated 20/26 MVA, with 132/11kV voltage ratio, and with on-load tap changers complete with transformer purpose made supports and anti-vibration pads. The cooling type shall be ONAN/ONAF and the transformers shall be provided with fire detection and alarm system and SERGI transformer explosion protection system.

3.4.2 Service Conditions

See Section “General Electrical Requirements”.

3.4.3 Standards

The transformers shall conform to the applicable requirements of the latest edition of the following international standards:

- IEC Publication 60076
- IEEE C57.12.00
- IEEE C57.12.10
- IEEE C57.12.70
- IEEE C57.12.80
- IEEE C57.12.90
- IEEE C57.13
- IEC Publication 60076-10
- IEC 60060
- IEC 60085
- IEC 60354
- IEC 60529
- IEC 60567
- IEC 60814
- IEC Publication 60076-7
- IEC Publication 60137 (Bushing)
- IEC Publication 61869
- IEC Publication 60811, 60230, 60502, 60228
- IEC TC37, WG-4
- IEC Publication 60214
- IEC Publication 60071
- IEC 61181
- IEC 61198
- IEC 60296-2003
- IEEE 62
- IEEE 637
- IEEE 1538

3.4.4 Functional Specifications

All generator step-up transformers shall be oil-immersed, (ONAN/ONAF), with the oil preservation system of the constant pressure conservator type, with a flexible diaphragm to preclude direct contact of oil with air, complete with accessories, and spare parts, suitable for outdoor operation. The star points of the 132 kV windings shall be solidly earthed.

The core of each transformer shall be of high grade, non-ageing electrical silicon steel of low hysteresis loss and high permeability. The Low Voltage side bushings on the generator transformer shall be suitable for connection to generators bus.

The high voltage bushings shall be condenser type, and shall be free from partial discharges up to the test voltage.

All bushings shall comply with IEC 60137. The HV bushings shall be inside an oil box adequate for HV connection. The LV bushings shall be air insulated. The neutral terminals shall be provided with outdoor type bushing insulator.

Each transformer case shall be capable of withstanding, without leakage or distortion, an internal gas pressure of 0.7 bar and essentially a full vacuum and shall be designed and constructed for vacuum filling in the field.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Each transformer oil tank shall be provided with an approved self-resetting pressure relief device for the release of any pressure that may be generated in the tank to save it from damage. It shall operate at a static pressure lower than the hydraulic test pressure and outlets shall be arranged to face away from the bushings. The device shall be provided with two sets of normally open signaling contacts. These contacts shall be used to operate alarms/trips.

The transformer shall be equipped with bushing type current transformers for the high voltage and neutral terminals. The transformer shall be protected by a water deluge system with all the accessories i.e., piping, deluge valve, sensors, nozzles etc.

The transformers shall be equipped with a motor-operated 17 position on-load tap changer (OLTC) on the HV side, with a regulating range of ± 8 x 1.25%. The OLTC shall be manually controlled by the operator, not having an automatic voltage regulator so that when interacting with the excitation voltage regulator they do not oscillate against each other.

3.4.5 Key Technical Parameters

3.4.5.1 Transformers

Nominal capacity per 3-phase unit	20/26 MVA
Rated Voltage	132 / 11 kV
Maximum System Voltage	145 kV
Rated Frequency	50 Hz
Vector Group	YNd11
Voltage Impedance	Ud ≥ 12%
Tap Changer	On-load
Voltage Regulation	± 8 × 1.25%
Cooling Type	ONAN / ONAF
Neutral Point Earthing Mode	Solid earthing
Rated short-time power frequency withstand voltage (HV)	275 kV
Rated lightning impulse withstand voltage (HV)	650 kV
Rated Short Circuit Level	50 kA
Rated short-time power frequency withstand voltage (LV)	28 kV
Rated lightning impulse withstand voltage (LV)	75 kV
Noise Level	< NEMA TR-1
Efficiency (minimum)	≥ 99 %
Temperature rise at 40°C ambient (Coil)	65 K
Temperature rise at 40°C ambient (Oil)	60 K
Insulating Liquid	Mineral oil, IEC 60296

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

3.4.5.2 H.V Surge Arresters

- Material type — Zinc Oxide
- MCOV (maximum continuous operating voltage) — not less than 145 kV
- Standard Nominal Discharge Current rating — 10 kA (IEC 60099)
- Insulation impulse withstand voltage — 650 kV
- Insulation wet power frequency Withstand voltage — 275 kV

3.4.6 Overload Requirements

The overload rating and operation shall be in accordance with IEC 60076-7. The overload capability of any ancillary equipment such as bushings, CTs, oil expansion tanks, leads etc. shall not be less than the transformer overloads rating. The transformers shall also be capable of withstanding momentarily, without injury, a voltage of 20% greater than the rated generator voltage, when the generator full load is rejected.

3.4.7 Short Circuit Capability

The transformer and its accessories shall be capable of withstanding mechanical and thermal stresses caused by short circuit fault currents without mechanical deformation or impairing electrical capabilities. The sudden pressure relay and other alarm initiating devices will not respond to the effect of the through fault short circuit currents.

3.4.8 SERGI Transformer Fire Protection System

Transformers shall be equipped with transformer explosion prevention system of SERGI type complete with sensors, control unit, and interfaces.

3.4.9 Tests

3.4.9.1 General

Each transformer shall be subjected to the routine shop and quality control tests and all applicable tests required by IEEE C57.12.90, in addition to any special test required in accordance with this Specification. Test procedures shall be submitted to the Employer prior to any tests being performed. The Contractor shall submit test procedures and notify the Employer sufficiently in advance of tests, giving the date and place where such tests shall be made. The Contractor shall furnish to the Employer certified copies of all test results in electronic PDF format. The results of each test shall be recorded in the form of test certificates or reports as specified.

3.4.9.2 Type Tests

Type tests shall be made on one unit of each type of different equipment at the Contractor's expense in presence of the Employer and the Employer and the actual type test report shall be submitted to the Employer for approval. Instead of carrying out the type tests, the Contractor may submit duly certified and complete type test reports for tests carried out by an independent, accredited authority on similar equipment of the same type. However, the Employer reserves the right of accepting these certificates or to reject them partially or totally.

The generator step-up transformers shall be subject to the following type tests:

- Noise level test in accordance with IEC 60076-10,
- Zero phase sequence impedance measurement in accordance with IEC 60076-1
- Short-circuit test in accordance with IEC 60076-5.
- A temperature rise test, in accordance with IEC 60076-2. The test shall be conducted

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

on the tapping corresponding to the maximum losses.

- Dielectric Type Tests in accordance with IEC 60076-3.
- Type tests shall be carried out on bushings in accordance with IEC 60137.
- Type test shall be carried out on one tap changer of each type in accordance with IEC 60214.

3.4.9.3 Transformer Routine Tests

Usual non-destructive tests shall be performed on the tank welds. The tank welds shall be given a pressure test by filling the tank with dry nitrogen, dry carbon dioxide, or dry air to the highest pressure for which the tank is designed and exploring all welded seams with a suitable leak detector. There shall be no perceptible leaks and the transformer shall hold the test pressure for four hours without leakage. Any alternative pressure test shall be submitted to the Employer for approval.

The transformer tank shall be vacuum tested to a negative pressure of 25 mm Hg absolute or less prior to filling the tank with oil. The pressure rise shall not exceed 25 mm Hg in 30 minutes while the vacuum pump is not operating. This test may be performed as part of the filling procedure.

All test equipment shall be supplied for the specified shop tests in accordance with the latest issue of the applicable international standards. Calibration of all test equipment shall be traceable to the National Institute of Standards and Technology (NIST), and calibration certificates shall be submitted for approval. Certificates shall be renewed in accordance with the Quality Control Plan. For the loss tests, the instrumentation shall be calibrated for power factor.

Insulation resistance shall be measured at 1000 V and shall indicate a minimum resistance of 50 MΩ to ground.

The following tests shall be made at the completion of winding, at the conclusion of all other tests, and prior to shipment.

- Resistance of high voltage and low voltage windings, including all taps.
- Applied and induced voltage tests.
- Exciting current and no-load loss curves on rated voltage connections at 90%, 100% and 110% of rated voltage.
- Impedance and load loss test at rated current on the rated voltage connection and on the tap extremes of the transformer.
- Heat run on the transformer at lowest and highest MVA ratings.

Pressure tests at 25% above maximum nameplate rating shall be performed for the duration of 6 hours and shall be made immediately following the temperature rise test while the oil is hot.

On completion of all other tests and prior to shipment, the transformer shall be subjected to a one hour excitation loss run at 110% voltage. The current and power recorded at the conclusion of this test shall compare favorably with previous test results.

The following tests, described in cited sections of IEEE C57.12.90, unless otherwise indicated, shall be included:

- Resistance Measurement, Section 5.
- Polarity and Phase Relation, Section 6.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- Ratio, Section 7.
- No-Load Losses and Excitation Current, Section 8.
- Impedance Voltage and Load Losses, Section 9.
- Dielectric Tests, Section 10.
- Temperature Rise, Section 11.
- Audible Sound Emission, Section 13.
- Measurement of zero-sequence impedance.
- 1 minute power frequency separate source AC withstand voltage test on auxiliary wiring and function tests on auxiliary equipment/devices. The functional tests of all auxiliaries including tap changer shall be performed.

3.4.9.4 Additional Transformer Tests per IEEE C57.12.90

The following additional transformer tests shall be performed per IEEE C57.12.90:

- Insulation Power Factor, IEEE C57.12.90, Section 10.
- Bushing Power Factor, IEEE C57.19.00.
- Impulse Tests, IEEE C57.12.90, Section 10.3 (Full and Chopped Wave Test).
- Switching Impulse Voltage Tests, IEEE C57.12.90, Section 10.6.
- Bushing Capacitance, IEEE C57.19.00.
- Short-Circuit Tests

3.4.9.5 Site Tests

Following tests shall be performed on generator step-up transformers at site:

- Visual inspection,
- Insulation resistance,
- Winding resistance and continuity on all taps,
- Polarity,
- Dielectric test of oil, and
- Functional test of all control and protection apparatus.
- Transformer turn ratio test.
- Load tests.
- Sweep Frequency Response Analysis (SFRA) Test

3.4.10 Spare Parts, Maintenance Equipment and Tools

Spare Parts and Tools mentioned herein are the minimum required. Any other necessary spare parts and tools required for maintenance of the equipment shall be provided by the Contractor at no extra cost.

Table 3-8: Spare Parts and Tools

Sr. No.	Description	Unit	Qty.
	Mandatory Spare Parts		
1	132 kV bushings, complete with gasket, terminal connector and oil.	Set	3
2	11 kV bushings, complete with gaskets and terminal connectors.	Set	3

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Sr. No.	Description	Unit	Qty.
3	Neutral bushings, complete with gaskets and terminal connectors.	Set	3
4	Complete set of gaskets for 132 kV GSU transformers. Each set to consist of one of each size and type of gaskets furnished and one liter can of lubricating grease.	Set	3
5	Contacts and coils for each type and size of relay and contactor.	Set	2
6	Replacement parts for pressure relief devices.	Set	2
7	Pressure gauge of each type and size for the heat exchanger.	Set	2
8	Gas and oil actuated relay of each type, complete.	Set	2
9	Oil thermometer of each type, complete.	Set	2
10	Oil gauge of each type, complete.	Set	2
11	Air breather for conservator tank, complete.	Set	2
12	Thermal relay of each type, complete.	Set	3
13	Tapping switch assembly for 132 kV transformer.	Lot	2
14	Complete spares for oil preservation system for 132/11 kV GSU transformers.	Set	1
15	Winding temperature indicating device, each type.	Set	2
16	Current transformer, associated with temperature indicating device, each type.	Set	2
	Maintenance Equipment		
1	10% transformer oil in addition to net quantity required for filling the transformer.	Set	1
2	Consumable items such as filters, oils, etc. for 3-years of operation	Set	1
3	Dissipation test (Tan Delta) set to cover the range of equipment	Set	1
4	Insulation test set	Set	1
5	Winding resistance measurement test set	Set	1
6	AVR test set	Set	1
7	Special tools for dismantling and maintenance	Set	1
8	Hydraulic Jacks	Nos	4
9	Lifting apparatus	Set	1

3.5 MEDIUM VOLTAGE SWITCHGEAR

3.5.1 Scope

This section describes the technical requirements for the design, manufacture, factory testing,

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

delivery, erection, testing and commissioning of the three (03) medium voltage switchgears complete in all respects and all ancillary equipment for successful safe, reliable and continuous operation. Three (03) GCBs shall be part of medium voltage switchgear along with compartments provided for connection with segregated phase bus (SPB).

The Generator Circuit Breakers will be of vacuum type as insulating and interrupting medium and complying with IEC 62271-100 and IEC 62271-200. The Generator Circuit Breakers will be suitable for synchronizing duties and provided with interlocks to avoid incorrect operation of the disconnector or the earth switches.

The equipment offered shall be of high quality, sturdy, robust and of good design and workmanship complete in all respects and capable of performing continuous and satisfactory operations in the actual service conditions at site and shall have sufficiently long life in service as per statutory requirements.

The equipment offered shall be complete with all parts necessary for their effective and trouble-free operation. Such parts shall be deemed to be within the scope of the supply irrespective of whether they are specifically indicated or not.

3.5.2 System Conditions

The switchgear shall be metal enclosed, floor mounting, single front self-supporting cubical type suitable for indoor. The switchgear shall be easily extendable in future.

The switchgear assembly shall be designed for the power system having the following parameters.

a)	Nominal system voltage:	11KV
b)	Highest system voltage:	12KV
c)	Number of phases:	3
d)	Frequency:	50 Hz
e)	System earthing:	Solidly earthed neutral
f)	Short Current Rating:	40kA
g)	Continuous current rating:	1600A

3.5.3 Standards

The circuit Breaker shall confirm to the latest revision with amendment available of relevant standards, rules, and code. Some of which are listed herein for ready reference.

- IEC 62271-100 “Common specifications for high voltage switchgear, high voltage alternating current circuit breaker”
- IEC 62271-200 “AC metal enclosed switchgear and control gear for rated voltages above 1 kV and up to including 52 kV”
- IEC 62271-102 “Common specifications for high voltage switchgear, alternating current disconnector and earthing switches”
- IEC 61869-1 “Instrument transformers, part 1 general requirements”
- IEC 61869-2 “Instrument transformers, part 2 additional requirements for current transformers”
- IEC 61869-3 Instrument transformers, part 2 additional requirements for inductive voltage transformers”

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- IEC 60099 “Surge Arrestors”

3.5.4 Service Conditions

See Section “General Electrical Requirements”.

3.5.5 General Technical Requirement

a) The switchgear shall be of CRCA steel / corrosion proof aluminum-zinc construction with sheet not less than 3 mm thickness for load bearing section and not less than 2mm thickness for non-load bearing and shall totally dust and vermin proof. However, if vendor has standardized the thickness of enclosure other than above mentioned and it meets the performance requirements and the design has been established through type test, the same shall be accepted. The panels shall be rigid without using any external bracings. The switchboard panels should comply with relevant IEC and revision thereof and shall be designed for easy operation maintenance and further extension. Each circuit shall have a separate vertical panel with distinct compartments. Bus bar, metering, circuit breaker chamber, cables and cable box chamber should have proper access for maintenance and proper interlocks should be provided. All instruments (Except the Relays) shall be non-draw out type and safe guard in every respect from damages and provided with mechanical indicator of connection and disconnection position. The switchgear shall be completed with all necessary wiring, fuses, auxiliary contacts, terminal boards etc.

b) The switchgear boards shall have a single front, single tier, fully compartmentalized, metal enclosed construction, comprising of row of freestanding floor mounted panels. The adjacent panels shall be completely separated by steel sheets except in busbar compartments where insulated barriers shall be provided to segregate adjacent panels. The switchgear assembly shall be dust, moisture, rodent and vermin proof, with the truck in any position SERVICE, ISOLATED, TEST or removed, and all doors and covers closed. All doors, removable covers and glass windows shall be gasketed all round with synthetic rubber or neoprene gaskets.

c) The arcing contacts and bus bar should be rated for 40 KA faults for 3 seconds for 11kV system. Bus bars shall be capable of connecting one switchgear panel to other through proper insulated arrangement. The panels shall be modular in design.

d) The switchgear will be installed in a separate switchgear room, but the controls under normal conditions will be from the 11 kV remote supervisory control desk installed in the main control room.

e) The breakers should be able to be drawn out in horizontal position at ground level [with vertical/horizontal isolation]. When breaker is drawn out in horizontal position none of the live components inside the 11KV switchgear panel should be accessible. The safety shutters shall be robust and shall automatically cover the live components when the breaker is drawn out. The switchgear shall have complete interlocking arrangements at the fully inserted and fully drawn out and test positions. Withdrawal of the breaker should not be possible in ON position, it should not be possible to close the circuit breaker in service unless the entire auxiliary and control circuit are connected.

f) Circuit breaker shall be vacuum; draw out type housed in a separate cubicle of the switchboard and shall be enclosed from all sides. A sheet steel hinged lockable door shall be at the front. It shall be possible to withdraw the circuit breaker to ‘Test’ and “Isolated’ position with the door closed. Door interlock shall be provided such that the

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

door can only be opened after withdrawing the breaker to 'Isolated' position and the breaker cannot be racked into the 'Service' position unless the door is closed. A visual indication as to show when the breaker is in 'Service', 'Test' or 'Isolated' position shall be provided in front of the door.

g) Switchgear construction shall have a bushing or other sealing arrangement between the circuit breaker compartment and the busbar / cable compartments, so that there is no air communication around the isolating contacts in the shutter area with the truck in service position.

h) The breaker and the auxiliary compartments provided on the front side shall have strong hinged doors, busbar and cabling compartments provided on the rear side have bolted compartment covers with self-retaining bolts. Breaker compartment doors shall have locked facility.

i) Built-in / separate trolley mounted earth switches for incomer (busbar earth) and outgoing (feeder cable earth) shall be provided.

j) Two separate earthing terminals shall be provided in each panel and shall be connected to the earth bus within the panel. The earth bus shall be of copper and shall have adequate cross-sectional area.

k) Total height of the switchgear panels shall not exceed 2600 mm. The height of switches, pushbuttons and other hand-operated devices shall not exceed 1800 mm and shall not be less than 700mm.

l) Suitable base frames made out of steel channels shall be supplied along with necessary anchor bolts and other hardware, for mounting of the switchgear panels. These shall be dispatched in advance so that they may be installed and levelled when the flooring is being done, welding of base frame to the insert plates shall be as per approved installation drawings.

3.5.6 Busbar and Connections

a) Bus bars and all other electrical connection between various components shall be made of electrolytic copper of rectangular / tubular cross sections, as per the type tested and ratified design. The bus bars section should have ample capacity to carry the rated current of minimum 1600 Amps in panel current rating at an ambient temperature of 40 deg C, continuously without excessive heating and for adequately meeting the thermal and dynamic stresses in the case of short circuit in the system up to full STC rating of 40kA for 3 sec.

b) All bus bars connections shall be firmly and rigidly mounted on suitable insulators to withstand short circuit stresses and vibrations. 'Self-supported busbar' design will be acceptable if the same is ratified by type tests for the specified rating and busbar support drawings approved during type tests shall be furnished with the offer.

c) All fasteners (Nuts Bolts) used for bus bar connections shall be of non-magnetic stainless steel. Only Belleville type washers shall be provided for each nut bolt. If the fasteners used are not of stainless steel the Proposer shall state in their offer the material used and confirm that the same is non-magnetic and is superior to stainless steel.

d) Adequate clearance between 11 kV point and earth and between phase shall be provided to ensure safety in accordance with the relevant IEC standard specification and the same shall be capable of withstanding the specified high voltage tests as per IEC 62271-200 and amendment thereof.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

e) Sharp edges and bends either in the bus bars or bus bar connections shall be avoided as far as possible. Wherever such bends or edges are un-avoidable, suitable compound or any other insulation shall be supplied to prevent local ionization and consequent flashover.

f) The bus bars along with their supporting insulators etc. shall have a short time current rating of 40 kA for 3 sec. Test certificate of bus bar for rated STC rating shall be submitted, along with the Proposal. This shall be confirmed by the tenderers in their technical offer. These insulators shall be of solid core porcelain or epoxy resin cast, with suitable petticoat design. Insulators shall have a cantilever strength of not less than 1200 kgf.

g) The Bus Bar should be color coded.

3.5.7 Circuit Breaker

a) The vacuum circuit breaker shall be draw out type suitable for installation in the switchgear cubicles (indoor). The breaker shall comply with IEC 62271-100 for circuit breaker and IEC 62271-200 for the switch gear and latest amendment thereof. Construction of breaker shall be such that the points, which require frequent maintenance, shall be easily accessible.

b) The circuit breakers shall be spring operated, motor/manually charging of the spring feature, manually released. VCB shall have spring closing mechanism for 3 pole simultaneous operation. The speed of closing operation shall be independent of the speed of hand operating level. The indication device shall show the OPEN and CLOSE position of breaker visible from the front of cubical.

c) The circuit breakers shall be type tested as per IEC 62271 for compliance with the following requirements:

d) E2 class: The circuit breakers shall not require maintenance of the interrupting part of the main circuit during its expected operating life;

e) C2 class: The circuit breakers shall have very low probability of restrike during capacitive current breaking.

f) M2 class: The circuit breaker should require very limited maintenance and should be tested for endurance for 10,000 close – open operations.

g) The breakers shall be capable of making and breaking the short time current in accordance with the requirement of IEC 62271-100 and latest amendment thereof and shall have three phase rupturing capacity of 40KA for 3 second at 11 KV. The continuous current rating of all current carrying parts of breaker shall be 1600 Amps for all items. The total break / make time shall be not more than 4 cycles for break and 6 cycles for make time for all breakers.

h) Circuit breaker shall be suitable for reclosing cycle i.e., O-0.3 sec.-CO-30 sec.- CO.

i) The spring release coil for VCB close and VCB trip coil shall both be rated for continuous energization at the rated close / trip voltage. Trip and close coil shall be suitable for 220 V DC.

j) The vacuum circuit breakers shall ensure high speed extinction and adequate control of pressure during breaking of current and also designed to limit excessive over voltages.

k) Comprehensive interlocking system to prevent any dangerous or inadvertent operation

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

shall be provided. Isolation of circuit breaker from bus bar or insertion into bus bar shall only be possible when the breaker is in the open position.

l) Vacuum Circuit Breaker shall have completely sealed interrupting units for interruption of arc inside the vacuum. The vacuum interrupter sealed for life.

m) Vacuum interrupter should have an expected life of 30000 operations at rated current and should be capable of operating at least 100 times at rated short circuit current.

n) Vacuum interrupter technical data sheets & outline drawing particularly provided by the manufacturer should also be provided with Proposal.

o) The circuit breaker shall be provided with motor for spring charging operation. Spring charging motor shall be suitable for 240V, 50 Hz, single phase AC and 220 V DC Supply. Suitable rating starter/fuse shall be provided for Motor protection. Provision shall be available for charging the springs manually as well, and to close CB mechanically.

p) All circuit breakers should have mechanical ON/OFF indicator and spring charge indicator. These shall be visible from the front without opening the panel door. Also, there shall be provision for mechanical (manual) tripping and also for manual charging of the springs.

3.5.8 Current Transformers

a) The requirement of ratio, VA capacity, class or accuracy, limit factor etc. for resin cast CTs installed in different types of units are as specified in other section of Specifications.

b) Primaries shall be wound or bar or window type, rigid, high conductivity grade copper conductor. Unavoidable joints on the primary conductor shall be welded type, preferably lap type. The current density at any point shall not exceed 1.6 A/sq. mm.

c) The Insulation level of all the CTs shall be as per IEC requirement for 11 kV primary voltage.

d) Short time current rating of CTs shall correspond to 40KA faults for 3 seconds of 11kV system. CTs shall be triple / double core and dual ratio. Instrument safety factor for metering core shall not exceed 2.5.

e) The designed accuracy should be available even at the lowest ratios.

f) The secondary terminal of the current transformers shall be such that effective and firm wire terminations are possible. Shorting links of adequate capacity shall be provided at the terminal blocks for sorting of the leads from secondary terminals of current transformers. The secondary terminal of the CTs shall be earthed at one point.

g) The CTs shall be resin/epoxy cast. Contact tips on primary terminals shall be silver plated. Correct polarity shall be invariably marked on each primary and secondary terminal.

h) Secondary terminal studs shall be provided with at least three nuts, two plain and two spring washers for fixing leads. The stud, nut and washer shall be of brass, duly nickel plated. The minimum outside diameter of the studs shall be 6 mm. The length of at least 15 mm shall be available on the studs for inserting the leads. The space clearance between nuts on adjacent studs when fitted shall be at least 10 mm.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

3.5.9 Potential Transformers

a) Potential transformer, ratio, accuracy class, as specified in other sections of Specifications shall be provided. Potential transformers shall be provided along with HT HRC fuse and Triple Pole & Neutral MCB, rated 1 Amp, with monitoring contacts on PT LV circuit. Primary and secondary neutrals of the PT shall be brought out and earthed. If required, the busbar connected P.T. may be housed in a separate cubicle. PT mounted on top of the panel shall not be acceptable.

b) PT may be provided in a separate compartment. The primary and secondary contacts (moving & fixed type) shall have firm grip while in service. Service position locking mechanism shall be provided and indicated by Proposer in relevant drawing. Rigidity of primary stud point with earth bus in service position shall be confirmed.

c) Contact tips of primary/secondary contacts shall be silver plated. Correct polarity shall be distinctly marked on primary and secondary terminal.

d) Secondary terminal studs shall be provided with at least three nuts, two plain and two spring washers for fixing leads. The stud, nut and washer shall be of brass, duly nickel plated. The minimum outside diameter of the studs shall be 6 mm. The length of at least 15 mm shall be available on the studs for inserting the leads. The space clearance between nuts on adjacent studs when fitted shall be at least 10 mm.

3.5.10 Protection Relays

All relays shall conform to the requirements of IEC-60255/ IEC 61850. Relays shall be suitable for flush or semi-flush mounting on the front with connections from the rear. The relay for entire Project shall be of same type. The relays shall be numerical protective & communicable type. Composite relay unit having O/C, E/F & directional element etc. shall be preferred. Relays should have USB / ethernet communication port and RS485 / RS232 serial communication port for communication through IEC 61850 Ed II (with high-speed GOOSE communication and certified by KEMA/CPRI certificate level A for IEC 61850 compliance). Licensed version of the relay software should be provided as per user's requirement.

3.5.11 Measuring Instruments

a) All instruments shall be switchboard type, back connected, suitable for flush mounting and shall comply with the requirements of latent issues of relevant Indian Standards. The instrument cases shall be dust proof, water tight, vermin proof and specially constructed to adequately protect the instruments against damage or deterioration due to high ambient temperature and humidity.

b) All instruments shall be access adjustable and calibrated before dispatch and shall have means for calibration check and adjustment at site.

c) All ammeters shall be digital type with direct reading scales. The scale value of ammeters shall be as per the primary current ratings of the associated current transformers.

d) All voltmeters shall be of digital type with direct reading scales. The maximum scale value of voltmeters shall be 50% in excess of the primary voltage of associated PT.

e) Indicating Wattmeters shall be of digital type of accuracy class 1.

3.5.12 Circuit Breaker Control Switch

a) Circuit Breakers Control Switches should have finger touch proof terminals. For the convenience of maintenance, screw driver guide should be from top/bottom of the

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

switch and not from the side. Terminal wire should be inserted from the side of the switch terminal.

b) Terminal screws shall be captive to avoid misplace during maintenance.

c) Switch shall be with 48 mm x 48 mm escutcheon plate marked with Trip & Close.

d) Circuit Breakers control switch shall be non- discrepancy type.

e) Trip-neutral-close, with pistol grip handle shall be pushed in to spring return to either trip or close position from Neutral position for safety and not just turn to trip.

f) One contact to close in each position of Trip and Close. Contact not required in Neutral position.

3.5.13 Cubicle

a) The switchgear cubicle (panel) shall be free standing floor mounting indoor type. There shall be sufficient reinforcement to have level surfaces resistance to vibration and rigidity during transportation & installation.

b) Design & construction of the switchgear panel shall be of the highest order. All sheet steel work shall be treated as per the seven tank process before applying primary coating. The panels after final painting shall present an aesthetically pleasing appearance, free of any dent or uneven surface.

c) Power compartments shall be provided at the top of the switchgear panels and shall be suitable for segregated phase bus entry from the top. After connection with SPB the compartment shall be properly sealed.

d) Power compartments shall be suitable for connection with segregated phase bus. Power compartments shall be robust enough & self-supporting.

3.5.14 Testing and Commissioning GCB

The equipment offered should have been successfully type tested in line with the relevant standard and technical specification. The design of circuit breaker shall be proven through all the routine and in accordance with IEC 62271-100 / 200 and any amendment thereof. Photocopy of all the test reports shall be enclosed with the tender. The Proposer shall be required to submit complete set of the following type test reports along with the offer.

3.5.14.1 Type Tests

a) Lightning Impulse Voltage withstand Test.

b) H.V. dry 1 min power frequency withstand test.

c) Short time and peak withstand current test.

d) Short circuit test with basic duties.

e) Single phase breaking capacity test.

f) Temperature Rise test.

g) Seismic Level Test

Circuit Breaker

Each circuit breaker shall be fully type tested as per IEC 62271 - 100/200, including the following tests:

a) short time and peak withstand current test.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

b) short circuit breaking capacity and making capacity.

c) Capacitive current switching test: Cable charging current breaking test (Ur less than or equal to 52 kV).

d) Dielectric test i.e., power frequency withstand and impulse withstand test.

e) Temperature rise test.

f) Mechanical Endurance Test at ambient temperature.

g) Measurement of resistance of the main circuit.

h) Internal arc test (IAC AFLR).

Current Transformer

a) Short Time Current Test.
b) Impulse Voltage Withstand Test.
c) Temperature Rise Test

Potential Transformer

a) Impulse Voltage Withstand Test
b) Temperature Rise Test

Switchgear Panel

a) IP 4X Test

3.5.14.2 Routine Tests

Each Switchgear shall be completely assembled in manufacturer's workshop and following routine tests but are not limited to shall be conducted in accordance with IEC 62271-100/ 200/ 102. The Employer shall witness all tests.

- Visual inspection
- Operation test of the switching devices
- 1 minute power frequency withstands voltage test
- Measurement of the resistance of main circuit
- Insulation and functional test on auxiliary and control circuits
- All Tests on generator circuit breakers in accordance with IEC

3.5.14.3 Commissioning Tests

After installation of panels, power and Control wiring and connect Contractor shall perform commissioning checks. As listed below to proper operation of switchgear/panels and correctness of all respects.

In addition, the Contractor shall carry out all other checks and tests recommended by the manufacturers.

3.5.14.4 General

I. Check name plate details according to specification.

II. Check for physical damage.

III. Check tightness of all bolts, clamps and connecting terminal.

IV. Check earth connections.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

V. Check cleanliness of insulators and bushings.

VI. Check heaters are provided.

VII. H.V. test on complete switchboard with CT & breaker/ contractor lubricated in position.

VIII. Check all moving Parts are properly lubricated.

IX. Check for alignment of busbars with the insulators to ensure alignment and fitness of insulators.

X. Check for inter changeability of breakers.

XI. Check continuity and IR value of space heater.

XII. Check earth continuity of the complete switchgear board.

3.5.14.5 Circuit Breaker

I. Check alignment of trucks for free movement.

II. Check correct operation of shutters.

III. Check slow closing operation (if provided).

IV. Check control wiring for correctness of connections, continuity and IR values.

V. Manual operation of breakers completely assembled.

VI. Power closing/opening operation, manually and electrically at extreme condition of control supply voltage.

VII. Closing and tripping time.

VIII. Trip free and anti-pumping operation.

IX. IR values, resistance and minimum pick up voltage of coils.

X. Simultaneous closing of all the three phases.

XI. Check electrical and mechanical inter locks provided.

XII. Checks on spring charging motor, correct operation of limit switches and time of charging.

XIII. Check vacuum (as applicable).

XIV. All functional checks.

3.5.14.6 Current Transformers

I. Megger between windings and winding terminals to body.

II. Polarity tests:

a. Ratio identification checking of all ratios on all cores by primary injection of current.

b. Magnetization characteristics & secondary winding resistance.

III. Spare CT cores, if any to be shorted and earthed.

3.5.14.7 Voltage transformers

I. Insulation resistance

II. Ratio test on all cores.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

III. Polarity test

IV. Line connections as per connection diagram.

3.5.14.8 Cubicle Wiring

I. Check all switch developments.

II. It should be ensured that the wiring is as per relevant drawings. All interconnections between panels shall similarly be checked.

III. All the wires shall be meagered to earth.

IV. Functional checking of all control circuit e.g., closing, tripping, interlock, supervision and alarm circuit including proper functioning of component/ equipment.

V. Check terminations and connections. To check wiring related to CT and PT circuits, carryout primary injection and then check for secondary value at relay and metering instrument terminals.

VI. Wire ducting.

VII. Gap sealing and cable bunching

3.5.14.9 Relays

I. Check internal wiring.

II. Megger all terminal body.

III. Megger AC to DC terminals

IV. Check operating characteristics by secondary injection.

V. Check minimum pick up voltage of DC coils.

VI. Check operation of electrical targets.

VII. Check CT connections with particular reference to their polarities for differential type relays.

VIII. Relay settings.

3.5.14.10 Meters

i. Megger all insulated portion.

Check CT & VT connections with particular reference to their polarities for power type meter.

3.5.14.11 Spare Parts and Tools

Spare Parts and Tools mentioned herein are the minimum required. Any other necessary spare parts and tools required for maintenance of the equipment shall be provided by the Contractor at no additional cost.

Table 3-9 Spare Parts and Tools

Description	Unit	QTY
Mandatory spare parts (for each type used)		
Main contacts for three poles complete with springs, bolts, nuts etc.	Sets	4
Closing and opening trip coils of each type used	Sets	4

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Description	Unit	QTY
Drive motor of each type used	Sets	4
Breaker ON/OFF control switches	Sets	4
Miniature circuit breakers (MCBs) used in control/interlock circuits of each type/rating	Sets	5
Single-phase current transformer of each type used	Sets	3
Single-phase voltage transformer of each type used	Sets	3
Single-phase lightning arrester of each type used	Sets	3
Trip units (LSIG) of each type used	Sets	5
Indicating and measuring instruments each type i.e., voltmeters, ammeters and indication lights etc.	Sets	2
Anti-condensation heaters of each type and rating.	Sets	1
Maintenance Equipment		
Intelligent Instrument Transformer check device	Sets	1
Testing equipment for circuit breakers characteristics	Sets	1
Ratio automatic measuring instrument	Sets	1
Phase shifter	Sets	1
Tools		
Circuit breaker handling truck/trolley of each type used	Sets	1
Feeder grounding trucks/trollies with VTs of each type used	Sets	2
Remote controlled racking assembly as per requirement cord and control station of each type used	Sets	1
Temporary earthing sticks with accessories of each type used	Sets	2

3.6 PROTECTION AND RELAY EQUIPMENT

3.6.1 Scope of Work

The scope of work covers the design, manufacture, factory testing, delivery, erection, installation, testing and commissioning of the protection systems, relays and the associated equipment for the Generators, Main Step-up Transformers and Auxiliary Transformers complete in all respects.

The scope of work shall comprise:

- Three (03) sets of complete Generator Protection System
- Three (03) sets of complete Main Step-Up Transformers Protection Systems
- Three (03) sets of complete protection systems for the Auxiliary Transformers

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- One (01) set of tools and appliances
- One (01) set of spare parts

All equipment, wiring, panels, software, licenses, interconnections, settings, testing, documentation and training necessary for safe, reliable and continuous operation shall be deemed included in the scope of supply, whether explicitly mentioned or not.

3.6.2 Service Conditions

See Section “General Electrical Requirements”.

3.6.3 Standards

All equipment under these Technical Specifications shall be manufactured and tested in accordance with the latest revision of the following international standards.

In case there is contradiction between the contents of relevant clauses of any two standards, Contractor will proceed with the most applicable one with prior approval of the Employer

Table 3-10 Standard and Codes

Subject	Standard
Measuring relays and protection equipment, multiple parts	IEC 60255
Measuring relays and protection equipment - Part 22-1: Electrical disturbance tests	IEC 60255-22.1
Measuring relays and protection equipment - Part 151: Functional requirements for over/under current protection	IEC 60255-151
Programmable controllers	IEC 61131
Degrees of protection provided by enclosures (IP Code)	IEC 60529
Electrical measuring transducers for converting A.C. electrical quantities to analogue or digital signals	IEC 60688
Electromagnetic compatibility (EMC) - Part 4	IEC 61000-4
Communication standard for electrical substation automation system	IEC 61850
Cyber security support	IEC 62351
Parallel redundancy protocol (PRP)	IEC 62439
IEEE guide for generator protection	C37.102

3.6.4 Protection Schemes

The general principle for the protection of Generators, Main Step-up Transformers and Auxiliary Transformers shall be that these are covered by two high speed protection schemes which shall be independent to avoid common-mode failures.

The protection equipment shall be complete with all relay panels, instruments, meters, interposing and auxiliary relays, control switches, interposing current and voltage transformers, transducers and all auxiliary equipment. The protection scheme shall be provided with Cyber security support for compliance to IEC 62351 with Centralized Account Management. Separate cores of current transformer (CT) and voltage transformer (VT) shall be used for each protection

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

and metering. Minimum of one (01) core shall be provided as spare for each CT and VT. Whereas, separate CTs and VTs shall be used for primary and backup protection.

Protection equipment shall be designed and supplied to provide maximum discrimination between faulty and healthy circuits. All equipment is to remain inoperative during transient phenomena which may arise during switching or other disturbances to the system.

Signals and data provided by the protection relays shall be monitored by the control system.

The Contractor shall prepare and submit Control, Indication, Alarm and Trip function logic tables, protection philosophy diagrams and interlocking logic for the approval of the Employer before proceeding with the preparation of schematic diagrams.

The Contractor shall be overall responsible for proper functioning of the protection schemes and submit complete relay setting calculations, coordination studies and fault level assumptions for the Employer review and approval.

Relay shall be in accordance with IEC 60255 and shall be suitable for use with 1 A secondary current transformer and 110/63.5 V secondary voltage transformers. Annunciator relays shall be provided for the indication of operational states, alarm and danger or ground fault situations.

All static/microprocessor-based relays shall satisfy the type test withstand requirements of IEC 60255-22-1/2/3 and 4, and IEC 61000-4-4 including:

All relay cubicles shall be of degree of minimum protection IP32 to IEC 60529.

Separate relay protection cubicles comprising modern electronic relays shall be installed. Relays for primary and backup protection shall be physically and electrically segregated. The relays shall preferably be of the same make (manufacture) to build a uniform modular system.

The functioning of the protection relays shall not depend on the control system. The relays for Generator, Main Step-up Transformers and Auxiliary Transformers will be organized in two groups so that one group provides back-up protection for the other group. Protection scheme shall be duplicate protection independent all from instruments up to protection devices.

Auxiliary power shall be taken from the 220 V D.C. system. Separate circuits shall serve the two groups of relays to obtain maximum reliability. The relays shall be capable of operation properly with voltage variations of -20% to +10%.

Generator Protection

The minimum generator protection shall consist of:

24G	Generator over flux protection
32	Generator reverse power protection
49S	Stator winding overload protection
50/27	Inadvertent energization
50BF/62	GCB failure protection
64R	Rotor earth-fault protection
64S	100 % Stator earth-fault protection
81G	Under/over-frequency
87G	Generator differential protection

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

87GT	Overall differential protection
27G	Under voltage protection for synchronous condenser mode
40G	Loss of excitation
46G	Neg phase sequence
49R	Field winding overload
50/51G	Symmetric overload stator protection
59	Generator overvoltage protection
59NS	95% stator earth-fault protection
60VT	Voltage balance relay, VT circuit failure monitoring
81	Under frequency protection for synchronous condenser mode
51GN	Shaft current protection

Generator Step-Up Transformer (GSU) Protection

The minimum protection includes:

24MT	Over flux protection
50/51MT	IDMT overcurrent
51MT-N	Neutral earth fault
87MT	Differential protection
87N-MT	Restricted earth-fault protection
95MT	Gas Relay
49T	Oil/Winding temperature
50BF	GSU breaker failure protection

Auxiliary transformers minimum protection includes:

- Overcurrent
- Thermal
- Earth fault

3.6.5 Testing and Commissioning

3.6.5.1 General

The Works tests and the Site tests given hereunder shall be carried out by the Contractor.

3.6.5.2 Test Equipment

The Contractor shall provide all test equipment and test sets required for carrying out the inspections and tests.

A training simulator based on software configuration to include all protection equipment installed on generator/turbine, transformers for ease of understanding will be handed over to Employer along with other latest digital equipment recommended by Supplier. Fault diagnostic features shall be incorporated to train maintenance and operation Employers to operate and maintain this system in most appropriate manner.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

3.6.5.3 Type Tests

Type tests shall be carried out on each item of the equipment to be supplied. However, duly certified and complete test reports for tests carried out by an independent, accredited authority on similar equipment may be acceptable in lieu of actual tests, subject to the satisfaction of the Employer.

All microprocessor-based relays shall satisfy the type test withstand requirements of IEC 60255, and IEC 60801 including:

- 5 kV peak 1.2/50 microsecond impulse test,
- Electrical disturbance test - 1 MHz bursts,
- Radiated electromagnetic field disturbance test level 3, 10 V/m field strength,
- Electrostatic discharge test class III, 8 kV,
- Electrical fast transient test, level 4, 4 kV.

3.6.5.4 Factory Tests

All relay and associated equipment shall be type and routine tested in accordance with IEC 60255 and the tests proposed by the Contractor and approved by the Employer using special test sets and/or built-in test facilities.

Equipment containing semi-conductors shall be subjected to high frequency disturbance and transient overvoltage tests.

Control panels shall be tested for correct operation by simulating the external connections and equipment.

All cubicle wiring shall be flash tested.

3.6.5.5 Site Tests

The following tests shall be carried out:

- Current transformer magnetisation curves and polarity,
- Secondary injection tests on relays,
- Primary injection tests on relays and protection schemes,
- Wiring checks, insulation resistance at 1000 V ac,
- Loop resistance of current transformer circuits,
- Special tests on busbar protection and breaker failure protection schemes,
- Operational and alarm system checks, and
- On-load tests with simulated in and out of zone faults.

3.6.5.6 Spare Parts, Maintenance Equipment and Tools

Spare Parts, Maintenance Equipment and Tools mentioned herein are the minimum required. Any other necessary spare parts, maintenance equipment and tools required for maintenance of the equipment shall be provided by the Contractor.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Table 3-11 Spare Parts and Tools

Sr. No.	Description	Unit	Qty
Mandatory Spare Parts			
1	Primary Protection Relay (each type)	Sets	1
2	Backup Protection Relay (each type)	Sets	1
3	Breaker failure protection relay	Nos.	1
4	Differential protection relay	Nos.	1
5	Auxiliary relay (each type)	Sets	4
6	MCBs of each type	Sets	2
7	Electronic cards related to the measuring, processing and trip circuits of protection devices, comprising one (1) piece of each type	Lot	1
8	Electronic cards, trip relays, and other circuit components other than for protection devices, comprising one (1) piece of each type	Lot	1
9	DC/DC converters, power supply filters and other power supply units, comprising one (1) piece of each type	Lot	1
10	One lot of all switches, panel lamps, plugs and other accessories subject to wear and tear during five years of operation	Lot	1
Maintenance Equipment			
1	Relay Test Set OMICRON Model CMC356 (complete with all connection cables, registered software, modules etc.)	Sets	1
2	Current Transformer Test Set Megger Model 1605 (complete with all connection cables, registered software, modules etc.)	Sets	1
3	Secondary Injection test set to cover the range of equipment	Sets	1
4	Plugs for Relay testing complete with connection cable to the test unit.	Set	1
5	Primary Injection Test Set Megger Model ODEN AT/2X (complete with all connection cables, registered software, modules etc.)	Sets	1
Tools			
1	Any tools, plugs or devices needed for occasional blocking of relay functions during commissioning or special operation conditions.	Set	1
2	Parameter cables (each type)	Sets	4
3	Application software (licensed) each for Main and backup protection relay	Sets	1
4	laptop with serial interface, suitable for engineering and maintenance work with all components of the protection systems	Sets	1

3.7 DC AND UPS SYSTEM

3.7.1 Scope of Work

The scope of work covers the technical requirements for the design, manufacture, supply, erection, testing and commissioning of complete, fully functional 220 V DC and UPS System

for Powerhouse and Intake separately.

- One (01) set of 220 V DC and UPS system for powerhouse
- One (01) set of 220 V DC and UPS system for Intake

All equipment, accessories, interconnections, cabling, software, licenses, testing, documentation and training necessary for safe and reliable operation shall be deemed included in the scope of supply, whether explicitly mentioned or not.

3.7.2 Service Conditions

See Section “General Electrical Requirements”.

3.7.3 Standards and Codes

All equipment under these Technical Specifications shall be manufactured and tested in accordance with the latest revision of the following international standards.

In case there is contradiction between the contents of relevant clauses of any two standards, Contractor will proceed with the most applicable one with prior approval of the Employer.

Table 3-12 Standard and Codes

Subject	Standard
International electrotechnical vocabulary. Chapter 486: Secondary cells and batteries.	IEC 60050
Semiconductor converters - General requirements and line commutated converters (Parts 1 to 6)	IEC 60146
Low-voltage fuses	IEC 60269
Nickel-cadmium batteries. Technical specification	BS EN 2570
Secondary cells and batteries containing alkaline or other non-acid electrolytes – Vented nickel-cadmium prismatic rechargeable single cells	IEC 60623
Low-voltage switchgear and control gear - Part 2: Circuit-breakers	IEC 60947
Electromagnetic compatibility (EMC) - Part 4, consisting of 4 Parts	IEC 61000-4
Low-voltage power supply devices, dc output - Performance characteristics	IEC 61204
IEEE Recommended Practice for Surge Voltages in Low-Voltage AC Power Circuits	IEEE C62.41

3.7.4 Mode of Operation

The 220 V DC System for the Powerhouse and Intake separately comprises on each, 220VDC distribution boards, two (2) set of batteries and two (02) battery chargers. Battery shall be fed from battery charger (rectifier) at a time. Each battery charger will be supplied from 400V bus of powerhouse.

In normal operation, the chargers shall operate in parallel and each charger shall be able to float charge its own battery as well as supply the total load.

In the event of a mains failure, both batteries shall be able, when fully charged, to supply the total load, for not less than the specified standby time whilst maintaining the output voltage

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

within permissible limits.

The 230 V AC UPS system for the Powerhouse and Intake separately comprises on inverter subsystem with static and manual bypass switch and one (1) 230 V AC distribution board. Normally UPS will take power from 400 V bus. In case of power supply failure from 400 V bus, the supply will be from 220 V DC distribution board without any interruption to the load.

3.7.5 Functional Specifications

Lead acid batteries shall be provided sized for 10-hour discharge rate. The end cell voltage shall be 1.80V. The end of service life shall be the time when the battery no longer delivers 80% of its rated capacity. The batteries shall be installed on racks that all the cells are available for inspection, test and maintenance purposes and shall be braced to stop movement under seismic shocks.

The battery chargers shall be of the thyristor controlled, automatic, constant voltage type with current-limiting facilities, employing dry type, full wave, silicon-controlled rectifiers and plug-in modules, permanently connected across 220V batteries. The inverter shall be of the pulse width modulation (PWM) type, providing a single-phase output.

DC switchboard shall be of type metal enclosed; dead front assemblies of fused disconnect switches / circuit breakers and control devices. DC Switchboards shall be assembled from steel sections and fabricated and bolted sheet units, of modular design. The distribution board associated with each 220 V power supply system shall be adequately sized and identified with 30% spare ways for future expansion. At least one of the spare ways shall be equal to the largest installed size. The distribution board shall be supplied with double pole miniature or molded case circuit-breakers to IEC 60947-2 with thermally operated overload trips and instantaneous magnetic trips for short circuit protection for each incoming and outgoing circuit. All MCBs shall be provided with auxiliary contacts which shall raise both local and remote alarms (via the PCS), for loss of supplies.

Over / under voltage protection of DC distribution board and earth fault protection of each outgoing DC feeder shall be provided.

220VDC supplies shall be arranged for DC motors, control equipment, relay protections, alarms and annunciation circuits. 230 VAC UPS supplies will be arranged as required for such control equipment that cannot operate on DC supply and for powerhouse and Intake emergency lighting system.

The Control Room equipment to be fed by the UPS system will include all computers and related equipment, telecommunication equipment, and service systems. Sufficient emergency power will be provided for startup of the standby generator and for operation of any essential controls. Alarm and Annunciation System will remain operational always. UPS shall be dimensioned for the full load with a spare capacity of at least 20%.

The design and selection of equipment and components shall be based on achieving a minimum lifetime of 20 years, when operating under the specified service and ambient conditions. Suitable de-rating of power components shall be applied where necessary.

Electronic cards shall be suitably protected for the specified environment and shall be additionally protected against dust ingress. The immunity and emission to EMC shall be in accordance to IEC standard 61000-4.

The performance of the UPS unit shall not be affected, or in any way degraded, using portable radio transmitters/receivers operating in the frequency range 27-170 MHz, at 460 MHz and at

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

800 MHz when the severity of the electromagnetic radiation environment corresponds to Class 2, in accordance with IEC 61000-4-3.

3.7.6 Batteries

The batteries shall be of VRLA lead acid type in accordance with the latest applicable standard of IEC. Batteries shall have design life of 20 years at 25°C ambient temperature and shall be protected from damage due to thermal run-away occurred during abusive charging. Batteries shall have guaranteed operation for 10 years under rated operating conditions.

Table 3-13 Battery Technical Parameters

Item	Unit	Power House	Intake
Station Batteries	Set	**Two (2)**	**Two (2)**
Nominal Battery Voltage (Bank)	V	220	220
Number of cells		110	110
Type of cell		Lead Acid	Lead Acid
Nominal voltage (per cell)	V	2.0	2.0
Float voltage (per cell)	V	-	-
Boost Voltage (per cell)	V	2.24-2.28	2.24-2.28
End voltage used for capacity calculation (per cell)	V	1.80	1.80
Capacity of each battery	Ah	500	300

The number of cells and type of battery shall be selected so that the voltage of the battery does not exceed 110% of the rated voltage during float charging.

Miniature Circuit Breakers (MCBs) or bolted cartridge fuses shall be provided in both positive and negative leads and positioned as close to the battery as possible and shall be rated at five times the charger float output rated current. These MCBs or fuses shall be mounted preferably on the end of the battery panel. The fuse links shall comply IEC 60269 or some equivalent standards and shall be mounted in fuse carriers with an insulated barrier between the poles. The MCBs shall be in accordance with appropriate standard. A fuse blown or MCB tripped alarm shall be provided to the plant alarm system.

3.7.7 Battery Chargers

Battery chargers of thyristor controlled, automatic, constant voltage type with current-limiting facilities, employing dry type, full wave, silicon-controlled rectifiers and plug-in modules shall be provided. Chargers shall be fully automatic, constant voltage thyristor-based systems, designed for high efficiency conversion of incoming commercial AC to DC power for charging batteries, while supplying power to continuous DC loads.

The chargers shall be completely equipped for a fully automatically controlled charging including both float and equalizing charging of the batteries. Chargers shall be of a constant voltage type with current limiting device. The charger shall maintain the batteries in a fully charged condition at the float charge setting. Normal charging time shall be of maximum eight (08) hours. A boost charge facility shall also be provided, capable of restoring a discharged

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

battery to the fully charged condition in maximum two and half (2.5) hours without damage to the battery.

The charger efficiency shall not be less than 90%. The charger shall be rated to supply the load (comprising the delivered load together with 20% spare for future use). Chargers shall be naturally cooled.

Battery charger apparatus shall be provided with following alarm devices.

- Overvoltage (when system DC voltage rises more than 5 V above its normal automatic float voltage.
- Undervoltage (when system DC voltage falls below 85% of nominal. A time delay shall be incorporated to prevent initiation during temporary voltage drops.)
- Charger failure
- Diode/Thyristor & surge circuit protection/fuse failure detection
- Earth fault
- AC phase failure

All alarms shall be provided with potential free contacts for the DCS system.

3.7.8 UPS System

Major components of UPS are inverter, static bypass switch and manual bypass switch. Voltage failure shall be sensed on the output of the static switch. An automatic transfer to the alternate source shall occur when the output voltage of the primary source deviates by more than ±10% from nominal. Voltage of the alternate source shall be monitored. Transfer shall be permitted only if voltage of the alternate source is within ± 10% of the nominal. Static switch transfer time shall be less than ¼ cycles (5 ms). Contacts shall be provided to alarm deviation of the alternate source voltage beyond these limits. Return to normal shall be automatic for all externally caused transfers such as overload but shall be manual for internally caused transfers such as primary source failure. Automatic transfer shall occur after a preset time delay during which alternate source voltage shall remain ± 10% of the nominal voltage. Manual retransfer shall be initiated by pushbutton. Before retransfer occurs, synchronism of the output of the inverter with the alternate power source shall have been automatically accomplished.

The inverter shall consist of a solid state, static, one-phase, full wave inverter with output filter and electronic output voltage controller. The inverter shall utilize pulse width modulation technology, IGBT semiconductors, digital control, and have a digital communications interface with the plant control system. The inverters shall have equipment necessary to protect the equipment from overload, short circuits and 100% loss of load. Current limiter features shall be provided.

A two-position, manual bypass switch of electro-mechanical type shall also be mounted in the inverter cabinet. The manual by-pass switch shall select between the static switch output or the utility input, allowing servicing of the static switch without complete loss of power to the load.

3.7.9 Panels

Panels shall be assembled from steel sections and fabricated and bolted sheet units, of modular design with minimum ingress protection class of IP 41.

The panel shall be of modular, robust and sturdy design constructed in conformity to the

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

relevant part of IEC 60439. The panel shall be of sheet steel floor mounting type steel sheet thickness shall be not less than 2.5mm. However, in case of type tested rigid frame design, the thickness of steel sheet may be reduced but not below 2mm according to manufacturer's standard design. The panel shall be adequately ventilated and shall be completely vermin proof. Copper grounding bus for cubicle earthing shall also be provided. Doors shall be connected to the enclosure by means of separate flexible grounding straps. Provision of pockets inside the charger front door cabinet for keeping drawings during maintenance shall be provided.

The busbars shall be insulated copper with silver plating at all bolted joints.

Each main panel shall include an intelligent controller collecting information on DC voltage, DC current in each branch, and making the information available to the control system. The incoming circuit from the batteries to each board shall be provided with an ammeter with a center zero scale of suitable range and voltmeters for DC buses. Instruments shall be digital. Circuit breaker trip alarms shall also be collected by the intelligent controller for collection by the control system.

3.7.10 Tests

3.7.10.1 General

The chargers and inverters shall be tested at the factory in accordance with relevant IEC publications or IEEE standards. The Employer is entitled to witness all the tests.

The Contractor shall provide all special test apparatus and test sets required for carrying out the inspections and tests.

The boards shall be assembled at the manufacturer workshop with all apparatus, instruments and meters connected and various components shall be tested in accordance with requirement of latest relevant international standards. Tests shall be witnessed by the Employer.

3.7.10.2 Routine Tests

Routine tests and electrical type tests shall be carried out in accordance with applicable Standards.

Type tests shall be made on one unit of each type of different equipment. Instead of carrying out type tests, the Contractor may submit certificates of tests made on equipment of the same type. However, the Employer reserves the rights to accept these certificates or to reject them partially or totally. For the rejected part, the Contractor shall conduct the test again and submit the same to Employer for his approval.

Test Certificates shall be from KEMA (Netherland), CESI (Italy), CRIEPI Lab (Japan), KERI Lab. (S. Korea) or any other laboratory approved by the Employer.

3.7.10.3 Batteries, Chargers, Inverters and Distribution Switchboards

The battery materials shall be subject to appropriate tests and sample tests shall be carried out on cells according to IEC or international Standards.

The charger components shall be tested in accordance with relevant IEC or other international Standards. Following type tests shall be performed on chargers.

- DC voltage-current characteristics
- Automatic voltage regulation operation

- Conversion efficiency
- Temperature rise
- High voltage test
- Alternating current measurement
- Reverse leakage

The following routine test shall be carried out on chargers

- DC voltage-current characteristics
- High voltage test
- Visual inspection
- Operation of auxiliary devices
- Alternating current measurement
- Reverse leakage

Complete chargers, inverters and distribution boards shall be subjected to temperature rise, high voltage insulation resistance and operational tests. The ripple at the output shall be measured with no battery connected and temperature rise and other effects under permanent short-circuit at the output terminals shall be measured. Temperature rises as part of already completed Type Test is also acceptable.

Chargers and inverters shall also be subjected to radio interference tests.

Following routine test shall be carried out on DC switchboard:

- Mechanical operation test
- High voltage test
- Visual inspection
- Resistance measurement test
- Functional test
- Wiring checks

Other tests recommended by the manufacturer

3.7.10.4 Site Tests

3.7.10.5 Batteries and Chargers

The insulation to earth of the complete dc installations shall be tested.

Tests shall be carried out on the batteries and chargers to confirm the charger ratings and adjustment and the operation of the battery and charger control and alarm systems. Initial charge, controlled discharge and recharge tests shall be carried out to demonstrate the rated capacity of each battery.

Ripple measurement of charger output with battery connected shall be performed.

The specific gravity and cell voltages of the batteries when fully charged shall be recorded.

3.7.10.5.1 Inverters/ Static and Bypass Switches

Following tests shall be carried out:

- Visual inspection,

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- Functional tests, and
- Insulation test.

3.7.10.5.2 Distribution switchboards

Following tests shall be performed:

- Visual inspection,
- Functional tests,
- Dielectric tests, and
- Setting and functional tests of sequence and protective devices.

3.7.11 Spare Parts, Maintenance Equipment and Tools

Spare Parts, Maintenance Equipment and Tools mentioned herein are the minimum required. Any other necessary spare parts, maintenance equipment and tools required for maintenance of the equipment shall be provided by the Contractor.

Table 3-14 Spare Parts and Tools

3.8 11/0.4 KV STATION AUXILIARY TRANSFORMER(S)

3.8.1 General

This section specifies the technical requirements for the design, manufacture, delivery, erection, testing and commissioning of 11 /0.4 kV auxiliary transformers complete with all their accessories and necessary interconnections for safe and reliable operation.

All equipment under the technical specifications shall be manufactured and tested in accordance with the latest revision of the relevant IEC standards.

3.8.2 Scope of Work

The scope of work covers design, delivery to site, storage, erection, testing, commissioning and proper functioning of the equipment, including all auxiliary systems, protections and reliability tests necessary to meet the Contract requirements..

The powerhouse shall be equipped with four (04) no. 11kV/400V, 630 kVA, dry type station auxiliary transformers including one spare transformer, connecting HV side to 11 kV busbar and LV side to 400V switchgear and associated enclosure complete with accessories.

The power distribution system at intake shall be equipped with two (02) no. 11kV/400V, oil type 400 kVA auxiliary transformers including one spare transformer.

Station Auxiliary Transformers for powerhouse shall be of dry type three-phase units mounted in enclosures with suitable damp proof heating arrangement, integral with their associated 400 V switchboard.

Auxiliary Transformers for Intake shall be of pad mounted oil immersed type. The transformers shall be complete with all accessories and attachments as detailed in these specifications or otherwise required for satisfactory operation, service and maintenance under all specified operating conditions.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

3.8.3 Operating Conditions

Dry type transformers located in the powerhouse will be in locations covered by the heating, ventilating and air conditioning (HVAC) system with ambient air temperature shall normally not exceeding 40°C.

The oil-immersed distribution transformers located outdoors shall be suitable for the following environmental conditions:

- Maximum Temperature 50°C
- Minimum Temperature - 20°C

3.8.4 Standards

The work performed shall be in conformance with all applicable codes and standards including, but not limited to, the latest revision of those listed below.

If there is an apparent discrepancy between any of the requirements of this Specification and those stipulated below, then the most stringent requirements shall apply.

Table 3-15 Standards

Title	Standard
Power transformers	IEC 60076
Thermal evaluation and classification of electrical insulation	IEC 60085
Degree of protection provided for enclosures	IEC 60529
Determination of transformer and reactor sound levels	IEC 60076-10
Sound level meters	IEC 61672-1/2
Dry-type power transformers	IEC 60076-11
Measuring Relays & Protection Equipment	IEC 60255
Insulation Coordination	IEC 60071

3.8.5 Key Technical Parameters

3.8.5.1 Dry Type Transformers for Powerhouse

Three-phase, dry type station auxiliary transformer shall meet the following requirements as a minimum:

Table 3-16 Technical Parameters

Item	Unit	Value
Nominal Capacity	kVA	630
Rated Voltage	kV	11 / 0.4
Maximum System Voltage	kV	12
Rated Frequency	Hz	50
Vector Group	-	Dyn11

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Item	Unit	Value
Voltage Impedance	%	6%
Tap Changer	-	Off-load
Voltage Regulation	%	± 5 x 2.5%
Cooling Type	-	AN
Neutral point earthing mode	-	Direct Earthing
Lightning impulse (1.2/50 µs) withstand voltage Primary HV winding Secondary LV winding	kV	 75 kV N/A
Power frequency withstand voltage (1 min): Primary HV winding Secondary LV winding, Phase	kV rms	 38 kV 3 kV
Noise Level	-	NEMA TR-1
Temperature rises at 40ºC ambient temperature Winding	K	85 K

3.8.5.2 Oil Type Transformers

Three-phase, oil type station auxiliary transformer for Intake supplies shall meet the following requirements as a minimum:

Table 3-17 Technical Parameters

Item	Unit	Values
Nominal Capacity per 3-phase unit	kVA	400
Rated Voltage	kV	11 / 0.4
Maximum System Voltage	kV	12
Rated Frequency	Hz	50

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

3.8.6 Functional Specifications

3.8.6.1 Dry Type Station Auxiliary Transformer(s)

The dry type, three-phase units shall be mounted in enclosures, and protected by a 15 kV disconnect switch with current limiting fuses.

Dry type transformers may be of the cast resin type or open winding type, suitably braced to withstand short-circuit forces. The thermal classification to IEC 60085 shall be 200. Insulation material shall be of Class F (IEC 60076-2).

The core shall be constructed from high-grade, cold rolled, non-ageing, low loss and high permeability grain-oriented silicon steel laminations. The material shall conform to the latest edition of relevant IEC standard.

Special care shall be exercised in the selection, treatment and handling of core material (steel) to ensure that the laminations are as flat as possible and finally assembled core should be free from distortion. The core laminations shall be annealed after removing all sharp projections and each lamination shall be coated with durable baked enamel / glass insulation. The complete core shall be coated with special resin as a protection against corrosionand moisture ingress.

All parts of the cores shall be of robust design capable of withstanding any shocks to which they may be subjected during handling, transportation, installation and service.

Adequate provision shall be made to prevent movement of the core and winding relative to the frame during transportation, installation and in service.

The windings shall be of high-conductivity electrolytic copper and transposed winding conductors shall be employed where appropriate.

The windings shall be designed to reduce to a minimum out-of-balance electro-magnetic forces in the transformer at all voltage ratios.

Windings shall be adequately braced to prevent distortion due to any abnormal operating condition.

The terminals shall be designed to carry the fault current without damage, for a duration at least equal to the short-circuit period for which the main windings are designed, in accordance with IEC 60076.

Thermal control of coils shall be provided via two separate signal systems for alarm and tripping. RTD (PT-100) sensors shall be provided in the low voltage windings inside the cast coils for measurement of temperature. The temperature protection equipment shall be suitable for use with 220 V DC voltage.

3.8.6.2 Oil Immersed Auxiliary Transformers for Outdoor Installation

Oil immersed transformers shall be provided with high conductive electrolytic copper windings. Insulation material shall be according to latest IEC Standard 60076-2.

The insulation of windings and connections shall be free from insulation compositions likely to soften, shrink or to collapse during service. None of the materials used shall shrink, disintegrate, carbonize or become brittle under the action of hot oil at any load condition.

Oil filled transformers shall have galvanized steel radiators forming an integral part of the tank.

The tank and radiators shall have sufficient cooling surface area to allow continuous operation

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

of the transformers at their self-cooled rating.

Transformers shall be with ONAN type cooling.

Transformers shall be provided with two earthing terminals of adequate size capable of carrying the maximum possible earth fault current.

The terminals shall be designed to carry the fault current without damage, for a duration at least equal to the short-circuit period for which the main windings are designed, in accordance with IEC 60076.

Each transformer shall be provided with winding temperature indication and protection. Dial type thermometer for measuring the oil temperature with two normally open contacts for temperature alarm and tripping shall be provided. Also, dial type float operated, magnetic type oil level gauge with one low level normally open contact shall be furnished.

3.8.6.3 Flux Density

The flux density shall not exceed 1.65 Tesla when operating at the rated voltage and frequency on any tap position.

3.8.6.4 Enclosures

The enclosure shall consist of a rigidly constructed steel framework which shall be completely clad in sheet steel and if necessary, with the provision of screened openings to provide natural cooling. The degree of enclosure protection shall be IP23 to IEC 60529. At 400 V, the apparatus shall be suitable for continuous operation on a three-phase, 50 Hz system. The three-phase fault level at 400 V shall be determined by the Supplier based on the final design.

Internal access shall be by means of hinged doors at the front of the enclosure and the arrangement shall ensure that the transformer can be withdrawn easily on wheels via a track.

Temperature detectors including temperature transmitters and temperature gauges shall be provided for monitoring and signaling the winding temperatures to the respective LCU.

Each enclosure shall be provided with anti-condensation heaters.

Each enclosure shall be provided with a door operated interior light. An earthing terminal shall be provided for each enclosure.

3.8.7 Testing and Commissioning

3.8.7.1 Test Equipment

The Contractor shall provide all special test apparatus and test sets required for carrying out the inspections and tests.

3.8.7.2 Factory and Type Tests

Routine tests and electrical type tests shall be carried out in accordance with IEC 60076, IEC 60255 and other IEC Standards as applicable.

Type tests shall be made on one unit of each type of different equipment at the Contractor’s expense in presence of the Employer and the actual type test report shall be submitted to the Employer for approval. Instead of carrying out the type tests, the Contractor may submit duly certified and complete type test reports for tests carried out by an independent, accredited authority on similar equipment of the same type. However, the Employer reserves the right of accepting these certificates or to reject them partially or totally.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

3.8.7.3 Routine Tests

- Power frequency test on Primary and Secondary windings.
- Transformer turns ratio test.
- Insulation resistance test.
- Winding resistance test.
- Short circuit (load loss test).
- Induced overvoltage withstand test.

3.8.7.4 Type Tests

- Temperature-rise test to IEC 60076 on transformer where type test certificates from approved institutions in respect of identical designs cannot be substituted.
- Impulse tests to IEC 60076 on transformer where type test certificates in respect of identical design cannot be substituted, and
- Noise level tests on transformer.

3.8.7.5 Site Tests

Following tests shall be performed on transformers at site:

- Visual inspection,
- Insulation resistance,
- Winding resistance and continuity on all taps,
- Polarity,
- Dielectric test of oil, and
- Functional test of all control and protection apparatus.
- Transformer turns ratio test.
- Load tests.

3.8.8 Mandatory Spare Parts, Maintenance Equipment and Tools

Spare Parts, Maintenance Equipment and Tools mentioned herein are the minimum required. Other necessary spare parts, maintenance equipment and tools required for maintenance of the equipment shall be provided by the Contractor.

Table 3-18 Spare Parts

Sr. No.	Item	Unit	Value
1	Bushing of each type used complete with gaskets and accessories	No.	1

3.9 LOW VOLTAGE SWITCHGEAR

3.9.1 Scope of Work

The scope of work covers design, manufacture, delivery, erection, testing and commissioning of low voltage switchgear and all necessary ancillary equipment complete with their accessories for Powerhouse and Intake including all interconnections, cabling within panels, and interface with control and protection systems.

3.9.2 Standards

The work performed shall be in conformance with all applicable codes and standards including, but not limited to, the latest revision of those listed below.

If there is an apparent discrepancy between any of the requirements of this Specification and those stipulated below, then the most stringent requirements shall apply.

Table 3-19 Standards

Title	Standard
Current transformers	IEC 61869-2
Potential transformers	IEC 61869-3
High voltage switchgear and control gear	IEC 62271-103
High voltage cables	IEC 60502
Cables	IEC 60228
High voltage metal clad switchgear assemblies	IEC 62271-200
Identification of insulated and bare conductor by colors	IEC 60445
Power transformers	IEC 60076
Transformer accessories	IEC 60076-7
LV switchboards	IEC 61439
Protection level circuits	IEC 60529
Metering equipment for purchase of private power	WAPDA Standard Specification P-199.98

3.9.3 Functional Specifications

The equipment in the LV switchgear assemblies shall consist of low voltage power air circuit breakers, molded case circuit breakers, buses, current transformers, voltage transformers, indicating instruments, relays, control devices, associated wiring and test blocks.

Electrical separation of type ‘Form 3b’ is required as factory delivery for individual circuits to prevent electrical shock through contact with exposed-conductive-parts, which may be

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

energized by a fault in basic insulation of the circuit. The equipment shall satisfy the requirements of “Form 4b” when installation is completed and all cable terminations are finalized.

Key technical parameters are shown in below table:

Table 3-20 Technical Parameters

Item	Unit	Value
Rated Nominal Voltage	V	400/230
Rated Insulation Voltage	V	2500
Rated Continuous Current	A	1250A
Rated Short Time Withstand Current	kA	Rated short time Withstand current calculation shall be submitted by contractor and review by Employer.
Frequency	Hz	50
Busbars		Copper
Busbar Joints		Silver Plated
Busbar Insulation		Shrink Sleeves
Control Voltages	VDC	220

The 400 V switchboards shall be metal-enclosed, multi-cubicle, multi-tier type factory-built assemblies of compartmented design based on the draw-out principle for indoor installation in accordance with IEC 61439 and suitable for continuous duty under site ambient conditions.

Complete protection shall be provided against approach to live parts under all normal operating and maintenance conditions.

The degree of protection IP42 to IEC 60529 shall apply to the enclosure. All ventilation openings and vent outlets shall be screened to prevent ingress of vermin.

Three-phase with neutral busbars and an earthing bus bar shall be provided throughout the entire length of the switchboards.

Provision shall be made for electric heaters with thermostat to prevent condensation, particularly when the apparatus is out of service.

All necessary monitoring, measuring and control equipment shall be provided.

Numerical protection devices fitted with test facilities are to be used throughout the LV switchgear. LSIG (Long Time, Short Time, Instantaneous and Ground) adjustable digital trip units shall be provided throughout. The Contractor shall ensure that the equipment is sufficiently protected.

Each busbar shall be adequately supported against short-circuit forces and provision shall be made to allow for thermal expansion of the conductors due to normal and pulse currents and short- circuit currents.

3.9.4 LV Circuit Breakers

The individual circuits of the switchboards shall be of the following type:

- Withdrawable air-break circuit breakers for incoming circuits and main outgoing

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

feeders. Air circuit breakers shall comply with IEC 60947.

- Moulded case circuit breakers shall be provided for each distribution feeder circuit. The circuit breakers shall be in accordance with IEC 60947. All moulded case circuit breakers are manually operated, except as marked EO for electrically operated on the single line diagrams.
- MCBs shall comply with IEC 60898 and shall be high speed fault limiting thermal/magnetic trip.
- Low voltage power circuit breakers consist of 3-pole electrically and mechanically trip-free draw out type air circuit breakers and are complete with inter-pole barriers for eliminating all fault communication, arc quenchers, manual and electrical stored-energy operating mechanism, mechanical position indicator, and are mounted on a draw out mechanism in the breaker compartment.
- All three pole breakers shall have digital trip devices type LSIG. The electrically operated circuit breakers are equipped with push buttons for local control, and digital controls for remote operation from the control system.

3.9.5 Remote Control, Indications and Measurement

All circuit breakers shall also be remotely controlled from the operator's console in the central control room.

The Contractor shall provide the provisions for following remote measurements and signals to the central control room:

- Withdrawable circuit breaker not available (in test position or withdrawn)
- Withdrawable circuit breaker ON / OFF, separate
- Withdrawable circuit breaker faulty

For each main switchgear section and each sub-distribution:

- No control voltage (group signal of individual in-coming and outgoing feeders)
- Protection activated (group signal)
- No busbar voltage

3.9.6 Protection and Metering

The following protection shall be provided as a minimum by the Contractor complete with current transformers, voltage transformers and necessary devices:

- Instantaneous overcurrent (50) and inverse time overcurrent (51)
- Time-definite earth-fault overcurrent protection (51N)
- Overvoltage protection
- Busbar under-voltage protection
- Trip circuit supervision relay protection

As a minimum requirement, the following local measurements shall be provided:

- Three-phase current indication of all in-feeds and outgoing feeders which are equipped with air circuit breakers and MCCBs
- Single-phase current indication for outgoing feeders equipped with air circuit breakers, MCCBs and feeders of more than 250 A equipped with hand operated load break switches or breakers feeding the DC Battery Chargers and the Change-Over units of

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

the inverters / UPS.

- Single-phase current indication for all motor feeders equal to or greater than 75 kW.
- Voltage indication with suitable 7-way voltmeter selector for measurement of phase-to-phase and phase-to-neutral voltages in all the in-feeds equipped with air circuit breakers / MCCBs and in all in-feeds of sub-distributions of the switchgear installations

3.9.7 Busbar and Connections

The busbars and connections shall be continuously rated for the Site conditions and currents specified. Either insulated or uninsulated busbars are acceptable subject to approval in respect of clearances in air and evidence of dielectric tests applicable to the whole installation. Taping is not acceptable. Any insulating material used can withstand the heating effects of the rated short-time withstand current without permanent deformation or deterioration and shall comply with latest IEC standards for thermal stability and flammability.

Each busbar shall be adequately supported against short-circuit forces and provision shall be made to allow for thermal expansion of the conductor due to normal and pulse currents and short- circuit currents.

The busbars shall be contained in a separate compartment within the general casing of the switchgear and shall not be accessible by normal means.

3.9.8 Current Transformers

The current transformers shall have separate cores for metering and protection.

The winding for measuring purposes shall have the following characteristics:

Accuracy class	:	0.2
Instrument security factor (FS):		5

Windings for protection purposes shall have the following characteristics:

Protection class	:	5 P
Accuracy limit factor	:	10

3.9.9 Voltage Transformers

The indoor voltage transformers shall be of the single-phase dry synthetic resin type meeting the requirements of IEC 61869-3.

The windings for measuring purposes shall be designed for accuracy according to class 0.2.

The voltage transformers shall have an additional secondary winding for earth fault protection, connected in broken delta with a resistive burden. The protection class shall be 3P for protection applications.

The secondary shall be provided with miniature circuit breakers with alarm contacts. Voltage transformers shall be protected by HRC fuses on the primary side.

The burden for voltage transformers secondary shall be between 25-80 % of the nominal burden.

3.9.10 Testing and Commissioning

3.9.10.1 General

The testing shall be performed in accordance with the IEC recommendations for the actual

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

equipment.

The testing shall consist of complete functional tests and technical tests to verify significant technical specifications.

The test plans and test specifications for both the factory tests and the site tests shall be presented to the Employer and approved by him in due time before the actual tests shall be performed.

All test results shall likewise be presented to the Employer for approval.

3.9.10.2 Factory and Type Tests

3.9.10.2.1 General

Routine tests shall be made on each unit of all equipment.

Routine tests shall be performed in the manufacturer's workshop on the individual apparatus and on the complete installation, respectively, all in accordance with IEC-Standards.

The Employer are entitled to witness all Factory and Type Tests.

3.9.10.2.2 Routine Tests

The following routine tests are required:

- visual inspection
- power frequency HV tests at main circuit
- dielectric tests of the auxiliary circuits
- functional test of the control circuits
- check of the operational sequence
- check of the denominations

3.9.10.2.3 Type Tests

Type tests shall be made on one unit of each type of different equipment at the contractor's expense in presence of Employer and the actual type test report will be submitted for approval.

Instead of carrying out the type tests the Contractor may submit suitable certificates of tests made on equipment of the same type. However, the Employer reserves the right of accepting these certificates or to reject them partially or totally.

The following type tests are required:

- Dielectric test including lightning, power frequency voltage withstand test, and power frequency voltage withstand test on auxiliary and control circuits
- Temperature rise test
- Resistance measurement of main circuit
- Short time withstand current and peak withstand current test
- Verification of degree of protection
- Partial discharge test
- Mechanical operation test
- Test for auxiliary devices
- Verification of correct wiring

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

3.9.10.2.4 Site Tests, Commissioning and Test on Completion

3.9.10.2.4.1 General

Final functional and operational tests shall be carried out after the erection at Site.

The complete installation and – as far as reasonable – the individual apparatus shall be tested at Site as follows:

- Visual inspection
- Dielectric tests
- Functional test
- Test of the functional sequence
- Setting and functional test of protection devices (primary injection method)

3.9.11 Mandatory Spare Parts, Maintenance Equipment and Tools

Spare Parts, Maintenance Equipment and Tools mentioned herein are the minimum required. Any other necessary spare parts, maintenance equipment and tools required for maintenance of the equipment shall be provided by the Contractor.

Table 3-21 Spare Parts

3	Remote controlled racking assembly with 50-foot (15 m) cord and control station of each type used	Sets	1
4	Temporary earthing sticks with accessories of each type used	Sets	2

3.10 CABLES

3.10.1 Scope of Work

This Section specifies the technical requirements for the design, manufacture, works testing, delivery, erection and commissioning of cables for power, control, instrumentation, communication, data cables and 11kV overhead lines including all terminations, joints, supports and accessories. The scope of supply shall include:

11kV Overhead Lines

- Single-circuit line from Powerhouse to Intake Area.

11kV Cable

- One (01) lot of single-core cables for the Powerhouse
- Additional sets as required for connections between OH lines terminal poles and switchgear and step-down transformers

LV Power Cables

- One (01) lot of 400 V AC power cables for the Powerhouse, Intake and Spillway Area.
- One (01) lot of 220 DC power cables for the Powerhouse, Intake.

There shall be 400 V supply from intake to Spillway Area.

- One (01) Lot of Communication, control and instrument cables for all locations.
- One (01) Lot of fiber-optic cables for internal and external data transfer systems for all locations.
- One (01) Lot of material for supporting, laying, protecting, fixing and terminating of the cables and the OH lines for all locations.

The quantities, types of cables and 11 kV overhead lines to be provided under the Contract shall be determined by the Contractor to connect the equipment provided under this Contract and with external points as required. 10% of the final quantities required for the Project shall be provided as spares.

The Contractor shall include 11 kV network and cable length, sizes and rates for the supply and termination of additional quantities of cables as part of tender.

All the Cables and Cables Trays shall be supplied on the basis of whole reels. Remaining partial reels at the end of the work shall be turned over to Employer as spare cable.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

3.10.2 Standards

The work performed shall be in conformance with all applicable codes and standards including, but not limited to, the latest revision of those listed below.

If there is an apparent discrepancy between any of the requirements of this Specification and those stipulated below, then the most stringent requirements shall apply.

Table 3-22 Standards

Title	Standard
Thermal evaluation and classification of electrical insulation	IEC 60085
Basic and safety principles for man-machine interface, marking and identification - Identification of conductors by colors or numerals	IEC 60446
Specification for wrought aluminium for electrical purposes.	BS 2627
Electric cables. Thermosetting insulated, armoured cables for voltages of 600/1000 V and 1900/3300 V	BS 5467
Mechanical cable glands. Armour glands. Requirements and test methods	BS 6121
Electric cables. Armoured cables with thermosetting insulation for rated voltages from 3.8/6.6 kV to 19/33 kV. Requirements and test methods	BS 6622
Electric cables. Thermosetting insulated, armoured cables for voltages of 600/1000 V and 1900/3300 V, having low emission of smoke and corrosive gases when affected by fire	BS 6724
Zinc or zinc alloy coated non-alloy steel wire for armouring either power cables or telecommunication cables. Land cable	BS 10257
Non shielded 0-2 kV Cables	ICEA S 95-658
Conductors of insulated cables	IEC 60228
Electric cables - Tests on extruded over-sheaths with a special protective function	IEC 60229
Electric cables - Calculation of the current rating Part 1 to 3	IEC 60287
Tests for electric cables under fire conditions - Circuit integrity (Part 1 to 7)	IEC 60331
Tests on electric and optical fibre cables under fire conditions (Several Parts)	IEC 60332
Power cables with extruded insulation and their accessories for rated voltages from 1 kV (Um = 1,2 kV) up to 30 kV	IEC 60502
Test on gases evolved during combustion - Determination of halogen acid	IEC 60754-1
Test on gases evolved during combustion - Determination of acidity	IEC 60754-2
Measurement of smoke density	IEC 61034
Cable Tray Systems and Cable Ladder Systems for Cable Management	IEC 61537
Optical fibre cables	BS EN 187000

3.10.3 General

3.10.3.1 Cables

All MV cables shall be of cross-linked polyethylene (XLPE) insulation with sheath of low smoke

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

zero halogen (LSZH) and either of fire retardant or of fire resistance characteristics suitable for installation in hydroelectric power plant environments. All LV power cables, signal and instrument cables shall have LSZH insulation.

All cables shall be suitable for installation in cable trays, above-ground and below-ground conduits, and in outdoor covered concrete cable trenches. Cables shall also be suitable for direct burial.

Copper conductor and armouring shall be used for all cables except specified elsewhere in specifications.

3.10.3.2 11kV Overhead Lines

11 kV overhead line including lattice steel structures, surge arrestors, dropout cut out, conductor, galvanized steel wires, dead end clamps, anchor shackle, termination kits, complete earthing arrangement, danger and sign plates, cross arms, disc & pin insulators, D-shackle, stay rod and other accessories required for complete functioning of the system shall be provided.

The Contractor shall submit his Quality Assurance procedure being followed in manufacturing cables for the approval of the Employer.

3.10.4 Voltage Drop Limits

Maximum voltage drop on MV feeder = 3.5%
Maximum voltage drop on LV feeder = 2.5 %

3.10.5 Cable Trays, Racks and Supports

3.10.5.1 General

The Contractor shall furnish, install and test cable trays, racks and supports and other necessary fittings.

3.10.5.2 Supports and Other Steelwork

All cable supports including racks, trays, sunshields and other steel work with all necessary fixings, bolts, nuts, screws and clamps shall be supplied by the Contractor. Metal work shall be galvanized. The Contractor shall take all precautions to prevent damage to the galvanising. Where steelwork, racks or trays supplied in standard lengths are cut or minor damage has occurred to the galvanising the exposed steel shall be treated with zinc rich paint or other method approved by the Employer. Heavily damaged items shall be replaced as directed by the Employer at no extra cost to the Employer.

The cable trays shall include all accessories like bends, elbows, tees, etc. and shall be of the perforated type for proper ventilation of the cables. The trays shall be made from 2 mm thick mild steel sheets and the trays shall have a minimum 50 mm edge height.

Cable supports, racks and trays shall be erected in accordance with the layout drawings prepared by the Contractor and approved by the Employer. Any modification found to be necessary for satisfactory installation shall be to the approval of the Employer.

All cable trays and supporting metalwork shall be bonded to each other and to the station earthing mesh.

3.10.5.3 Erection of Supports

Expansion bolts shall be used for the fixing of supports and associated steelwork to concrete

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

and masonry.

The fixing of cable supports and associated steelwork to building structural steelwork shall be done with bolted clamps. Weld gun stud fixing will be allowed as approved by the Employer. The drilling of structural steelwork shall not be allowed except in special circumstances and then only with the prior permission of the Employer.

3.10.5.4 Installation on Racks

Heavy single-core and multicore cables shall be clamped directly to the racks with cleats having bores of the correct sizes for the relevant cable diameters. The cleats shall be of silicon aluminium, glass-filled nylon or other tough, non-hygroscopic material. Single core cables shall be erected in close trefoil three-phase groups in non-magnetic clamps. Wooden cleats shall not be used.

The horizontal distance between supporting clamps for all cables having a conductor cross-sectional area greater than 125 sq mm shall be with the approval of the Employer.

The distance between rack supports for smaller power and multicore control cables shall be one metre for both horizontal and vertical runs. After installation, cables shall be neatly arranged and parallel to each other.

3.10.5.5 Installation on Trays

Small power cables, protection, control, communication and data cables shall be run on trays and shall be secured with heavy duty plastic straps and fixings to the approval of the Employer. After installation, cables shall be neatly arranged and parallel to each other.

3.10.5.6 Cable Ducts

All required cable ducts will be provided under this section of contract.

The cable ducts shall be of material LSZH. The ducts shall be of suitable sizes to carry required number of cables with 20% of free space.

3.10.5.7 Cable Markers

Suitable cable markers of Aluminium with punch marks shall be provided and suitably permanently tagged to the cables for easy identification.

3.10.5.8 Core Identification

Approved numbered ferrules shall be supplied and fitted to every cable core of control and instrument cables at each termination. The ferrules or sleeves shall be of insulating materials which shall have black text engraved on a white background. The ferrules or sleeves shall be unaffected by oil or damp. Adhesive markers shall not be used.

All markings for terminal blocks, cables, cable conductors and wiring shall be located on the corresponding design drawings.

A common system of ferrule numbering shall be adopted such that ferrule numbers at field terminations shall agree with ferrule numbers on the internal wiring of equipment.

3.10.6 Testing and Commissioning

All cables and other equipment and materials covered by these Specifications shall be subject to inspection and tests in accordance with these Specifications. The tests listed in this section are the minimum requirements.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Routine tests at Works shall be carried out as required by these Specifications.

The Contractor shall be required to carry out type tests in accordance with the internationally recognized Standards (IEC, BS etc.) unless authenticated evidence is produced to the satisfaction of the Employer to show that the type tests have already been satisfactorily carried out on each type of cable being supplied.

The Contractor shall certify that the cables and accessories offered shall be identical in all essential particulars in respect of design, materials and workmanship with the cables and accessories for which type tests are offered in support of his Proposal.

3.10.6.1 Test Equipment

All apparatus, instruments and connections for the Site testing of the cables and accessories shall be provided by the Contractor

3.10.6.2 Routine Test

Routine tests shall be conducted on all cables as specified in above referred IEC and BS standards.

3.10.6.3 Site Test

Site tests shall be conducted on all cables as specified in above referred IEC and BS standards.

3.10.7 Mandatory Spare Parts, Maintenance Equipment and Tools

Spare Parts mentioned herein are the minimum required. Any other necessary spare parts, maintenance equipment and tools required for maintenance of the equipment shall be provided by the Contractor.

Table 3-23 Spare Parts

Sr. No.	Description	Unit	Qty
MV Cable			
1	Clamps for all used cable size.	Set	5
2	Outdoor/indoor MV cable sealing ends	Lot	1
3	Termination and jointing kit for each type and size of 11 kV cable.	Nos.	5

3.11 EMERGENCY DIESEL GENERATING UNITS (EDG)

3.11.1 Scope

The scope of work shall cover the design, manufacturing, supply, installation, testing and commissioning of emergency diesel generators as follows:

- One (01) No. 500 kVA* rated EDG for the Powerhouse
- One (01) No. 100 kVA* rated EDG for the Intake/Weir Area

Note: *The rating indicated is the minimum required. The final rating shall be determined by the Contractor and shall be subject to the approval by the Employer.

All equipment shall be manufactured and tested in accordance with the latest revision of the relevant IEC standards.

The emergency diesel generator of powerhouse is required to provide “black start” capability of the generating unit when power from normal or alternate source is not available. The generator shall also be required to meet emergency load requirements in the power plant when the power supply fails. The governor shall be of the droop type to enable paralleling the generator to the distribution system for load testing.

The Contractor shall determine the capacity of the diesel generator based on the loads and submit to Employer for approval. The Contractor shall use the following criteria for specifying the main parameters of the emergency generator set and its control system:

- Voltage level of the system to be supplied from the generator is 400V
- Load requirements and duration
- Control and automation

The emergency diesel generators shall be furnished with speed governor, lubricating oil facility, air inhalation, cooling facility, fuel supply facility, exhaust facility, battery starting system, exciter, voltage adjuster and control panel.

The Contractor shall prepare the detailed design of the installations and submit drawings of the equipment for the installation.

The Contractor shall submit certificates of compliance, test reports and/or approval documents for the EDGs to be delivered for this Project.

3.11.2 Standards

The equipment shall conform to the applicable requirements of the latest edition of the following international standards:

Subject	Standard
• Rotating electrical machines	IEC 60034
• Current transformers	IEC 61869
• Electrical relays	IEC 60255
• Low voltage switchgear and control-gear assemblies	IEC 61439
• Degrees of protection provided by enclosures (IP code)	IEC 60529
• Low voltage switchgear and control-gear	IEC 60947
• Reciprocating internal combustion engines performance	ISO 3046
• Reciprocating internal combustion engine driven	ISO 8528

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

alternating current generators sets

- Diesel Engine Manufacturers Association Standards DEMA
- National Electric Manufacturers Association NEMA MG-1
- Letter symbols to be used in electric technology IEC 60027
- International electro technical vocabulary IEC 60050

3.11.3 Functional Requirements

The Emergency Diesel Generating Units (EDGs) shall be designed for operation of essential power plant auxiliary services, control room requirements with minimum 20% spare capacity during any outage of the grid connected power system. The EDG of powerhouse shall also provide sufficient power for black start of the power generating units including excitation, control, protection and lubrication systems.

The diesel engine and generator shall be interconnected to form a unit. The overload capacity shall be 10% of the rated output for one hour in every 12 hours of operation under the most adverse combination of climatic conditions at site.

The diesel engine shall be equipped with the following:

- Flexible flange coupling to the generator
- Speed governor, electronic
- Filters for air, fuel oil and lubricating oil
- Lubricating oil coolant pump
- Starter motor
- Fuel injection stopping coil
- Monitors of oil pressure
- Monitoring of cooling water temperature
- Radiator-type cooler with directly driven fan and ducting to wall opening

The diesel engine shall be of heavy-duty solid injection, compression ignition, exhaust gas turbocharged with intercooler, water-cooled closed circuit with radiator, air starting, four stroke, multi-cylinder with exchangeable cylinder liners, forced lubrication with lubrication oil cooler, electronic governor, suitable flywheel for flicker-free operation and exhaust silencer with necessary piping etc. all parts shall be easily accessible for inspection and repairs.

The lubricating oil system shall be closed circuit, forced feed type with duplex oil filters with an automatic bypass to avoid stoppage of oil circulation. The generator shall be continuous running duty type (SI) as per IEC 60034-1.

The generator shall be protected by housing, self-ventilated, drip proof, for tropical climate and equipped with a brushless excitation system with rotating diodes and voltage regulator.

Temperature rise of the windings shall not be more than 90°C for class-F insulation with an ambient temperature of 40°C under rated conditions.

The generator shall be designed to withstand speed of 1.2 times the rated speed.

The control panel shall contain all necessary equipment for control, protection and operation of the units. Facilities for both manual and automatic start/stop shall be available.

The generator body and control panel shall have provision for earthing. Control panel shall have auto-changeover facility, digital automatic voltage regulators, CTs, PTs, CBs, protection devices relays, indication alarms. The degree of protection provided by the enclosure for the

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

generator shall be IP-23 as per IEC 60034-5.

The switchover of loads from diesel generating unit to station service supply after starting of one of the four units following a black-start shall be done by automatic changeover.

The long-term fuel oil storage tank shall have a capacity of at least 72 hours of continuous operation. The tank shall have double wall with leakage monitoring equipment and shall be furnished with float switch and fuel level gauge. The fuel oil day tank shall have the capacity for at least 08 hours full load running, with equipment for automatic refilling from the storage tank.

The battery shall be of the lead acid type, alternatively gel-acid type.

3.11.4 Operations, Interlocking and Synchronization

The EDGs shall form part of the auxiliary power supply system and shall be capable of island mode operation and parallel operation with another supply. The EDGs shall provide standby power in case of complete loss of normal power and shall have the facility for auto-start in the event of failure of the normal supplies to the main 400 V board.

Each EDGs shall be star connected, with the star point brought out via current transformers.

Each star-point shall be earthed via neutral earthing resistor supplied by the Contractor. The resistor shall be able to withstand the continuous third harmonic current circulated during parallel operation with the auxiliary transformers. The Contractor shall submit detailed calculations on the size of the earthing resistors for approval by the Employer before start of the manufacture.

The EDG for powerhouse shall be supplied with a local control panel which shall include all facilities for remote auto-start and control by the Plant Control System (PCS) as well as facilities for the manual starting and loading. The EDG of powerhouse shall be provided with auto/manual control selection, start-up, synchronizing and sequential loading from the central control room (CCR). The Contractor shall supply necessary equipment on the Local Control Cubicle for interfacing with the PCS (Plant Control System) for remote operation from the control room.

On a complete shutdown of the system, the EDGs shall start and supply their respective boards. The synchronizing facility shall also be used for reconnection of the normal supply, following a blackout, before shutting down the EDGs.

The EDGs shall be automatically shut down in response to electrical and mechanical fault conditions, in all modes. Faults shall operate a lockout system, as required, requiring reset by operator before a start can be initiated.

3.11.5 Generator

The generator shall be protected by housing, self-ventilated, drip proof, for tropical climate and equipped with a brushless excitation system and voltage regulator. The generator terminal voltage level shall be readily adjustable to 10% of rated voltage. The maximum acceptable voltage variations during steady state generation shall be 2.5%, and in the transient state with load fluctuations of up 25%, the maximum acceptable voltage variations shall be 5%. This shall be achieved by incorporating automatic voltage regulator (AVR), the excitation system shall be of brushless type with rotating diodes.

The AC generator shall be of constant voltage, 50 Hz, three phase, four wire, internally air cooled, solidly grounded neutral, self-excited type with a power factor of 0.85. Damper

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

windings shall be uniformly distributed round the rotor. Temperature rise of the windings shall not be more than 90°C for class-F insulation with an ambient temperature of 40°C under rated conditions.

The generator shall be designed to withstand speed of 1.2 times the rated speed.

The generators shall have the following ratings:

- Output *500 kVA & 100 kVA (prime rating)
- Voltage 400V, 3Ø
- Frequency 50 Hz
- Power factor 0.85 lagging
- Speed 1500 rpm
- Neutral grounding Solidly grounded

*Note: * The rating indicated is the minimum required. The final rating shall be determined by the Contractor and shall be subject to the approval by the Employer.*

3.11.6 Control Panel

The control panel shall be located in the Diesel Generator Room and shall contain all necessary equipment for control, protection and operation of the units. Facilities for both manual and automatic start/stop shall be available.

The generator body and control panel shall have provision for earthing. Control panel shall have auto-changeover facility, automatic voltage regulators, CTs, PTs, CBs, protection devices relays, indication alarms. The degree of protection provided by the enclosure for the generator shall be IP-23 as per IEC 60034-5.

The following instruments shall be provided on local control panel:

- Voltmeter and Selector Switch
- Ammeter
- Wattmeter
- Frequency meter
- Power factor meter
- Synchro scope
- Double voltmeter
- Double Frequency Meter
- Engine Speed Indicator
- Hours Run Indicator
- Lubricating Oil Temperature and Pressure
- Cooling Water Temperature
- For Turbocharge Engines, Charge Air Temperature and Pressure
- Tank Fuel Level Gauge

3.11.7 Fuel Oil System

The long-term fuel oil storage tank shall have a capacity of at least 72 hours of continuous operation. The fuel oil day tank shall have the capacity for at least 12 hours full load running. Both tanks shall have double wall with leakage monitoring equipment and shall be furnished

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

with float switch and fuel level gauge

3.11.8 Lubricating Oil System

The lubricating oil system shall be closed circuit, forced feed type with duplex oil filters with an automatic bypass to avoid stoppage of oil circulation. The generator shall be continuous running day type (SI) as per IEC-60034-1.

3.11.9 Starting Battery

The battery shall be of the lead acid type, alternatively gel-acid type. Each cell shall have an individual container preferably of clear plastic. The container shall be completely closed and provided with an acid spray preventing ventilation plug. The number of cells shall be selected, to prevent that the battery voltage does exceed 110% of rated voltage during the float charging. Bolted or welded interconnections between the cells shall be provided.

3.11.10 Tests

3.11.10.1 General

The testing shall be performed in accordance with the IEC recommendations for the actual equipment.

The testing shall consist of a complete functional test and a technical test to verify significant technical specifications.

The test plans and test specifications for both the factory tests and the site tests shall be presented to the Employer and approved by him in due time before the actual test shall be performed. The Employer shall be entitled to witness all the factory tests.

All test results shall likewise be presented to the Employer for approval.

3.11.10.2 Factory Tests

Works tests shall include electrical and mechanical tests in accordance with the relevant Standards and in addition, any tests called for by the Employer to ensure that the DG Sets being supplied fulfills the requirements of these Specifications.

The following Factory tests shall be performed:

- Routine tests shall be made on each unit of all equipment.

Factory acceptance Test Program:

- Full load heat run to determine temperature
- Test run for the diesel generating units on variable loads at nominal speed, duration three hours.
- 1 hour with 10 % overload
- 1 hour with 75 % load
- 1 hour with 50 % load
- 15 min. with 10 % load

The following parameters shall be measured and recorded:

- Speed in RPM and frequency in Hz.
- Voltage and frequency variations under stated conditions
- Routine no load tests

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

After acceptance the engine water cooling system shall be drained prior to packing for shipment.

Type test certificates shall be supplied by the manufacturer if required.

3.11.10.3 Site Tests, Commissioning and Test on Completion

Final functional and operational tests shall be carried out after the erection on Site.

Site Test Program:

- Visual Inspection
- Check of cabling
- Adjustment of CB settings
- Start-up of Diesel Engine
- ½ hour no load test run
- Generator on load tests
- Checking temperature of cooling system
- Insulation resistance tests
- Continuity tests,
- Rotational tests on all motors,
- Tests to prove correct operation of interlocks, starting, tripping and closing circuits, indication, etc.
- Synchronising tests,
- Operation of all protective gear circuits by primary and secondary injection,
- Protection gear timing test as may be necessary,
- Operation of alarm devices, and
- Interface tests of powerhouse EDG with PCS.
- Noise measurement test

3.11.10.4 Spare Parts, Maintenance Equipment and Tools

Spare parts mentioned herein are the minimum required. Any other necessary spare parts for maintenance of the equipment shall be provided by the Contractor.

Table 3-24 Spare Parts

Description	Unit	Qty.
Piston complete with rings each type.	Set	2
Piston ring sets each type	Set	2
Big end bearings each type	Set	1
Small end bearings each type	Set	1
Main bearings each type	Set	2
Fuel injectors each type	Set	2
Injector nozzles and needles each type	Set	2
Fuel high pressure pipes	Set	2
Cylinder head gasket each type	Set	2
Connecting rod complete each type	Set	2

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Description	Unit	Qty.
Oil seals each type	Set	1
Carbon brushes each type	Set	1
Maintenance Equipment		
Tools as recommended by the contractor for complete dismantling, assembly and maintenance of diesel generating unit. The tools shall be delivered with a tool cabinet.	Lot	1
Spare parts and consumables according to the recommendations of the manufacturer for 2000 hours of operation.	Lot	1
Consumable items such as filter, oils, etc. for 2-years of operation	Lot	2

3.12 ELECTRICAL AND INSTRUMENTATION WORKSHOP

The Powerhouse will be provided with an Electrical Workshop. The scope of work will comprise the following:

- One (01) operation, maintenance and spare part management system, complete with all accessories
- One (01) lot of work benches, tool cabinets and chairs suitable for industrial maintenance activities
- One (01) lot of standard tools and instruments for Electrical & Instrumentation Workshop.

The proposed equipment, machines and tools will be appropriate to carry out all necessary electrical and related mechanical works for repair and maintenance of the Powerhouse electrical equipment. The Contractor shall submit a detailed list and technical specifications of all workshop equipment, tools and instruments for review and approval by the Employer prior to procurement.

The Contractor shall be responsible for delivery, installation, commissioning and demonstration of the workshop facilities, including training of Employer's personnel where required.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

SECTION 4 PLANT CONTROL AND INSTRUMENTATION SYSTEM

4.1 GENERAL

The Contractor shall undertake the design, manufacture, works testing, delivery, erection, site testing and commissioning of the Control and Instrumentation (C&I) systems required for the control, alarm and protection of the power plant to satisfy requirements described in this specification and as required to complete the installation. The rules of good engineering practice and the relevant approved standards and regulations shall be observed.

The systems shall be so designed that in the event of subsequent modifications to the controls and associated signal processing, expansion of the system is convenient and straightforward.

The Contractor shall develop the detailed specification for the protection systems throughout the plant in accordance with IEC 61508 and IEC 61511. Protection functions that fall out with the scope of the above standards shall be highlighted to the Employer and designed according to good industry practice, employing redundancy to achieve reliable operation.

The Contractor shall be responsible for the supply of the complete Plant Control System including all necessary hardware, software and services that are needed to complete the systems.

The Contractor shall provide as part of the system documentation any required software licenses necessary for the Employer's perpetual, unrestricted use and application of the equipment supplied by the Contractor.

4.2 STANDARDS AND CODES

The control and instrumentation equipment supplied by the Contractor shall be designed, specified, selected, installed, commissioned or operated according to the applicable requirements of the latest edition of the following international standards:

Subject	Standard
Programmable controllers	IEC 61131
Controllers with analogue signals for use in industrial process control systems	IEC 60546
Electrical measuring transducers for converting A.C. and D.C. electrical quantities to analogue or digital signals	IEC 60688
Transmitters for use in industrial-process control systems	IEC 60770
Thermocouples	IEC 60584
Pressure Measurement Instruments and Apparatus	ASME PTC 19.2
Temperature Measurement Instruments and Apparatus	ASME PTC 19.3
Flow Measurement	ASME PTC 19.5
Preparation of function charts for control systems	IEC 60848
Electromagnetic compatibility for industrial-process measurement and control equipment	IEC 61000-4
IEC Safety Handbook containing all basic safety standards	IEC Safety
Functional safety of electrical/electronic/programmable electronic safety-related systems	IEC 61508
Functional Safety: Safety instrumented systems for the process industry sector	IEC 61511
National Electrical Code	NFPA 70

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

National Fire Alarm and Signaling Code	NFPA 72
Degrees of protection provided by enclosures (IP Code)	IEC 60529
Annunciator sequences and specifications	ANSI/ISA S18.1
Management of Alarm Systems	ANSI/ISA S18.2
Process measurement control functions and instrumentation – Symbolic representation	ISO 3511-1
Definition, specification, and analysis of systems used for SCADA and automation systems	IEEE C37.1
Standard for Surge Withstand Capability (SWC) Tests for Relays and Relay Systems associated with Electric Power Apparatus	IEEE C37.90.1
Tele-control Equipment and Systems	IEC 60870
Information technology – Telecommunications and information exchange between systems	ISO/IEC TR 11802
Industrial communication networks – Fieldbus specifications	BS EN 61158
HART Communication Protocol Specifications	HCF-SPEC-11, 13, and others
Instrumentation symbols and identification	ISA S5.1
Graphic symbols for distributed control/shared display instrumentation logic and computer systems	ANSI/ISA S5.3
Unique identification in power plants and related facilities – principles and definitions, recommended practice	IEEE 803
KKS Application Explanations for Hydro Power Plants	VGB-B106
Function-related Documentation of Power Plant Instrumentation and Control in line with Operating Requirements	VGB-R 170
Tests for electric cables under fire conditions	IEC 60331-111 & 21
Low-voltage switchgear and control gear assemblies	IEC 61439

4.3 SCOPE

This section specifies the detailed requirements for the design, manufacture, factory testing, erection, site testing and commissioning of a modern state-of-the-art Plant Control System (PCS) for Powerhouse.

The PCS shall principally be composed of the following systems, components and ancillaries not being limited to:

- Two (2) operator workstations with double LED monitors and alarm printers;
- Two (2) LCD large screen displays with controller;
- One (1) fire detection and alarm panel with printer;
- One (1) metering station;
- One (1) archiving system for long term and spontaneous data archiving;
- One (1) training and simulation station with LED type double monitor and printer;
- One (1) Engineering Workstation with LED type double-monitors and laser color printers;
- One (1) interface with firewall to Office LAN and Web Client for remote access;
- One (1) redundant GPS master clock system with interface to secondary system;
- One (1) redundant SCADA gateway to Substation Automation System (SAS);

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- One (1) Portable Service Station;
- One (1) redundant fibre optic main Gigabit bus system according to IEC 60870-5-104;
- Three (3) unit local control panels (ULCPs) with field-bus interfaces to sub-controllers and monitors;
- One (1) station auxiliary LCU;
- One (1) lot of RTU(s) for the intake/weir gates and water level measurement monitoring;
- One (1) set of furniture for the CCR.

4.4 DOCUMENTATION

For this particular control system, the Contractor shall submit complete system documentation with service manuals and fault detection and rectification procedures for all control system equipment, including computer equipment and associated hardware furnished by him.

The Contractor shall also include complete software documentation including software and hardware manuals.

The operation and maintenance manual shall as a minimum contain the following:

- Technical specifications, covering the most important technical specifications of the control system equipment and associated hardware, with any reference data for data storage, processing, and any other data, the user might need during day-to-day operation.
- Block diagrams showing all major modules incorporated in the control system.
- General system description of all control system equipment and major modules, and particularly covering modules affecting the man-machine interrelationship.
- Operating instructions covering all system functions, such as start-up procedures, back-up procedures, system services management, printer operation etc.
- Instructions for routine maintenance and user's first-aid actions, such as replacing printer ribbons etc., identification of faulty equipment and patching in or transferring operation to stand-by units or modules.
- General system description of all main modules and operating features of the various systems.
- Short-form descriptions and tables of syntax and contents of the various software program modules, the operating system and any programming languages included.

4.5 FUNCTIONAL REQUIREMENTS

The actual implementation of the plant control system shall be proposed by the Contractor in the Basic Design. Control and operation of the power station shall include:

- Automated Plant Control System (PCS) at powerhouse Central Control Room.
- Backup control at bay/unit level.
- Auxiliary control at device level.
- Interface to the Substation Automation System (SAS), transmitting and receiving data to meet the requirements of the remote load dispatch centre
- Remote control / communication between Plant Control System (PCS) and superior remote-control system (Regional Control Centre).

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

On each level it shall be possible to either select the level, thereby blocking operation from higher levels, or refer operation to the higher level.

The PCS shall include provisions for:

- Powerhouse Control and Protection.
- Generator Control and Protection.
- Transformer Control and Protection.
- Turbine Protection.
- Regulators.
- Metering.

4.5.1 Plant Control System (PCS)

The plant control system (PCS) shall be of the programmable distributed digital type with LED type VDUs and work stations, which are interconnected upon a duplicated data highway (fiber optic). The power plant shall be monitored by utilizing computers, with integrated control and monitoring of main equipment in the whole powerhouse achieved via operator workstations in the central control room.

Separate duplicated processors shall be provided for the turbine generator units, the switchyard equipment, station auxiliaries and water level measuring equipment. For the overall control and monitoring of the entire power plant, a modern state-of-the art microprocessor-based control system shall be delivered. The capacity of the systems shall be designed to handle future extensions. The main man-machine interface point is the central control room of the powerhouse.

The control system shall have the following salient features:

- Local control of the individual components and systems
- Manual and automatic control from the unit control boards of each unit
- Automatic and restricted manual control from the plant control room
- Interface for tele-control from a Regional Load Dispatch Centre

A central control room shall be provided in the powerhouse for the installation of plant control system equipment. The proposed control features shall allow the operation and supervision of the entire plant including the switchyard from the control room.

The equipment in the central control room shall include two operator workstations, one engineering workstation, servers, large screens display units, printers, UPS power supply, GPS clock system, tele-control gateway, network devices etc. The operator workstations shall mainly be used to complete operation automation and management of the whole powerhouse, including filing, classification, retrieval and management of historical data, generation and printing of operation report, as well as the function of man-machine interface, i.e., real-time supervision and control of equipment operation in the power plant. Two workstations work as mutual hot standby and interlock when operating. The engineering workstation shall be used to complete maintenance of the computer monitoring system and software development. A portable workstation shall be provided for routing maintenance and debugging of the plant control system (PCS) in the power plant.

The tele-control gateway shall be responsible for communication with Regional Load Dispatch Center (future provision).

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

The main components of the central control room shall comprise the following control depth for the control and indication of:

- The generators, transformers, switchgears along with two large screen displays (LSD) behind the desk, with indicators showing the position of circuit breakers, disconnect switches and earth switches, etc.
- A turbine generator control equipment for the control and monitoring of generating units. The LSD shall provide a pictorial indication of the unit control system.
- 11 kV and low voltage (400V) auxiliary systems supplying the auxiliary services in the powerhouse.
- Engineering workstation and operator work stations, provided with two LED type video display units (VDUs), for control, monitoring and display of various functions.
- One sequential events recorder and printers to both operator and engineering workstation consoles.
- Remote terminal units and interface cabinets for the SCADA equipment.
- Provision for a supervisory control and data acquisition (SCADA) system shall also be made for providing future interlinking with Regional Load Dispatch Centre (future provision).

4.5.2 Local Control Units (LCUs)

The local control for the turbine generator units and station auxiliaries shall be located beside each individual piece of controlled equipment. Remote controls of all these equipment shall be carried out from the respective suite of control desk in the power house control room. Remote IOs/RTUs shall be provided for water level monitoring.

4.5.3 Training Simulator

An off-line dynamic training simulator shall be included to provide in-plant training to the operators and to simulate the effects of normal incidents, e.g., load rejection etc.

4.6 CONTROL LEVELS

4.6.1 The Plant Control Level

A computerized Plant Control System (PCS) for the supervisory control of the Power plant. The Plant Control System monitors and controls the complete power plant and covers the generating units in the powerhouse, auxiliary systems including the 11 kV and 400V switchgears and the water level monitoring at weir/intake, tailrace areas and control of intake ate operation. The PCS is located in the Central Control Room.

4.6.2 The Local Control Level

A Digital Local Control Unit (LCU) with local touch panel shall be provide, one for each generating unit and one for the auxiliary systems. Remote IOs/RTUs shall also be provided for water level monitoring at weir/intake and tailrace areas. The protection relays shall be part of the unit control system but operationally independent from the local computer.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

4.6.3 The Manual Control Level

Manual operation from the object control board and Emergency Stop from separate, independent panels.

In addition to the plant control, local and manual control level, the interface of communication in plant shall be equipped for remote control / communication. On each level it shall be possible to either select the level, thereby blocking operation from higher levels, or refer operation to the higher level.

The redundancy for programmable logical controllers at each level shall be provided.

4.7 DESCRIPTION OF EQUIPMENT

4.7.1 Plant Control System (PCS)

For the overall control and monitoring of the entire power plant complex, a computerized Plant Control System (PCS) shall be delivered, as main system for the complete power plant and associated switchyard.

Plant Control system shall have the following functions:

- Data acquisition functions
- Recording system
- Time synchronization and time tagging system
- Blocking of information
- Acknowledging of information
- Command procedure
- Regulating commands and set-point commands
- Data security-and consistency
- Personnel admission security to the system
- On-line change of data
- On-line trends
- Long-term trends
- kWh calculations, production plants etc.
- Self-diagnosis
- Blocking facilities to protect all software against virus infection
- Full graphic picture building
- Software and licenses for system configuration
- Software and licenses for system maintenance

4.7.2 Local Control Units (LCUs)

Computerized LCUs based on programmable logic controllers (PLC) shall be installed in cabinets with process interface, protection relays and a touch panel. The unit shall be autonomous.

The LCUs shall as a minimum comprise the following equipment:

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- Cabinets for the equipment
- Programmable logical controller (with necessary remote input/output units).
- Software as required
- Local control panel
- Measuring converters
- Signal interface equipment
- Communication Interface
- D.C. power and control voltage distribution
- Double uninterruptible internal D.C. power supply unit
- Meters with pulse contact output
- Indication and analogue Instruments
- Touch Panel
- Synchronization Device
- The programmable logical controllers (PLC) shall be capable of controlling and monitoring the following functions:
- Start and stop sequences of the generating unit
- Synchronization
- Transfer of set point values to the voltage controller, the water level controller and to the turbine governor
- Power set point to the turbine governor
- Monitoring temperatures for the generating unit
- Monitoring the operational values of the generating unit
- Local time tagging of all indications and alarms
- Alarm annunciator system
- Controlling the auxiliary feeders for the generating unit subsystems
- Communication towards the plant control system
- Automatic change over between station service transformers and emergency backup power.
- Water level monitoring

4.7.3 Communication System

The main communication buses of the Plant Control System shall be of optical fiber. The data communication system for the LCUs shall be arranged as dual optic fiber network.

4.7.4 Power Supply Systems

An uninterruptible Power Supply System (UPS) shall be used for essential A.C Power to the communication and plant computer control system (PCS). The UPS system shall be online type and equipped with its own batteries. The primary supply feed shall be from the AC

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

distribution System with the backup power from batteries/UPS being made available through a rapid acting (¼ cycle) Static Transfer Switch (STS).

The 400 V TN-S system via an A.C/D.C/A.C, converter shall supply the PCS with necessary battery backup for operation of the PCS system for at least 90 minutes.

The LCUs shall also be supplied by the 220 VDC systems. Other voltages used shall be supplied from internal supplies inside LCUs. All internal power supplies shall be 100% redundant systems/back-up.

4.7.5 GPS Clock System

The PCS requires exact time at most of the distributed stations so as to apply time stamps accurately or to schedule time-dependent procedures. The scope comprises a complete functional clock system, including installation, cabling, commissioning and acceptance tests and shall not be limited to the following equipment:

- Clock system mounted in a free-standing cubicle
- Cable distribution system with junction terminals
- Differential frequency/ time indicator with automatic and manual adjuster in the control panel
- Antenna for receiving of international time signal (GPS) to adjust the clock automatically

The digital clock system shall have provision for time stamping of events and this time stamp shall have a resolution of 2 ms or better. The system clock used as a basis for time stamps shall be synchronized by the GPS system to give an absolute accuracy of time stamps of better than 1ms. The clock shall be equipped with the antenna and system interface module. The antenna shall be mounted on an adequate position.

4.7.6 Connection to the Regional Control Centre

The plant shall be capable for remote control / communications between PCS and superior remote-control system.

4.8 DESCRIPTION OF OPERATION

4.8.1 Start and Stop of the Generating Units

Start Mode 1: Automatic Start

Normal-start, fully automatic, with automatic synchronizing to the grid. This sequence shall be initiated manually either from the Plant Control System (PCS) or from the relevant LCU.

Start Mode 2: Semi-automatic Start

Automatic start sequences up to unit running, not-energized and at rated speed. Energizing and synchronizing can then be selected Automatic or Manual. This sequence shall also be initiated manually either from the Plant Control System (PCS) or from the relevant LCU.

The PCS shall be programmed for the following:

- Verify that the unit is in a condition to start i.e., no alarms up, spiral case pressure established, generator brakes off, electrical supplies established, governor and excitation systems healthy etc.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- Start turbine, generator and transformer auxiliaries such as cooling water, governor pumps, thrust bearing pumps etc.
- Conduct all turbine, generator, transformer and switchgear pre-start checks to ensure that auxiliaries have started and supplies are established.
- Instruct the digital governor to run up the unit.
- Stop the thrust bearing oil pumps at a pre-set speed.
- Start the excitation system at a pre-set speed.
- Accept a ready to synchronize and voltage matched signal from the digital governor and AVR respectively.
- For start mode 1, continue on to close the generator circuit-breaker and load. For start mode 2, give a "Ready to Synchronize" signal then wait at speed no load for the signal to synchronize and load.

Check for excess starting time to online operation and alarm and shut down if excessive. In the case of start mode 2 the check shall be done in two stages i.e., to speed no load and to on line operation.

4.8.2 Control Functions during Generation

During generation the PCS shall:

- Give operator initiated set points to the digital governor for generator active power (MW) or Turbine flow (m3/s)
- The choice of parameter for set point control shall be selected from the PCS and correspondingly changed in the digital governor.
- Give operator initiated set points to the generator excitation system for MVArs.
- Monitor unit operation.

4.8.3 Stop Logic

The PCS shall:

- Instruct the digital governor to lower power in accordance with the pre-set unloading rule established within the governor.
- Open the generator circuit-breaker at a pre-set power.
- Close the guide vane to their fully closed position.
- Start the thrust bearing oil pumps at a pre-set speed.
- Apply the generator brakes at a pre-set speed.
- Stop the thrust bearing oil pumps at a pre-set time after dead stop.
- Release the generator brakes at a pre-set time.
- After a pre-set period, turn off turbine, generator and transformer auxiliaries such as cooling water and governor pumps.
- Activate the unit creep detection system.
- Check for excess stopping time and alarm and trip if excessive.

4.8.4 Unit Shutdown

There are six (6) shutdown modes as follows:

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

T1 - Rapid Shut Down for Mechanical Faults

Conditions

- High bearing temperature
- Vibration trips
- Low oil levels etc.

Actions

- Guide vane close at rapid rate via rapid close signal to governor electro-hydraulic valve
- At zero power, generator circuit-breaker is tripped

T2 - Rapid Shut Down for Electrical Faults

Conditions

- Electrical protection operates

Actions

- Generator circuit-breaker is tripped, and
- Guide vane close at rapid rate via rapid close signal to governor electro-hydraulic valve

T3 - Partial Shut Down

Conditions

- Load rejection
- 132kVcircuit-breaker trip
- Unit over-speeds

Actions

- Generator circuit-breaker is tripped, and
- Guide vane fast run down to speed no load conditions via rapid close signal to governor electro-hydraulic valve

T4 - Rapid Shut Down with Release of Water

Conditions

- Fire or high air temperature sensed in the generator
- Generator differential protection operates
- Generator inter-turn protection operates

Actions

- Generator circuit-breaker is tripped, and
- Guide vane close at rapid rate via rapid close signal to governor electro-hydraulic valve

T5 - Emergency Shut Down

Conditions

- Unit over-speed indicated by electrical over-speed sensors
- Low governor oil pressure or level
- Emergency shut down push-button operated

Actions

- Generator circuit-breaker is tripped

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- Emergency shut down solenoid activated and guide vane close at rapid rate
- Inlet valve emergency close

T6 - Mechanical Over-speed

Conditions

- Over-speed above the electrical speed sensing

Actions

- Mechanical over-speed device operates hydraulic shut down valve
- Generator circuit-breaker is tripped
- Needle Valves close at maximum rate
- Inlet valve close

The shut downs shall be executed via the unit protection system with the PCS used as a back-up.

4.8.5 Control Functions Whilst the Unit is at Standstill

Whilst the unit is at standstill the PCS shall accept a unit creeping signal from the digital governor and, if creep is detected, start thrust bearing oil injection pump and apply the generator brakes.

4.9 TECHNICAL REQUIREMENTS

4.9.1 Plant Control System

The Plant control System (PCS) shall be complete with all necessary technical facilities for communication with the lower-level Unit control systems.

All data storage media and software shall be checked for inherent faults and virus before delivery, and shall be guaranteed error-free.

All equipment shall be of modular design. Major units such as services, primary memory modules, I/O ports, hard disk drives, peripherals controllers, internal power supplies etc., shall be easily serviceable and replaceable modules or parts of such modules.

The control system shall satisfy the response time criteria stipulated below:

Time to bring up new mimic diagram on workstation display, with all dynamic information displayed as stored in the computer databases:

Maximum [1] second

Time to regenerate the total information for the station by updating all databases with the total signal information from all LCUs:

Maximum [2] seconds

In the above time response requirements, any time required for the transfer of the necessary information between the LCUs and PCS, shall be included in the stated maximum time response limits. The response time of the displays shall not be significantly affected by any amount of communication between any units, not relevant to the information in the actual display.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Under normal conditions there shall be no need for personnel supervision beside normal (routine) maintenance.

Any alarm condition reported, whether critical or non-critical for the operation of the power station, shall generate an audible and a visual alarm signal to alert the operators.

For test purposes and control of operation, and in case of failure of any equipment, it shall be possible from the PCS to change limit values, set point values, alarms and commands in any LCU without affecting the system.

No fault in the PCS shall interrupt or affect the operation of the power station.

Backup copying and program maintenance shall be possible without interfering with the actual operation of the control systems.

4.9.2 Firewall System

For the interconnection between the SCADA/DMS/ HMI and other networks, a firewall system shall be used. The purpose of this firewall system is to provide an additional layer of security (in addition to the access control mechanisms provided by the SCADA/DMS/HMI software) for the SCADA/DMS/HMI network.

By default, the firewall shall deny any network traffic from other networks destined to the SCADA/DMS/HMI network. Only traffic explicitly allowed in the firewall configuration shall pass the firewall.

The firewall system shall monitor the state of all established connections and shall automatically update its internal connection table accordingly.

There shall be one network interface connected to the SCADA/DMS/HMI. For every interconnection to other networks, one additional interface shall be used. There shall not be more than one network connected to one firewall interface.

The Proposer shall provide a detailed specification of his proposed firewall system with his offer. The Proposer shall state how many network interfaces may be installed in his proposed firewall system.

The Proposer shall define and implement a logging scheme which keeps track of all denied attempts of access to the SCADA/DMS LAN. Firewall system

4.9.3 Software Functions

The software functions shall be decided during the detailed design phase and shall be subject to the approval of the Employer.

The plant control system software/hardware technical support and spares availability for at least fifteen (15) years, shall be provided by the contractor.

4.9.4 Data Acquisition and HMI Functions

The Control System Software shall include all normal Data Acquisition- and HMI- software function such as:

- Data acquisition from all LCU’s, including status signals, fault signals, analogue
- measurements, etc.
- Transferring commands and control outputs to the LCU.
- Alarm handling and event recording.
- Dynamic coloring

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- Dynamic presentation of the start/stop sequence for each generator set.
- Database functions for storage of momentary status, fault and measurement information and for long–time storage of measurement data for historical analysis, for trend-displays and for storage of production data, for periodical reports. Information for the last thirty (30) days shall be stored in the server memory. Long-term storage shall be stored on appropriate equipment.
- Status reports, measurement reports and production reports, etc. The reports shall be automatically presented at pre-defined times or manually initiated by the operator.
- Energy Recording Scheme:
- All individual kWh and kVArh reading for meters “kWh/kVArh meters” shall be presented on operator's request in addition, the following energy records shall be computed:
    i. Total gross production for the power plant
    ii. Total net production on outgoing transmission lines
    iii. Station consumption
- kWh production reports shall be presented automatically at pre-defined times or manually at the initiative of the operator. The kWh-reports shall present production values for each generation unit, each out-going line and computed records as above with following reports:
    i. Daily reports of hourly production values, including lowest and highest hourly value (with time identification) and average over the day.
    ii. Weekly reports of daily averages, including lowest and highest hourly value (with data and time identification) in the week.
    iii. Monthly reports of daily averages, including lowest and highest daily average and lowest and highest hourly value (with data and time identification) in the month.
    iv. Yearly reports of monthly average, including lowest and highest daily average and lowest and highest hourly value (with data and time identification) in the year.
- In the case of lost data due to faults in the acquisition system or any other faults the missing data the Supplier shall propose a replacing strategy. The software shall perform any recalculations required to correct erroneous data in the weekly, monthly and yearly reports.
- Provision shall be made for Energy Recording System.

4.9.5 Operation Software Implementation

The control system software shall be extended with the following applications:

- Water flow calculations.
- Joint active and/or reactive power output control, either separately according to pre-set values, or related in a percent relationship.
- Scheduled operation, where the total (active and/or reactive) power output from the station is set to automatically follow a pre-defined schedule, including start and stop of units.
- The I/O signal should cover at least the following:
    i. All breakers and isolators (open/close)
    ii. Breaker fault alarm

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

iii. Transformer fault alarm
iv. Telecommunication fault alarm
v. Transformer MW/MVAr
vi. Line MW/MVAr
vii. Generator MW/MVAr
viii. Busbar voltage
ix. Frequency
x. Tap-change position of transformers
xi. Fire Alarm and Detection, Fire Fighting System I/O.
xii. Drainage and Dewatering System I/O.
xiii. Compressed Air System I/O.
xiv. Cooling water System I/O.
xv. Flow Measurement I/O.
xvi. Battery Charger and UPS, I/O.
xvii. DG Set I/O.
xviii. 132kV Switchgear I/O.
xix. Power Intake Gates and Trash Rack, I/O.
xx. Protection System I/O.
xxi. Turbine and Governors related I/O.
xxii. Water Level Measurement I/O.
xxiii. weir site equipment's I/O etc.

- The system should be complete in all respects to meet all operational requirements.

4.9.6 Generating Units (LCUs)

The LCUs for the generating units shall as a minimum comprise the following equipment:

- Cabinets for the equipment
- Programmable logical controller (with necessary remote input/output units, Remote I/0)
- Software as required
- Local control panel
- Measuring converters (if necessary)
- Signal interface equipment
- Communication Interface
- DC power and control voltage distribution
- Double uninterruptible internal DC power supply unit
- kWh meter with pulse contact output

Indication and programmable controllers analogue Instruments:

- Generator voltage each phase with selector switch
- HV busbar voltages
- Generator speed
- Frequency
- Active and reactive power

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- Phase currents
- Excitation current
- Excitation voltage
- Turbine stroke limiter
- Turbine guide vane
- Generator circuit breaker (open/closed)
- HV circuit breaker (open/closed)
- Excitation AC circuit breaker (open/closed)
- Excitation DC circuit breaker (open/closed)
- Inlet valve position (open/closed)
- Lamp for activated start sequence
- Lamp for stop sequence

Alphanumeric display showing all the same time:

- Alarms
- Temperatures
- Water Levels
- Speed Droop
- Voltage Droop
- Control equipment:
- Remote/Local operation selector switch
- Start mode selector
- Start push-button
- Stop push-button
- Emergency stop push-button with cover to avoid unintended operation
- Active power adjustment (increase/decrease)
- Voltage adjustment (raise/lower)
- Socket for portable synchronizing unit

The programmable logic controller (PLC) shall be capable of controlling the following functions:

- Start and stop sequences of the generating unit
- Synchronization
- Transfer of set point values to the voltage controller, the water level controller and to the turbine governor
- Power set point to the turbine governor
- Monitoring temperatures for the generating
- unit Monitoring the operational values of the
- generating unit Local time tagging of all
- indications and alarms
- Alarm annunciator system
- Local panel for manual control
- Controlling the Motor Control Centre (MCC) for the generating unit subsystems
- Communication towards the plant control system'

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

The Contractor can modify the above panels as per their scheme, but the scheme shall be submitted to the Employer for the approval.

4.9.7 Auxiliary Systems (LCU)

The LCU shall supervise the auxiliary power supply and in addition to this, LCU shall also supervise the drainage pumps, ventilation system, the cooling water pumps, firefighting water pumps, lighting and small power etc.

The LCU shall supervise the powerhouse station power supply system and provide automatic switching to the available power sources according to agreed priority schedule.

The LCU shall cover the 11 kV and 400 V distribution systems for common subsystems of all the generating units of Power House.

The LCU shall generate an automatic startup of the powerhouse diesel generating unit in case of a power supply failure for the station power system.

The control of the MV (11 kV) switchgear (all circuit breakers) and LV (400 V) switchgear (Incoming & bus coupler breakers only) shall be carried out through PCS via operator workstations in the central control room (CCR) or from local points at the switchboards. However, the status of all circuit breakers of both MV and LV switchgears along with the bus voltages shall be displayed at the Operator workstations in the central control room. The LCU(s) shall be delivered and installed in cabinets with process interface.

The programmable logical controller shall be capable of controlling the following functions as a minimum:

- Open / Close Control of all 11 kV Circuit Breakers.
- Open / Close Control of all 400 V incoming and bus coupler circuit breakers on all the LV switchgear.
- Control and monitoring of plant auxiliary systems i.e. Drainage pumps, dewatering pumps, ventilation system, the cooling water pumps, firefighting water pumps, lighting and small power etc.
- Communication towards Plant Control System

4.9.8 Communications between Powerhouse and 132 kV Switchyard

Communication signaling is required between the powerhouse and the 132kV switchyard area. This shall be carried out using fiber-optic cable connecting the powerhouse to the switchyard. The SAS of the 132 kV switchyard shall be interconnected with the PCS by an optical fiber communication link through protocol converter.

4.9.9 Water Level Measurement

Water level monitoring system shall be provided at intake, weir and tailrace areas to monitor the water levels in these areas. Redundant water level transmitters shall be installed at each point. The water level measuring instruments shall be digital displayed with at least two decimals. Redundant remote I/Os shall be provided to interface water level measuring equipment with PCS. This water level measuring equipment shall be interfaced with PCS via remote I/Os connected to PCS and displayed on the large screen display in CCR.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

4.10 CONTROL ROOM EQUIPMENT

The Control System shall be a standard system or at least be based on a standard system, from an internationally well recognized Supplier. The computers shall be from an internationally recognized Vendor such as DELL, IBM, HP, DEC, SUN or equivalent.

The supply shall include all equipment, which is deemed necessary to follow the process and the layout of control system. It shall include all interconnections (interfaces) to other systems of the plant and relevant cabling.

The following equipment shall be provided, as a minimum, in the CCR:

One main control console including the following equipment;

- Two (02) Operator Workstations including:

  Two (02) 21inch color VDU (LED) monitoring screens
  Operator station electronics
  One operator keyboard
  One operator keypad
  One optical mouse
  One graphic display driver
  One A4 laser printer

- One (01) Engineering / Operator Workstation including:

  Two (02) 21 inch color VDU (LED) monitoring screens
  Operator station electronics
  One operator keyboard
  One operator keypad
  One optical mouse
  One graphic display driver
  One A4 laser printer
  One A3 color laser printer

- One portable workstation
- One alarm printer with pedestal
- Historical data archival and retrieval station
- Two 70'' Inch (Minimum) Large Screen Display.

Alarm history displays and audible alarms for each priority shall be provided. Printer failures shall be alarmed.

Centralized fire alarm system shall also be installed in the CCR.

Following furniture shall be provided as a minimum in the CCR:

- control desks
- cubicles for withdrawable connections
- Six (06) operator adjustable and movable arm chairs

4.11 PACKING AND SHIPMENT PREPARATION

Prior to shipment, all shipping stops, bolts, ties etc. shall be installed in cabinets and devices. The Contractor shall install additional protection as required to prevent damage during

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

shipping. Any delicate modules or circuit boards shall be disconnected, packed and shipped to the site to be remounted by the Contractor's field personnel. All accessories, mounting devices and packing lists shall be packed and shipped with the equipment.

Each separately shipped group of equipment shall be prepared as an individual shipping unit and shall be braced adequately and rigidly so that no damage shall occur in transit, lifting or installation. Provisions shall be made for lifting and skidding. All lifting points shall be clearly marked. All temporary bracing shall be bolted so that no cutting torches shall be required for field installation. Disconnected wiring shall be properly supported. The equipment shall be adequately protected against the weather and mechanical damage during transit and storage.

4.12 TESTS

4.12.1 General

The testing shall be performed in accordance with the IEC recommendations for the actual equipment.

The testing shall consist of a complete functional test and a technical test to verify significant technical specifications.

The test plans and test specifications for both the factory tests and the site tests shall be presented to the Employer and approved by him in due time before the actual test shall be performed.

All test results shall likewise be presented to the Employer for approval.

4.12.2 Factory Tests

The Contractor shall perform comprehensive functional tests for all equipment according to a predefined schedule, suggested by the Contractor and approved by the Employer.

The Employer shall be entitled to witness all the factory tests. The test shall be on the assembled system with the communication system.

4.12.3 Site Tests, Commissioning and Test on Completion

The Contractor shall perform comprehensive functional tests for all equipment according to a predefined schedule, suggested by the Contractor and approved by the Employer.

4.13 SPARE PARTS, MAINTENANCE EQUIPMENT AND TOOLS

Table 4-1: Spare parts maintenance equipment and tools

Sr. No.	Description	Unit	Qty
01	Operator station computer with monitor, fully configured	Nos.	1
02	Redundant main server core components, fully configured	Set	1
03	PLC processor modules for each PLC used	Set	2
04	PLC communication interface modules of each type used	Set	2
05	PLC power supply modules of each type used	Set	2
06	Digital and Analogue I/O modules of each type used	Set	2
07	Panel mounted HMI monitors	Set	2

07	Bit error rate test equipment (for serial lines).	No.	1
08	Frequency counter/time measurement meter (frequency to min 100 MHz, time periods with 10 ns resolution or better, for portable and bench use).	No.	1
09	Digital tracer kit (including pulse injector and logic probe).	Nos.	2

PUBLIC PROCUREMENT REGULATORY AUTHORITY (PPRA) EPADS

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

SECTION 5 PLANT TELECOMMUNICATION EQUIPMENT

5.1 TELEPHONE SYSTEM (EPABX)

5.1.1 Scope of Work

The Digital telephone exchange shall be modular in design. The system shall also have provision to be upgradable to IP telephone network. The system shall be extended to the Switchyard and sufficient number of subscribers shall be provided. Additionally, this system shall be connected to the PAX system of switchyard/substation.

The proposed Telephone System shall comprise the following equipment but not limited to the following;

- Main Distribution Frame
- Main Telephone Junction Box
- Digital Telephone exchange
- Main power supply system
- Back-up power supply system
- Digital Telephone sets
- Analogue Telephone sets
- All interconnecting cables, terminations, protection devices
- All other required accessories

5.1.1.1 Technical Requirements

A. General

The EPABX shall be state-of-the-art, digital, non-blocking type utilizing Pulse Code Modulation (PCM) and Time Division Multiplexing (TDM) and Stored program Control (SPC). It shall be field proven and conform to ITU-T A-Law Companding standard. It shall at least be equipped with 64 subscriber lines and 08 trunk lines. The system shall allow simultaneous voice and data communication over one twisted pair telephone cable.

The system shall be able to operate in the following environmental operating conditions:

Temperature	10 to 50°C
Humidity	5 to 95 %

The various types of interface circuits required are as follows:

Analogue Extension:	Two wire Dual Tone Multi-frequency (DTMF) according to ITU-TQ.23
Analogue Trunk:	In accordance with PTA standard
Digital Trunk:	2 Mbit/sec (comprising 10 digital trunks)

The EPABX system shall incorporate a wide range of self-initiating diagnostic routines for the monitoring of system performance and identification of errors.

The proposed EPABX should be configured to handle the following traffic:

0.35 Erlangs per each extension

0.90 Erlangs per each trunk

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Blocking of calls shall be less than one percent under normal operating conditions.

The Contractor shall state the maximum number of simultaneous calls possible within the exchange.

An adequate range of alarm and test facilities shall be provided in the EPABX to enable the maintenance personnel to rapidly access and localize the fault conditions. The facility of remote access of the EPABX for operation and maintenance purposes shall be available.

The EPABX system shall comply with the following interfaces and protocols:

- EURO ISDN BRI & PRI
- ITR6
- Q.931
- QSIG
- DPNSS
- CCS
- V.24/V.25/28/35
- LAP-D

B. Software Features

The system shall have following minimum features:

- Trunk direct inward dialing
- Call data recording
- Malicious call trace
- Night service
- Dial/call by name
- Password for up/down grading of traffic class
- Number redials
- Call forwarding
- Call pickup
- System speed dialing
- Individual speed dialing
- Call back on no answer
- Generation of billing reports
- Call transfer
- Three and eight party conference
- Distinctive ringing
- Timed reminder service
- Hold toggle
- Connection restriction
- Cyclic/linear comfort hunt group
- Class-of-service changeover
- PIN/follow me
- Do not disturb
- Camp-on or camp on security

C. Telephone Sets

i) Desk telephone set

Desk telephone shall be a standard single line push button analogue tone dialling set. The keypad and the dialling from the telephone set shall conform to the ITU-T Q23 standard. It shall be possible to attach a hands-free unit, if required.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

ii) Wall mounted telephone set

Wall mounted telephone shall be a push button analogue tone dialling set designed for installation on the wall only. The keypad and the dialling from the telephone set shall conform to the ITU-T Q23 standard.

iii) Executive telephone sets

Executive telephone shall be a push button tone dialling set with display of at least 2x24 characters to show Names and CLIP, at least 24 programmable memories, digit display, provide full hands-free operation, have programmable function keys with LED indication, support context sensitive features, name dialling and display as well as Message display.

D. Main Distribution Frame (MDF)

The termination frames shall be housed in a self-standing 19" cabinet (separate from the EPABX cubicle) lockable from the outside. The cabinet shall be dust and vermin proof, designed to a protection class of IP54. Provision shall be made to earth the cabinet to the grounding system. The entry of cables shall be from the bottom through suitable glands provided in the plates and care shall be exercised that the glands are tightly closed after the installation of cables.

The connecting blocks shall be of the quick-connect type, each capable of accommodating at least 10 pairs. It shall incorporate over-voltage and over-current protection on all external trunk and subscriber circuits. These protectors shall be either carbon or gas tube type. Access to the connecting blocks shall be from the front. One (1) quick connect tool shall be provided with the MDF cabinet.

E. Power Supply

In the equipment room, the mains voltage supply (230 Volt AC/50Hz) shall be available.

As reserve power, the equipment shall be equipped with a 48 Volt DC reserve system, to provide system operation in the event of a commercial power failure. The battery shall be designed to provide a maximum of eight (8) hours backup. The batteries shall be of sealed maintenance free type, supplied complete with cells, connectors, stand and all accessories.

F. Cabling

All cabling, between the telephone sets and the EPABX and between the EPABX and MDF/communication equipment shall be supplied and installed by the Contractor in trenches/ducts and/or cable trays. The telephone cables shall be multi-pair, twisted and screened with suitable protection against vermin/rodent attack.

5.2 IP PABX TELEPHONE SYSTEM - (PUBLIC TELEPHONE SYSTEM)

5.2.1 Scope of Work

The scope of works shall include supply, Installation, Testing & Commissioning of IP Telephone system with passive work complete with equipment, accessories, tools, labor and all associated work for 100% completion of work. All Proposers shall have to visit the site to take physical dimensions of hoist way, pits overhead and machine room to verify their horizontal / vertical lengths etc. before submission of proposals. The Proposers may raise the queries for any clarification, missing information or ambiguity if any, within one week after issuance of tender documents. Any work to be carried out by the owner / main contractor, should be mentioned clearly along with the Proposal, otherwise no claim against extra work shall be acceptable. Specification, Drawings and BOQ etc. should be read carefully to comply

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

specified loads, serving landings and other general and special safety features. Any deviation from specification / BOQ should be mentioned well in time before submission of Proposal.

The IP Based Telephone System works are to be performed; the requirements given in the Schedule shall be fulfilled. The Contractor shall be responsible and provide the following:

All the Major equipment e.g., Call Manager, Gateway, 19'' rack, IP Phone Executive, Analogue Phone, Server, all Software Licenses shall be provided from the same manufacturer.

- Provide the necessary hardware and software for above System:
- All software packages shall be provided in original installation media along with their licenses
- Preparing an Engineering Design Report covering, at least, the following subsystems:

1) Detailed Drawings for the IP Telephone system showing all areas of the Project.
2) The exact quantities and types of hardware and software required
3) Cable, conduit schedules and routing plan
4) Schematics and interconnection diagrams of complete IP Telephone system showing Telephone system components including Call Manager, Gateway, 19'' rack, IP Phone Executive, Analogue Phone, Server, all Software Licenses and other elements to monitor and control the processes outlined above.
5) Technical details of the hardware and software of the complete systems.
6) Details of any civil works required.
7) Detailed description of the data acquisition software, user configurable functions and software features to be provided.
8) Complete details, brochures and pictures of the proposed area.
9) Installation, testing and commissioning procedures and methodology.

- Procure, transport and deliver equipment and hardware to site, after approval of the above report(s) by the Employer. No payment shall be made without approval of design report.
- Submit Factory Acceptance Test procedures along with Schedule of Time
- Design, Install, test and commission of IP Telephone system in accordance with the procedures given in the engineering design report.
- Provide training to the Employer's personnel.
- Proposer shall submit with his Proposal the following Documents/Data for all system equipment including Call Manager, Gateway, 19'' rack, IP Phone Executive, Analogue Phone, Server, all Software Licenses.
- Brochures and data sheets of each equipment
- Test standards and design
- Backup calculations
- End user certificates
- International Standards Reports/Certificates

5.2.2 Standards

All equipment shall be of imported origin. Materials/Equipment shall be designed, manufactured, tested and installed according to the BS/IEC/ISO/ITU/EN/CE Recommendations. The latest edition and amendments shall apply in all cases. As a minimum, following shall be applied:

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

a. EN 60950-1:2006/A11:2009/A1:2010/A12:2011/A2:2013 Information technology equipment – Safety – Part 1: General requirements.
b. EN 55032:2015 Electromagnetic compatibility of multimedia equipment – Emission requirements.
c. BS EN 61000-3-2:2014: Electromagnetic compatibility (EMC). Limits. Limitation of voltage changes, voltage fluctuations and flicker in public low-voltage supply systems.
d. EN 55024:2011: Information technology equipment. Immunity characteristics. Limits and methods of measurement
e. EN 61000-3-2:2014: Electromagnetic compatibility (EMC). Limits. Limits for harmonic current emissions.

5.2.2.1 General

The IP Telephone system shall be supplied and installed by approved Manufacturer to Employer's approval. The Telephone system is intended to establish efficient communication. The Telephone system shall be suitable for making local, long distance and overseas calls.

IP Based PABX and Telephone System shall have a lifespan of 20+ years with 100%+ output guaranteed.

The proposed Telephone system shall comprise the following equipment but not limited to;

- Hybrid PABX
- Gateways
- Network Switches
- Software's
- Main Distribution Frame
- Main Telephone Junction Box
- Analog Telephone Sets
- IP Executive Telephone sets
- All required accessories

5.2.2.2 Functional Description

5.2.2.2.1 IP PBX Functional Description

The IP PABX shall Supports the built-in voice mailbox service and at least Hybrid IPABX having Capacity 2000 lines Including IP Phone Executive, Analogue Phone, Gateways, Network switches, all Software Licenses and power failure for minimum with Four-hour backup.

The IP PABX shall have Hybrid IPABX having Capacity 2000 lines with VAS Support IP PBX for 2000 subscribers with VAS support, High-quality voice processing, Carrier class reliability, 700 VoIP channels, 16 E1 streams, Support for 2 built-in SD 8 GB and Hardware redundancy.

The IP Telephone system shall be supplied and installed by approved Manufacturer to Employer's approval. The Telephone system shall intend to establish efficient communication. The Telephone system shall be suitable for making local, long distance and overseas calls.

IP Based PABX and Telephone System shall have a lifespan of 20+ years with 100%+ output guaranteed.

The IP PABX should be excellent communication quality and high flexibility, the system provides a foundation for building secure VoIP solutions. The IP PABX shall Supports basic

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

calling services, including communications system with wide range of services i.e., contact center and call center, communicator, chat, SMS sending, calls recording, conferences and video conferences, manageable call queuing and other.

The Trunk gateway shall be use for interfacing of signal and media streams of TDM and VoIP networks. The gateway shall be used as an IP PBX with VAS support and a universal solution for info communication new generation networks (NGN).

The gateway shall support 16 E1 streams (SS7 and PRI) and 700 VoIP channels.

The Trunk gateway shall provide high level of fault tolerance due to embedded state-of-the-art chip and uniform load distribution among sub-modules, power modules redundancy and usage of up-to-date technologies based on parallel computing. The gateway will switch to a backup sub-module in case of a primary sub-module fault.

The gateway shall have strict compliance with up-to-date protocols' requirements, recommendations and standards. The gateway shall have functional compatibility with a variety of equipment such as Digital PBX, IP PBX, Switches, VoIP gateways, SIP phones, programmable SIP clients, etc.

The hardware transcoding shall be based on Media Codecs, Mind speed Technologies helps to negotiate media streams with different VoIP codecs which shall use in up-to-date networks.

Intellectual call routing shall be based on billing system responses via the RADIUS protocol which shall allow customers to create flexible methods of call processing.

The intellectual protection shall be against unauthorized external SIP subscriber's connection and connections via http/https/telnet/ssh shall realize on the trunk gateway (Dynamic Firewall, Static Firewall, black and white lists of IP addresses and sub networks).

The main features of IP PABX shall be following as:

i. Calls management

- Routing based on called number (CdPN) or calling number (CgPN)
- Number modifications before and after routing
- Call recording according to number mask and dial plan
- Use of multiple dial plans
- Subscriber lines restriction
- Subscriber service mode
- Trunk group cut-off
- Direct connection of trunk groups
- Prefix for few trunk groups
- Interactive voice menu (IVR)
- Uploading/downloading of configuration as a single file
- Lines limiting for SIP interface
- Egress and ingress lines restrictions for a subscriber
- Ingress load limiting (calls per seconds) for a trunk group

ii. Audio Compression

- G.711 (a-law, μ-law), G.729 (A/B), G.723.1, G.726 (32 Kbps)

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

iii. Fax transmission

- T.38 Real-Time Fax, G.711 (a-law, μ-law) pass-through

iv. Voice standards

- VAD (Voice Activity Detection)
- CNG (Comfort Noise Generation)
- AEC (echo cancellation, G.168 recommendation)
- AGC (automatic gain control)

v. Quality of service (QoS)

- Assignment for SIP and RTP
- Dynamic and Static jitter buffer
- Ingress/egress traffic rate limiting

vi. DTMF

- INBAND, RFC 2833, SIP INFO, SIP NOTIFY transmission methods

vii. Billing

- Billing data shall be recorded in CDR file. CDR files shall keep on a local HDD and remote FTP server.
- RADIUS Accounting
- Supported billing systems: Hydra Billing, LAN Billing, Porta Billing, Net UP,
- BG Billing (there is an opportunity of integration with other systems

viii. Flexibility

- Multiple network interfaces creation for telephony (SIP, RTP) with different IP addresses
- Operation with multiple numbering plans
- Signal SS7 channel redundancy
- Voice activity control (by the presence of RTP or RTCP)
- Individual routing for streams from a single SS7 link set

ix. TDM protocols

- SS7
- PRI (Q.931)
- Q.699 (PRI and SS7 interaction)
- V5.2 LE
- V5.2 AN

x. VoIP protocols

- SIP, SIP-T/SIP-I, SIP-Q
- H.323
- SIGTRAN (M2UA, IUA)
- H.248

xi. Capacity

- Up to 700 VoIP channels

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- Up to 16 E1 streams
- Maximum load intensity 14 cps

xii. Interfaces

- 2 x 1000Base-X ports (2 slots for SFP modules)
- 3 x 10/100/1000Base-T (RJ-45) ports
- E1 (2 x CENTRONICS-36 connectors)
- 2 SATA ports (for SSD modules installation)

xiii. Management and monitoring

- E1 and VoIP channels monitoring in web interface
- Management of channels and SS7 links in web interface
- Alarm logging with the opportunity to save entries to syslog server
- Tracings are stored on the SSD and USB storage
- Emergency notification through SNMP

xiv. Security

- Black and white IP addresses lists
- Attempts of access to device are logged
- Automatic blocking by IP address after unsuccessful login attempts
- or/and access via http/https/telnet/ssh
- List of permitted IP addresses for access to control of the device
- Access rights delimitation - admin/user
- Delimitation of rights to access calls records
- Control of opposite RTP stream's source IP address

xv. Redundancy

- Operation in warm redundancy mode 1+1
- The system switches the redundant part on automatically
- Automatic synchronization of main redundant module settings

xvi. Advanced SIP/SIP-T/SIP-I functionality

- Registration and authentication of 2000 SIP subscribers
- VAS support for 1000 SIP subscribers
- SIP and SIP-T/SIP-I interaction
- Trucking and subscriber registration of SIP trunks
- Transit registration of subscribers on SIP trunk with switching to local service mode in case of server unavailability

xvii. Value added services

- Call Forwarding
  - Call forwarding out of service (CFOS)
  - Call forwarding on no reply (CFNR)
  - Call forwarding unconditional (CFU)
  - Call forwarding on busy (CFB)
- Call Transfer

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- Music on Hold (MOH)
- Call Hold
- Call Hunt
- Call Pickup
- Busy Lamp Field
- Conference add-on (CONF)
- Conference for a list of subscribers
- 3-Way conference
- Intercom
- Paging
- Outgoing calls restrictions
- Egress communication by password (RBP)
- Password activation (PWD ACT)

5.2.2.2.2 Password reset (PWD)Analog VoIP Gateways

The Analog VOIP Gateway shall PBX functionality, High-quality sound, Current and voltage port protection, Measurement of subscriber line physical parameters and the length of lines shall be 5 km. The analog VoIP gateways shall be planned for voice and fax data transmission through IP networks. The gateways shall provide subscribers with high-quality phone connection with support for isolated PBX operation mode and wide range of supplementary services.

The Analog VOIP Gateway shall have

- FXS ports: 24
- FXO ports: up to 32
- Type of connector: TELCO-50
- Ethernet 10/100/1000BASE-T ports (RJ-45): 2
- VoIP protocols: SIP, SIP-T, H.323
- Fax transmission: T.38, G.711 pass through
- WAN connections types: Static, DCHP, PPPoE/PPTP
- Operating temperature: from 0 to +40° C
- Form factor: 19", 1U
- Operating humidity: ≤ 80%

The Analog VOIP Gateway shall have high quality of sound ensured by the use of the high-performance hardware based on Mind speed chip, support for main audio codecs used in VoIP networks (G.711, G.723.1, G.726, G.729), echo cancellation function, use of silence detector, comfort noise generation, DTMF signals reception and generation and prioritization mechanisms (QoS).

In case of the loss of main SIP server connection, The Analog VOIP Gateway switches shall have redundant SIP server, which shall automatically monitor the service capability of the main one. If there is a connection loss with both servers, local switching among gateway subscribers shall be saved.

The Analog VOIP Gateway shall have multilingual management interface and support for group management means based on DHCP (DHCP auto provisioning).

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

A unified management system shall be used for monitoring and control of a large number of gateways on a network. The system shall provide centralized management of a gateway group and its ports monitoring via the unified WEB interface

The main features of Analog VOIP Gateway shall be following as:

a) VoIP protocols

- SIP
- SIP-T
- H.323

b) Voice codecs

- G.729 (A, B)
- G.711 (a-law, μ-law)
- G.723.1 (6.3/5.3 Kbps)
- G.726 (32 Kbps)

c) Fax

- T.38 UDP Real-Time Fax
- G.711 (a-law, μ-law) pass-through

d) Voice standards

- VAD (voice activity detector)
- CNG (comfort noise generation)
- AEC (echo cancellation in accordance with ITU-T G.168)
- AGC (automatic gain control)
- PLC (packet loss concealment)

e) Features

- SIP server authentication with common username and password for all subscribers
- SIP server authentication with individual username and password for each subscriber
- Support for redundant SIP servers
- Support for Outbound SIP servers from DHCP Option 120
- Direct routing to the unregistered devices on a SIP server
- Internal switching is saved in case of SIP server connection loss
- Locally Supplementary Services' processing (distributed mini PBX mode)
- Regular expressions in Dial plan
- Caller and called numbers modifications
- Distinctive ring service
- User tone signals
- Limitation of simultaneous connections
- CPC (Calling Party Control): disconnect signal by circuit disruption
- Support for pay phone
- Support for operation behind NAT (STUN, Public IP)
- Signal generation when a handset is off-hooked

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- Supplementary Services management via phone added codes
- Applying of settings without reboot
- Forming of DHCP Option 82, Agent client circuit ID, Agent remote ID sub option

f) Quality of service (QoS)

- 4 priority queues
- Packet distribution to queues based on 802.1p and/or DSCP
- Assigning of DSCP and 802.1p priorities for SIP and RTP packets

g) Value Added Services

- Caller line identity presentation (CLIP)
- Issuing of a caller name and time of a call in FSK mode
- Calling line identification restriction (CLIR)
- Call Transfer
- Call Pickup
- 3-Way Conference
- Hotline/Warmline
- Call Waiting
- Call Forward (CFU, CFB, CFNR, CFOOS)
- Call Group
- Call Hold
- Music on Hold (MOH)
- Message-waiting indicator (MWI)
- Do not Disturb (DND)
- IMS (3GPP TS 24.623) for Call Hold, Call Waiting, 3-Way Conference, Hotline, Call Transfer

h) Network functions

- 802.1Q
- Possibility to use different VLAN for signaling, RTP and management
- SNTP
- Local and external DNS
- STP
- LLDP
- Dual homing redundancy
- IPSec
- Firewall

i) Types of connections

- Static IP address
- DHCP client
- PPPoE client
- PPTP client

j) Remote monitoring

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- HTTP/HTTPS
- SNMP
- TR-069

k) Configuring

- HTTP/HTTPS, FTP/FTPS, TFTP
- Auto update of the firmware and configuration (DHCP)
- Command line interface (CLI) via Telnet, SSH, Console port RS-232
- Parameters configuring via SNMP (management system)
- WEB interface
- Parameters configuring via TR-069

l) Diagnostics

- Syslog
- Checking for a phone available on the line
- Subscriber lines parameters testing

m) Statistics

- Detailed statistics per port
- Call history

n) Security

- Username and password control
- Access rights differentiation: admin/user
- Configuration file encryption
- Access to WEB via RADIUS authentication
- Access to WEB only via HTTPS

5.2.2.2.3 Operator Console Phone

The contractor shall provide Console Phone with an integrated switch. The Console Phone shall achieve high data processing speeds. The Console Phone shall support all major audio codecs used in VoIP networks (G.711 and G.729a), as well as Call Answer, Call Cancel, Audio Controls and training mode. The Console Phone shall have access to integrated hospitality features including room status, guest telephony privileges, automatic wake-up calls, room to room call blocking, occupancy status, guest check-in /check-out and guest reports. The Console Phone shall have direct connection of 48 IP Programmable Key Module that shall provide up to 96 additional Direct Station Select (DSS). The Console Phone shall have highly visible four line 80-character display which shall shows date, time, call status information, calling line identification, and calls waiting. The main feature of the Console Phone should be following as:

- 14 fixed function keys dedicated to basic and enhanced call-handling activities
- 10 Soft Keys that control access to the attendant features through call state sensitive keys
- Multiple call hold positions and line appearances
- Intelligent Directory and Live Content Suite applications support
- Support for Automatic Call Distribution (ACD) agent and supervisor
- Hands-free speakerphone operation (full duplex)

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- Secure Call Recorder Connector (SCRC) support as well as standard Record-a-Call functionality
- Two integrated headset / handset jacks
- Dual-port IP console (10/100 MB) switched
- Ethernet) – connect a computer and a console with a single Ethernet drop
- Multiple powering options (IEEE 802.3af compliant)
- Support IEEE 802.1p/q for Voice QoS
- Support RTP over UDP/TCP for Voice Traffic and Signaling
- Speak to multiple parties through conference calling
- Speak with parties in the conference individually through call splitting
- Change / clear users' status to "Do Not Disturb"
- Set / clear "Call Forward Always" on an extension
- Clear Call Forward Always, Do Not Disturb, and Message Waiting indications across all
- View system alarms and emergency call alarms
- Operating Temperature: -10°C to +45°C
- Relative Humidity: Up to 95%

5.2.2.2.3.1 Medium Executive IP Phones

The IP Phone shall have these features:

- Power over Ethernet (PoE) for VP-15P
- 2 SIP accounts
- Auto provision (TR-069, DHCP)
- Headset connection
- Large LCD display

The IP phone shall have High quality of sound and high performance. All the main audio codecs shall use in VoIP networks (G.711, G.722, G.723.1, G.726, G.729). The IP Phone shall have Echo cancellation, Silence Detector, DTMF signals reception and generation as well as traffic prioritization (QoS) ensure high quality of voice data.

a) Features and capabilities of IP Phone

- 2 SIP accounts configuring independently
- Geographical redundancy of a SIP server (support for up to 4 SIP redundant servers)
- Flexible dial plan
- Operation without a SIP server
- Caller name and number displaying (Caller ID)
- Mute
- Redial
- Different ring-tones for different accounts
- Possibility to upload ring-tones to the phone
- Call history
- Local phonebook for 200 phone numbers

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- LDAP Remote Phonebook
- Speakerphone mode
- Short text messages transmitting and receiving (SIP MESSAGE)
- View voice mail counters
- Indication on waiting voice messages (MWI)
- Remote phonebook
- Displaying of watched subscriber line status (BLF)

b) Value Added services

- Call Hold
- Call Transfer
- Call Waiting
- Call Forward on Busy
- Call Forward on no response
- Call Forward unconditional
- Do not Disturb mode (DND)
- Caller Line Identification Restriction (CLIR)
- Local 3 Way-conference
- Support for remote conference according to RFC4579
- Hotline/warmline
- Intercom calls acceptance
- Automatic Call Answer
- Call Pickup

c) Display and indicators

- 3.2 inch (81 mm) backlit monochrome display, 128x64 resolutions
- Functional keys with LED indication: message, headset, mute, speakerphone
- Functional keys without LED indication: conference, call hold, call transfer, redial, volume adjustment keys
- 6 programmable keys

d) VoIP protocol

- SIP

e) Audio codec support

- G.711 a-law, μ-law
- G.723.1
- G.726
- G.729

f) Voice standards

- Voice activity detection (VAD)
- Acoustic Echo Suppression (AES)

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

g) Diagnostics

- Device status monitoring via the web interface
- Displaying of debugging information in Syslog, Telnet

h) Monitoring and management

- Management web interface (Russian and English versions)
- SSH
- Telnet
- Auto provision (TR-069, DHCP)

i) Network protocols and security

- Data network connection: Static, DHCP, PPPoE, No IP
- Time and date synchronization via NTP
- QoS 802.1p, DSCP traffic marking
- Support for 802.1X
- Support for NAT traversal: STUN mode, Public IP
- Support for LLDP, LLDP MED
- Support for SIP over TLS
- Support for SRTP
- LDAP over TLS

j) Technical features

- RAM 128 MB
- Flash 16 MB
- Software redundancy
- 2xRJ45 10/100Mbps Ethernet ports
- 1xRJ9 (4P4C) for handset connection
- 1xRJ49 (4P4C) for hands-free connection
- Power over Ethernet technology
- Power adapter: 5 VDC, 2A
- Operating temperature: from +5°C to +40°C
- Operating relative humidity at +25°C: up to 80%
- Desktop case

5.2.2.2.3.2 Analog Phone

The instrument shall be standard single line push-button type with analogue voice transmission and adjustable volume control for the receive side. The keypad and dialing from the telephone set shall conform to the latest standard. The Employer shall approve the color of the telephone set. Type and make of the telephone along with technical information shall be supplied.

Telephone sets shall be supplied with CLI features. The telephone sets to be supplied shall comply with the following:

- Plug-in, coiled handset cord.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- CLI
- Palladium silver contacts in the speech circuit.
- Adjustable ringing volume.
- Redial
- Flash
- Adjustable voice level.
- Service management function
- Dialing mode Pulse / Tone
- DTMF dialing system
- Last number redial function - REDIAL
- Transfer of calls function - FLASH
- Turn off the microphone during a call - MUTE
- Insert a pause between numbers dialed - PAUSE
- Ring tones - switching the ringer volume
- Signaling IN-USE
- Comfortable lightweight headset
- Mounted on a wall or desktop
- label to save your number
- Operating range - temperature from 0°C to 45°C
- Relative humidity up to 90% RH

5.2.2.2.4 Main Distribution Frame

The termination equipment for the trunk and extensions circuits shall be wall-mounted type. It shall be sized to accommodate all internal and external circuits plus a twenty percent spare capacity. The connecting blocks will be of the quick-connect type. Each of the trunk circuits and outside cable pairs will be protected with over-voltage and over-current protectors. These protectors shall be either carbon or gas tube type. MDF shall have the capacity of 1x1000 Pair wiring Tag blocks.

5.2.2.2.5 Power Supply

In the equipment room, the mains supply provided by WAPDA shall be available. The mains voltage (230 Volt AC/50 Hz) will be subject to possible fluctuations and variations normally encountered in the WAPDA power supply network. The Contractor shall be solely responsible to ensure that its proposed equipment is designed to function from the WAPDA mains voltage as well as on backup power supply system. Minimum four hours backup power supply shall be provided.

5.2.2.2.6 Telephone Cables

The Telephone cables shall be multi-pair as mentioned in the Bill of Quantities. The cables shall be PVC insulated having 0.6 mm dia. Tinned copper conductor cables. The PVC conduits/Cable tray shall be used for the installation of Telephone System. Telephone cables Sizes shall be as per standard Length. Size of cable calculation shall be provided in drawing.

5.3 PUBLIC ADDRESS SYSTEM (PAS)

The system shall be modular in design, flexible and field programmable. The system shall feature an “attention alarm” signal to precede the spoken messages.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

The PAS system shall be extended to the switchyard/Substation according to the requirements.

5.3.1 Microphone

The microphone shall be fitted on a table stand by means of a 'swan necked' flexible support. The table stand shall house the on/off switch and LED indicators, which shall indicate the "power on" status and the audio level output of the amplifier.

The microphone shall conform to the following specifications:

a. Type : Dynamic
b. Directivity pattern : Cardioid
c. Frequency range : 150-15000 Hz (3 dB points)
d. Impedance : 200 Ohm
e. Sensitivity : 1.65 mV/Pa
f. Front to rear ratio : 14 dB at 1000 Hz
g. Max. sound power level : 128 dB

5.3.2 Audio Amplifier and Distribution System

The audio amplifier and distribution system shall be supplied in a standard 19" rack and shall comply with the IEC standards laid down for such equipment.

The system shall be modular in structure. The electronics shall be protected against errors in switching, loading and connections as well as oscillations, open circuit and short circuits.

The input module shall accept at least two microphone inputs. Level adjustment for each input shall be provided on the front panel of the module.

The output amplifier module shall be capable of delivering up to 250 W of audio power with minimum distortion. Two such output modules shall be provided to share the total load. The audio distribution shall be such as to ensure that partial public address facility is available at all key locations in the event of failure of one power amplifier.

It shall be possible to individually select a loud speaker or a group of loud speakers by simply pressing an identified push button. The unit shall be able to handle minimum four such identification push buttons. It shall be possible to program a loud speaker or a group of loud speakers for control from any one of the identifications pushes buttons. In addition, a universal push button for broadcasting the message to all loud speakers shall also be provided.

An "attention alarm" signal module shall also be provided. The attention alarm shall be a two/four tone chime with adjustable pitch and repetition rate. It shall be activated from the microphone "on" switch at the operator's desk so that it precedes each spoken announcement. Feedback of the attention alarm signal shall be provided at the operator's desk. The electronics shall ensure that the microphone remains un-operational while the attention signal is on.

In addition to above, the audio amplifier equipment shall feature a limiter circuit to restrict the output level by reducing the amplification factor under conditions of excessively high input peaks so as to protect the amplifier from being over driven.

The amplifier equipment shall be provided with suitable indicators for following indications:

a. On/Off indication

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

b. Audio output level indication

A local monitor loud speaker shall also be provided. The audio distribution shall be achieved through delay lines with adjustable delays to compensate for such problems as dead spots and reverberation. The Contractor shall determine the exact quantity of delay lines required to achieve a satisfactory solution. The PAS shall interface to EPABX to facilitate public announcements from the telephone sets.

Main technical features of the audio amplifier system shall conform to the following:

a. Power output: 250 W per output module
b. Total harmonic distortion at 1000 Hz: 0.5%
c. Effective frequency range (3 dB points): 200 to 10000 Hz
d. Signal to noise ratio (with microphone controls down): 90 dB
e. Temperature range for guaranteed operation: -10 to 50°C

5.3.3 Loudspeakers

a) Column

Column type loudspeakers shall be provided at various locations within the power house control building. The Contractor may also propose alternate type provided full justification of its benefits is elaborated. The columns shall be installed on adjustable mounting brackets.

The main technical features of the loudspeakers shall conform to the following:

a. Sound projection pattern: Cardioid (horizontal plane).
b. Beamwidth: In vertical plane shall be proposed by the Contractor according to floor dimensions, angle and height of mounting.
c. Power output: 12 W with adjustable taps for 18W&6W
d. Frequency range: 200-10000 Hz.
e. Sound pressure: 113 dB at 24 W.
f. The column shall be encased in a casing which is durable and suitable for use in industrial environment.
g. Connection to the audio amplifier of various loudspeaker columns shall be such that no appreciable mismatch with the audio amplifier would occur in case of a failure of one loudspeaker column.

b) Flush Mounted

Flush mounted loudspeakers shall be provided wherever false ceiling is available within the power house control building. The specifications shall, in general, be the same as that for the column type stated above.

c) Horns

At selected locations within the switchyard and other outdoor locations, horns loudspeakers shall be provided that cover the entire switchyard area and outdoor premises.

5.3.4 Cables

Sufficient microphone, loudspeaker and power supply cables shall be provided. The cables shall be installed in trenches/cable trays and no cable splicing shall be allowed.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

The main features of the microphone and loudspeaker cables shall be:

a) Microphone Cable

a.	Impedance (wave)	: 75 ohms
b.	Insulation voltage (shielded pairs)	: 1000 V
c.	Cross-section drain current (min. 20 mA)	: Stranded copper wire, suitable for microphone
d.	Type of cable	: Twisted (1 pair) copper shielded

b) Loudspeaker Cable

a.	Insulation voltage	: 1000 V
b.	Cross-section	: Min. 0.25 m2, stranded copper wire
c.	Type of cable	: Twisted (1 pair) copper shielded

5.3.5 Power Supply

The equipment shall be powered from the 220V AC power system.

5.4 VIDEO SURVEILLANCE (CCTV) SYSTEM

5.4.1 General

The Video surveillance system shall comprise CCTV cameras, power supplies and video recording equipment enabling selected locations of the power house premises to be monitored remotely from the power house control building. The objective of video surveillance system shall be to monitor the entry/exit gates, boundaries, power house premises for security purposes and operational monitoring.

Video archives for past seven days shall be maintained to facilitate post facto analyses of any untoward incidents. System design shall be flexible to permit future extension of the system. This subsystem shall comprise of the following major components:

a. Video cameras
b. A network video recorder capable of storing video bit streams generated by each camera of up to the last seven days.

The CCTV system shall be extended to the switchyard according to the requirements including outdoor-rated cameras and accessories suitable for harsh environmental conditions.

5.4.2 Operational and Control Philosophy

The video Surveillance system shall comprise of a number of camera sites transmitting digital (i.e., encoded) images to the Network video Recorder (NVR) installed at control building and receiving camera control commands from the system operator or the system monitor located in the at the control room. The video Surveillance system includes the control building head-end electronic subsystem, which receives, decodes, and disseminates images and data from the field and commands the control and display infrastructure. Video surveillance system shall monitor the gates and associated structure for trouble free operation and also serve as a security tool. System design shall be flexible to permit extension to give video coverage of key areas of the premises to help identify any unusual activity. CCTV video bit streams shall be switched at layer 3 network switches. All CCTV cameras shall be mounted on a suitable structure.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

5.4.3 Component Definitions Camera Assembly

The camera assembly shall be defined as a closed-circuit television (CCTV) color camera enclosed in a domed, environmental housing with an integral motorized lens, a camera positioner, an integral receiver/driver, a pole and/or base-mounted control cabinet, any and all mounting hardware and power supplies, a local control panel, an image encoding device, a control data transceiver, and the required communication interface device. The camera assembly shall be capable of individual, or local, camera site control by way of a Pan, Tilt and Zoom (PTZ) controller composed of dedicated hardware or soft configured on the monitoring station.

5.4.4 Functional Provisions

The Video Surveillance system shall be managed with commands and control from a system operator who shall decide which visual images shall be collected from the camera site. The system operator shall prescribe those images through control of the CCTV cameras field of view with the pan, tilt, and zoom feature, The Video Surveillance system shall manage the transmission of the prescribed images based on the system operator, designated monitoring terminal in the control building. The images shall then be processed and, at the option of the system operator, displayed as commanded on monitors and/or wall mounted LED mimic board. The system operator shall have the ability to control all internal and external functions of the camera assembly from the monitoring terminal.

5.4.5 Main Equipment Specifications

a) Pan/Tilt/Zoom (PTZ) IP Day/Night Color Doom Camera

a. Pan 360° endless, 0.2°/s– 350°/s
b. Tilt: 180°, 0.2°/s–350°/s
c. Image Sensor: Progressive scan CMOS 1/2.8” or higher
d. 30x Optical zoom and 12x Digital zoom
e. Auto camera tour and 20 preset points or more.
f. Support static or dynamic IP
g. Alarm Inputs: 2 or higher
h. Memory: 512 MB RAM, 256 MB Flash
i. Minimum Illumination: 0.1 Lux @F2.0
j. Auto-focus and Auto-iris
k. Supported Protocols: IPv4/v6, HTTP, TCP
l. Video Compression: H.264 (MPEG-4 Part 10/AVC)
m. Resolution:1920x1080 (HDTV 1080p)
n. Frame Rate of up to 30 fps (50/60 Hz) or more in all resolutions
o. Power: PoE (Power over Ethernet), IEEE 802.3af/802.3at
p. Casing: IP66-, IK10- and NEMA 4X-rated

b) Fixed IP Day/Night Color Camera

q. Image Sensor: Progressive scan CMOS 1/2.8” or higher
r. 30x Optical zoom and 12x Digital zoom
s. Auto camera tour and 20 preset points or more.
t. Support static or dynamic IP

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

u. Alarm Inputs: 2 or higher
v. Memory: 512 MB RAM, 256 MB Flash
w. Minimum Illumination: 0.12 Lux @ F1.4 (30fps)
x. Lens: 3-10mm, F1.4 or higher, Digital PTZ
y. Autofocus, P-iris and IR corrected
z. Supported Protocols: IPv4/v6, HTTP, TCP
aa. Video Compression: H.264 (MPEG-4 Part 10/AVC)
bb. Resolution:1920x1080 (HDTV 1080p)
cc. Frame Rate of up to 30 fps (50/60 Hz) or more in all resolutions
dd. Power: PoE (Power over Ethernet), IEEE 802.3af/802.3at
a. Casing: IP66-, IK10- and NEMA 4X-rated

c) Network Video Recorder (NVR)

a. Built in network Interface 100 base TX, RI45 connector
b. Support for Internet Protocol: TCP/IP, UDP/IP, HTTP, FTP, SNMP
c. Built in digital motion detector (on/off)
d. System shall be triplex i.e. facilities for view, recording and replay.
e. MPEG-4 and JPEG dual stream output for simultaneous live monitoring and high-resolution recording.
f. View up to 8 cameras simultaneously.
g. Simultaneous recording and playback with 400 fps.
h. Network video Management system: Advanced and reliable IP camera surveillance software with full functions for advanced management, flexible scheduling, fast searching and analysis, images from multiple locations can be stored and managed centrally, allowing for authorized access from anywhere.
i. DVD Writer support. A user-friendly software utility to support the DVD writing to be provided.
j. User friendly GUI based interface of software for PTZ control and other features.
k. Data storage: Minimum 4 TB. The system shall follow FIFO recording.

5.5 VHF RADIO SYSTEMGeneral

This section describes services and deliverables for the two ways Radio Dispatching System required for Attabad Lake HPP.

5.5.2 VHF Repeater/Base Station (BS)

Two-way VHF radio base system shall offer maximum mobility, ruggedness, and all-weather operation to allow the personnel to be instantly connected. Repeater/BS shall work in full duplex mode in frequency range of 134-174 MHz. The system shall have robust heat sink, large cooling fans and a high-performance power module to be able to provide up to 50W stable power at full duty cycle operation. A built-in backup support system shall be provided to automatically switch to an external power supply if the AC power supply fails. The cooling fan shall be thermostatically controlled to ensure a stable temperature environment. Suitable omnidirectional antenna and coaxial cable shall be provided for complete installation of the system.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

BS shall have LED display and flexible scanning features to optimize operations in a wide variety of environments.

The system shall be able to program up to 16 CTCSS/DTCS tones (TX/RX tones respectively) in a channel to allow sharing the channel with multiple personnel groups.

Additionally, the system shale be programmed to have different tones for priority/exclusive use to a specified group.

VHF BS shall be mounted on a 19" rack with self-diagnostic function to check for intimal errors and faults.

5.5.3 VHF Walkie Talkie Sets

Walkie Talkie sets shall be rugged, suitable for rough use typically military applications and able to withstand physical shocks due to accidental dropping of the device. Walkie Talkie sets shall be light weight, compact without sacrificing the performance and need reach required for the Project. Sets shall have powerful Li-Ion battery providing at least l6 hours of operation. Walkie Talkie sets shall be able to alert the user when it goes out of range. BS thus shall be able to alert the field unit to move back into range. Walkie Talkie sets shall have built in timer requiring the user to reset at a predetermined interval. If not reset Walkie Talkie shall enable emergency mode to alert help.

5.5.4 Dispatch Console

A PC based modular workstation shall be provided for maximum control and reliability for sophisticated conventional and trunking system. The dispatch console workstation shall provide fully functioned dispatch capabilities for conventional radio systems and shall be able to control multiple, wireless radio systems. The dispatch system workstation shall be based on a standard Microsoft® Windows® environment, with a touch screen capability. Dispatch console shall have simple and easy to use interface with user-friendly icons, menus and screen layouts with telephone, paging and signaling resources on one screen, which shall be able to customize conveniently for individual users and shall have quick response time. The interface shall also give users a complete overview of dispatching activity for managing information.

5.5.5 VHF Vehicular Mobile Station (MS)

Mobile VHF transceiver shall have MIL grade rugged construction with high quality front mounted speakers, DTMF microphone and programmable buttons. Mobile station shall have multiple 2-tones, 5-tone signaling with lone worker function. VHF mobile station shall have built in encoder/decoder CTCSS and DCS able to operate 42 and 104 CTCSS and DCS undertone frequencies respectively. VHF MS shall have automatic repeater checker and automatic warning on/off features.

1/4 wave radiating mobile VHF antenna shall be provided typically working in the frequency range of 135-175MHz with typical length of 52cm. Antenna shall be made of Stainless-steel tapered rod with vertical polarization.

5.5.6 Frequency Allocation

Employer shall obtain the license from FAB and PTA for the proposed 37MHz (137- 174MHz) spectrum required for the VHF communication in the powerhouse premises. Contractor shall provide full technical assistance for licensing documentation.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

5.6 SPARE PARTS

The Proposers shall submit the list of Spare Parts with his Proposal along with unit rates for each spare.

The cost of the spare parts shall be included in the cost of equipment to be supplied

and installed by the Contractor. The list of spares shall be prepared by the Proposer on the following basis:

- The spares shall be sufficient for five (5) years of operation.
- At least one module of each type shall be included in the spare parts list, if the total amount of modules is less than or equal to ten (10).
- If the total number of modules is more than ten (10), the spare modules to be supplied shall be at least ten percent (10 %) of the total number of modules (the fractions shall be rounded off to the nearest higher integer).
- The Proposer shall demonstrate that the above criteria have been followed while submitting the spare part list.

5.7 TESTS / INSPECTION

5.7.1 General

All type and routine tests on each equipment shall be performed at the manufacturer's works in the presence of the Employer or his representative. Type tests may be waived off in case test certificates as certified by an approved standard laboratory of repute approved by the Employer. Submission or merely producing the type test certificates shall not relieve the Contractor to carry out the required standard/routine tests.

The Contractor shall inform the Employer about the date and time of test of each equipment at least two weeks in advance. The witnessing of test by the Employer or his representative shall not absolve the Contractor from his responsibility for the proper functioning of the equipment, and for furnishing the guarantees.

5.7.2 Test and Inspection

Within two months of the commencement date the Contractor shall submit for the approval of the Employer a Test and Inspection Plan for all items whether at the manufacture's location, the Site or elsewhere up to the date of taking over certificate in accordance with the provisions of the Contract. Such plan shall be in two parts covering factory tests and site tests respectively. The plan shall include a description of the item or part of the Works to be inspected or tested, the nature and frequency of the inspection and testing, the type and size of samples to be taken (if any), the means of recording the test and inspection data, the name and specific responsibilities of any proposed test and inspection agency and all other information necessary to describe the test or inspection to be performed. Not later than two months prior to the commencement of any particular test full details of the proposed method of test, test parameters and test circuits shall be submitted for the Employer approval and following such approval shall become part of the Test and Inspection Plan.

Such plan, as approved and modified by the Employer, shall be used for the inspection and testing and shall be revised and resubmitted for the Employer approval if the Contractor desires to change the sequence, method or nature of the test or inspection or if such a change is required by changes in the Work Program or scope of the Work.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Measuring equipment shall be subject to the Employer approval and, if required by the Employer, it shall be calibrated at such independent laboratory as may be agreed. The cost of any such calibration shall be demand to be included in the BOQ rates and prices.

The cost of all tests required by the Specification, including the cost of providing samples where needed, shall be borne by the Contractor.

No approval of tests or inspection of the Work or portions of the Work by the Employer shall relieve the Contractor of his responsibility to complete the Work according to the Specification, including the satisfactory execution of all necessary site inspections and tests nor shall it relieve him of his duties and obligations under the Contract.

5.7.3 Factory Acceptance Test (FAT)

Factory Acceptance Test procedure shall be prepared by Proposer along with Quality Assurance Plan. The document shall be subject to Employer approval.

All major equipment and Extra Low Voltage (ELV) System equipment shall be tested in the factory prior to clearance for shipping. The FAT shall include individual equipment tests under fully assembled condition.

The FAT shall demonstrate adherence that the equipment meets the design standards and functional compliance. One (1) month prior to the FAT, Proposer shall submit a test procedure to the Employer for approval. Duration of FAT at manufacturer's works shall be at least one week.

Owner's representative may, at Employers sole discretion, attend the FAT. In this event, Proposer shall ensure all tests shall be carried out in the presence of Employer personnel. If Employers declines to attend the FAT, Proposer shall carry out these tests and submit the results to Employers for review. Factory Acceptance Tests (FATs) shall be documented with the results obtained and the success or failure of the test. The test results shall be submitted to Employers prior to clearance of the FAT and authority by Owner is given to ship.

"All major equipment and Extra Low Voltage (ELV) System equipment to be supplied under this Contract which has been manufactured in or outside Pakistan shall be subject to inspection by Employers or its authorized representative at its points of original manufacture before its dispatch to site. The Contractor shall make necessary arrangement and provide all the facilities required for such inspection".

Pre-Inspection Tests and Factory acceptance tests (within Pakistan and abroad) shall be witnessed by the representatives of the Employer and Employer or any other internationally certified testing agency/body as appointed by the Employer. All costs in connection with witnessing of the factory acceptance tests by the representative of Employer/testing agency/body shall be borne by the Contractor. In case the factory acceptance test is witnessed by the representatives of Employer, the Contractor shall bear all the costs that shall include the costs of first class air travel from Pakistan to place of inspection/testing and back.

Prior to taking over of the works or any section or to putting any portion of the works into service, the Contractor shall carry out Tests on Completion in accordance with the provisions of the Specification. The tests shall be carried out in the presence and to the satisfaction of the Employer.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

SECTION 6 132kV SWITCHYARD AND 132KV LINE END BAYS

6.1 SCOPE OF WORK

The design, supply, installation, testing and commissioning of Plant & Equipment for 132kV switchyard at Attabad Lake Hydroelectric Power Plant which consist of three transformer bays (Step Up transformers), one power transformer bay and two 132 kV transmission line bays. The 132kV bays shall be arranged in breaker & half scheme. The scope further includes the design, supply, installation, testing, and commissioning of Two (02) 132 kV Line End Bays, including extension and integration with the existing 132kV busbar, protection, control, grounding, and SCADA systems at 132/66 kV Aliabad Regional Grid Station, complete in all respects. The 132 kV Line End Bays to be constructed at 132/66 kV Aliabad Regional Grid Station shall be fully compatible with the existing switchyard configuration, busbar arrangement, protection and control schemes, SCADA system, earthing system, equipment ratings, and operational philosophy of 132/66 kV Aliabad Regional Grid Station. The Contractor shall ensure complete technical integration and shall coordinate with the Grid Station authorities to meet all applicable requirements.The Attabad Lake HPP will be interconnected to the proposed 132/66 kV Aliabad Regional Grid Station and existing 33kV Sost Grid Station. One (01) Double Circuit 132kV transmission line about 14.5 km for Aliabad 132/66 kV Regional Grid Station has been proposed and one 33 kV existing 33kV single circuit Transmission Line shall be connected from 132kV Attabad Switchyard for dispersal of energy generated at Attabad Lake HPP. Synchronization with Gilgit grid system is proposed to be done in the powerhouse control room.

The interconnection with 132kV switchyard and power plant shall be through 11kV segregated phase bus in underground trench. AC auxiliary supply shall be fed from power plant through One (01) No. feeder and the other feeder shall be taken from 132kV switchyard. The complete DC system shall be installed in switchyard control house building.

The scope of Facilities includes design, manufacture, supply, insurance to Site, delivery to wharf at seaport in Pakistan, unloading and loading at seaport, transportation to the Switchyard site, unloading and storage at site, installation, testing and commissioning of Plant & Equipment for 132kV Switchyard and 132 kV Line End Bays as specified in the Employer's Requirements.

All materials, tools, equipment and services, necessary for the reliable and safe operation of the Switchyard, whether specified in these Documents or not, shall be included in the Proposal except items specifically excluded from the scope of Facilities as listed in this section.

Type tests reports for all the specified equipment including circuit breakers, disconnectors & earthing switches, current transformers, CCVTs, surge arresters, protection system, line traps, line matching units, power line carrier and protection signaling equipment from any of the specified independent authority/independent laboratory pursuant to Employer's Requirements shall be provided for all the specified type tests specific to the offered equipment. In case the type test reports are not available, these tests shall be carried out in accordance with the relevant Employer's Requirements in the presence of the Employer and Employer's representative at no cost to Employer, at the time of routine tests at the manufacturer's works. If facilities for type tests are not available at manufacturer's premises, these tests shall be got carried out from one of the independent laboratories specified in the Employer's Requirements.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

The Facilities shall also include provision of Spare Parts, Erection and Testing Equipment and Maintenance Tools, and Training of the Employer's Staff in accordance with the requirements listed in the Employer's Requirements.

The Facilities have been provided in Specifications Drawings and indicated in the Single Line Diagram, Switchyard layout and other relevant drawings, will also help in understanding the scope of work for switchyard.

a) The Switchyard equipment to be provided, installed, tested and commissioned at the Switchyard includes but is not limited to the following:

1. Circuit Breakers.
2. Disconnectors.
3. Disconnectors with earthing switches.
4. Current Transformers.
5. Capacitor Voltage Transformers.
6. Surge Arresters.
7. Line Traps/Fiber.
8. High voltage bus work.
9. Steel Structures.
10. Switchyard Grounding System (Only Equipment Protective Earthing Connection).
11. Paging System.
12. Secure Metering System.
13. Relay Boards and protective relaying systems.
14. Control and small Power Cables.
15. AC Auxiliary Supply board and DC system.
16. Telecommunication and SCADA System.
17. Testing and Maintenance Equipment.
18. CCTV system and PAS system as per specifications mentioned in the section 5 of this document.
19. All other auxiliary items for the completion of work including testing devices, equipment and spare parts as listed in the Specifications.
20. Cable trays, ladders, conduits and accessories inside the switchyard and control house building/generator room.
21. Any other item which is not included here but is necessary for integrated operation of the Plant as advised by the Employer

The civil works required for all the above-mentioned facilities (except for Two (2) 132 kV Line End Bays at 132 kV Aliabad Regional Grid Station) are not a part of E&M Scope. The Civil Scope(except two (02) 132 kV Line End Bays at 132 kV Aliabad Regional Grid Station) shall be provided by Civil Contractor (Package-I)

Technical Provisions of various equipment have been given in the relevant sections.

b) Two (02) 132kV End Line Bays equipment to be provided, installed, tested and commissioned at 132/66 kV Aliabad Regional Grid Station includes but is not limited to the following:

1. Two (02) 132kV AIS Line End Bays Equipment.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

2. Extension and integration with the existing 132kV busbar, protection, control, grounding, and SCADA systems.

3. LV cables and integration with existing system.

4. Extension of Lighting system (if required).

5. Cable trays, conduits and accessories.

6. Construction of fence, its lighting and grounding.

7. Extension of CCTV System (if required)

8. Spare Parts

9. Any other item which is not included here but is necessary for the safe, reliable and Integrated operation of the Line End Bays as advised by the Employer.

c) All concrete works, reinforcement, structural steel, embedded parts, grouting, excavation, backfilling, compaction, drainage arrangements, and finishing works for the Two (02) 132 kV Line End Bays (at 132/66 kV Aliabad Regional Grid Station) shall conform to the applicable sections of the Civil Works Technical Provisions of Package-I, including quality control, testing frequency, material approval procedures, and inspection requirements.

The Contractor shall ensure that:

1. Foundation levels are coordinated with the completed or ongoing works of 132/66 kV Aliabad Regional Grid Station;
2. Earthing and grounding systems are properly integrated with the existing Grid Station grounding grid;
3. All embedment, anchor bolts, sleeves, and cable trench interfaces are accurately positioned prior to installation of E&M equipment;
4. Any interface discrepancies are immediately reported to the Engineer for instruction.

6.2 ENVIRONMENTAL CONDITIONS AND APPLICABLE STANDARDS

6.2.1 Site Investigation

Location of the switchyard Site is stated in Volume-II Part-III.

6.2.2 Applicable Standards and Codes

All Plant for switchyard design shall be generally in accordance with latest revision of the following standards except where specifically directed otherwise. The latest applicable standards shall be those which are in force thirty (30) days prior to the date of Proposal opening.

6.2.2.1 General

IEC 60050(151)	International Electrotechnical Vocabulary Part 51: Electrical and Magnetic Devices
IEC 60050(441)	Chapter 441: Switchgear Control gear and fuses.

The Contractor shall provide four (04) sets of standards of these documents as part of the as-built documentation. However, an additional set of the standards, comprising the standards listed herein and other standards that the Contractor will intend to use in the design, construction, testing and commissioning, shall be submitted to the Employer for his reference within two months of the signing of the Contract Agreement.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

6.3 SWITCHYARD AND LINE END BAYS DESIGN

6.3.1 General

These Specifications cover the requirements for design, supply, installation, testing and commissioning of Plant and Equipment for Attabad 132 kV switchyard and Two (2) Line End Bays at 132/66 kV Aliabad Regional Grid Station. Design of civil engineering Facilities associated with this Contract (including Cable Trenches, Equipment Foundations, Earth work, Control house Building, Guard Rooms, Metering Room, Boundary walls, drainage etc.) is responsibility of Civil Contractor and included in separate Package-I (Except for Two (02) 132 kV Line End Bays at 132/66 kV Aliabad Regional Grid Station). Single line diagram and equipment arrangement plans indicate the details of Facilities shall be carried out.

The Contractor shall prepare detailed drawings on the basis of information provided in the Employer's Requirements listed herein.

6.3.2 Physical Design Parameters

The Plant and Equipment to be installed in the switchyard and covered by these Specifications shall be for outdoor use and shall be suitable in every way for continuous and reliable service. The conditions under which it will operate are to be considered throughout.

6.3.2.1 Outdoor Ambient Air Temperature (Referred to power plant data)

Maximum, degree C	40
Maximum mean over any 24 hours	35˚C
Mean in any year	30˚C
Minimum, degree C	-23

6.3.2.2 Relative Humidity

The relative humidity may approach 100 percent. During the monsoons high humidity may persist for many days along with temperature ranging from 30°C to 40°C.

6.3.2.3 Altitude

The height above mean sea level of the switchyard Site is almost 2500 meters.

6.3.2.4 Wind Loading

(1) Maximum wind gusts velocity of 45m/sec. for 5 seconds acting at a height of 10 meters above ground level.

(2) The wind load factor on outdoor structures shall be:

1 x projected area for cylindrical structures

2 x projected area for square rectangular lattice structures.

(3) The design wind speed given above shall be escalated to give an increased velocity depending on the height above ground level of the Plant upon which the wind force is acting in accordance with the following formula:

$$V = 45(H/10)^{1/7}$$

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Where V is the wind velocity in meters per second
H is the height above ground level in meters.

6.3.2.5 Earthquake Factor

All the joints and all the base mounted fastenings of free-standing electrical Plant and Equipment, transformers, circuit breakers, disconnectors, surge arresters, instrument transformers, line traps and bus bars shall be designed for a horizontal acceleration intensity as per zone 3 of the Uniform Building Codes or may be refer to other part of Employer's requirements.

6.3.3 Electrical Design Parameters

Following design parameters shall be considered as a guideline for design of the 132 kV Switchyard and Line End Bays at Remote End (where applicable):

(1)	Nominal system voltage, kV, rms.	132
(2)	Rated voltage for the equipment, kV, rms.	145
(3)	Frequency, Hz.	50
(4)	Rated continuous current at 40°C ambient temperature A, rms.	
	a) Busbars	2000
	b) Feeders	2000
(5)	Bay width, center lines of columns, mm.	12000
(6)	Bay equipment clearances:	
	(a) Phase to Phase (center lines), mm	3000
	(b) Average height of equipment live parts in the bay from the foundations level, mm.	4250
(7)	Bus bar conductor clearances.	
	(a) Phase to Phase (Center lines), mm	3500
	(b) Average height of live parts from the foundations level, mm.	10000
(8)	Minimum clearance lives part to ground, mm.	1750
(9)	Height of overhead shield wire, mm.	16900
(10)	Minimum creepage distance, mm.	4495
(11)	Lightning impulse withstand level, kV, peak.	650

The Contractor shall check and submit calculations for the adequacy of the busbars current ratings keeping in view the future extension of the switchyard as specified in the Specifications Drawings.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

The clearances/heights specified under items (6), (7), (8), (9) & (10) are the minimum requirements. The Contractor shall study and prove that with these clearances adopted all the equipment and conductors are fully protected against lightning and these clearances are adequate for safety of the personnel. The Contractor shall also check the clearances due to increase of altitude as almost 2500m from sea level.

The lowest portion of any support insulator of HV equipment shall be at height of minimum 2300 mm above finished ground level.

6.3.4 Electrical Service Conditions

6.3.4.1 AC Circuit Voltage

Supply, Nominal:

- 3-Phase 400 volts neutral grounded
- 1-Phase 230 volts

Fluctuation of supply Voltage	+ 10 percent - 15 percent

For equipment rating:

- 3-Phase	400 Volts
- 1-Phase	230 Volts

6.3.4.2 Frequency

50 Hz

6.3.4.3 DC Control Voltage

- Nominal	110 Volts D.C.
- Range	+ 10 percent - 15 percent

6.3.4.4 DC Voltage for Telecommunication System

- Nominal	48 Volts
- Range	+ 10 percent - 15 percent

6.3.5 Overhead Lightning Protection

Overhead shielding wires and surge arresters, as specified in Section 6.5 & 6.10 respectively of the Technical Specifications, shall be provided to adequately protect the equipment against the lightning protection and surges. Earthed masts shall be provided wherever necessary. The Contractor shall also provide design calculations of the shielding system for Employer review and approval. Shield wire shall be connected directly to each of the respective steel structure. Shield wire shall additionally be connected to the grounding mesh of the switchyard at the points identified in the Conceptual Drawings, Volume-II Part-III of the Employer Requirements.

6.3.6 Tension and Suspension Insulators

Tension and suspension insulator strings shall be designed using insulators, the characteristics of which are given in Section 6.5 of these Specifications.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

6.3.7 Cable Trenches

Cable trenches for 132kV switchyard shall be designed in accordance with requirements of Site and as approved by the Employer. The sizes of the cable trenches shall be provided by E&M Contractor and construction will be carried out by Civil Contractor.

6.3.8 Cable Laying

Control and power cables shall be laid in cable trenches and cable conduits. Direct burial of cables shall not be allowed. Joints shall not be used for control & small power cables and 11 kV XLPE cables (if used).

Cable trenches shall be designed in accordance with requirements of Specifications drawings.

Fire barriers shall be provided in the cable trenches to prevent spreading of fire.

Cable conduits, cable trays, racks and their supports shall be designed in accordance with requirements of Section 6.15 of these Specifications.

6.3.9 Steel Structures

Steel structure for equipment supports and switchyard tower gantries shall be designed in accordance with requirements of Section 6.4 of these Specifications.

6.3.10 Cubicles/Panels

6.3.10.1 General

Cubicles/panels (local control cubicles, marshalling kiosks, marshalling boxes, relay panels, control panels, AC/DC panels, fault and event recorder panels inverters, fire protection panels etc.) of all the equipment shall be fabricated from sheet steel not less than MSG 2.5 mm thick. However, in case of type tested rigid frame design, the thickness of the steel sheets may be reduced, but not below 2mm, according to manufacturer's standard design. The exterior color of cubicles/panels shall be of designation RAL 7032 while interior color shall be RAL 9010. The cubicles/panels shall be of vertical type construction, seam welded at corners and ground smooth. All the outdoor cubicles/panels shall be vibration free, weather proof and vermin proof conforming to protection class IP55. Protection class of indoor cubicles/panels including cubicles/panels of relay board, metering board, fire protection, inverter and any other cubicle/panel with front door shall be IP54. Except where specified otherwise, cubicles/panels of indoor control boards and auxiliary control panels without front door and with control, annunciation and indication devices and indicating instruments/meters mounted at the front shall conform to at least protection class IP54. Neoprene gasket between the door and frame shall be provided to prevent the ingress of moisture. Structural backing shall be provided, where required, in such a manner that the complete assembly shall be rigid, self-supporting and free of vibration, twist and weave.

6.3.10.2 Cubicles/Panels Interior

No component shall be mounted less than 300 mm above the floor of the cubicle/panels or 150 mm from the roof. Any unused area of cubicles/panels shall be kept free of wiring to permit the installation of possible future components.

6.3.10.3 Doors And Latches

Each cubicle/panel shall be equipped with a hinged door with hinges on the left. The door shall have its edge bent inwards for rigidity. There shall be a three-point latch and activating handle. The handle and door shall have matching projections with a 12.5 mm diameter hole suitable

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

for locking the cubicle/panel door with a padlock. Alternately, facility for locking the door with a key-operated lock shall be provided.

6.3.10.4 Lighting, Outlets and Telephone Jacks

Florescent lamps fixtures shall be provided in each outdoor/indoor cubicle/panel one on each side. Appropriate type of lamps fixtures shall be provided in the small boxes where florescent lamps cannot be provided. The lamps shall be door operated type.

A 240 V, 5A single phase three pin outlets along with its MCB to fit standard prong plugs shall be installed inside each cubicle assembly. MCBs shall have auxiliary contacts for remote signaling and sensitive earth fault protection for personnel safety. Plugs shall also be provided for each power socket.

A telephone jack/socket shall be provided in each cubicle/panel. A hook for supporting head set shall be provided conveniently close to the jack in the outdoor cubicle/panel. Telephone jacks/sockets in all the indoor and outdoor cubicles/panels shall be inter wired to effect the direct wire telephone system specified in relevant section.

6.3.10.5 Ground Bus

A copper ground bus bar shall be provided with tapped holes and screws and shall be connected to the shields or associated earth continuity conductors of all incoming cables.

6.3.10.6 Control Circuit

110V DC miniature circuit breakers (MCBs) shall be provided for protecting DC control circuits. MCBs shall be fitted with auxiliary contacts for remote signaling.

6.3.10.7 Terminal Blocks and Terminals

Terminal block for VT shall be disconnecting type. For CT circuits terminal block shall be disconnecting and shorting type and terminal blocks for control wiring shall be molded with marking strips and covers. White marking strips shall be provided for circuit designation. Each connected terminal of each block shall have the circuit designation. Terminal studs and wires shall be numbered or otherwise marked in accordance with the applicable schematic and wiring diagrams with permanent contrasting marking fluid.

Terminal blocks shall be arranged with sufficient room for any connection of incoming cables. Parallel rows of terminal blocks shall be spaced at least 150 mm apart. At least 20% spare terminals shall be provided in each block or group of blocks. Blocks shall be mounted in vertical columns along the sides of cubicles or on vertical panels specially provided for terminal block.

6.3.10.8 Component Wiring

Wiring between terminals of various devices shall be point to point (no splicing or `T' connection shall be allowed). All internal wiring shall be neatly truncated in wiring troughs.

All groups of bundled conductors to hinged doors and panels shall use extra-flexible wire arranged so that a twisting, rather than a bending motion is imparted to the moving conductor bundle.

All wires shall be identified at both ends according to the interconnection diagrams.

6.3.10.9 Heaters

Space heaters of sufficient capacity along with thermostat, humidistat, control switches and circuit breakers shall be supplied for each cubicle to reduce condensation which may occur.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

However, for smaller cubicles thermostat-controlled heater shall be provided. `Auto-Manual' selector switch shall be provided for space heaters. Visual indication shall be provided to show ON or OFF status of the heater.

6.3.11 132kV Switchyard Control Room

The equipment layout plans in the 132kV switchyard control house building is provided in Conceptual Drawings Volume-II Part-III. The Contractor shall design, manufacture, supply, install, test and commission the following equipment in the switchyard control room:

(1) Metering Panels and Energy Meters.
(2) Telecommunication and SCADA equipment.
(3) Protection/ Mimic/BCU Panels/SAS.
(4) AC and DC systems and other ancillary equipment.
(5) Fire Protection System for outdoor and indoor equipment and Fire Extinguishers.
(6) Cable trays, cable mounting racks, control and small power cables for equipment interconnection and power cables.
(7) Any other equipment required to comply with the Specifications.

6.3.11.1 Cables Layout

The cables layout design in the Control room shall incorporate the following requirements:

(1) All cables should enter the control and relay panels from bottom of the panels through appropriate size of cable gland.

(2) The panels in this portion of the building shall be placed on the same raised false flooring and the cables shall enter into the panels through opening from below. All necessary equipment/material that may be required in addition to those already mentioned shall be supplied by the Contractor.

6.3.12 Levelling of Site

The Contractor, shall level the Site as required and to the extent considered necessary by the Employer. The Contractor shall also remove the grass, bushes etc. to clear the Site.

6.3.13 Independent Laboratories

For the specified requirement of type tests and type test reports by an independent authority/independent laboratory, the following laboratories will be considered as independent laboratories:

(1) KEMA Labs, Holland.
(2) CESI Labs, Italy.
(3) CRIEPI Labs, Japan.
(4) HV & SC Labs, Pakistan.
(5) any other laboratory accredited by EA (European Co-Operation for Accreditation) or a member thereof.
(6) any other laboratory accredited by ILAC (International Laboratory Accreditation Cooperation) or a member thereof.
(7) any other laboratory accredited by 1AF (International Accreditation Forum) or a member thereof.
(8) any other laboratory accredited by STL (Short-Circuit Testing Liaison) or a member thereof.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

6.3.14 Secured Metering System (SMS) for Tariff Metering

Secured Metering System (SMS) comprising main and backup for tariff metering at electrical energy exchange points (132 kV side of step-up transformer). SMS shall be designed, installed, tested and commissioned according to the Specifications provided in the Employer Requirements. For this purpose, dedicated/independent 132 kV instrument transformers (CTs and PTs) and a separate metering room in 132 kV switchyard shall be constructed.

6.3.15 Drawings, Technical and Descriptive Data Proposal Drawings and Descriptive Data

(1) Proposed general arrangement of equipment in the switchyard along with sections, details of the equipment, busbar heights and clearances fully dimensioned.
(2) Proposed arrangement and layout of equipment in the Control room.
(3) Proposed arrangement and layout of trenches and ducts.
(4) Type test reports.
(5) Technical literature, data and information required necessary to demonstrate compliance with the Specifications..

6.3.15.1 Approval of Drawings

The drawings to be submitted by the Contractor for approval shall include, but not be limited to the following:

1) Single Line Diagrams.
2) Switchyard Layouts and Sections
3) Protection and Metering Diagrams
4) Telecommunication Diagrams
5) Schematic Diagrams
6) Trip Logic Diagram
7) Interconnection Diagrams
8) Panel Wiring Diagrams
9) Conduit and Cable Drawings
10) Equipment Drawings
11) Trench Layout plans
12) Equipment loading diagrams
13) Lightning Protection System for outdoor bays
14) AC and DC Station Service Drawings
15) Instrument transformers performance calculations
16) Relay settings calculations
17) Telephone system, paging system drawings
18) Current transformer/voltage transformer performance calculations
19) Voltage drops calculations for AC/DC circuits
20) Protection concept and logic diagram.
21) Any other drawing/data/calculation required by the Employer.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

6.3.15.2 Details on Drawings

The drawing of 132kV switchyard Control house building shall show at least the following details:

(1). Equipment layout plan drawing.
(2). Any other detail necessary for installation of equipment in the buildings.

6.4 STEEL STRUCTURES

6.4.1 General

This Section comprises the Standards and Specifications pertaining to the fundamental requirements of design, manufacture, testing, inspection, supply and erection of steel support structures for line terminations, supporting buses and other equipment such as earth/lightning masts, circuit breakers, disconnectors/isolators, instrument transformers, line traps, surge arresters and post insulators.

All drawings and statements shall be in English language and Metric System of measurements shall be used.

6.4.2 Scope of Work

Design, manufacturing, testing, inspection, supply, erection, installation, commissioning and guaranteeing of all steel support structures required or specified or implied herein are included in the scope of the Contract. The material and fabrication shall be the best of their respective kinds and to a standard not less than specified herein.

General configuration of structures for the switchyard provided in the Contract Documents indicate details of Work to be carried out.

Lattice type structure with height as specified based on electrical requirements comprises structural steel members with connecting bolts, nuts, washers, check nuts and step bolts (if required) shall be furnished. All steel material shall be hot dip galvanized after fabrication. The Contractor shall ensure proper fitting and alignment of offered structures.

The Contractor shall be responsible for submitting all detail designs and drawings as required or specified herein on the basis of information provided in the Contract Documents and as directed by the Employer. The Contractor shall prepare as-built drawings/documentation and submit to the Employer.

6.4.3 Design Standards

Unless otherwise specified in these Specifications or in the drawings, the Contractor shall conform to the applicable requirements of the latest revisions of the following standards or equivalent as approved by the Employer. The latest applicable standards shall be those which are enforced thirty (30) days prior to the date of Proposal opening.

AS ASCE 7	(Minimum Design Loads for Buildings and Other Structures)
ASCE 10	Design of Latticed Steel Transmission Structures
ASCE Manual No. 74	Guidelines for Electrical Transmission Line Structural Loading
ASCE Manual No. 113	Switchyard Structure Design Guide

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

6.4.4 Structural Loadings

Calculations for loadings on terminal structures used for dead ending of conductors, overhead shield wires and switchyard bus structures shall be carried out by the Contractor and submitted to the Employer for approval. A twenty (20) degree angle of entry for terminal structures with conductor tension acting on one side with terminal span 60 to 80m shall be assumed.

Loading and design shall be in accordance with the requirements of the latest ASCE Manual No. 113 and ASCE Standard 10 based on the information hereof.

6.4.4.1 Wind and Ice Loads

Structures shall be designed for (i) wind acting at 90 degrees to the surfaces (ii) wind acting at 135 degrees (45 degrees) to the surfaces. Wind pressure corresponding to 160 km/hr wind velocity acting horizontally in any direction at 25˚C everyday temperature shall be used. Ice loading should also be considered on structures and overhead wires.

6.4.4.2 Vertical and Tension Loads

Equipment weights and dead loads (including conductors, overhead shield wires, insulators and assembly hardware) together with estimated construction/maintenance loads as required.

6.4.4.3 Loading due to Thermal Forces

Thermal stresses caused by a temperature variation as indicated in Volume-II Part-I shall be taken and expansion joints shall be provided at the appropriate locations.

6.4.4.4 Earthquake Intensity

Horizontal earthquake acceleration of an intensity of 0.32g acting in any direction shall be considered for the design of ground structures acting in any direction irrespective of their height and flexibility. The above value shall be considered as the Zero Period Acceleration (ZPA).

All the joints and base mounted fastening of free-standing electrical equipment such as circuit breakers, dis-connectors/isolators, instrument transformers, line traps, bus bars, surge arresters and post insulators shall be designed to resist the effects of an acceleration intensity 0.32g in any direction.

6.4.4.5 Short Circuit Loads

Short circuit loads shall also be considered in the design of steel structures as per maximum short circuit level.

6.4.4.6 Load Cases and Load Combinations

The above loads shall be combined with tension of conductor loading on the structure. The various load combinations and load cases to be used shall be as per relevant Standards and Codes.

6.4.5 Design

6.4.5.1 General

The Contractor shall submit complete details of the structure design proposes to furnish, showing outline dimensions together with member dimensions, stresses and calculations in sufficient detail to determine compliance with the Contract Documents.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

The switchyard shall be adequately protected against direct lightning strokes, by the use of shield wires located on the switchyard structures. The height, location, and number of shield wires shall be such as to protect the equipment installed within the switchyard to a failure rate of shielding from direct lightning strokes of not greater than 1 per annum.

6.4.5.2 Slenderness Ratio (L/R)

Determination of L/r ratio and allowable compressive stress shall be based on ASCE 10 "Design of Latticed Steel Transmission Structures".

The maximum L/r ratio of a member shall not exceed to the following limits:

(a)	For main compression member	150
(b)	For secondary members carrying calculated stresses	200
(c)	For redundant members without calculated stresses	250

6.4.5.3 Allowable Unit Stresses

All parts of the structure shall be so proportioned that the unit stresses in members, produced by design load factors shall not exceed the values as given in ASCE Standard 10 and as summarized below.

Members shall be of such size, shape and length as to preclude damage or failure from vibration or stress reversal.

a) Compressive Stress

The allowable unit stress on the gross section of axially loaded compression members shall be calculated as:

$F_c = [1- \{(KL/r)^2/ (2C_c^2)\}].F_y$ --------- ---------- (1)

when $KL/r \leq C_c$

OR

$F_c = 200,000/(KL/r)^2$ --------- ---------- (2)

when $KL/r > C_c$

in which $C_c = \pi\sqrt{(2E/F_y)}$ --------- ---------- (3)

where,

F_y = Minimum guaranteed yield strength, kg/mm^2
F_c =Allowable compressive stress in member, kg/mm^2
E =Modulus of Elasticity of the material, kg/mm^2
KL/r =Largest effective slenderness ratio of any un-braced segment of the member and provided that the largest (b/t) ratio is not more than the limiting value given by:

$(b/t)_{Lim}=66.289/\sqrt{F_y}$ --------- ---------- (4)

in which,

b = Distance from the edge of fillet to the extreme fiber
t = Thickness of the material

If the width-thickness ratio exceeds $(b/t)_{Lim}$, equations (1) and (3) shall be modified by substituting for F_y the value F_{cr} given by:

$F_{cr} = [1.8 - \{0.8(b/t)/(b/t)_{Lim}\}] F_y$ --------- ---------- (5)

where $(b/t)_{Lim} \leq b/t \leq 99.433/\sqrt{F_y}$

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

$F_{cr} = 5900/(b/t)^2$ --------- ---------- (6)

where $b/t > 99.433/\sqrt{F_y}$

b) Tensile Stress

Allowable Tensile Stress (F_t) through the minimum Net Section shall be taken as applicable yield point (F_y).

c) Bending Stress

Allowable Bending Stress (F_b) on Extreme Fibers shall be taken as the applicable yield point (F_y).

d) Shearing Stress

Allowable Shear Stress (F_s) shall be taken as 5/8 of the applicable yield point (F_y).

e) Bearing Stress

Allowable Bearing Stress, for all steel materials specified herein shall be taken as 1.65 times the applicable yield point (F_y).

f) Combined Compression and Bending

Members simultaneously subjected to both axial compression and bending stress shall be designed as:

$$f_c/F_c + f_b/[F_b(1 - f_c/F_c)] \leq 1$$

f_c = Actual axial compressive stress (resultant axial force divided by the effective cross-sectional area of the column).

f_b = Actual bending stress, tension or compression whichever is greater at extreme fiber (bending moment divided by the Section Modulus).

g) Combined Shear and Tension

Where applicable, maximum stress resulting from combined shear and tension shall be investigated.

6.4.6 Materials

All materials shall be of the highest grade free from defects and imperfections of recent manufacture, unused and of the classification and grades designated, conforming to the requirements of the latest revision of the relevant Standards cited herein. All structural steel sections, plates and its connection bolts, nuts, washers, check nuts and step bolts (if required) shall be hot dip galvanized after fabrication.

6.4.6.1 Structural Steel

All rolled steel sections and plates shall be supplied in accordance with latest edition of EN 10025 (minimum S355J2 grade) or equivalent Standard. The following minimum steel thickness shall apply:

(a)	Main members	6 mm
(b)	Secondary members carrying calculated stresses	5 mm
(c)	Redundant members without calculated stresses	4 mm
(d)	Gusset Plates	6 mm

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

(e) Size for stub 8 mm

6.4.6.2 Bolts And Nuts

All steel structure connection bolts and nuts shall be of steel and shall conform to the requirements of ISO 898-1 (minimum 6.8 property class), ISO 898-2 (minimum 6.8 property class), DIN 7990 and DIN 555. All steel structure connection bolts, nuts, washers and check nuts shall be of minimum 16 mm size.

All connections shall be bolted type and shall be designed for 100% member capability. 5% surplus of bolts, nuts, washers and check nuts shall also be supplied. A connecting bolt shall contain one nut, one washer and one check nut.

a) Bolt Spacing

Minimum spacing of bolts shall be as follows:

Bolt Diameter	Minimum Bolt Spacing
16 mm	40 mm
20 mm	50 mm
22 mm	60 mm

b) End Distances

The minimum end distances measured from the centre of the bolt hole to the end of the member shall be as follows:

(i) For Compression Members
One and one-half bolt diameter.

(ii) For Tension Members
In an end connection of not more than three bolts, the end distance shall not be less than that given in (i) above or the following value, whichever is greater.

$$\frac{0.865P}{F_y \times t} + 0.38d$$

Where,

P = Ultimate load on bolt, kg
t = Thickness of member, mm
d = Nominal bolt diameter, mm
F_y = Yield stress of material, kg/mm^2

c) Minimum Edge Distance

Minimum distance from any hole centre or edge member shall be as follows:

Bolt Diameter	Minimum Edge Distance		
	Rolled Edge	Sheared Edge	Flamed Edge
16mm	19mm	24mm	27mm
20mm	26mm	30mm	33mm
22mm	32mm	33mm	36mm

For gusset plate one and half bolt diameter.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

6.4.6.3 Washers

All washers shall be of galvanized malleable iron or steel conforming to the requirements of DIN 7989 and shall be provided for all bolts. Only one washer per bolt shall be used.

6.4.6.4 Check Nuts

Galvanized check nuts of the type approved by the Employer conforming to the requirements of DIN 7967 shall be provided for all bolts.

6.4.6.5 Step Bolts

Galvanized step bolts shall be provided on one leg of gantry columns and shall have minimum16mm diameter. The length of bolts shall be 180 mm. Steps shall be spaced approximately 300 mm to 350 mm apart.

6.4.7 Steel Fabrication

6.4.7.1 Holes

All holes shall be clean-cut without torn or ragged edges. All burrs resulting from reaming or drilling shall be removed. All holes shall be cylindrical and perpendicular to the member. The diameter of the finished hole shall be 1.5mm greater than the nominal diameter of the bolt.

6.4.7.2 Welding

Welding shall be performed in accordance with the latest edition of "Code for Arc and Gas Welding in Building Construction", as formulated by the American Welding Society or equivalent Standard.

A shielded arc-welding process shall be used. All welds shall be made in such a manner that residual shrinkage stresses will be reduced to a minimum.

6.4.7.3 Galvanizing

All plates and shapes shall be hot dipped galvanized after fabrication in accordance with ASTM Designation A123 or equivalent Standard. All bolts, nuts and washers shall be hot dipped galvanized in accordance with ASTM A153 or equivalent Standard. Re-threading of bolt threads after galvanizing will not be permitted.

All necessary precautions shall be taken in the selection of steel and its fabrication and preparation for galvanizing to prevent embrittlement of any item or parts of item including bolts and nuts.

Material on which galvanizing has been damaged shall be re-dipped. Any member on which the galvanized coating becomes damaged after having been dipped twice shall be rejected.

All material shall, prior to shipping, be dipped in a suitable solution to protect the galvanizing from “white rust” corrosion during transit. Full details of the treatment proposed shall be submitted to the Employer for approval. The effectiveness of the treatment shall be verified in accordance with ASTM Standard B201.

6.4.7.4 Repairs of Damaged Steel

(a) Correction of Mis-fabricated and Damaged Steel

All shop errors and damaged steel shall be reported to the Employer or their representatives who will decide the manner in which corrections shall be made. All costs incurred due to punching, drilling or cutting shall be deemed to be included in the steel erection costs.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Pieces bent in handling may be used if they can be straightened to the satisfaction of the Employer, without structurally damaging the material. If bent pieces cannot be satisfactorily repaired, they shall be replaced.

(b) Damage to Galvanizing

Small areas of galvanizing damaged by abrasion, in straightening bent pieces or by necessary clipping in the field, shall be repaired by carefully cleaning the affected area and painting. The appropriate paint will be furnished by the Contractor.

Damaged area shall be wiped with clean rags saturated with Xylene or equivalent solvent, followed by wire brushing then re-cleaned with solvent to remove residue, and painted with one coat of "Galvanox", or approved equivalent.

Galvanizing damaged by drilling or punching shall be repaired by applying an aluminium paste or zinc rich coating material to completely fill all voids between the bolt and the surfaces bared, or all exposed steel surfaces around the holes or on cuts on which such corrective work is permitted. The coating material shall be "Galvanox" or approved equivalent.

6.4.7.5 Prototype Assembly

Before starting mass fabrication of steel structures, one structure of each type shall be shop assembled and vertically erected on a suitable foundation bed to assure proper fit of all parts as finally manufactured. Following should be kept in view during shop assembly.

(a) Check carefully each member while assembling the prototype to revise and amend the detailed drawings according to the correct solution.
(b) For each member, the length, position of holes and interface with other members shall be checked accurately for proper fitness.
(c) Quantity of each member and bolts shall be carefully checked from the bill of materials when assembling the prototype.
(d) On the assembled structure eventual modifications shall be examined and performed, if necessary, without modifying its functionality.
(e) Drawings and bill of materials, sizes of bolts, fillers etc. shall be put up-to-date accordingly, in all details before starting mass production.

All changes/modifications incorporated in the drawings shall be brought to the notice of Employer along with corrected final copies of the drawings for approval. The Manufacturer shall also submit details of all the changes/modifications carried out.

The Employer may witness a shop assembly of any or all types of steel structures before shipment.

6.4.7.6 Marking

All structural members shall be marked with the correct designation shown on the shop drawing. Marking shall be done by stamping the members prior to galvanizing with numerals or letters of minimum 12mm height, and shall be clearly legible after galvanizing.

6.4.7.7 Tolerances

Ease of assembling the structure in the field is of utmost importance. The structure shall be so manufactured that all members carrying the same mark shall be interchangeable when assembled. The structure shall fit without undue pressing and no reaming or drifting of holes shall be required. When erected, the structures shall not deviate from the vertical by more than 1/300.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

The Contractor shall be responsible for the correct fitting of all parts and shall replace free of cost any defective materials discovered during erection. The Contractor shall also be responsible for the correction in the field of any errors not previously discovered.

The permissible variation from dimensions for structural size steel shapes shall not exceed the prescribed limits in ASTM A6 Standard.

6.4.8 Tests

6.4.8.1 Manufacturer's Tests

The Manufacturer shall select two samples from each heat to carry out the following tests to satisfy himself that the products comply with the Specifications.

(a) For Sections and Plates

(i) Chemical composition (Ladle Analysis)
(ii) Tensile test
(iii) Bend test

(b) For Nuts and Bolts

(i) Proof load test
(ii) Ultimate tensile strength test
(iii) Ultimate tensile strength test under eccentric load
(iv) Cold bend test
(v) Hardness test
(vi) Galvanizing test

(c) For Washers and Ring Fillers

(i) Hardness test
(ii) Galvanizing test

The Manufacturer shall maintain a record of tests carried out by himself for examination by Inspectors during pre-shipment inspection.

6.4.8.2 Acceptance Tests

The Contractor shall provide sampling plan prior to pre-shipment inspection for Employer approval. The following acceptance tests shall be carried out during pre-shipment inspection.

(a) For Sections and Plates

(i) Visual examination
(ii) Verification of dimensions and weights
(iii) Prototype assembly tests
(iv) Chemical composition
(v) Tensile tests
(vi) Bend tests
(vii) Galvanizing tests

(b) For Nuts and Bolts

(i) Verification of dimensions
(ii) Visual inspection
(iii) Proof load tests

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

(iv) Ultimate tensile strength tests
(v) Galvanizing tests

(c) For Washers and Ring Fillers

(i) Verification of dimensions
(ii) Visual inspection
(iii) Galvanizing tests

The Contractor shall render all necessary assistance to the Inspectors during above-mentioned tests.

6.4.8.3 Acceptance and Rejection

Chemical Composition

To indicate adequately, the chemical composition of a heat or a lot, the minimum number of samples selected to represent the heat shall be as follows:
50 tons or more 2
50 tons or less 1
If a piece fails to meet the requirement the lot shall be rejected.

Tensile Properties of Section and Plates

Sample plan for tension and bend tests shall be made for each grade of steel. Three (03) tension and two (02) bend tests shall be made (for every 50 tons' lot) from the finished offered material for each grade of steel.
If a test piece fails to meet the requirement the lot shall be rejected.

Tensile Properties of Bolts and Nuts

Sample plan for proof and tension tests shall be made for each size of bolts and nuts. Twenty (20) proof and tension tests shall be made (for every 50 tons' lot) from the finished offered material for each size of bolts and nuts.
If a test piece fails to meet the requirement the lot shall be rejected.

Galvanizing

The acceptance and rejection on the basis of galvanizing test will be according to the specified Standards. The galvanizing test shall be carried out on all ferrous parts complying with the following requirements:
(i) Weight of zinc coating
(ii) Uniformity of zinc coating
(iii) Adherence of zinc coating
(iv) Zinc coating thickness

Test samples for determination of compliance to the tests specified shall be performed in accordance with relevant ASTM Specification and shall be taken from each lot. The lot shall consist of a quantity as specified in the relevant standards.

6.4.9 Drawings and Descriptive Data

Drawings and descriptive data for each structure shall include, but not limited to:

(a) Outline drawings
(b) Design calculations, 3D computer models, and stress diagram by using SAP2000 software. Design calculations along with computer printouts shall be fully documented.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

(c) Erection drawings
(d) Bill of materials

6.4.10 Design and Drawings for Gantry Steel Structures

The Contractor shall submit detailed design calculations, load analysis and supporting information for design of gantry steel structures for review and approval by the Employer. However, the Employer may provide the prevailing steel structure drawings during execution of the Contract for fabrication in which case there is no need to design the gantry steel structures.

Any modifications in the specified designs for adaptation thereof to the Project specific requirements shall be Contractor's responsibility and shall be done without any additional cost to the Employer.

Since the Project is to be executed under an EPC Contract, the Contractor shall verify the adequacy of the designs with regard to the intended application per the switchyard layout and equipment arrangement, to be proposed by him and to be subsequently reviewed and approved by the Employer.

6.5 HIGH VOLTAGE BUS WORK

6.5.1 General

These Specifications cover the requirements of design and manufacture of conductors, insulators and hardware for switchyard buses and overhead shield wire.

6.5.2 Conductors and Buses

6.5.2.1 General

The 132 kV bus bar shall have mechanical strength to withstand stresses arising from symmetrical short circuit currents of 40 kA. The continuous current rating for main bus shall not be less than 2000 A under the specified conditions. The continuous current ratings for the overhead conductors to be used for equipment inter-connections shall not be less than the continuous current ratings of the equipment i.e. 2000A under the specified conditions.

Two bundle all aluminum "Coreopsis" conductor shall be used for main busbar of 132 kV switchyard. Overhead buses to be used for line/transformer feeder shall be "Coreopsis" conductor.

Ground connections shall be provided on equipment buses at all the necessary locations for temporary earthing on both sides of the equipment(s) under maintenance. Design, quantity to be supplied and locations of connectors shall be subject to approval by the Employer's Representative.

Span between switchyard gantry and transmission line towers (terminal tower) shall be furnished by others. However, the Contractor shall supply and install all necessary hardware and conductor for connections between 132kV transmission lines and 132kV switchyard equipment.

6.5.2.2 Stranded Conductor

The AAC (All Aluminum Conductor) to be supplied shall conform to requirements of ASTM designation B 231-95, Class AA, or equivalent standard with the following characteristics:

<u>All Aluminum Stranded Conductor</u>

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

(1)	Conductor Type	**Coreopsis**
(2)	Conductor size, kCM	1590
(3)	Stranding, Aluminum wires:	
	Number.	61
	Diameter, nominal, mm.	4.115
(4)	Conductor diameter, nominal, mm.	37.04
(5)	Mass, nominal, kg/km.	2216
(6)	Rated strength, kN.	120
(7)	Number of conductors per bundle	2 & 1
(8)	Bundle configuration	Twin & Single
(9)	Bundle spacing, mm	200 for twin bundle Conductor

6.5.2.3 Rigid Tubular Conductor

Rigid tubular conductor shall be used, where applicable, in the switchyard. Tubing shall be commercially sound and of uniform thickness throughout.

Continuous current carrying capacity of 80 mm diameter tube with wall thickness of 10 mm (or higher size, as required to meet the specified requirements) to be used for 132 kV equipment interconnections shall be not less than 2000A at 30°C temperature rise above an ambient temperature.

Expansion joints and/or expansion terminals shall be provided for strain free installation.

The ends of the conductor shall be fixed to the ends of tube to prevent movement of the stranded conductor, (in case of a tube to stranded conductor joint).

The following provisions shall be made to prevent vibrations of the tube. The installation arrangement shall be analyzed to determine the type and frequency of vibrations:

- If fundamental frequency of the tubular conductor is above 7 Hz, a single stranded conductor used for the strain bus shall be installed inside the respective tube. Necessary end capping and jointing of tubular conductor shall be provided to avoid slipping of the conductor.
- If the fundamental frequency is below 7, Hz the use of special vibration absorbers is necessary. These absorbers should be adjustable to the resonance frequencies of the relevant tube.

6.5.2.4 Shield Wire

The overhead shield wire shall conform to extra high strength grade, Zinc Coated Class B Steel stranded in accordance with ASTM A-363-98 or equivalent Standards. The shield wire shall have the following characteristics:

(1)	Diameter of galvanized steel wire, mm.	9.15
(2)	Number of strands of wire.	7
(3)	Diameter of each coated strand, mm.	3.05
(4)	Grade of wire.	Extra High Strength (EHS)
(5)	Nominal weight of the	406

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

	wire, kg/km.	
(6)	Minimum breaking strength of wire, kN	68.4
(7)	Weight of Zinc Coating, kg/m^2, of uncoated strand surface	0.52 (Class B)
(8)	Elongation, %	4.0

6.5.2.5 Spacing and Clearances

The minimum spacing and clearances shall be as given in Section 6.3 of these Technical Specifications.

6.5.3 Insulators

6.5.3.1 Dead-End and Suspension Type Insulators

The dead-end and suspension type insulators shall conform to the following:

(1) Characteristics and Requirements

(a) The insulators shall be high impact strength, glazed, wet process porcelain type.

(b) The entire exposed surface shall be glazed and free from imperfections.

(c) The insulators shall have clevis and tongue fittings, securely connected to insulators.

(d) Care shall be taken when providing the required leakage distance to avoid designs in which skirts are mechanically fragile.

(e) A suitable permanent identification of the rated strength of each insulator shall be included in the glazed finish with the initials or Trade Marks of the manufacturer and year of manufacture. All markings shall be plainly legible and durable.

(f) The design of the insulators shall be such that breakage of the porcelain cannot materially affect the mechanical strength of the insulators.

(g) Dead-end/Tension and suspension type insulators for insulator assemblies shall comply with the requirements of ANSI C29.1 and ANSI C.29.2 latest edition or equivalent IEC standards. The creepage distance of the assembly shall be 4495mm for 132kV respectively.

(h) The insulator shall be modern Fog type design embodying deeper outer skirts and shallow inner grooves. The Contractor shall prove to the satisfaction of the Employer that the contamination collection properties of the insulator unit are 50-60 percent of the standard 254 x 146 mm disc.

(i) The insulator assembly shall be of double string for main busbar. Tests shall include all of the applicable tests specified in ANSI C29.1 and ANSI C29.2 (latest edition) or equivalent IEC standards. Each insulator shall also be subjected to the tension proof test at the minimum load of half the Mechanical and Electrical strength of insulators.

For verification of design, ten (10) insulator units shall be selected at random from lot and tested for thermal-mechanical performance in accordance with the latest revision of IEC Publication 60575 except temperature variations which shall be from -10°C to 65°C. The criteria for acceptance of the insulators shall be as follows:

(1) The results of the Performance Tests shall match the results of ordinary Electro-Mechanical or mechanical failing load test. Thus, the specified

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

electro-mechanical or mechanical failing load that applies to the ordinary electro-mechanical or mechanical failing load test should be reached also in the performance tests.

(2) Fracture pattern shall not change.

(3) Electrical puncture should not occur before reaching the maximum load and the ultimate fracture.

(4) The quality index Qs should be equal to or greater than the acceptance constant K to meet the requirements of the test. The acceptance constant K shall be 3 for a sample size of ten insulators. The quality index is defined by:

$$Q_s = \frac{R-R_s}{S}$$

R = Mean value of the test

R_s = Specified Electro-Mechanical or mechanical failing load (rated load value)

S =Standard deviation.

(2) Minimum Electrical & Mechanical Requirements

(a)	ANSI Class.	52-6
(b)	Dimensions:	
(1)	Disc diameter, mm.	254
(2)	Disc spacing, mm.	146
(c)	Flashover values:	
(1)	Power frequency:	
(i)	Dry, kV, rms.	95
(ii)	Wet, kV, rms.	55
(2)	Critical impulse 1.2x50 μ sec wave	
(i)	Positive, kV, peak	125
(ii)	Negative, kV, peak	130
(d)	Radio interference voltage:	
(1)	Test voltage to ground, kV	10
(2)	Max. RIV at 1000 kHz micro volts.	50
(e)	Leakage distance, mm.	432
(f)	Dry arcing distance, mm	203
(g)	Power frequency puncture voltage, kV, rms.	110
(h)	Combined, electrical and mechanical strength, kg.	11300
(i)	Impact strength, kg-cm.	104

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

(j)	Glaze color	Chocolate Brown

6.5.3.2 Station Post Type Insulators

The insulators shall be of the outdoor, solid core station post type as specified below. The insulators shall conform as a minimum to the applicable requirements of IEC 60168 latest edition or equivalent standards.

The Contractor shall submit calculations to show that the cantilever strength of the post insulators is at least 250% of the maximum force encountered during a full short-circuit for the longest span and full wind load including effect of circuit breaker auto-reclosing.

Porcelain shall be manufactured by the wet process and shall be one piece, non-porous, homogeneous and free from cavities or other flaws. The glazing shall be uniform in brown color and free from blisters, burns and other defects and shall meet all applicable requirements of IEC Standard Publication 60273.

The characteristics of the insulators shall be as follows:

(a) Electrical Values (minimum)		**132 kV**
(i)	IEC Designation (may vary with altitude correction factors)	*C10-650
(ii)	Lightning impulse withstand, voltage, kV, peak (may vary with altitude correction factors)	650 kV
(iii)	Switching impulse withstand voltage, wet, kV, peak	-
(iv)	Power frequency 1 min. Withstand wet, voltage,	275 kV
(v)	Radio interference voltage: (a) Test voltage, kV rms to ground	92 ($1.1xU_r/\sqrt{3}$)
	(b) Max. RIV, at 1000kHz, micro volts.	500
(vi)	Creepage distance, mm. & may vary with altitude correction factor	4495

(b) Mechanical Values, Failing Load (minimum)

1. Bending, N.10000
2. Torsion, Nm **4000

Proposer to select the insulators according to the specified requirements and the layout of the equipment. The insulator ratings/IEC designation shall be subject to approval by the Employer.

The Contractor shall supply post insulators of higher torsional strength if so required for the offered type of disconnectors.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

6.5.4 Hardware

6.5.4.1 General

All hardware such as connectors, joints and clamps shall be designed for specified aluminum conductor or aluminum tubing.

6.5.4.2 Connectors

All connectors shall be of aluminum and shall have a current carrying capacity and strength equal to or greater than the buses/equipment for which they are used but shall not be less than 2000A corresponding to buses/equipment continuous rating of 2000A. The material of connectors for aluminum conductors practically shall be free from copper.

(1) Connectors for Stranded Conductors

Compression type connectors shall be used for dead-end and jumper terminal connections suitable for specified all aluminum conductors. All other connectors shall be of bolted type.

The dead-end compression connectors shall consist of steel tongue and an aluminum body for the stranded conductor and an aluminum terminal for the jumper terminal. Each dead-end assembly shall be supplied with a jumper connector suitable for straight or 30 degree vertical offset terminations and shall be furnished with clevis, clevis bolts and cotter pin etc.

The compression dead-end connectors shall be supplied with sufficient amount of high grade inhibitor to fill all the assemblies plus 20% spare inhibitor.

The conductivity of dead-end bodies shall not be less than the conductor itself.

The compression connectors as well as bolted type connectors shall meet the specification requirements of heat cycling duty given hereunder when subjected to Heat Cycling test. This requirement shall be met for compression dead-end connectors when bolted jumper terminals are included in the test.

One compression connector and bolted type connector of each type shall be subjected to the heat cycling duty test.

The test shall be as follows:

The test current shall be the power frequency current and should raise the surface temperature of the conductor to 140 degrees centigrade. The ambient temperature shall be kept between +15°C and +30°C. The minimum length of conductor used for determining this current shall be 2 meters and the conductor temperature shall be measured near the center of the test length.

The joint shall be assembled in accordance with the manufacturer's recommendations on conductor of the size and type with which it is to be used. The assembly to which a tensile load not exceeding 20% of the UTS of the conductor may be applied, shall be directed indoors so that the conductor is roughly horizontal. Air shall be able to circulate freely around the assembly which shall not however, be exposed to draughts. The minimum length of conductor on each side of the fitting shall be 2 meters.

The test current shall be passed continuously through the assembly for a period of 30 minutes. The current shall then be interrupted, and the assembly shall be allowed to cool to within 5°C above the ambient temperature. The sequence of operation shall be repeated so that 500 cycles of heating and cooling are applied. Temperature of joints, jointed conductor and of room shall be recorded continuously.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

During the last 5 cycles, the maximum temperature measured when the test current is flowing at any point on the surface of the fittings, shall not exceed that of the conductor.

The strength of the joint and that of the reference conductor shall be measured before and after completion of heat cycle test. All measurements to be made at ambient temperature. There shall be no sign of local heating, burning or fusing of any part of the joint or of the conductor.

The bolted connectors shall meet the following requirements:

- Spring washers, tooth lock washers and other locking devices against loosening of screws are not admissible for bolted connectors. Plain stainless steel washers of high tensile strength must be provided beneath screw head and nut. For bolted flat, plain stainless steel washers of about 5 mm thickness and extended outside diameter shall be used.
- Clamping screws shall be made from hot-dip galvanized steel of tensile strength class 8.8 or from stainless steel of grade A2-F80. Screws of aluminum or aluminum alloy are not admissible. The minimum thread diameter of 10 mm shall be adhered to in any case.
- The conductor groove of connector shall be adapted to the conductors to be connected (no diameter range admissible).
- The contact surface of connectors shall be machined.
- The conductor groove for stranded aluminum conductors shall be provided with a suitable corrugation.
- Connectors made from forged aluminum alloy shall preferably be used for aluminum conductors.
- On connectors fitted with covers, forged covers shall preferably be used due to mechanical requirements.
- The Contractor shall submit test reports of heat cycle test along with other type tests reports on each type of bolted connector used for Employer's review.
- The Employer shall study the test reports and advise the contractor of the tests to be performed.

(2) Connectors for Solid Conductors (Tubes, Studs, etc.)

- The radius of conductor grooves shall bear such a ratio to the radius of tube that an abrasive contact be produced on the current-carrying connector components.
- The bearing of tubes in the clamps of supports require thermally stable friction bearings of low coefficient of friction. A permanent and reliable transmission of charging current to the support shall be ensured.
- The angle of deflection of tubes in the suspension clamps shall be 8 degrees in all directions.
- The mechanical and electrical connection on expansion clamps shall be separated within the clamp. The current may be only conducted via the electrical connection.
- All-aluminum conductors of short lay length shall be used for the current transmission on expansion clamps. The conductors shall be connected with the connector by inert gas shielded arc welding. The welding's shall be protected from infiltrating and retaining humidity.
- The conductors of jumper shall be arranged such that the current be distributed over the conductors as uniformly as possible.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- The expansion of tubes in expansion clamps shall not be impeded. In case that the provided expansion be exceeded, the locking device shall prevent the tube from falling out of the suspension clamp.

(3) Connectors for Equipment Terminals

The connectors to be fixed with the terminals of various equipment shall be of monometallic or bimetallic types depending upon the material of the terminal's aluminum or copper.

6.5.4.3 Conductor Suspension Clamps

Conductor suspension clamps shall be suitable for specified conductors which will be used for the buses. each suspension clamp shall be capable of holding the conductor without slipping when the conductor is under tension of 35 percent of its ultimate strength. bus support clamps shall be designed to allow for thermal expansion.

6.5.4.4 Conductor Tension Assembly

The assembly shall be designed with two strings of insulators for main 132kV bus bar and shall withstand without permanent deformation of any of the components at a conductor tension equal to the full rated ultimate strength of the conductor applied simultaneously on all the conductors in the bundle.

6.5.4.5 Corona Performance

Complete insulator tension as well as suspension strings assembled with all fittings in a manner as nearly as possible to the arrangement to be used shall be tested for maximum riv at (1.1xvr/√3) kv rms shall not exceed 500 micro volt.

6.5.4.6 Strain Clamps for Shield Wire

Strain clamps for overhead shield wire shall be of galvanized malleable iron, bolted type and shall have an ultimate strength of not less than 7000 kg.

6.5.5 Drawings, Technical and Descriptive Data

6.5.5.1 Proposal Drawings

Drawings and catalogue data for conductors, tubular bus, shield wire, insulators and fittings and hardware incorporating the dimensions, materials and finish shall be supplied in specific facilities data at the time of Proposal.

6.5.5.2 Approval Drawings

All Specific Facilities Data of AAC conductors, tubular conductors, insulators and hardware, the Contractor/Manufacturers Drawings and calculations shall be submitted for the approval of the Employer.

6.6 CIRCUIT BREAKERS

6.6.1 General

These Specifications cover the requirements for design, manufacture, testing, supply, installation and and commissioning of 132kV circuit breakers.

The circuit breakers shall be SF6 type, with self-contained power operated mechanism. Circuit breaker shall be designed, manufactured and tested in accordance with latest edition of IEC 62271-100, IEC 62271-1 and up-to-date experience incorporating any latest improvements in design and manufacture as currently employed in the industry.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

The 132 kV circuit breakers shall be of the single pressure Sulphur hexafluoride (SF6) type with self-contained power operated spring charged operating mechanism.

The 132 kV circuit breakers shall be three-pole outdoor type suitable for automatic tripping and automatic reclosing and complete with all necessary accessories to make a complete operating unit. The circuit breakers shall be suitable for single shot, 3-pole rapid auto reclosing.

The design of the circuit breakers shall be such as to minimize over voltages due to current chopping. The breaker shall be able to withstand the stresses created by evolving faults. The circuit breaker, with the contacts in either fully open or closed position, shall be capable of withstanding without puncture or flashover of any of its parts, the values specified for low frequency and full wave impulse voltage, when applied to the terminals of the breakers. The rated lightning impulse withstand voltage level of all parts shall be based upon a pressure equal to the minimum pressure of the interrupting medium required for a successful interruption at the circuit breaker rating.

6.6.2 Standards

The circuit breakers shall be designed, manufactured and tested in accordance with the latest edition of IEC publications.

In case the requirements laid down herein differ from those given in the above publications in any particular case, the circuit breaker shall comply with the requirements listed herein referred to that item.

6.6.3 Ratings

The circuit breakers shall be rated conforming to the requirements of latest edition of IEC 62271-100 and IEC 62271-1 except as other-wise specified herein and as follows:

(1)	Nominal system voltage, kV, rms	132
(2)	Rated voltage, (Ur) kV, rms	145
(3)	Rated insulation level:	
	(a) Rated one minute power frequency, withstand voltage, kV, rms.	
	- Phase to earth and between phases	275
	- Across open breaker	275
	(b) Rated lightning impulse withstand voltage, kV, peak.	
	- Phase to earth and between phases.	650
	- Across open breaker	650
(4)	Rated normal frequency, Hz.	50
(5)	Rated current at 50 Hz and 50°C not less than, A.	2000
(6)	Rated short-time withstand current, kA, rms	40

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

(7)	Rated peak withstands current, kA, peak.	100
(8)	Rated duration of short circuit, second	1
(9)	Rated short-circuit breaking current at rated voltage and 50 deg. C, not less than kA, rms.	40
(10)	Percentage of DC component, %.	30
(11)	Rated short-circuit making current, kA, peak.	100
(12)	Rated operating sequence	O-0.3sec-CO-3min-CO
(13)	Rated out-of-phase breaking current, kA, rms	10
(14)	Rated line charging breaking current, A	50
(15)	Rated cable charging breaking current, A	160
(16)	Classification for re-strike performance during capacitive current switching	Class C2
(17)	Rated break time, ms.	40-60
(18)	Maximum RIV at (1.1xVr/√3) kV rms line to ground micro volts	500
(21)	First pole-to-clear factor	1.3* 1.5 (for test duty T1)
(22)	Classification for number of mechanical operations the circuit breaker shall be capable to perform	Class M2
(23)	*Minimum creepage distance, mm.	4495

-	Normally open	25%
-	Normally closed	25%

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

(26) Insulation levels, creepage distance and other rating shall be adjusted as per IEC to make equipment suitable for installation at almost 2500m altitude from sea level.

Note: *(for test duties T100, T60 and T30)

6.6.4 Switching Requirements

The circuit breaker shall be suitable for switching transmission lines for any type of fault.

The circuit breakers shall be suitable for single shot high speed three pole auto-reclosure for 132kV circuit breakers.

The circuit breaker shall be capable of interrupting the charging current of transmission lines and cables up to the value specified under sub-clause 6.6.3 above at rated voltage. The requirements of capacitive current switching shall be as outlined in Clause 6.111 of IEC publication 62271-100, Edition 2.0.

The circuit breaker shall meet the requirements of simultaneity of poles specified in Clause 5.101 of IEC 62271-100, Edition 2.0.a

The break time at 25 percent current rating with normal control voltage applied, shall not exceed the rated break time. No re-strikes at the main contacts shall be permitted under any operating duty.

The maximum noise level of the circuit breaker, when operated to close or open the three poles simultaneously shall be less than 140 dB(A) at 1-meter horizontal distance at the perimeter of circuit breaker with cabinet closed.

The circuit breaker shall be suitable to meet the requirements for full out-of-phase switching. The interrupting capability shall not be less than 25% of rated short circuit current at a voltage across one phase of value equal to two times the maximum rated phase voltage.

The circuit breaker shall be capable of handling the Short-line fault conditions associated with line switching in accordance with IEC Publication 62271-100 (latest addition).

6.6.5 Performance Requirements

6.6.5.1 Temperature Rise

The temperature rise of any part of the circuit breakers shall not exceed the temperature rise limits specified in IEC Publication 62271-1. The reference ambient temperature shall be 40°C.

6.6.5.2 Voltage Equalization (Not Used)

The voltage across series connected interrupting contacts of circuit breaker shall be made as nearly equal as economical design permits by shunting interrupting contacts with suitable capacitors.

6.6.5.3 Radio and Telephone Interference

All equipment shall be designed and constructed so as not to cause interference with radio reception or telephone communication circuits in accordance with the most modern practice. Limits of radio influence voltage is 500 micro volts when breakers are tested at 1.1xUr/√3 line to ground voltage as per IEC 62271-1.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

6.6.6 Controls and Auxiliaries

6.6.6.1 Tripping and Closing Requirements

The circuit breaker closing and tripping circuits shall be rated for 110 V D.C. Electrical tripping facilities for the operating mechanism of 132 kV 3-pole circuit breaker shall be duplicated to include, but not necessarily limited to the following:

(1) Two electrically independent and identical trip coils for each pole of the breaker and arranged to minimize the probability of failure of one trip coil affecting the operation of the second trip coil.

(2) Two electrically independent and identical sets of wiring, terminals and protecting equipment for connection to two 110 V DC for 132kV circuit breaker independent tripping power circuits.

(3) Auxiliary switches and auxiliary circuits shall be capable of carrying at least 10 A continuously without exceeding the temperature limits specified in IEC 62271-1 at temperature of 40°C ambient.

(4) The control system shall include circuitry to trip the breaker by energizing both sets of trip coils if pole- disagreement should occur and alarm shall be initiated in the control room. A timer shall be furnished in the control cubicle to permit allowable phase discrepancy condition during single pole auto- reclosing. The setting range of timer shall be between 0.5 seconds to 2.0 seconds.

(5) The closing device shall be capable of closing the breaker for any value of voltage between 85% and 110% of rated control voltage and tripping device shall be capable of tripping the breakers for any value of voltage between 70% and 110% of rated control voltage.

6.6.6.2 SF6 Gas Requirements

The Contractor shall supply all relays, switches and accessories to provide for fail-safe operation of the circuit breakers during conditions of low gas density. The density shall be sensed in two stages, the first stage indicating an alarm. The second stage shall prevent closing or tripping of the breakers in case the SF6 gas density is too low, for safety reasons, and shall also give annunciation on control board. One temperature-compensated density meter for 132 kV circuit breakers shall be provided properly enclosed in a suitable enclosure.

The SF6 gas sealing system shall guarantee minimal leakage under extreme temperature conditions and effectively restrict the entry of moisture or other gases. Maximum permissible leakage rate shall be 1% per annum. The material used for sealing system shall not deteriorate due to the exposure of the gas, vapors, temperature variations and mechanical forces during the long-term service. Maintenance of the sealing system should generally be possible without dismantling the breaker pole and draining the SF6 gas. The breaker design shall prevent liquefaction and partial condensation of moisture of the insulating parts of the breaker operating mechanism and SF6 containers.

SF6 gas conforming to IEC Publication 60376 shall be used.

6.6.6.3 Additional Requirements

All circuit breakers shall be designed for closure and tripping by remote and local electrical controls. Local electrical control shall be from the outdoor control cubicle by means of a local close-trip control switch. The control location shall be selected by a local-remote transfer switch provided within the outdoor control cubicle. The `local' operation of the circuit breaker

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

shall be possible only when associated disconnectors are open. A two position `maintenance - off' switch shall also be provided in the outdoor marshalling kiosk for operating the breaker when it is under maintenance. This switch shall normally be in `off' position. In maintenance position, the breaker shall be locally operable provided the associated disconnecting switches are open. The breaker shall also be disconnected from the remote control and protection system when the switch is placed in `maintenance position'.

Necessary provisions shall be made to exhibit indications in the control room when the LOCAL-REMOTE transfer switch is in the LOCAL position.

All output contacts including breaker auxiliary switch contacts shall be wired out to terminal blocks. The circuit breakers shall be mechanically and electrically trip free and have an anti-pumping feature.

6.6.6.4 Interlocking System

Electro-mechanical interlocking shall be supplied with each breaker. Electro-mechanical interlocking shall be provided to prevent operations of the associated disconnectors when circuit breaker is closed.

6.6.7 Construction

6.6.7.1 General

Main assemblies shall be of modular design having same opening distance between the fixed and moving contacts. Any interrupter shall be removable without affecting the other interrupter or support column insulator in any manner so that it shall be unnecessary to drain sf6 from the whole pole when only one interrupter has to be inspected or replaced.

The circuit breaker shall be autonomous in gas supply, and no permanent external gas accumulators or piping shall be required. For refilling purposes, portable SF6 gas bottles shall be furnished. Refilling shall be possible while circuit breaker is in service.

The construction of the circuit breaker and the associated equipment shall ensure safety of personnel. The isolation from live parts shall be by elevation. All moving parts shall be suitably covered.

6.6.7.2 Phase-Spacing between Poles (Not Applicable)

The circuit breaker shall be installed with not less than the specified distance between poles. The minimum distance between poles of 132 kV circuit breakers are specified in Specification Drawings.

6.6.7.3 Line Terminals

The circuit breaker terminals shall be suitable for the specified conductors

6.6.7.4 External Insulation

The external insulation shall be designed, manufactured and tested in accordance with relevant IEC Publication. These shall be SF6 gas insulated type. The porcelain shall be of the wet process, homogeneous, free from cavities and other defects. Circuit breaker support columns shall be designed to withstand internal pressure of at least three times the maximum operating pressure. The color of porcelain shall be chocolate brown.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

6.6.7.5 Ground Terminals

Each mounting column, of each pole of the circuit breaker shall be provided with two copper grounding lugs suitable for 185 sq.mm standard copper conductor. Terminals shall be capable of carrying rated short-time current of the breaker.

6.6.7.6 Finish

On all outside surfaces of metal parts, one coat of metal primer and two coats of outdoor paint shall be applied. During application, special attention shall be given to welded seams. All exposed nuts and bolts shall be treated to prevent corrosion.

6.6.8 Operating Mechanism

The operating mechanism and appurtenances shall conform to IEC Standard Publication No. 62271-100 The operating mechanism for 132 kV circuit breakers shall be 110V DC motor operated spring charged only.

The circuit breakers equipped with spring charged operating mechanism shall be closed by the stored energy of charged springs. The mechanism shall be designed such that the failure of spring will not prevent tripping and will not cause tripping or closing. The energy stored in motor-compressed spring shall be sufficient for an OPEN-CLOSE-OPEN operation at rated short circuit current. The charging motor shall be direct current. The motor shall not require more than 15 seconds to recharge the closing springs after a close-open operation. Means shall be provided to prevent operation of the mechanism when maintenance work is being done.

The operating mechanism shall be capable of performing the duty cycle as specified in Clause 6.6.3 of these Technical Specifications.

Working parts of the mechanism shall be of corrosion resisting materials, and all bearings which require frequent greasing shall be equipped with pressure-type grease fittings and shall be readily accessible without dismantling the mechanism or housings. The mechanism and control system shall be strong, robust, positive, fast and shall not have objectionable rebound or require critical adjustments or frequent maintenance.

The mechanism shall be designed so that it will not cause tripping or closing when there is no control command.

Provision shall be made on the circuit breakers for the attachment of a device to record the operation of valves, contacts, etc., so that timing tests can be made to verify the sequence of operation as prescribed.

For purposes of inspection and adjustment, means shall be provided to permit local operation of the breaker, so designed that the contacts of the breaker may be operated slowly for adjustment.

Mechanical position indicator to indicate the position of the breaker shall be provided. Open position shall be indicated by using letter "O" with green color as background while closed position shall be indicated by letter "C" with red as background color. Separate operation counter shall be provided for each pole of the circuit breaker.

Motor over-running indication feature shall be incorporated to signal the excessive running of the motor of hydraulic pump due to any gas leakage.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

6.6.9 Provisions for SCADA and Remote Control Functions

Provisions shall be made for remote `open' and `close' operations, position indications and failure alarm (at remote stations) for 132 kV circuit breaker as specified.

Identified terminals in the control boards shall be wired to auxiliary contacts of the circuit breakers. The auxiliary contacts shall comprise separate parts for NO and NC potential free contacts for open and close positions respectively.

6.6.10 Outdoor Cubicles and Components

6.6.10.1 General

Outdoor cubicles of all the circuit breakers shall be vermin proof and weather proof, of protection Class IP55. The master control housing shall contain all breaker indicating devices, MCBs for AC and DC circuits, closing and tripping controls, and alarm relays for all the necessary mechanical and electrical apparatus and accessories required. All mcbs shall be provided with auxiliary contacts and sensitive earth fault protection for personnel safety. Separate MCBs shall be provided for heating and lighting circuits.

There shall be a neoprene gasket between the door and frame to prevent the ingress of moisture. Each of the cubicles shall be mounted so as to be accessible from ground level. Structural backing shall be provided, where required, in such a manner that the complete assembly shall be rigid, self-supporting and free of vibration, twist and weave.

6.6.10.2 Cubicle Interior

No equipment shall be mounted less than 300 mm above the floor of the cubicle or 150 mm from the roof. Any unused areas of panels shall be kept free of wiring to permit the installation of possible future components.

6.6.10.3 Doors and Latches

Each cubicle shall be equipped with a hinged door with hinges on the left.

The door shall have its edge bent inwards for rigidity. There shall be a three-point latch and activating handle. The handle and door shall have matching projections with a 12.5 mm diameter hole suitable for locking the cubicle door with a padlock

6.6.10.4 Lighting, Outlets and Telephone Jacks

Interior lighting operating from a door switch shall be provided within each cubicle assembly.

A 240 V, 5A single phase three pin convenience outlet along with its MCB to fit standard prong plugs shall be installed inside cubicle assembly.

A telephone jack shall be provided in each cubicle assembly. A hook for supporting head set shall be provided conveniently close to the jack. Telephone wiring up to control desks, relay room and PLC room in the control building shall be provided for work during erection and maintenance.

6.6.10.5 Ground Bus

A copper ground bus bar shall be provided with tapped holes and screws and shall be connected to the shields or associated earth continuity conductors of all incoming cables.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

6.6.10.6 Control Circuit

110V DC miniature circuit breakers shall be provided for protecting DC control circuits 132 kV circuit breakers.

6.6.10.7 Terminal Blocks and Terminals

Terminal blocks for control wiring shall be molded type with marking strips and covers. White marking strips shall be provided for circuit designation. Each connected terminal of each block shall have the circuit designation. Terminal studs and wires shall be numbered or otherwise marked in accordance with the applicable schematic and wiring diagrams with permanent contrasting marking fluid.

Terminal blocks shall be arranged with sufficient room for easy connection of incoming cables. Parallel rows of terminal blocks shall be spaced at least 150 mm apart. At least 20% spare terminals shall be provided in each block or group of blocks.

Blocks shall be mounted in vertical columns along the sides of cubicles or on vertical panels specially provided for terminal blocks.

6.6.10.8 Component Wiring

Wiring between terminals of various devices shall be point to point (no splicing or 'T' connection shall be allowed). All internal wiring shall be neatly truncated in wiring troughs.

All groups of bundled conductors to hinged doors and panels shall use extra-flexible wire arranged so that a twisting, rather than a bending motion is imparted to the moving conductor bundle.

All wires shall be identified at both ends according to the interconnection diagrams.

6.6.10.9 Heaters

Space heaters of sufficient capacity along with thermostat, humidistat, control switches and circuit breakers shall be supplied for each control cabinet to reduce condensation which may occur. `Auto-Manual' selector switch shall be provided for selecting the operating mode of the heaters.

6.6.10.10 Schematic Diagram

A schematic diagram of the control circuit block of the circuit breaker shall be provided.

6.6.10.11 Motors

All motors shall conform to IEC standards for motors and as specified herein:

Fractional horsepower motors shall be rated for 230 V, single phase, 50 Hz supply. All other and reversing motors shall be rated for 400 V, three phase, 50 Hz.

The motors shall be squirrel-cage induction type, direct on line starting, normal starting torque, low starting current.

The motor shall be single speed having a continuous service factor of 1.0.

Motors for circuit breakers equipped with spring charged operating mechanism will be rated for 110V DC for 132 kV circuit breakers.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

6.6.10.12 Structures

The structural steel supports for the circuit breakers as well as all necessary related steel materials shall be designed in accordance with design parameters and instructions given in Section 6.4 of these Specifications. Supporting structures, mounting bolts, nuts and accessories shall be as specified in Section 6.4 of these Specifications.

6.6.10.13 Material and Workmanship

The material and workmanship throughout shall be of the best quality in accordance with accepted modern practices. The design shall be such that installation, replacements and general maintenance may be undertaken with a minimum of time and expense. Each complete unit shall be designed for continuous operation at full-rated capacity and liberal factors of safety shall be used throughout the design. All screw threads and bolt sizes shall comply with ISO Standards for metric threads.

6.6.10.14 Shop Cleaning and Painting

All interior and exterior surfaces of tanks, enclosures, cabinets and other metal parts which are not galvanized and are exposed to oil or weather shall be thoroughly cleaned by degreasing and abrasive blasting, or other equivalent means to remove all grease, scale, corrosion, and foreign substances, subject to the approval of the Employer. All interiors and exteriors except tanks which shall receive the Manufacturer's standard treatment shall be given at least one priming coat and one finish coat of light colored paint or enamel. Interiors of operating compartments shall have a finish coat of gloss white. All exteriors shall be given not less than 3 coats of paint consisting of primer and finish enamel. The finish coat shall have high grey color. The total dry film thickness of the 3 or more coats of paint shall not be less than 0.09mm, of which not less than 50% shall be finish enamel.

All machine-finished or bright surfaces shall be thoroughly cleaned, coated with a suitable, easily removable, corrosion resisting compound and wrapped or otherwise protected from damage during shipment.

Four liters of finish paint shall be furnished for re-finishing damaged surfaces after erection.

6.6.11 Tests

6.6.11.1 General

The circuit breakers shall be subjected to tests in the shop and at site in the presence of the Employer for conformity to the requirements of the Specifications.

Six (6) certified copies of the tests made, and of the results thereof after the tests are made, shall be furnished by the Contractor to the Employer for approval. The results of these tests shall be in such form as to provide means of determining compliance with the applicable Specifications for the material tested. If any item of the plant is of a new design or if essential parts have been redesigned, additional test reports to verify this data shall be submitted for Employer approval.

Tests required herein shall be carried out in accordance with the latest issue of IEC Publication of IEC 62271-100 and IEC 62271-1.

6.6.11.2 Type Tests

One representative circuit breaker with associated equipment out of the circuit breakers of the same design which shall be supplied, shall be assembled complete in the factory and type tests shall be carried out in accordance with the latest issue of IEC Publications 62271-100

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

and IEC 62271-1. However, duly certified and complete test reports for tests carried out by an independent laboratory on similar circuit breaker shall be acceptable in lieu of actual tests. Independent laboratories are specified in Clause 6.3.13 of these Technical Specifications. Six copies of the test reports shall be submitted for Employer review and approval.

The required type tests are as follows:

(1) Dielectric tests.
(2) Radio interference voltage (RIV) tests.
(3) Measurement of the resistance of the main circuit.
(4) Temperature rise tests.
(5) Additional tests on auxiliary and control circuits.
(6) Short-time withstand current and peak withstand current tests.
(7) Tightness tests.
(8) Electromagnetic compatibility (EMC) tests.
(9) Mechanical and environmental tests.
(10) Short circuit making and breaking tests.
(11) Capacitive current switching tests.
(12) Verification of the degree of protection.
(13) Extended mechanical endurance tests.
(14) Static terminal load test.
(15) Critical current tests.
(16) Short-line fault tests.
(17) Out-of-phase making and breaking tests.
(18) Single phase tests.
(19) Shunt reactor current switching tests.
(20) **Contacts Opening/Closing Time:** The circuit breaker shall be tested to demonstrate that all main contacts in different poles open or close within the times specified in clause 5.101 of IEC 62271-100.

6.6.11.3 Routine Tests

Routine tests shall be carried out on all circuit breakers and porcelain enclosures and supports furnished under this Contract at the factory after final assembly, in accordance with the latest issue of IEC Publication 62271-100. Six copies of the certified test reports shall be submitted for Employer review and approval in accordance with Employer Requirements. No equipment shall be shipped until the required routine tests have been approved by the Employer.

(1) Dielectric test on the main circuit.
(2) Tests on auxiliary and control circuits.
(3) Measurement of the resistance of the main circuit.
(4) Tightness test.
(5) Design and visual checks.
(6) Mechanical operating tests.

The Contractor/manufacturer shall arrange inspection of spare parts to be supplied under the Contract during witnessing of Factory Acceptance Tests (FATs) at manufacturer's premises.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

6.6.12 Porcelain Enclosures and Supports

Each porcelain enclosure of the offered circuit breakers and support or insulating tube or piping which is, or may be, subjected to internal pressure from the breaker shall be given a pressure test of not less than 2 times the maximum pressure to which it could be subjected in service, held for a period of one minute.

6.6.13 Name Plates

A non-corrodible metal nameplate shall be attached to each circuit breaker and its operating devices in a position which shall be clearly visible to a person standing on the ground. The nameplate should list the data specified in Clause 5.10 of IEC Publication 62271-100.

A nameplate shall also be attached to each piece of equipment giving full identification and rating data by its manufacturer as specified in Sub-Clause 5.10 of IEC Publication 62271-1.

Coils of operating devices shall have a reference mark permitting the complete data to be obtained from the manufacturer.

6.6.14 Drawings, Technical and Descriptive Data

The following drawings, information and descriptive data shall be supplied:

(1) Technical Data of circuit breakers as per the format of Specific Facilities Data to Proposal provided in Employer Requirements.
(2) The requisite information required to be supplied with the Proposal in accordance with Sub-clause 9.101 of IEC Publication 62271-100 and shall be supplied in the manner and form given therein.
(3) Outline drawings, photographs, descriptive sheets and sketches to describe clearly the construction and operation of the circuit breaker.
(4) The details of the minor and the general maintenance requirements for servicing and replacement of the contacts, and the requirements of maintenance on the number of switching operations at:
    (a) Full short circuit capacity (100 percent).
    (b) Half short circuit capacity (50 percent).
    (c) Quarter short circuit capacity (25 percent).
(5) The minimum electrical clearance between stationary and moving conducting parts when the circuit breaker is in the normal open position.
(6) The minimum phase spacing.
(7) Full description of any device incorporated in a circuit breaker to limit or control the rate of rise of restriking voltage across the circuit breaker contacts.
(8) The details of the operating mechanism, literature and catalogue data showing full details of the opening and closing sequences of the mechanism under all conditions.
(9) Type test reports.
(10) Instruction manual.
(11) Experience records for the offered type of breakers.

6.6.14.1 Approval of Technical Data / Drawings / Documents

(1) Technical Data of circuit breakers as per the format of Specific Facilities Data to Proposal provided in Employer Requirements.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

(2) Approval Drawings shall show the detailed physical arrangements of the breaker, high voltage connections, wiring and schematic diagrams of the control scheme.
(3) Also provided shall be the transport, storage, installation, erection, maintenance and operation instruction books. These instructions to be written in accordance with IEC Publications 62271-100 and 62271-1.
(4) Impact loading of circuit breaker during the opening and closing operations.
(5) Test reports.
(6) Any other information that the Employer may require.

6.7 DISCONNECTORS AND EARTHING SWITCHES

6.7.1 General

These Specifications cover the requirements for design, manufacture and testing of 132kV disconnectors with or without earthing switches. The design manufacture and testing shall be in accordance with the latest edition of IEC Publications 62271-102 and 62271-1 and the requirements listed herein and shall incorporate the latest improvements in design and manufacture as currently employed in the industry. In case the requirements laid down herein differ from those given in the specified standards in any particular case, the disconnectors and earthing switches shall comply with the requirements listed herein referring to that item.

The disconnectors shall be air switches with or without earthing switches as specified. These shall be outdoor, motor operated, three-pole for 132kV with grouped operation and will be used for isolating equipment and earthing of the line circuits. The 132kV disconnectors shall be horizontal center-break type. The earthing switches shall also be motor operated.

6.7.2 Ratings

The ratings and electrical characteristics of the disconnectors and earthing switches, where applicable, shall be as follows:

1.	Nominal system voltage, kV, rms.	132
2.	Rated voltage, kV, rms	145
3.	Rated insulation level:	
	(i) Rated 1 min. power frequency withstand voltage:	
	(a) Phase-to-earth and between phases, kV, rms	275
	(b) Across the isolating distance, kV, rms	315
	(ii) Rated lightning impulse with-stand voltage:	
	(a) Phase-to-earth and between phases kV, peak	650
	(b) Across the isolating distance, kV, peak	750
4.	Frequency, Hz.	50

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

5.	Rated normal current at 50°C not less than, A, rms	
	(a) Bay disconnectors	2000
7.	Rated short-time withstand current for disconnectors and earthing switches, kA, rms	40
9.	Rated duration of short circuit, sec.	1
10.	Rated peak withstands current for disconnectors and earthing switches, kA	100
11.	Rated short-circuit making current for earthing switches, kA, peak	100
12.	For earthing switches:	
	a) Rated induced current for electro-magnetic coupling A (rms)	80
	b) Rated induced voltage for electro-magnetic coupling, kV (rms)	2
	c) Rated induced current for electro-static coupling, A (rms)	2
	d) Rated induced voltage for electro-static coupling, kV (rms)	6
13.	Minimum creepage distance, mm	384495
14.	Maximum time required to open or close the disconnector, seconds	5
15.	Maximum RIV at ($1.1xU_r/\sqrt{3}$) rms line-to-ground voltage, and 1000 kHz, micro volts.	500
16.	Number of operations (CLOSE-OPEN), disconnectors shall be capable to perform.	10,000
17.	Percentage of spare auxiliary switches:	
	- Normally open	25%
	- Normally closed	25%

18. Insulation levels, creepage distance and other rating shall be adjusted as per IEC to make equipment suitable for installation at 2500m altitude from sea level.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

6.7.3 Construction

6.7.3.1 General

The disconnectors shall be mounted on station post type insulators specified in Clause 6.5.3.2 Transmission of motion to the blades shall be via rotating insulators. The disconnectors shall be complete with steel structure supports, bases, mounting bolts, operating rods with hardware, electro-mechanical interlock facilities, ground and line terminal connectors, earthing switches where specified, operating mechanisms and all other accessories necessary for satisfactory operation. The disconnectors/earthing switches and mechanisms shall be designed to prevent entrance and accumulation of water or dirt.

6.7.3.2 Mechanical Strength

Disconnectors and earthing switches when installed shall be able to bear on the terminals the total forces (including static mechanical terminal load, wind load and electrodynamic forces on the attached conductors) relating to the application and rating without impairing their reliability or current carrying capacity. The conductors attached to the disconnectors shall be as per the approved layout and sections drawings of the respective switchyard.

6.7.3.3 Switch Base

The base of each switch pole shall be of galvanized steel structure, rigid and self-supporting without cross bracing between phases. The disconnectors and earthing switches shall operate properly when the base is mounted on the supporting steel structures.

6.7.3.4 Bearings and Gears

All bearings and gears shall be contained in weather sealed housings providing ability for maximum axial and lateral loading with minimum friction. Each rotating insulator stack shall have double roller or double ball bearings at the base, and at the top end. The vertical operating pipes, if 3 meter or more in length, shall be suitably supported by ball or roller thrust bearings. The ball and roller bearings shall be greaseless and maintenance free type and shall be accessible for dismantling and replacement at site.

6.7.3.5 Insulators

All switches shall be provided with solid core post type insulators as specified in Clause 6.5.3.2 and shall have provision for alignment of insulator stacks. The adjusting means shall not require removal of insulators, bolts, or cap screens. The color of insulators shall be chocolate brown.

6.7.3.6 Contacts and Blade

Blades of the poles of the disconnectors / earthing switches shall be designed for synchronized operation. The contacts shall be high pressure self-cleaning silver plated type. The disconnector / earthing switch shall be manufactured from high conductivity copper or aluminum alloy. The current path shall not be through any spring, hinge or movable pin connection. The formed contact ends of blades shall be silver-plated to ensure good contact transfer characteristics. The contact pressure shall be developed by movement of the entire blade. The contacts of the disconnectors / earthing switches shall be so designed that blade opening shall be prevented during short circuits.

Fixed guides shall be provided so that proper seating of the contacts will be obtained when a blade is out of line in either direction. The disconnector/earthing switch contacts shall be outfitted with corona rings.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

6.7.3.7 Terminals

Terminals shall be suitable for the conductors to be used as per the approved layout for 132kV switchyards.

6.7.3.8 Terminal Connectors

The switches shall be provided with terminal connectors as required.

6.7.3.9 Grounding Lugs

Copper grounding lugs suitable for 185sq.mm stranded copper cable shall be furnished for connecting each disconnector base and the lower end of each vertical operating rod to the steel structure. The base shall be connected to the grounding grid at two diagonally opposite points.

6.7.3.10 Finish

All ferrous parts shall be galvanized in accordance with ASTM specification A-153 or A-123 standards.

6.7.3.11 Earthing Switches

Earthing switches shall be provided on all three poles of the line disconnectors. The earthing switches shall be motor operated with a hand wheel or a crank for manual operation and electrically and mechanically interlocked so that it cannot be closed when the line disconnector is closed and conversely the line disconnector cannot be closed when the earthing switch is closed. A flexible copper braid with a current carrying capacity equivalent to a 185sq.mm stranded copper cable shall be provided on each earthing switch for connection to the grounding lugs. The earthing switches shall ground the jaw end of the disconnectors on the line side.

6.7.3.12 Interlock

Necessary electro-mechanical interlocks shall be furnished for disconnectors for lines and circuit breakers.

The electro-mechanical interlocks shall perform the following functions:

1. To prevent operation of each circuit breaker disconnectors when associated circuit breaker is closed.
2. To prevent operation of line disconnector when associated breaker is closed.
3. To prevent remote/local operation of disconnectors when associated circuit breaker is being maintained (whether open or closed).
4. To prevent closing of earthing switch when line disconnector is closed.
5. To prevent closing of line disconnector when earthing switch is closed.
6. The arrangement shall be made to ensure that the disconnector cannot be operated mechanically with manual operating handle when the associated circuit breaker(s) is (are) in closed position.
7. Arrangement shall be made to ensure that the line earthing switch cannot be closed when line is energized from the remote end.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

6.7.3.13 Mounting

The disconnectors shall be installed on steel supporting structures of galvanized steel construction as specified in Clause 6.7.3.3 hereof.

6.7.3.14 Ground Bus

A copper ground bus shall be provided with tapped holes, screws, and connecting lugs for terminating a 120 mm2 bare ground conductor, in the interior of the control cubicle.

TAGS

Wires shall be tagged with a neoprene disc or equivalent, stamped with the cable number for easy identification.

All devices shall be identified in accordance with the schematic and wiring diagram associated with the panel.

6.7.3.15 Control Circuit

Control voltage shall be 110 V DC for 132 kV disconnectors. DC control supply with MCBs as required shall be provided.

6.7.3.16 Terminal Blocks

Terminal blocks for control wiring shall be molded disconnecting type with marking strips and covers. White marking strips shall be provided for circuit designation. Each connected terminal of each block shall have the circuit designation and wires shall be marked in accordance with the applicable schematic and wiring diagrams with permanent contrasting marking fluid AC, DC circuits shall be physically separated in groups. Terminal blocks shall be arranged with sufficient room for easy connection of incoming cables. Parallel rows of terminal blocks shall be spaced at least 150 mm apart. At least 20% spare capacity will be provided in each terminal block or group of blocks.

6.7.3.17 Component Wiring

Wiring between terminals of various devices shall be point to point (no splicing or 'T' connection shall be allowed). All internal wiring shall be neatly truncated in wiring troughs.

Outgoing wiring shall be connected to terminal blocks suitable for connection to multi-conductor cables. One wire shall be connected to each terminal point. All outgoing wires of terminal blocks shall be grouped.

All wiring shall be identified at both ends.

6.7.3.18 Humidity Control and Interior Lighting

Space heaters of sufficient capacity along with thermostats and humidistats shall be provided for each operating housing to reduce condensation which may occur. The heaters shall be arranged and protected so as to create no hazard to adjacent equipment. The heaters shall be rated for 230 V, single phase, 50 Hz.

Local control cubicles/housings shall be provided with interior illuminations. Lamps shall be controlled with door operated switches.

Separate MCBs shall be provided for space heating and interior illumination. MCBs shall be equipped with sensitive earth fault protection and auxiliary contacts.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

6.7.4 Operating Mechanism

6.7.4.1 General

The operating mechanism of the disconnector and earthing switch shall be operable both electrically and manually. The disconnectors equipped with pneumatic operating mechanism shall not be acceptable. The mechanism shall be mounted on the base supporting the switch structure and shall affect a smooth and thoroughly controlled movement throughout the entire operating cycle and shall be permanently lubricated. The mechanism(s) shall be provided with operation counter and shall also be grounded in a suitable manner.

6.7.4.2 Electrical Operation

The electrical operation of 132kV disconnectors shall be through 110 Volts DC motor which shall be capable of operating the disconnectors or the earthing switches for supply voltage between 85% and 110% of the rated value.

The motor shall be protected by suitable MCBs. The possibility of over-travel shall be eliminated by limit switches, opening the motor circuit and by application of mechanical brake(s). The limit switches and the operating rod travel shall be adjustable for various operating gear ratios.

All disconnectors and earthing switches shall be designed for closure and opening by remote and local electrical controls. Local electrical control shall be made from outdoor control cubicle by means of a local Close - Open control switch. The control location shall be selected by a Local - Remote selector switch provided on the outdoor control cubicle. Local controls shall be provided right at the disconnector/earthing switch location as well as in the relevant bay marshalling kiosk.

When the selector switch is in the "Local" position, it shall not be possible to operate the disconnector from the control room. When the Local/Remote Switch, is in the "Remote" position, the disconnector shall not electrically operate locally.

Any opening or closing operation once initiated, shall be completed under the action of seal-in contacts and limit switches.

The auxiliary switches consisting of at least twelve electrically separate SPDT contacts rated at 110 V, as specified, 10A minimum, shall be provided in an enclosure, in or near the operating mechanism for signaling, interlocking and control. The auxiliary switches shall be wired to the terminal block, in the outdoor control cubicle.

6.7.4.3 Manual Operation

For emergency operation, an adequate manual operating device with a hand wheel or a crank handle shall be furnished. A suitable hanger shall be provided on the outside of the housing to hold the crank when not in use.

A means of disengagement shall be provided between the power operated mechanism and the manual mechanism such that the power operating device will not operate when manual operation is being performed. If the disconnector has been opened manually, it shall be possible to close it electrically or vice versa.

The auxiliary switches and the limit switches shall continue to function normally when the equipment is manually operated.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

6.7.4.4 Provisions for SCADA and Remote Control Functions

Provisions shall be made for remote `Open and Close' operation and status indication for each 132kV disconnector and earthing switch.

Identified terminals in the interface panel shall be wired to auxiliary contacts of disconnectors and earthing switches for the above purpose.

The auxiliary contacts shall comprise separate parts for N/O and N/C potential free contacts for close and open positions.

The auxiliary contacts shall be of the type which change state only when the disconnectors/earthing switch has completed its opening or closing operation. The auxiliary contacts shall monitor the open, close and intermediate position of the disconnectors.

6.7.5 Name Plates

All disconnectors shall be provided with metal nameplates one located on each switch base and one on the operating mechanism where it can be readily seen from ground level. All the nameplates shall be corrosion proof. The nameplates shall give full identification and rating data by its manufacturer in accordance with IEC Publication 62271-102 (latest edition).

6.7.6 Tests

6.7.6.1 General

The disconnectors and earthing switches shall be subjected to tests in the shop and at site in the presence of the Employer for conformity to the requirements of the Specifications.

Six (6) certified copies of the tests made, and of the results thereof after the tests are made, shall be furnished by the Contractor to the Employer for approval. The results of these tests shall be in such form as to provide means of determining compliance with the applicable Specifications for the material tested. If any item of the plant is of a new design or if essential parts have been redesigned, additional test reports to verify this data shall be submitted for Employer approval.

One complete 3-pole disconnector and earthing switch shall be assembled in the factory to prove the design. In addition, the live parts of each pole of each disconnector and earthing switch shall be assembled and mounted on base (less insulators) and tested to check operation and alignment.

Tests required herein shall be carried out in accordance with the latest issue of IEC Publication 62271-102 and IEC 62271-1.

6.7.6.2 Type Tests

All type tests but not limited to the following shall be carried out on disconnectors/earthing switches in accordance with the latest issue of IEC Publication 62271-102 and IEC 62271-1. However, duly certified and complete test reports for tests carried out by an independent authority/laboratory on an identical disconnector/earthing switch shall be acceptable in lieu of actual tests. Independent laboratories are specified in Clause 6.3.13 of these Technical Specifications. Six copies of the test reports shall be submitted for Employer approval.

(1)Dielectric tests.

(2)Radio interference voltage (RIV) tests.

(3)Measurement of the resistance of the main circuit.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

(4)Temperature rise test.

(5)Short-time withstand current and peak withstand current tests.

(6)Verification of the protection.

(7)Electro-magnetic compatibility test (EMC)

(8) Tests to prove the short-circuit making performance of earthing switches, if applicable.

(9)Operating and mechanical endurance tests.

(10) Operation at the temperature limits.

(11) Bus transfer current switching tests (for 132kV disconnectors)

(12) Induced current switching tests.

6.7.6.3 Routine Tests

Following routine tests shall be carried out in accordance with the latest issue of IEC Publication 62271-102 and IEC 62271-1. Six copies of the certified test reports shall be submitted to the Employer for review. No equipment shall be shipped until the required routine tests have been approved by the Employer

(1) Dielectric tests on the main circuit.
(2) Dielectric tests on auxiliary and control circuits.
(3) Measurement of the resistance of the main circuit.
(4) Design and visual checks.
(5) Mechanical operating tests.

6.7.6.4 Electrical Equipment Test

(1) **Motor:** All motors shall be tested at the factory. Tests shall consist of at least those defined as routine factory tests by the appropriate IEC Standards for each type of motor, including but not necessarily limited to:

(a) Power frequency dielectric withstand tests on windings.
(b) Inspection of bearings
(c) Measurement of winding resistance

(2) **Assemblies:** All electrical assemblies other than motors shall be tested at the factory. Tests to be made shall include:

(a) Power frequency dielectric withstand tests on power and control circuits, including wiring and equipment, in accordance with IEC Publications.
(b) Continuity of control circuit wiring and of the grounding of non-current carrying parts of equipment
(c) Operation tests under simulated service conditions to ensure correct operation of all equipment and devices, proper mechanical functioning of all parts of the assembly, and correct mutual functioning of inter-related components.

6.7.7 Drawings, Technical and Descriptive Data

6.7.7.1 Drawings, Technical and Descriptive Data to be supplied with the Proposal

Proposal Drawings and descriptive data shall show the main constructional and operating features of the disconnectors, earthing switches and associated accessories. Following information shall be submitted as minimum:

(1) Technical Data of disconnectors and earthing switches as per the format of Specific Facilities Data to Proposal provided in Employer Requirements.
(2) Outline drawings, photographs, descriptive sheets and sketches to describe clearly the construction and operation of the disconnectors/earthing switches.
(3) The minimum phase spacing.
(4) Literature and catalogues showing details of operating mechanism.
(5) Control Scheme.
(6) Certified reports of type tests carried out by an independent authority.
(7) Instruction manual.
(8) Supply list.

6.7.7.2 Approval Drawings / Documents

(1) Technical Data of disconnectors and earthing switches as per the format of Specific Facilities Data to Proposal provided in Annexure-I at the end of this document.
(2) Approval drawings shall show the scheme of connections diagrams incorporating the various desired features of the disconnectors/earthing switches and accessories. Following drawings/documents shall be submitted:

(a) Outline drawings, catalogues/ drawings showing constructional details.
(b) Drawings showing the interlocking.
(c) Schematic and wiring diagrams.
(d) Outdoor control cubicle details.
(e) Nameplate drawing.

(3) Installation, erection, maintenance and operation instruction book.
(4) Test reports.

6.8 CURRENT TRANSFORMERS

6.8.1 General

These Specifications cover the requirements for design, manufacture, testing and commissioning of current transformers for 132kV switchyard and for current transformers for special applications (secured energy metering system) of 132kV switchyard. The current transformers for special applications (secured energy metering system) shall be supplied as specified.

The current transformers shall be single pole, free standing, hermetically sealed, oil filled, self-contained, outdoor type. These shall be supplied complete with oil level indicators, steel support structures, solderless clamp type HV connectors for connection to conductor and/or aluminum tube, terminal boxes with terminals for outgoing secondary wires, grounding terminals and marshalling boxes as specified. The oil shall conform to latest issue of relevant IEC Publication.

The current transformers shall be multiple ratio type for 132kV switchyard.

The current transformers shall be designed, manufactured and tested in accordance with the latest issue of relevant IEC Publications and particulars listed herein which shall be taken as the minimum requirements. Upward revision of any of the parameters found necessary at the time of detailed engineering by the Contractor and development of current transformer performance characteristics shall be made while finalizing the design of the current

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

transformers without any additional cost. All taps shall be selectable from secondary side. Selection of taps from primary side shall not be acceptable.

6.8.2 Ratings

The current transformers shall have the following ratings

		132 kV	SMS
1	Nominal system voltage, kV, rms.	132	132
2	Rated voltage for the equipment, kV, rms.	145	145
3	Rated frequency, Hz.	50	50
(a)	Rated switching impulse withstand voltage, kV, peak.	–	–
(b)	Rated lightning impulse withstand voltage, kV, peak.	650	650
(c)	Chopped lightning impulse withstand voltage, kV, peak.	748	748
(d)	Rated power frequency withstand voltage, kV, rms.	275	275
5	Rated short-time (one-second) thermal current rating (Ith), kA, rms.	40	40
6	Rated dynamic current rating [Idyn = 2.5(Ith)], kA, peak.	100	100
7	Rated primary current, A, rms.	2000	2000
8	Rated secondary current, A, rms.	1	1
9	Transformation ratios (by means of taps on the secondary windings)	1600-800-400-150/1A	1600-400-150/1A
10	Number of secondary cores	5	1
(a)	Accuracy Class – Measuring core (1)	0.2S	0.2S
(b)	Accuracy Class – Protection cores (4)	5P20, TPS (IEC 61869)	–
12	Instrument security factor for measuring core	5	5
13	Rated output of each secondary winding at the lowest tap, VA	15, 30, 30, 30, 30	15

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

14	Between sections insulation: Rated power frequency withstand voltage, kV, rms.	3	3
15	Secondary winding insulation: Rated power frequency withstand voltage, kV, rms.	3	3
16	Interturn insulation: Rated withstand voltage over complete secondary winding, kV, peak.	4.5	4.5
17	Maximum temperature rise in the insulating oil above ambient of 50°C	55	55
18	Minimum external creepage distance, mm	4495	4495
19	Radio interference voltage at 1.1 Ur/√3 kV and 1000 kHz, µV	500	500
20	Maximum permissible partial discharge level	As per Table 6 of IEC 61869-2	
21	Insulation levels, creepage distance and other ratings adjusted for installation at 2500 m altitude		

6.8.3 Accuracy Classification

The accuracy classification given in Clause 6.8.2 shall be achieved without secondary turn compensation.

The protection cores of the current transformers to be supplied under this contract shall meet the requirements of 5P20 accuracy class for 132 kV switchyard. In addition to this, the protection cores shall fulfill the transient dimensioning requirements of IEC 61869-2 for TPS class current transformers.

6.8.4 Construction

6.8.4.1 General

The current transformers shall be constructed to provide adequate insulation for the insulation class specified and to withstand mechanical and thermal stresses produced under short circuit conditions. All insulation and magnetic materials shall have proven and well established physical and electrical properties such as to give continuous and prolonged service without deterioration.

The current transformers shall be hermetically sealed with the arrangement other than nitrogen gas cushions such as synthetic or stainless steel bellows or expandable cells to accommodate oil level variation. Suitable grade of stainless steel shall be used if steel bellows are provided with the provision of suitable device for indicating the position of bellows.

6.8.4.2 Secondary Terminals and Terminal Boxes

The secondary leads shall be brought out through the current transformer tank wall by means of multiple bushings, equipped with connectors for 2.5 sq.mm to 10 sq.mm stranded copper

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

conductor and shall terminate in a low voltage weather proof box mounted on the side of the tank. The name plate shall be fixed at the outside of the terminal box to be visible with the box closed. Connection diagram shall be affixed inside the secondary terminal box so that it can be easily read while working in the box.

6.8.4.3 Cores and Windings

The cores shall be made of high quality non-aging grain oriented silicon steel, carefully selected, tested and annealed to provide the best magnetic characteristics.

The cores and windings structure shall be rigidly braced and clamped to sustain given mechanical short time rating. The design of cores and windings shall be such as to ensure high accuracy, uniform impulse distribution throughout the winding and low leakage reactance. Each secondary winding shall be wound on a separate core.

6.8.4.4 H.V. Bushings

The current transformers shall be equipped with H.V. bushing of an insulation class not less than that of winding terminal to which they are connected and of creepage distance as specified in Section 6.8.2.

The bushings shall be manufactured from wet type porcelain and suitable for continuous outdoor service. The bushings shall be so constructed as to produce a uniform electrical stress distribution throughout, contain no voids, and be leak proof at all temperatures. Provisions shall be available for power factor testing of each bushing. Each current transformer shall be equipped with bellows position indicator readable from ground level.

6.8.4.5 Tank

The tank shall be constructed of corrosion-proof, high-quality cavity free cast aluminum alloy and shall be suitably reinforced to withstand handling and excessive pressure under fault conditions without distortion. All welded joints pipe work and valves etc. shall be oil leak tested. A clamp on cover shall preferably be provided to allow access to component parts within the tank without undue difficulty. Grounding lugs complete with connectors suitable for 185 Sq.mm stranded copper conductor shall be provided.

6.8.4.6 Accessories

The current transformers shall be provided with the following accessories:

(1) Lifting lugs.
(2) Drain and filling valves with stainless steel plugs.
(3) Bellows and level indicators.
(4) Insulation/Gas monitoring system (Hydrant type or approved equivalent).

6.8.5 Marshalling Boxes

A marshalling box (1000x600x300mm) shall be mounted on Centre phase structure with terminals to terminate all phase cores of a set of three single phase Ct. Self-shorting and isolating type terminals shall be provided for CT secondary circuits. These boxes shall be fabricated from steel sheet not less than MSG 2.5mm thick, seam welded at corners. However, in case of type tested rigid frame design, the thickness of steel sheets may be reduced but not below 2 mm according to manufacturer's standard design. At least 20% spare terminals shall be required. These boxes shall be designed for protection class IP55. Gland plates shall be provided for proper termination of cables.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Heaters with thermostat and humidistat shall be provided inside each marshalling box it required to eliminate condensation in the box. Lamps with door operated switch shall be provided for internal illumination. There shall be a single phase power socket inside each marshalling box. An MCB with auxiliary contact shall be provided for switching ON/OFF the AC power supply to the heating, illumination and power socket. The MCB shall also be equipped with sensitive earth fault protection for personnel safety.

Each star-point of the CT circuit shall be separately grounded through isolating type terminals to enable convenient verification of single point grounding of the interconnected CT circuits.

6.8.6 Terminal Marking

The terminal markings for the current transformers shall be in accordance with IEC Publication 61869-2 and shall clearly identify the secondary terminals corresponding to each specified current ratio.

6.8.7 Name Plates

The rating plate markings shall be of permanent nature and shall be in accordance with latest issue of IEC Publication 61869-2. In addition to the data mentioned in IEC, knee point e.m.f (Ek), magnetizing/exciting current at Ek and secondary winding resistance at 75˚C temperature of each core at each tap shall be engraved on the nameplate. Engraving shall be white on a black background.

6.8.8 Warning

A permanent legible warning shall be placed inside the current transformer terminal box carrying the wording "Caution: Transformer never to be energized with secondary circuit open".

6.8.9 Tests

6.8.9.1 General

The current transformers shall be subjected to tests in the factory and at Site in the presence of the Employer for conformity to the requirements of the Specifications.

Six (6) certified copies of the tests made, and of the results thereof, shall be furnished by the Contractor to the Employer for approval after the tests are made. The results of these tests shall be in such form as to provide means of determining compliance with the applicable Specifications for the material tested. If any item of the plant is of a new design or if essential parts have been redesigned, additional test reports to verify this data shall be submitted for the Employer's approval.

6.8.9.2 Type Tests

The following type tests shall be made on a single CT of each type in accordance with the latest issue of IEC Publications IEC 61869-2 and IEC 60060-1:

(1) Short time current tests.
(2) Temperature rise test.
(3) Lightning impulse tests on primary windings.
(4) Determination of errors and accuracy of protective and measuring cores including instrument security factor test for measuring core.
(5) Wet test for outdoor type transformers.
(6) Radio interference voltage measurement (RIV).

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

However, duly certified and complete test reports for tests carried out by an independent authority/laboratory on similar CT shall be acceptable in lieu of actual tests. Six (6) copies of the test reports shall be submitted for Employer's review and approval.

Independent laboratories are specified in Clause 6.3.13 of these Technical Specifications.

6.8.9.3 Routine Tests

The Following Routine Tests Shall Be Made On All CTs in accordance with the latest issue of relevant IEC publications, for all ratios and at all taps:

(1) Verification of terminal markings.
(2) Power frequency withstand test on primary windings.
(3) Partial discharge measurement.
(4) Power frequency withstand test on secondary windings.
(5) Power frequency withstand test between sections.
(6) Inter-turn overvoltage tests.
(7) Determination of errors and accuracy of protective and measuring cores.
(8) Dissolved gas analysis and measurement of moisture content of oil.
(9) Magnetizing characteristics verifications at each tap of each core.
(10) Measurement of winding resistance at each tap of each core.

6.8.9.4 Special Tests

The following tests shall be performed on a single CT in accordance with latest issue of the relevant IEC standard:

(1) Chopped lightning impulse test on primary winding.
(2) Measurement for capacitance and dielectric dissipation factor.
(3) Mechanical test.
(4) Measurement of transmitted over voltages.

However, duly certified and complete test reports for tests carried out by an independent authority/laboratory on similar CT shall be acceptable in lieu of actual tests. Independent laboratories are specified in Clause 6.3.13 of these Technical Specifications. Six (6) copies of the test reports shall be submitted for Employer review and approval.

6.8.10 Drawings, Technical and Descriptive Data

The Contractor shall furnish following information:

(1) Technical data as per the format of specific facilities data to Proposal provided in Employer Requirements.

(2) Drawings showing outline dimensions, construction and installation details of the current transformers.

(3) Manufacturer manuals for inspection, assembly, installation, testing, commissioning, oil sampling, dissolved gas analysis and measurement of moisture content of oil, maintenance.

(4) Reference data for moisture content and dissolved gases of oil.

(5) Current error and phase displacement data/ curves for variation of 5% to 120% in rated current for measuring cores.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

(6) Composite error data/curves for current ranging from rated primary to rated accuracy limit primary current for protective cores.

(7) Excitation curves for each of the protective and measuring cores at each tap.

(8) Resistance and leakage reactance of the secondary winding at each tap for protective and measuring cores.

(9) Type test reports from independent laboratory of similar current transformers.

6.8.10.1 Approval of Drawings and Data

Drawings and data to be submitted for review and approval shall include those specified in test reports, instruction manuals, schematic and panel wiring diagrams, interconnection diagram, nameplates, drawings, and other relevant drawings/data required for proper installation, operation and maintenance of the current transformers. The contractor shall prepare and submit for Employer's review and approval detailed current transformer performance calculations at each tap of each core to establish that the CT design parameters and characteristics are suitable for the present and future requirements of protection and metering systems. Upward revision in any of the parameters found necessary from the results of the performance calculations shall be incorporated in the final design of the current transformers without any additional cost.

6.9 COUPLING CAPACITOR VOLTAGE TRANSFORMERS / CAPACITOR VOLTAGE TRANSFORMERS / VOLTAGE TRANSFORMERS

6.9.1 General

These specifications cover the requirements for design, manufacture works, testing, supply, installation, testing and commissioning of CCVTs/CVTs for 132kV switchyard of Attabad Lake HPP and 132kV T/L.

6.9.2 Equipment Description

6.9.2.1 General

The CCVTs/CVTs shall be capable of withstanding the severe environmental conditions of outdoor operation experienced in tropical areas. The equipment shall be designed, manufactured and tested in accordance with latest issues of IEC 61869-5.

The CCVTs/CVTs shall be single phase units, oil-filled type. Each device shall be connected between the line and earth and shall be equipped with two secondary windings. Under no condition of operation shall a complex wave be generated which will interfere with proper operation of the relays. Each unit shall be furnished with ferro-resonance suppression devices.

The CCVTs shall be used for PLC signal coupling on transmission lines and shall be equipped with bushings for connection of PLC coupling equipment and, as required, with necessary carrier accessories. The carrier coupling accessories shall include the drain coil, the arresters or spark gap across the drain coil for over-voltage protection, external accessible earthing switch across the drain-coil and a fitting for carrier frequency cable.

The units shall consist of a capacitor divider unit and an electromagnetic unit properly designed and interconnected. A protective device shall be incorporated in the CCVT/CVT for the purpose of limiting over-voltage which may appear across one or more of its components, and to prevent sustained ferro-resonance (harmonic or sub-harmonic oscillation of the device or its associated burden).

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Each CCVT/CVT shall be supplied complete with corona free clamp type HV terminal connectors, earthing terminals, secondary terminal boxes and supporting steel structures, as specified.

6.9.2.2 Equipment Parameters

The CCVTs/CVTs shall be designed in accordance with the following ratings:

		132 kV	SMS
(1)	Nominal system voltage, kV, rms:	132	132
(2)	Rated voltage for the equipment, kV, rms:	145	145
(3)	Rated frequency, Hz:	50	50
(4)	Rated voltage factor for Continuous operation:	1.2	1.2
(5)	Rated lightning impulse withstand voltage (1.2/50µs), kV, peak:	650	650
(6)	Rated switching impulse withstand voltage, kV, peak:	-	-
(7)	One minute power frequency withstand voltage, kV, rms:	275	275
(8)	Rated primary voltage, UPR, kV:	145/√3	145/√3
(9)	Rated secondary voltage of each winding, USR, V:	110/√3	110/√3
(10)	No. of secondary windings:	2	1
(11)	Rated output of each secondary winding, at a power factor of 0.8 lagging, VA:	100	50
(12)	Accuracy class requirement: Sec. winding-1 (measurement and preferably 0.2S-protection) down to zero burden: Sec. winding-2 (protection):	0.2+3P	3P
(13)	Total Simultaneous burden, VA:	200	50
(14)	One minute power frequency withstand voltage, applied between primary and secondary terminals, kV, rms:	5	5
(15)	One minute power frequency withstand voltage for: a) Low voltage terminal: b) Between Sections:	as per IEC 61869-5	
(16)	Impulse withstands level of the coupling device:	According to IEC	

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

(17)	Coupling capacitance, pF:	≥6000	≥6000
(18)	Minimum Creepage distance:	4495	
(19)	The R.I.V. at 1.1x Ur/√3 kV and 1000 kHz maximum, microvolts:	500	500

(20) Secondary terminals Connectors shall be suitable for 2.5 to 10 mm^2 stranded copper conductor.

(21) The temperature rise of a CCVT/CVT at the specified voltage, rated frequency, rated burden and at any power factor between 0.8 lagging and unity, shall not exceed 45 K above an ambient of 50°C.

(22) The total nominal stack capacitance of high voltage capacitors of CCVTs/CVTs/IVTs shall be greater than or equal to the value indicated in item 16, under the specified conditions with a tolerance of (+10%, -5%).

(23) When the CCVT/CVT/IVT is supplied at 120% of rated voltage and with a substantially zero burden, has its secondary terminals short-circuited, and the short-circuit is suddenly removed, the peak of the secondary voltage shall revert to a value which does not differ from its normal value by more than 10% after ten cycles of rated frequency.

(24) When the CCVT/CVT/IVT supplied at rated voltage and with a substantially zero burden, has its secondary terminals short-circuited, and the short-circuit is suddenly removed, ferro-resonance shall not be sustained for more than 2 seconds.

(25) Following a short-circuit of the supply at the primary and earth terminals, the secondary output voltage of the capacitor voltage transformer shall decay within one cycle of rated frequency, to a value of less than 10% of the peak value before short-circuit.

(26) Secondary winding-1 shall be used for metering as well as for protection functions. The specified accuracy shall, therefore, be maintained preferably down to zero burden.

(27) Insulation levels, creepage distance and other rating shall be adjusted as per IEC to make equipment suitable for installation at 2500m altitude from sea level.

6.9.3 Construction

6.9.3.1 General

The CCVTs/CVTs/IVTs shall be constructed to provide adequate insulation for the insulation class specified and to withstand the mechanical and thermal stresses produced under short-circuit conditions.

The high voltage capacitor elements shall be made of high quality paper and aluminum foil and shall be properly assembled to minimize changes in capacitance with time and temperature. They shall be enclosed in an oil-filled porcelain chamber, hermetically sealed with oil-resistant and weather-proof gaskets. The chamber shall be equipped with a bellows or gas cushion expansion device. Necessary steps shall be taken to ensure free expansion of oil and gas in the temperature range specified.

A dust-proof and weather-proof base housing shall be provided at the base of the high voltage capacitor stack, containing the intermediate potential transformer, compensation devices, ferro-resonance suppression devices and protective devices.

6.9.3.2 High Voltage (HV) Capacitors

The CCVTs/CVTs/IVTs shall be equipped with H.V. porcelain insulators, with insulator not less than that of the terminal to which they are connected and of creepage distance specified in Clause 6.9.2.2 item 18.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Each capacitor shall be equipped with a pressure indicator. Provisions shall be available in the electromagnetic unit for power factor testing and for this purpose a test terminal shall be provided at the base of the transformers. This terminal and the arrangement for earthing, thereof, shall be similar to the neutral bushing specified on the CCVT/CVT/IVTs. Oil level gauge shall be of a type which can be read with the equipment energized.

The insulators shall be manufactured from wet type porcelain and shall be suitable for continuous outdoor service. The porcelain shall be constructed so as to produce a uniform electrical stress distribution throughout and shall contain no voids, be leak-proof at all temperatures and shall be guaranteed to be within the specified RIV range.

The HF tap and the extra high rated intermediate voltage tap shall be brought out from the capacitor into the electromagnetic unit by means of porcelain bushings.

Intermediate voltage tap bushing insulation level shall be as under:

(1)	One minute power frequency withstand voltage :	Manufacturer to specify
(2)	Rated lightning impulse (1.2/50 µsec.) withstand voltage :	Manufacturer to specify

6.9.3.3 Neutral Bushings

The primary neutral connection shall be brought out through the welded steel plate tank wall or cover, with a dry polyurethane type bushing, capable of withstanding a 4 kV, 50 Hz test for connection to a neutral conductor.

6.9.3.4 Primary Line Terminals

The CCVTs/CVTs/IVTs shall be supplied with corona free 4-bolt clamp type terminal connectors, plated for connecting aluminum bus as specified in Employer Requirements for 132kV CCVTs/CVTs respectively including hardware required to bolt the connectors to CCVTs/CVTs high voltage terminals.

6.9.3.5 Secondary Terminals, Terminals and Marshalling Boxes

The secondary leads shall be brought out through the capacitive potential devices tank wall by means of multiple bushings, equipped with connectors for 2.5 to 10 mm2 stranded copper conductor and shall terminate in a low voltage weather-proof box mounted on the side of the tank. Secondary terminals shall be labeled with engraved stainless steel or escutcheon plate labels, to be approved by the Employer Mcbs with alarm contacts shall be provided for each core in the terminal box for protection against faults in the cable connections between the terminal box and the marshalling box. Protective characteristics of the Mcbs shall be coordinated with the rating of the CCVTs/CVTs as well as with the downstream protective devices.

The terminal box and the cabinets containing the PLC accessories and the PLC tuning units shall be located in such a manner that they will line up when the CCVTs are banked in line for three-phase operation.

The name plate shall be fixed at the outside of the terminal box to be visible with the box closed. Connection diagram shall be affixed inside the secondary terminal box so that it can be easily read while working in the box.

A marshalling box shall be erected on center phase supporting structure containing isolating type terminals to all secondary circuits, 2 mcbs (high speed CCVT/CVT protection switches

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

compatible with speed of the distance relays, with alarm contacts), two mcbs for metering and one mcb with auxiliary contact for synchronizing circuits.

Proper cable glands shall be provided in the marshalling box at the cable entry.

Humidistat controlled heaters shall be provided inside each marshalling box if required to eliminate the condensation from the box. Lamps with door operated switch shall be provided for internal illumination. There shall be a single phase power socket inside each marshalling box. An mcb with auxiliary contact shall be provided for switching ON/OFF the AC power supply to the heating, illumination and power socket. The mcb shall also be equipped with sensitive earth fault protection for personnel safety.

Each star-point of the CCVT/CVT circuits shall be separately grounded through isolating type terminals.

6.9.3.6 Grounding Terminal

The Contractor shall provide copper grounding lugs complete with connectors suitable for 185 Sq.mm stranded copper cable for CCVTs/CVTs.

6.9.3.7 Carrier Accessories

Coupling equipment accessories comprising drain coil, protective devices, carrier choke coil, and carrier earthing switch shall be provided either within the base housing or alternately in a separate housing mounted adjacent to the base housing. A low capacity connection shall be provided between the carrier coupling accessories and the coupling capacitor. The carrier earthing switch shall be able to effectively earth all carrier coupling components. The position of the carrier earthing switch shall not affect the performance of the CCVT. All connections which may be subjected to high potential rise during abnormal conditions shall be ground shielded.

6.9.3.8 Cores and Windings

The core for the intermediate transformer shall be made of high quality non-aging grain-oriented silicon steel carefully selected, tested and annealed to provide the best magnetic characteristics.

The windings shall be properly insulated for the specified insulation class and shall be capable of withstanding the maximum temperature that may exist in the equipment during the expected life of the winding.

If an earthing switch for the intermediate transformer is provided, the earthing switch shall be lockable in the open position. The position of the earthing switch closed or open shall not affect the level of the carrier signals transmitted through the transmission line. Visual indication shall be provided for position of the ground switch.

6.9.3.9 Tank

The tank shall be constructed of welded steel plate and shall be suitably reinforced to withstand handling and excessive pressures, under fault conditions, without distortion. Where welding is done, a sealed weld shall be used in every case so that no crack or pinhole is left where rusting could take place, or through which pickling solutions might attack the weld.

6.9.3.10 Steel Structures

The CCVTs/CVTs shall be delivered complete with steel supporting structures. The Proposer shall provide complete details of the structures with the Proposal.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

6.9.3.11 Name Plate

A weather-proof stainless steel name plate with engraved inscriptions shall be attached with each CCVT/CVT at a location easily accessible. Engraving shall be white on a black background.

The name plate shall contain all information as specified for rating plates and markings in the latest edition of IEC 61869-5

6.9.4 Tests

6.9.4.1 General

The CCVTs/CVTs shall be subjected to tests in the factory and at site in the presence of the Employer for conformity to the requirements of the Specifications. All tests shall be performed with the actual electromagnetic unit. The tests shall be made in accordance with the latest issues of IEC 61869-5.

Six (6) certified copies of the tests made, and of the results thereof, after the tests are made shall be furnished by the Contractor to the Employer for approval. The results of these tests shall be in such a form so as to provide means of determining compliance with the applicable Specifications, for the material tested.

6.9.4.2 Type Tests

The following type tests shall be made on a single coupling capacitor voltage transformer of each type in accordance with the latest issue of IEC Publications:

(1) Accuracy check (determination of errors).
(2) Temperature rise test.
(3) Capacitance and tan. δ measurement at power frequency
(4) Chopped impulse test.
(5) Radio interference voltage (RIV) tests.
(6) Short circuit withstand capability test.
(7) Lightning impulse test.
(8) Wet test for outdoor type transformers with AC voltage (for 132 kV CVTs/CVTs).
(9) Transient response test.
(10) Ferro resonance tests.
(11) Tightness of electromagnetic unit.
(12) Accuracy tests.
(13) Measurement of the transmission factor of high frequency over-voltages (special test)
(14) Mechanical strength test (special test).
(15) Determination of the temperature coefficient (special test).
(16) Tightness design test of capacitor unit (special test).
(17) High frequency capacitance and equivalent series resistance measurements in the range of the rated temperature category.
(18) Stray capacitance and stray conductance measurements of the low voltage terminal.
(19) Partial discharge test.

However, duly certified and complete test reports for tests carried out by an independent authority/laboratory on similar CCVTs/CVTs shall be acceptable in lieu of actual tests. Six (6)

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

copies of the test reports shall be submitted for Employer review and approval. Independent laboratories are specified in Clause 6.3.13 of these Technical Specifications.

6.9.4.3 Routine Tests

The following routine tests shall be performed on all CCVTs in accordance with the latest issue of relevant IEC publications:

(1) Tightness of capacitor voltage divider.
(2) Capacitance and tanδ measurement at power frequency.
(3) Power frequency withstand test.
(4) Partial discharge measurement.
(5) Verification of terminal markings.
(6) Power frequency withstand test on the electromagnetic unit.
(7) Power frequency withstand test on low voltage terminal.
(8) Power frequency withstand test on secondary windings.
(9) Ferro-resonance check.
(10) Accuracy check (determination of errors).
(11) Carrier drain coil impedance measurement and current carrying capacity test.
(12) Routine test for voltage limitation devices as per IEC 61869-5.

6.9.5 Drawings, Technical and Descriptive Data

The Proposer shall furnish the following information:

(1) Technical data as per the format of specific facilities data to Proposal provided in the Employer Requirements.
(2) Sketches showing outline dimensions and location of accessories. Descriptive data shall show main construction features of CCVT's/CVTs.
(3) A full description of the secondary network and transient suppression circuits.
(4) Accuracy curves for voltage error and phase angle error at rated frequency, at any voltage between 80% and 120% of the rated voltage and with burdens of between 25% and 100% of rated burden at power factor of 0.8 lagging.
(5) Type test reports from an independent laboratory/authority of similar type of CCVTs/CVTs.

6.9.5.1 Approval of Drawings and Data

Drawings and data to be submitted for review and approval shall include, but not necessarily be limited to, the following:

(1) Detailed construction drawings.
(2) Schematic and wiring diagrams.
(3) Name plates.
(4) Drawings required for installation, operation and maintenance.

6.10 SURGE ARRESTERS

6.10.1 General

These Specifications cover the requirements for design, manufacture and factory testing of surge arresters for protection of the switchyard equipment.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

The Contractor shall furnish station type metal oxide surge arresters suitable for protection of equipment from over voltages produced by lightning and switching operations. The arresters shall be capable of withstanding multiple-stroke currents, long duration lightning discharges and switching surges. After dissipation of the surge of lightning discharge, with a 50 Hz voltage equal to the voltage rating of the arrester across its terminals shall interrupt the follow current at first zero value of the current.

The arresters, unless specified otherwise shall be in conformance with applicable provisions of the latest IEC Publication 60099-1 and latest issue of IEC Publication 60099-4.

The surge arresters shall have an established record of satisfactory tests and service performance under temperature range specified in these Specifications. The arresters shall be supplied complete with steel supporting structures, terminal connectors, grounding connectors, cable and surge counters. The arresters shall be single phase, single pole, and outdoor type, with protective characteristics.

6.10.2 Ratings and Characteristics

Main ratings of the surge arresters will be as following:

(1)	Nominal system voltage kV, rms.	132
(2)	Rated frequency, Hz.	50
(3)	Arrester rated voltage (Ur) kV, rms.	120
(4)	Maximum continuous operating voltage, kV, rms.	96
(5)	Rated discharge current kA, peak.	10
(6)	Classification	Station type metal oxide arresters
(7)	Maximum ambient air temperature	40°C
(8)	Maximum residual voltages, at 20kA/10kA discharge currents of the following impulses kV, peak.	
(a)	Steep current Impulse (1x20 micro sec)	According to Table J.1 of IEC Publication 60099-4
(b)	Lightning current Impulse (8x20 micro sec.)	According to Table J.1 of IEC Publication 60099-4
(c)	Switching current Impulse (30x60 micro-sec)	According to Table J.1 of IEC Publication 60099-4
(9)	Maximum external (RIV) at 1 MHz measured at 5% above maximum system voltage, including connectors, micro volts.	500
(10)	Energy dissipation capability kJ/kV.	7
(11)	External Insulations:	
(a)	Lightning impulse voltage withstand, kV, peak.	650

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

(b)	Switching impulse voltage withstand, kV, peak.	-
(c)	Power frequency withstand voltage, wet, kV, rms.	275
(d)	Creepage distance	4495
(12)	Line Discharge Class *:	3
(13)	Insulation levels, creepage distance and other rating shall be adjusted as per IEC to make equipment suitable for installation at 2500m altitude from sea level.	

The Contractor shall submit calculations to prove that the specified line discharge class is sufficient for the longest line. In case the specified line discharge class is not adequate, the surge arrester of appropriate line discharge class shall be supplied.

6.10.3 Construction

6.10.3.1 General

Each arrester shall be completely sealed against atmospheric influences, and a pressure-relief device shall be fitted to ease any excess pressures in the arrester preventing explosive shattering of the housing. The relief device shall be such that it will not operate under normal operating conditions.

The design of the arresters shall be such that a reasonably uniform potential drop will exist across each section of the arrester regardless of any distortion of the electrostatic field due to the presence of salty dust, fog, water or sleet on the arrester porcelain, or uneven drying of the surface of the porcelain. All arrester units shall be interchangeable with equally rated units of the same construction.

6.10.3.2 Arresters Housing

The arrester housing units shall be composed of a suitable porcelain housing with metal end fittings enclosing the valve element. Housing shall, where possible, be single piece porcelain. The sealing arrangement at the end of each arrester unit shall consist of pre-stressed stainless steel sealing plates and rubber gaskets.

The porcelain shall be fabricated by the wet process, free from laminations, cavities or other flaws affecting their mechanical or dielectric strength and shall be well vitrified and nonporous. Seals shall be provided between the porcelain housing and metal end fittings and any materials used, so that it shall maintain their effectiveness over long periods. The metal end fittings shall be attached to the housing with solder or cement as appropriate for the construction used.

6.10.3.3 Metal Oxide Discs

The disc units shall be composed of an inorganic compound of a ceramic nature and shall be mechanically strong. The discs shall have an insulation covering at the edges with suitable mechanical and electrical strength to protect the valve element material and to eliminate flashovers at the edges. The contact surfaces of the discs shall have a metallic or other approved treatment for improving the contact between the discs and with the end connections.

6.10.3.4 Grading Rings

When required for proper performance, each arrester shall be provided with a metal grading ring assembly. The ring and ring support shall be of rugged design and construction to maintain the ring properly spaced under the wind loading specified in the Employer Requirements.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

6.10.3.5 Connectors

All the necessary line and ground connectors shall be provided for the proper connection of the surge arresters.

The Contractor shall furnish all materials for connecting ground terminal to its discharge counter including insulated ground conductor, conductor supports with brackets, terminal lugs and all other accessories for complete installation.

6.10.4 Steel Structures

The surge arresters shall be supplied complete with galvanized steel supporting structure so as to bring the height of center line of H.T. terminals in accordance with the Employer Requirements. The associated discharge counters shall be mounted on the supporting structure at a suitable height so that they can be read by a person standing at ground level. The arrester units shall be insulated from their supports at their bases so as to assure efficient operation of the discharge counters. The Contractor will make proper arrangement for fixation of the discharge counter on the steel support structure of surge arrester.

6.10.5 Leakage Current Meter and Discharge Counters

Each single phase arrester shall be equipped with a leakage current meter and discharge counter. Leakage current meters and counters shall have weather-proof enclosures and shall be explosion proof for full short-circuit current. The leakage current meter shall be of the type which, in addition to continuous indication of the leakage current, shall permit measuring/monitoring/analyzing of leakage current with external equipment without having to disconnect/de-energize the surge arrester. The connector/socket for this purpose shall be of the type which can be used with leakage current analyzers. Counters shall have a high speed response and shall have minimum effect upon overall protection afforded by the surge arresters. Counters shall be sensitive enough to record the minimum discharge current likely to take place inside the arresters. Discharge counters shall be of a type that does not need any external power source and shall be equipped with spark gaps to protect the counter coils. Discharge counters shall be equipped with minimum 4 digit level read-out. Discharge counter shall be fitted with remote indicators to initiate visual and audible signal in the control room.

A portable leakage current analyzer with necessary auxiliaries will be provided to determine the changes of the leakage current.

6.10.6 Name Plates

Each single-pole arrester shall be provided with a name plate permanently attached to the arrester and in case the arrester is composed of a number of units, each unit shall also have an individual name plate. The main name plate shall be attached to the lower arrester unit or base so that it can be read by a person standing at ground level.

The main name plate shall include the following information:

(1) Continuous operating voltage.
(2) Rated voltage.
(3) Nominal discharge current.
(4) Rated short-time withstand current in kA, rms.
(5) Manufacturer's name and trade mark, type and identification of complete arrester.
(6) Identification of the assembling position of the unit.
(7) The year of the manufacture.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

(8) Serial number of the arrester.

(9) If sufficient space is available, the nameplate should also contain line discharge class of the arrester.

Name plates shall be of a corrosion-resistant metal.

6.10.7 Factory Tests

6.10.7.1 General

The surge arresters shall be subjected to tests in the shop and at Site in the presence of the Employer for conformity to the requirements of the Specifications.

Six (6) certified copies of the tests made and of the results thereof, shall be furnished by the Contractor to the Employer for approval after the tests are made. The results of these tests shall be in such form as to provide means of determining compliance with the applicable Specifications for the material tests. If any item of the Plant is of a new design or if essential parts have been redesigned, additional test reports to verify the design shall be submitted for Employer approval.

6.10.7.2 Type Tests

The following type tests shall be made for each type of surge arrester in accordance with the latest issue of IEC Publication 60099-4 and standards specified herein. However, duly certified and complete test reports for tests carried out by an independent authority/laboratory on similar surge arrester shall be acceptable in lieu of actual tests.

Independent laboratories are specified in these Technical Specifications. Six copies of the test reports shall be submitted for Employer review and approval.

(1) Insulation withstand tests on the arrester housing.

(2) Residual voltage tests (steep current impulse, lightning impulse and switching impulse residual voltage tests) to demonstrate protective levels of the arrester.

(3) Long duration current impulse withstand test to demonstrate the ability of the resistor element to withstand possible dielectric and energy stresses without puncture or flashover.

(4) Operating duty test to demonstrate the thermal stability of the arrester:
   a) High current impulse operating duty test
   b) Switching surge operating duty test

(5) Verification of power frequency voltage versus time curve.

(6) Short-circuit tests to demonstrate the ability of the arrester housing to withstand short circuit currents without violent shattering of the housing under specified test conditions.

(7) Artificial pollution test in accordance with latest IEC practices.

(8) Internal partial discharge test.

(9) Seal leak rate test.

(10) Current distribution test for multi-column arresters.

(11) Bending moment test.

(12) Environmental tests.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

6.10.7.3 Routine Tests

The following routine tests shall be made on each arrester in accordance with the latest issue of IEC Publication 60099-4.

(1) Measurement of reference voltage.
(2) Residual voltage test.
(3) Internal partial discharge test.
(4) Leakage check for sealed housing.
(5) Current distribution test for multi-column arresters.

6.10.7.4 Acceptance Tests

The following tests shall be made on the nearest whole number to the cube root of the number of arresters to be supplied:

(1) Measurement of power frequency voltage on the complete arrester at the reference current measured at the bottom of the arrester.
(2) Lightning impulse residual voltage on the complete arrester or arrester unit.
(3) Internal partial discharge test.
(4) Special thermal stability test.

6.10.8 Drawings, Technical and Descriptive Data

6.10.8.1 General

Proposer shall supply following with the Proposal:

(1) Technical Data of Surge Arresters as per the format of Specific Facilities Data to Proposal provided in Employer Requirements.
(2) Detail catalogues and application guides for the proposed surge arresters.
(3) Dimension drawing and layout of the arrester.
(4) Catalogues of the accessories.

6.10.8.2 Approval Drawings / Data / Documents

Technical Data/Specific Facilities Data of surge arresters and accessories, outline drawings showing dimensions of the arresters with all necessary details showing characteristics of the arresters shall be supplied. Calculation as required shall also be submitted.

Approval drawings shall show detailed physical arrangements and connections with other relevant technical details including maintenance and installation details.

6.11 LINE TRAPS

6.11.1 General

These specifications cover the requirements for the design, manufacture, work testing, supply, installation, site testing and commissioning of the line traps on the 132kV transmission line circuits at 132 kV Attabad Lake HPP switchyard and shall conform to the NGC/DISCOs requirements Scope of works for the line traps.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

6.11.2 Equipment Description

6.11.2.1 General

Line traps (LTs) shall be designed for outdoor service and shall be capable of withstanding the severe atmospheric conditions experienced in tropical climates. The equipment shall be designed, manufactured and tested in accordance with the latest issue of IEC 60353 and particulars listed herein.

The units shall be of the wide-band tuned type (band to be selected later). 132kV LTs shall be pedestal mounted on top of the coupling capacitor voltage transformers.

Jumper clamps shall be included for connection of the overhead line with the line traps through down droppers. The clamps shall be suitable for fixing on line traps, the diameter of the conductor grooves on the clamp shall match that of the down droppers used.

The line trap shall comprise a main coil with a protective unit and a tuning device. The tuning unit shall be mounted inside the main coil such that it is easily accessible and can be changed without removing the line trap. Tuning device components shall be designed to withstand all relevant electrical and mechanical stresses.

The protective device shall use non-linear type arresters, according to IEC 60099-1. The nominal discharge current shall preferably be the same as that of the substation arresters, installed behind the line trap, but in no case shall be less than 5 kA.

The unit shall be capable of withstanding all relevant electrical and mechanical stresses.

6.11.2.2 Equipment Parameters

The line traps shall perform according to, or better than the parameters specified hereunder:

132kV Line Traps

(1)	Rated voltage	:	145kV, rms
(2)	Rated power frequency	:	50 Hz
(3)	Minimum inductance	:	0.315mH
(4)	Accuracy of inductance value	:	10%
(5)	Tuning pots frequency range	:	Wide band frequency range Covering at least 300 kHz band. Exact range shall be determined after frequency allocation.
(6)	Rated continuous current	:	2000 A
(7)	Rated short-time current	:	50 kA, rms
(8)	Dynamic short-time current	:	125 kA
(9)	Rated duration of short-time current	:	1 sec.
(10)	Rated blocking impedance (resistive component)	:	1.41 times the characteristic impedance of transmission line (according to IEC 60353 standard)
(11)	Insertion loss	:	< 2.5 dB
(12)	Ambient temperature	:	-10 to 50°C
(13)	Mounting	:	Pedestal mounted on top of CCVTs

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

6.11.3 Construction

6.11.3.1 General

The metallic parts shall be of non-ferrous galvanized or stainless steel material. The insulation shall have low moisture absorption, low dielectric loss, high tensile strength and high resistance to weather and chemical corrosion. Line traps shall have flat pad aluminum terminals. Post insulators and bird barriers shall be provided with the line traps. Corona shield shall be provided for 132 kV line.

6.11.3.2 Name Plates

The main coil, the protective and tuning devices shall be provided with rating plates of weather-proof stainless steel material mounted on the outside surface, on a location easily accessible. The inscription on these shall be indelibly marked.

Duplicate nameplates shall also be installed at a convenient height where these could be read from the ground.

The nameplates shall include, as a minimum, all the information specified in the latest edition of IEC 60353.

6.11.4 Test

6.11.4.1 General

The line traps shall be subjected to tests in the factory and at site in the presence of the Employer. The tests at Manufacturer's works shall require the line trap to be mounted in a condition similar to that in service.

The tests on the protective device shall be carried out in conformity with the recommendations of IEC 60099-1.

The Contractor shall furnish to the Employer for approval certified copies of the tests and the results thereof, after the tests have been conducted. The results of these tests shall take such a form, which provides means of determining compliance with the applicable Specifications for the material tested. If any item is newly designed or if main parts have been redesigned, additional test reports to verify this data shall be submitted for the Employer approval.

6.11.4.2 Type Tests

The following type tests shall be made on each type of line traps in accordance with the latest issue of IEC 60353. However, duly certified and complete test reports for tests carried out by an independent authority/laboratory on similar line traps shall be acceptable in lieu of performing actual tests. Independent laboratories are specified in the Contract Document. Six copies of the test reports shall be submitted for Employer review and approval.

(1) Temperature rise test.
(2) Measurement of radio influence voltage.
(3) Insulation tests.
(4) Short-time current tests.
(5) Measurement of the rated inductance of the main coil.
(6) Measurement of power frequency inductance of the main coil.
(7) Measurement of blocking resistance and blocking impedance.
(8) Measurement of tapping loss and tapping loss based on the blocking resistance.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

The Proposer shall state the field tested reliability of the tuning device.

6.11.4.3 Routine Tests

The following routine tests shall be performed in accordance with the latest addition of IEC 60353:

(1) Measurement of rated inductance of the main coil.
(2) Measurement of power frequency inductance of main coil.
(3) Measurement of blocking resistance and blocking impedance.
(4) Measurement of tapping loss and tapping loss based on the blocking resistance.

6.11.5 Drawings, Technical and Descriptive Data

6.11.5.1 Proposal Drawings and Descriptive Data

The Proposer shall furnish the following information:

(1) Sketches showing outline dimensions, and location of accessories. Descriptive data shall show main construction and operating features of line traps.
(2) Sketches of the steel support structures for pedestal mounting of the line traps and layout showing the arrangement for line trap mounted on top of coupling capacitor for each type of unit.
(3) Type test reports of exactly similar type of line traps from an independent and internationally recognized laboratory will be accepted.

6.11.5.2 Approval of Drawings and Data

The detail drawings, technical data and instructions to be submitted, shall include, but not necessarily be limited to, the following:

(1) Construction details, installation drawings and schematic diagrams.
(2) Tuning instructions.
(3) Name plate drawings.
(4) Drawings and instruction manuals for installation, operation and maintenance.

6.12 PROTECTION SYSTEM

6.12.1 General

These Specifications cover the requirements of design and construction of protection system that comprises protective relays, auxiliary relays and special purpose relays for 132kV AIS switchyard. The relays and protection system shall conform to the applicable requirements of IEC 60255 and IEC 61850 as well as to specifications described herein. Provision shall be provided in the protection relays to communicate with the Substation Automation System and Gilgit Baltistan/NPCC central control system through SCADA Gateway in accordance with the protocol specified in IEC 61850 and IEC60870-5-101/104 respectively.

The Contractor shall supply all necessary auxiliary relays, boards, wiring terminals etc., install the necessary equipment and commission it in accordance with requirements of these specifications.

The general philosophy for provision of protection scheme for the 132kV switchyard will be as following:

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

(1) For 132kV transmission line, one set of distance cum differential protection shall be provided for the transmission lines along-with O/C & E/F relay (4 elements). Moreover, differential protection shall also be provided in case the line length is short. The distance relay shall comprise of multi features as specified.

(2) There shall be separately MCB protected DC and CVT circuits for each protection. Independent CT cores shall be provided for each protection. Duplicate trip coils of the circuit breakers shall be provided with DC supplies from separate batteries. Each protection, main and back-up shall trip both the trip coils.

(3) Over current and earth fault relays shall form back-up protection and shall ensure final tripping within the thermal short time rating of the primary equipment.

(4) For 132kV circuit breaker, breaker failure protection shall be provided to detect failure of a circuit breaker to trip on fault following a trip initiation from the protective relays and will trip the “next-in-line” local breakers and remote breaker(s).

(5) 132kV busbar protection relay shall be suitable for one & half breaker scheme.

(6) The circuits shall be designed for necessary interface with the protection signaling equipment (PSE) for coordinated operation of both line ends of the protection scheme.

(7) The protection shall be stable during system transients and it shall operate correctly during system faults within the protected zones for the range of fault levels and with the relevant fault current DC time constants.

(8) Each trip circuit, along-with each breaker trip coil shall be monitored by supervisory relays to give audible and visual alarms for open and short circuits. The trip circuits shall be supervised in both open and close conditions of the circuit breaker. Trip circuit supervision relay shall also give an alarm in case of partially or completely shorted winding of trip coils. An alarm shall be initiated if trip circuit supervision itself fails. Separate panel shall be provided to supervise all trip coils per bay.

(9) Each protection set shall have separately protected and continuously supervised DC supply circuit. The DC supply protection shall be properly coordinated for discriminate isolation of the faulty section.

(10) DC power supplies and trip output shall be routed through test blocks.

(11) Before taking up the schematic diagrams, the Contractor shall prepare trip and alarm logic tables and protection and metering single line diagrams with as much detail as possible for Employer review and approval.

(12) Reliability analysis for relays and their components shall be provided. The Contractor shall also provide mean time between failures (MTBF) for each type of relay.

(13) a) All necessary equipment to communicate with the numerical devices such as latest laptop and peripheral devices including printers shall be provided. Licensed working software for communicating with the devices shall be part of the supply. Software shall be suitable for windows environment.

b) Numerical relays shall have serial/fiber optic interfaces and standard protocols, compliant with IEC 60870-5-103/IEC 61850 to facilitate data communication with station control system/Gilgit Baltistan (GB) control system.

(14) It shall be possible to upgrade the operating software of the numerical devices as it is further developed by the manufacturer.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

(15) The numerical devices offered under this contract shall be of latest version, of proven design, having minimum of Five (05) years' operating experience in a well reputed power utility power systems of voltage level 132kV and above.

However, the latest version of the same should be offered/quoted along-with type test reports of relays as per NGC type test policy.

(16) The devices to be supplied under this contract, including the numerical and static relays, shall have only industry class components.

Separate and independent relays shall be provided for each protection function except where it is specified that built-in function of a relay shall be used.

(17) LEDs and LCDs shall be used for targets showing visual indication of the protection status. Retrieval of fault Data/Alarms should be made available in numerical relays.

(18) In addition to built-in test blocks and sockets in the protective devices which may need special test plugs, external test blocks shall be provided in adequate numbers to enable testing the device with standard test plugs and test blocks and without affecting the other devices and protection functions. Moreover, test blocks shall be wired in such a manner that trip and alarm from the device and DC supplies to the device are interrupted upon insertion of the test plug. The CT and CVT circuits to each protective device shall be routed through the test blocks.

(19) The relay panels shall have front door with glass window. Rear doors shall be of double leaf type. Protection class of panel shall be not less than IP54.

Humidity control in the panels shall be affected by heaters controlled by humidistats and thermostats. Thermostat shall be set at 20˚C and humidistat at 60% relative humidity. However, it shall be possible to set thermos ate from 0 to 60˚C and hygrostat from 0-100% relative humidity ranges.

(20) All panels shall have door operated lamps for interior illumination. Three pin single phase, 230V AC receptacles shall be provided in each panel. There shall be separate MCBs for lighting and power receptacles. MCBs shall be equipped with auxiliary contacts and sensitive earth fault protection for personnel safety.

(22) The trip circuit supervision relays shall be such that in event of a fault in any one component, it shall not be possible to inadvertently trip the circuit breaker. The trip circuit supervision relays shall initiate a delayed alarm in the station. This alarm shall operate for loss of trip supply and for any interruption in the trip circuit wiring.

(23) Test blocks shall be provided to facilitate tests by secondary injection of all major fault measuring relays without disconnecting any wire or permanent connection. The test block shall permit direct injection of currents and voltages into the individual relays.

(24) Test blocks shall isolate the trip contacts of main protection relays on both side. Injection sockets shall be arranged so that it shall not possible to open circuit the current transformer secondary circuits when inserting test plugs.

The trip function, if not interrupted by a test switch, shall be blocked when inserting the test plugs.

(25) Three spare test plugs of each type shall be supplied.

(26) Selector switches should not be introduced in protection current transformers.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

(27) All tripping and inter tripping relays shall be of high speed, high burden, draw out and flush mounted type.

(28) Where with draw able type relays are used, there shall be designed so that when in the withdrawal position, associated current transformers shall be short circuited.

(29) The protection schemes shall include all hardware and software to remote setting/interrogation/fault evaluation.

(30) Current transformer requirements shall be determined to ensure high protection performance. The Proposer/contractor shall submit comprehensive technical report that includes the required CT burden and knee point voltage calculations. The report shall confirm that CTs will be designed to ensure a saturation free performance under both transient and steady fault conditions, taking due account of system X/R ratios, system fault levels and remanent flux conditions in the CT core.

(31) The design life of numerical protection relays shall be greater than 25 years.

(32) For overall letter integration via the communication facilities, the numerical protection relays shall support IEC 60870-5-103 and IEC 61850.

(33) Separate sets of MCBs with normally closed contact shall be provided for:

a) Each protection scheme

b) Fault recorder.

c) Metering.

d) Synchronizing.

(34) The arrangement and mounting of all indicating devices, control switches, relays and other apparatus shall be subject to the approval of the Employer and final approval from Employer.

(35) All possible precautions shall be taken to ensure that direct current operated relays which perform a tripping function are not liable to maloperation. For this reason, the following measures shall be taken:

a) The total capacitance to earth of all connections to the negative pole of the tripping battery shall not exceed 10 microfarad.

b) If the positive side of a relay coil is connected to wiring external to the relay cubicle, then the relay shall not operate if a capacitor of 10 microfarad charged to (110%) of rated voltage is discharged through the relay.

c) The current at operation shall be greater than 100 milliamps.

(36) The maximum A.C. fault voltage across any two points of a current circuit shall not exceed 3000 volt peak and nonlinear resistors shall be included if necessary to achieve this limitation.

(37) Each relay which initiates tripping shall be provided with a trip isolation facility which should be integral with the relay such that the tripping has to be isolated prior to withdrawal of the relay from its case.

(38) The Supplier/Contractor shall install only protection relays and equipment which are supported by guaranteed works, routine test certificates issued by the manufacturers.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

(39) The Supplier/Contractor shall provide electrical protection relay schedules to include manufacturer, type designation characteristic details and ranges and actual protection settings to be used, on a per circuit basis.

(40) All calculations to determine relay settings and adequacy of CT and CVT rating shall be submitted to the Employer for approval. In the event that the rating of the CVT or CT proposed is insufficient to accommodate the connected burden in accordance with this specification, the Contractor shall supply the CT and CVT with the necessary increased capacity at no extra cost.

(41) Microprocessor based relays wherever specified shall be of modular design and modular sub racks shall have standard width of 19 inches. The hardware design shall use latest state of art technology based on LSI/VLSI microprocessor technology and shall perform satisfactorily under highly noisy electrical environment. Microprocessor relays shall be complete with inbuilt self-monitoring/self-checking or auto testing features.

(42) Relays shall be of approved construction, flush mounted, draw out type, and shall be arranged so that adjustments, testing and replacement can be effected with the minimum of time and labor. Relays of the hand reset type shall be capable of being reset without opening the case.

(43) All devices shall be clearly labeled.

(44) Relay terminal arrangements shall be subject to the approval of the Employer Snap on type terminations will be accepted only if adequate termination locking features are available, which will prevent inadvertent/ accidental disconnection of terminations.

(45) Electrically reset tripping relays shall be provided where necessitated by the system of control.

(46) Unless otherwise specified, tripping shall always be directly from the relevant measuring relay and through the tripping relay operated from the respective main relays.

(47) Relays, where appropriate, shall be provided with flag indicators, phase identified where applicable. Flag indicators shall be of the hand reset pattern and shall be capable of being reset without opening the case. Where two or more phase elements are included in one case separate indicators shall be provided for each element.

(48) Relays which rely for their operation on an external D.C. supply shall have it monitored at the relay and an alarm provided in event of failure.

(49) Relays with provision for manual operation from outside the case, other than for resetting, will not be accepted and time delay relays shall not be of the dashpot type.

(50) Relays, whether mounted on panels or not, shall be provided with clearly inscribed labels describing their application and rating in addition to the general purpose labels. Demo type labels or similar will not be accepted.

(51) Attention is particularly drawn to the climatic conditions specified in Section 6.3 and relay designs should be entirely suitable for duty under these conditions. and at height of.

(52) To minimize the effect of electrolysis, relay coils operating on D.C. shall be so connected that the coils are not continuously energized from the positive pole of the battery.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

(53) Control and relay circuits, current and voltage transformer secondary circuits, battery and auxiliary power supply wiring, supervisory, alarm and communication circuits shall be protected against conductive, electrostatic and electromagnetic influences.

(54) Every panel shall have at the top left hand corner easily visible lamp to indicate that DC supply in the panel is off.

(55) The test terminals shall isolate the trip contacts of main protection relays on both the sides. Injection sockets shall be arranged so that it shall not possible to open the current transformer secondary circuits when inserting test plugs.

(56) All equipment as well as the terminals of the cubicles shall be easily accessible.

(57) All protections and associated equipment shall be of standard construction from experienced, reliable and well reputed manufacturers.

(58) Terminal blocks for CT connections shall have shorting, testing and disconnecting facilities which allow tests to be conducted with the circuit on load and which may be operated without disturbing the connected wiring. VT Terminal blocks shall have disconnected and testing facilities.

(59) All necessary additional devices, plug connections, conversional and short copper or fiber optic connection shall be part of supply.

(60) All protective relays shall be immune to D.C. failure. They shall never operate on loss of D.C.

(61) The following contacts and/or signals shall be provided, as minimum, in the output of relay sets:

i) Annunciation
ii) Sequence of events recorder alarm.
iii) SCADA functions.
iv) Station fault Recorder (Oscillographs fault trigger).
v) Reclose initiation.
vi) Reclose blocking.
vii) Breaker failure initiation.
viii) Optical fiber signaling and other communication signaling.

6.12.2 Operating Conditions

All relays shall be tropicalized and shall be suitable for satisfactory operation at an ambient air temperature having a maximum value of 40 degree C and 24 hours average value of 30 degree C and minimum temperature -10 degree C, and humidity reaching up to 95%.

6.12.3 Construction

6.12.3.1 General

All relays shall be so designed and constructed that mechanical shock or external vibration does not operate or damage them.

6.12.3.2 Relay Board

Panels dimensions shall not be less than 1000x1000 2000mm.

The static relays shall be designed in 19 inches rack-mounted modules.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

The relay board panels protection class shall not be less than IP54.

The construction detail of relay boards and panels shall comply with information given in Section 6.12, "Control and Recording Equipment". The relay panels shall have front door with glass window. Rear doors shall be of double leaf type.

All relay boards and panels shall be supplied factory wired and tested.

Relay panels at the switchyard shall have the following color scheme:

Exterior:	Pebble Grey - RAL7032 - Semi Gloss
Interior:	Cream White - RAL9010 - Semi Gloss
Plinth:	As Exterior

6.12.3.3 Numerical Protective Relays

(1) Relays shall be of approved types complying with IEC 60255 or other latest standard. (British Standard 142), shall have approved characteristics, be flush mounted in dust and moisture proof cases and shall comply with BS 2011 test Classification 20/40/04. The components of each relay shall be suitable for operation under ·the local climatic conditions.

(2) The relays should have been type tested in accordance with the latest IEC standards, with particular attention to the EMI immunity.

(3) All protection relays shall be of numerical type with communication facility with a protocol as per IEC 60870-5-103/IEC 61850. The protection schemes shall include all hardware and software to permit remote setting/interrogation/fault evaluation from the engineering work station of the control room. These relays are of a family of hardware known as Intelligent Electronic Devices (IED's). Auxiliary relays, repeat relays, trip relays and any other simple auxiliary or contact multiplication function may be based on standard attracted armature or other Electro-Mechanical techniques. Numerical relays should offer instrumentation, disturbance recording and event logging functions in addition to providing the principal protection function. Access to these functions shall be available locally at the relay as well as remotely as described below. Routine test requirements shall be limited to basic function testing through the provision 'of comprehensive, continuous self-monitoring alarm and diagnostic functions.

(4) In case protection relays of the numerical type (IED's) should be integrated to the PCMS. Numerical relays and schemes provided shall all be suitable for connection to a local communications network to allow the complete relay scheme to be interfaced to a central computer work station. The communications bus, necessary modems and interface units and all associated software should be provided as of the contract. With the resulting system it shall be possible to interrogate all numerical relays and schemes to monitor and extract recorded data (including settings, measurement parameters, and disturbance records). It shall also be possible to enable remote adjustment of relay settings if required.

(5) The numerical relays provided shall have following features:

i) Shall be based on digital signal processing and algorithmic based functions using multiple CPUs.

ii) Programmable scheme logic.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

iii) Measured quantities displayed.

iv) Shall be of compact design and modular software.

v) Shall have continuous self-monitoring and diagnostic features or shall have automatic relay and circuitry testing features.

vi) Shall have selection functions from protection software library and shall be complete with Menu-driven use interface program.

vii) Shall have serial interfaces (redundant ports) for on-line and off-line transmission of relay operation data, feeder load data, sequential, event and fault recording; remote setting etc.

viii) Time-tagged events/disturbance record shall have facility of historic fault information of at least five system faults and on demand shall display relay operations, fault recording, fault location, protection operating, times, feeder load data prior to fault etc. from each system disturbance.

ix) Shall have both front and rear serial-port for further data exploitation, equipment parameterization, retrieval of fault records, etc. A laptop PC and peripheral devices including printer, applicable software shall be supplied without an additional cost.

x) Shall be suitable for operation based on 110V D.C. auxiliary power sources for 132kV system as specified.

(6) The design of the numerical relays should be hardened against transient surge and over voltages caused by the CT/VT and DC circuits and associated field devices. The routing of cables shall be such as to limit interference to a minimum. Any auxiliary supplies necessary to power solid state circuits shall be derived from the main station battery and not from batteries built into the relay. Continuously energized relays including those with economy resistors will not be accepted for any application.

(7) Storage facility for fault information for at least five latest system faults, giving on demand operations, operating times, line load data etc.

(8) Numerical relays shall also be provided with local communication port to allow direct interfacing to a lap-top PC, to facilitate local interrogation, setting-up and recorded data extraction. Individual protection units shall be provided with an integral user interface to facilitate setting changes and observation of indications without the use of remote communications.

(9) Numeric/Static relays shall comply with the impulse withstand and high frequency disturbance tests specified in Appendix E of IEC Publication 60255-4, and type test reports covering these tests for all these relays shall be provided. Relays shall be CE marked in accordance with European Union requirements related to Electromagnetic Compatibility and Low Voltage Equipment safety. Equipment complying with other national standards may be accepted at Employer discretion and where the vendor provides copies of the relevant standards.

(10) Numeric/Static relays shall also remain stable under conditions of Radio Interference. Radio Interference tests acceptable to the Employer shall have been carried out by the Manufacturer and in this case RFI test reports shall be submitted for the Employer approval. If such tests have not been carried out, the Contractor shall carry out RFI tests to the satisfaction of the Employer and submit test report for approval.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

(11) Hardware and software shall be checked by software sub-routine continuously. Important components supervised shall include:

i) CPU's and associated Memory (ROM, RAM, EEPROM).
ii) Input signal validity (A/D converter).
iii) O.S. Software.
iv) Protection function software.
v) Watchdog and self-monitoring software.
vi) Output signal integrity.
vii) Algorithm execution / logic performance.
viii) Digital input conversion system.
ix) I/O logic points.
x) Power Supply Noise/Failure.
xi) Internal Clock.

(12) Functional elements in numeric relays shall have LED indicators on the front panels to enable identification of their operation, faulted phases, zones, hardware and software status etc.

(13) All numerical data communication shall comply with IEC-60870-5-103/IEC-61850 protocol.

(14) Operator Interface

All numerical protection systems shall be provided with an integral local user interface, to enable communication with the relay without the use of external equipment. Any facilities provided for connection to an external computer shall be an additional feature to the local user interface. No exceptions to this requirement shall be permitted.

(15) Relay serial communication facilities should allow all information which is available locally at the relay front panel to be accessed remotely. It should also be possible to carry out bulk transfer of settings and fault record information using appropriate licensed PC based software. The necessary software for communication with each relay type shall be provided as part of the contract.

(16) Identification.

Each protection relay shall have a unique identifier that is clearly visible. The software reference and issue level shall be identified. The marking of all relays shall comply with Clause 12 of IEC 60255-6(1988).

(17) Each protection relay shall be provided with LCD display facilities on which shall be shown:

The current transformer ratio (if applicable), including all ratios of multi ratio transformers and the ratio selected.

Voltage transformer ratio (if applicable).

(18) Settings.
Each protection relay shall provide a means by which the user can easily apply the required settings, which is also secure from inadvertent operation. A display of the selected settings shall be provided on the protection relay.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

6.12.4 Environmental Requirements

6.12.4.1 Atmospheric Environment

a) Temperature

The standard nominal range of ambient temperature shall be -10°C to +40°C. The protection system shall operate satisfactorily when tested to the following requirements:

IEC 60068-2-1 with severity class -10°C, 96 hours.
IEC 60068-2-2 with severity class +55°C, 96 hours.

The protection system shall be able to withstand the temperature requirements for storage and transportation with severity class -25°C to 70°C, 96 hours.

b) Relative Humidity

The protection system shall operate correctly with relative humidity conditions prevailing at site of 93% - 95% and shall have been tested to IEC 60069-2-3 with severity class 56 days. The contractor shall demonstrate the suitability.

c) Enclosure

The protection relays shall meet the requirements of the tests detailed in IEC 60529 with classification IP 51 (dust protected) for housing and IP21 for terminals.

It shall be projected against vertically falling drops of water in 4 fixed positions of 15° tilt with flow rate of 3mrn / minute for 2.5 minutes.

6.12.4.2 Mechanical Environment

a. Vibration (Sinusoidal)

Cross over frequency - 58 to 60 Hz.

The protection system shall meet the requirements of the tests detailed in IEC 60255-21-2 with severity class 1.

b. Shock and Bump

The protection system shall meet the requirement of the tests detailed in IEC 60255-21-2 with severity class-I.

Type of Test	Severity Class	Peak Acceleration (gn)	Duration of Pulse (ms)	No. of Pulses in each Direction
Shock Response	2	10	11	3
Shock with Stand	1	15	11	3
Bump	1	10	10	1000

c. Seismic

The protection System shall meet the requirements of the tests detailed in IEC 60255-21-3.

Cross over frequency = 8 to 9 Hz

X = horizontal axis, Y = vertical axis.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Severity Class 2	Peak Displacement below Cross over frequency (mm)		Peak Acceleration above Cross over frequency (gn)		No. of Sweepey Class in each axis	Frequency Range
	X	Y	X	Y		
2	7.5	3.5	2.0	1.0	1	1.35

6.12.4.3 A.C. Immunity

a. AC/DC Auxiliary Energizing

The protection system shall be capable of being energized from a D.C auxiliary energizing voltage of 110V for 132kV system.

The protection system or its associated power supply for use in 110V (nominal) DC supply system shall operate correctly over a voltage range +20% and -15%.

The static protection system shall meet the requirements of IEC Standard 60255-11 with interruptions to dc auxiliary energizing quantity of 10m sec.

AC 100 Hz ripple on DC supply, the relays shall withstand 12% AC ripple on the DC supply.

Performance Criteria Class-A.

b. Frequency.

The standard frequency shall be 50 Hz. The nominal range of frequency shall be -5 percent to +5 percent.

6.12.4.4 Insulation

a. Rated Insulation Voltage.

The rated insulation of circuits connected to current transformers of high impedance relays shall be 1000 V. All other circuits shall have an insulation voltage of 250V. All open contacts of the protection system shall withstand a voltage of 1000 V.

b. Dielectric Tests.

The protection system shall comply with the dielectric test requirements of IEC 60255-5:

i. I 2.0 kV rms for one minute between all terminals and case earth.
ii. 2.0 kV rms for one minute between all terminals of each independent circuit grouped together, and all other terminals.
iii. 1.5 kV rms for one minute across dedicated normally open contacts of output relays.
iv. 1.0 kV rms for 1 minute' across normally open contacts of charge over and watch dog output relays.

c. Impulse Withstand.

The protection system shall comply with the impulse test requirements of IEC publication 60255-5 of 5 kV peak 1.2/50 µs, 0.5 j across.

i. Each independent circuit and the case with terminals of each independent circuit together.
ii. Independent circuits with the terminals of each independent circuit connected together.
iii. Terminals of the same circuit except normally open metallic contacts.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

6.12.4.5 Electromagnetic Compatibility

The requirements of this section of the specification are applicable to electronic protection systems whether these are based on analogue, digital or numerical design techniques. These requirements may also be applied to electro-mechanical relays that radiate electromagnetic interference during their operation.

High frequency Disturbance

The protection system shall comply with the requirements of IEC publication 60255-221 with severity class-III.

1MHZ burst disturbance test.

2.5 kV Common Mode

Power supply, CTs, PTs, opto inputs, output contacts, terminal block, communication.

1kV differential Mode

Power supply, flied voltage, CTs, PTs, opto inputs and outputs contacts. Performance Criteria Class-A.

6.12.4.6 Fast Transients

The protection system shall comply with the requirements of IEC publication 60255-22-4 with severity level III and IV.

2kV, 5 kHZ (Class-III) and 4 kV 2.5 kHZ (Class-IV) Power Supply, field voltage, opto inputs, outputs contacts, CTs, VTs.

2kV, 5 kHZ (Class III) and 4 kV, 2.5 kHZ (Class-IV) Capacitive Coupling. Terminal Block communication connections.

6.12.4.7 Conducted / Radiated Emissions

6.12.4.7.1 Conducted Emission

The protection system shall comply with the requirements of EN550II (Class A) and EN 52022 (Class B)

0.15 - 0.5 MHz, 79 dBJlV (quasipeak) 132 dBJlV (average)

0.5 - 30 MHz, 73 dBJlV (quasipeak) 60 dBJlV (average)

6.12.4.7.2 Radiated Emission

The protection system shall comply with the requirements of EN 55011 (Class A) and EN 55022 (Class A).

30 - 230 MHz, 40 dBJlVlm at 10 m measurement distance.

230 -1000 MHz, 47 *dBJlV/m* at 10 m measurement distance.

Electro static Discharge

The protection system shall comply with the requirements of IEC publication 60255-22-3 with severity class-III and class-IV.

Class 4: 15 kV air discharge.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Class 3: 6 kV contact discharge.

Test carried out both with and without cover fitted

6.12.4.8 Conducted / Radiated Immunity

6.12.4.8.1 Conducted Immunity

EN 61000 4...,.6 (level 3)

10 Vemf@ 1 kHZ 80% am, 150 kHZ to 80 MHZ

Spot tests at 27 MHZ, 68 MHZ.

6.12.4.8.2 Radiated Immunity

The protection system shall comply with the requirements of IEC Publication 60255-22-3 with severity Class-III.

10VIm 80 MHZ - 10 HZ @ 1 kHZ 80% am.

Spot tests at 80 MHz, 160 MHz, 450 MHz and 900 MHz.

Performance Criteria Class A.

Radiated Immunity from digital radio telephones.

The protection system shall comply with the requirements of EN 50204

10VIm 900 MHZ ± 5 MHZ and 1.89 OHZ ± 5 MHZ,

200 HZ rep. Freq; 50% duty cycle, pulse modulated Performance Criteria Class A.

6.12.4.8.3 Special Purpose Relays

Special purpose relays shall be semi flush draw-out type as far as possible for front of panel mounting and generally constructed as indicated in these Specifications. These relays include, but are not limited to reclosing, synchronizing and carrier signaling relays.

6.12.4.9 Auxiliary Relays

Auxiliary relays shall be of rugged construction and shall have a high degree of reliability even when they have been idle for long periods of time. All auxiliary relay coils and contacts shall be suitable for continuous operation at 110 V DC for 132kV system with a tolerance of +10% and -15%. The relay coils shall be so designed that their consumption is kept to a minimum and yet sufficient contact pressure is ensured when the relay operates to make contacts. Rating of the contacts and make rating shall not be less than 5A at 110V DC and shall have a good margin on contacts break ratings of resistive and inductive loads involved.

Auxiliary relays shall be of instantaneous type or time delayed as required. The time delay provided in the relays shall not be affected by changing temperature or humidity.

Auxiliary and contact multiplier relays in the tripping circuits shall be of high speed type or better than class-I relays as defined in IEC-60255.

Manual reset auxiliary relays shall be high speed, multi-contact type with operation indicator.

Auxiliary tripping relays shall be self-reset with operating time not exceeding 5 milliseconds, front-connected type suitable for rear-of-panel mounting.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

6.12.4.10 Settings

All setting adjustments shall be inaccessible until the case or the cover is removed. The settings shall be clearly marked and shall be visible when the relay case is closed.

If the relay is intended for setting adjustment on load i.e. the adjustment being directly in a current transformer secondary circuit, means shall be provided to ensure that the current transformer is not open circuited during adjustment.

6.12.4.11 Coils

The current coils of the relays shall withstand the thermal and mechanical stresses of at least 35 times the continuous current rating of the coil for one half second or 20 times the continuous rating of the coil for 3 seconds without damage to the coil or associated mechanical or electronic components. The continuous rating shall be twice the rated current, with the specified temperature rise.

Voltage coils shall withstand thermal stresses due to continuous energization at voltage 25 percent in excess of the rated voltage at all settings of the relay.

6.12.4.12 Contacts

The operating contacts shall have a liberal rating so that there is no contact damage or mal-operation. Where necessary a sealing device which shall be released when the desired function is completed.

6.12.5 Ratings

(1) System frequency is 50Hz.

(2) The control voltage shall be 110V DC for 132kV, subject to tolerances as specified below. All control and indicating devices, relays and instruments operating on 110V DC shall have a minimum tolerance of +10% and - 5% for variation in voltage.

The continuous contact rating of protective relays for tripping of the breakers shall not be less than 5A at 110V DC and continuous rating of contacts for alarms shall not be less than 4A at 110V DC.

(The temperature rise of coils when tested at continuous rating shall not exceed the values given below. The values shall be determined by resistance method at rated frequency and at rated current or voltage or the setting current or voltage whichever is lower.

Insulation Class	Max. Value of Air Temperature (°C)	Max. Temperature Rise at Ambient Air Temperature (≤40°C)
A	105	65
B	130	90
C	180	140

The classification of insulating materials is according to IEC standards. Temperature rise for this Project shall be corrected for the specified ambient temperature of 50˚C.

(5) Tripping contacts shall be capable of making and carrying 30 A for at least 2000 operations in a duty cycle specified in IEC Standards.

(6) Relays shall be capable of withstanding for one minute a low frequency test of the following values:

(a)	Insulation to ground and	Minimum 1500 volts, rms.
		between circuits:
(b)	Across normally open	Minimum 1500 volts, rms.
		contacts:

(7) The accuracy class of all relays shall conform to the applicable requirements of approved international standards.

6.12.6 Operating Characteristics

6.12.6.1 Numerical Line Distance Relay - Protection

The transmission line protection relay shall be numerical, high-speed, non-switched, fully micro-processor based, distance type relay suitable for single and multipole tripping of long, and heavily loaded lines as well as short lines.

Final selection of the relay shall be subjected to approval of the Employer

The numerical distance relay shall include the following features:

a) Sensitive directional and directional comparison earth fault protection.
b) Mutual compensation for parallel lines.
c) Fault location.
d) Sequence of events recording.
e) Fault recording event recording and disturbance recorder.
f) Stub protection.
g) Weak end infeed trip.
h) CVT fuse failure supervision
i) Detection broken conductor.
j) Power swing detection/blocking.
k) Under voltage/over voltage features.
l) Adjustable characteristic angle.
m) High Resistance fault detection.
n) Variable residual compensation for all zones.
o) Delta directional comparison.
p) CT supervision/PT supervision.
q) CVT transient detection.
r) Breaker contact wear monitor.
s) Residual voltage protection.
t) GPS time synchronizing.
u) Switch on-to-fault facility.
v) Easy setting mode.
w) Programmable LEDs.

The distance relays shall have provision for operating in any of the following modes of operation via power line carrier communication system:

1) Permissive under-reach transfer tripping.
2) Permissive over-reach transfer tripping.
3) Stage acceleration.
4) Directional comparison blocking and un-blocking schemes.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

High resistance earth faults are difficult to detect by using distance relays if they were set to operate for such fault, there would be danger of operation due to load currents for this reason the distance protection shall incorporate or be associated with facilities for detection of such faults using sensitive directional earth fault elements.

Directional comparison earth fault scheme shall be integrated with the distance protection and capable of using the same power line carrier protection signaling command as the associated distance protection. The scheme shall be in-operative during the single pole auto-reclose dead time.

When permissive over-reach signaling is selected the distance protection and direction comparison earth fault protection shall include a signal echo scheme which re-transmits the received signal if the line isolator or both circuit breakers are open.

It shall be possible to extend the first zone step to 120% of the basic length of the protected section during protection signaling system (PLC) failure or when charging a dead line. During the auto reclose dead time the first step shall automatically be set back to normal first zone setting of the line impedance.

The characteristics of measuring elements for all types of faults shall be directional impedance and shall have Mho type, quadrilateral/lenticular features to best suit various fault conditions under phase-to ground and interphase faults. Measures shall be taken to avoid undesired tripping due to current reversals during switching operations. Phase and ground fault compensation features shall be incorporated to ensure accurate distance measurement for all types of faults.

The scheme shall be suitable for operation when connected with capacitor voltage transformers.

The scheme shall be capable of functioning in conjunction with auto-reclosing relays and shall be capable of actuating single and three phase tripping of the faulted phase(s). Moreover, provisions shall be made to initiate three pole tripping if either single phase tripping order is given after time delay or another phase of the protected line becomes faulted after one pole has been tripped. Provision shall also be made to ensure three phase tripping when breaker at either end of the line is closed manually onto fault on the protected line with the line previously de-energized. In this case the auto-recloser shall be blocked.

The relays shall operate with correct directional sense for zero voltage three phase faults, based on the normal voltage existing at the relay terminals prior to the faults by a memory unit/module. Provision shall be made to prevent false operation of the unit and to give annunciation for loss of voltage due to fault on the secondary side of the CVTs. The blocking of false operation shall be faster than minimum first zone operating time of the relay.

Power swing blocking function shall be included in the distance protection scheme with a convenient arrangement to render it out of service if necessary. Indication of power swing blocking will be provided.

The power swing blocking shall be provided with selection feature to select any of the following mode:

i) Blocking of all zones
ii) Blocking of zone 3
iii) Blocking of zone 2, zone 3
iv) Blocking of zone 1 only

v) Unblocking of any selected mode

In addition to feeding the system parameter and desired relay settings with a PC, it shall also be possible to make all relay settings manually, through man machine interface unit provided at the front of the relay.

The relay shall be immune to electromagnetic disturbances. The relay shall not generate, conduct or radiate noise which could interfere with other equipment in the switchyard.

There shall be complete galvanic separation between internal processing units and the external connections.

A signaling unit shall be provided with the scheme to indicate the particular phase or phases etc. and zones involved even if the relay picks up and no tripping command results. External remote reset of these indications shall be possible. The scheme shall be provided with sufficient contacts for wiring to the remote Annunciator and SDER.

The scheme shall be insensitive to the specified range of frequency changes and to the DC component in the fault current. The scheme shall provide at least four zone directional detection of all inter phase faults and ground faults and fourth zone for· reverse direction. The first zone of the relay shall normally be set to cover 85% of the line length and shall operate well within one cycle for all phase and ground faults respectively, within the first zone setting. Individually adjustable timing relays shall be provided for second and third zone time delayed tripping.

To protect the zone between the single line circuit breakers and the line disconnectors, while the-line isolator is open, signal to the distance relay shall be provided through auxiliary switch contacts of the disconnectors to activate stub protection. Also zone 3 timer shall be by-passed under this condition.

The reach of each zone shall be individually and independently adjustable. The Contractor shall furnish necessary evidence to show that each step of operating time is sufficiently independent of the magnitude of fault current.

Provisions shall be made for detection of broken transmission conductors not involving ground.

The Contractor shall submit sufficient evidence supported by relay setting calculations and relay characteristics on R-X diagrams, based on the line surge impedance loading (SIL) and line length to show that the offered relays have the required reach on each transmission line section where it shall be applied without load encroachment. Means shall be applied for the protection to function correctly during low fault currents.

The DC-DC converters provided with the relays shall be conservatively rated and shall be of robust design so as to provide the required operating voltage and isolation of high frequency transients at the full range of battery operating voltage with the relay room ambient temperature specified.

Serial interfaces for on-line and off-line transmission of relay operation data, line load data, fault recording, remote setting and remote test initiation be provided.

Relay shall be able to store at least 50 events and 10 disturbance records and shall be able to download locally and remotely from engineering workstation and NPCC/RCC (Gilgit) through the Switchyard Control System gateways.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Serial connection facility to a PC with printer/plotter for further data exploitation with the required software.

6.12.6.2 Transmission Line Fault Locator

A built-in fault locator shall be provided with distance numerical protection. The built-in fault locator shall provide readout of the distance to fault in kilometers, ohms or as a percentage of line length. It shall be possible to start the fault locator by fault detection, trip command from the distance relay and by external command from any other protective device. Means for remote indication for fault location shall be available.

The fault locator shall be based on impedance to fault measurements as against measurement of wave propagation time.

The fault locator shall have a high setting range to cover long line section. The measuring time shall not exceed 30 msec, with minimum measuring accuracy of ±2% on 2 digit, display or equivalent accuracy on 3 digit display. The measurement shall not be impaired in case of double end infeed or with fault resistance. The fault locator shall be suitable to, function in ambient temperature up to 50 deg. C and under severe environmental disturbances resulting in H.F. transients and shall conform to the transient tests specified in latest issue of relevant IEC and ANSI standards. Means shall also be provided to enable it to function correctly in case of zero sequence mutual compensation.

6.12.6.3 Line Differential Protection

On short lines, line differential protection shall be provided. Line differential protection shall be numerical high speed, suitable for operating with fiber optics connection as applicable for various lines.

They shall be sensitive enough to detect the minimum fault (phase or earth fault) expected in the system or 1.2xIn, whichever is lowest.

Inter-phase and earth fault protection shall remain stable in the event of through fault current up to the peak short circuit level.

The protection shall be capable of high speed operation with maximum operating time not exceeding 20 ms at five times the settings.

The differential protection shall fully discriminate between internal and external faults and shall be capable of identifying the faulty phases.

Starting elements, if of over current type, shall be provided with filter for the second and third harmonics for primary operating values in the range of 20-100% rated current for earth fault and 50-300% for phase fault. Alternatively, the starting elements shall be of the under impedance type.

Comparison or measurement of the protection shall preferably be done over the complete cycle providing fast operating time.

6.12.6.4 Over Current and Earth Fault Protection

The relay shall have non-directional three phase over current elements and one earth fault element.

The relay shall have the facility of selection of following characteristics according to IEC 60255 and BS-142.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

(a) Standard inverse.
(b) Very inverse.
(c) Long time inverse.
(d) Extremely inverse.
(e) Definite time over current.

Relay shall have adjustable settings for both operating current and time, the design of the relay being such that the setting can be carried out without taking relay out of service. The range of current settings for phase fault shall cover at least 5-200 percent of rated current with tapings a minimum of 5-percent intervals and time setting adjustment shall be 0 to 3 seconds at ten times the setting current. Time setting for both over current and earth fault elements shall be adjustable over a range of at least 0.05 to 1.0 times in steps not exceeding 0.025 times. Earth fault element shall have a minimum range of setting from 5% to 80% with tapping of 5% interval.

The high set element shall have a setting range of 200 percent to 3000% of nominal current the tripping time of high set elements should have within 20 ms.

Each protection element shall have separate trip and alarm contacts and separate trip indicators.

Relays shall be supplied with front and rear ports equipped with communication software for local/remote access of data and parameter down load.

HMI - Keypad facilities shall be provided for local access to setting, monitoring and disturbance data shall also be provided.

The relays shall be thermally rated such the operating time of the relay at the highest practical current levels on combination of current and time multiplier settings shall not exceed the time thermal with stand time of the relay.

The actual relay pick-up current shall not exceed 1.1 times the relay setting and reset value shall not be less of 90% of pick-up current.

6.12.6.5 Reclosing Relays

Built in auto-reclosure within distance relay shall be used for 132kV system.

6.12.6.6 Synchronism Check Relays

The synchronism verifier relay shall check the conditions of synchronism existing between two system voltages at the two terminals of each circuit breaker and close the respective circuit breaker when the voltages are within the set limits in phase and frequency. Also included shall be the feature that the relay will allow circuit breaker closure when one of the sources is de-energized. If the two systems are not in synchronism, then closing of the circuit breaker shall be blocked.

The manual Mimic synchro-check scheme shall be implemented with one relay per voltage level.

Status (On, Off) of the relevant disconnectors and circuit breakers shall be taken into account in the selection of the voltage transformers to be connected to the synchronism check relays and the synchronizing instruments so that the applied voltages to these devices will correspond to the system voltages that are actually present at the two terminals of the circuit

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

breaker which is to be closed. The scheme shall ensure that the voltage transformers will not be paralleled at the secondary side.

The operating time of the relay shall be adjustable in the range 0 to 100 seconds. The relay shall have phase angle setting range of 5 to 80 degrees.

Synchronism-check relay shall have provision for the following conveniently selectable modes and combinations thereof:

- Incoming system live, running system dead (live line, dead bus)
- Incoming system live, running system live (live line, live bus)
- Incoming system dead, running system live (dead line, live bus)
- Incoming system dead, running system dead (dead line, dead bus)

A three position synchronism selector switch, marked with positions Auto-Off-Manual, shall be provided adjacent to each discrepancy type circuit breaker control switch on the remote control panel in the control room. Besides selecting the appropriate voltages and applying these to the synchronism check relay of the respective circuit breaker and the common synchronizing instruments, the selector switch shall activate the synchronism check scheme as follows:

Switch in Off position

No voltage applied to the respective synchronism check relay. No voltage applied to the common synchronizing instruments. Closing command to the circuit breaker is blocked.

Switch in Auto position

Voltages applied to the respective synchronism check relay and the common synchronizing instruments. Upon turning the circuit breaker control switch to command position, synchro-check scheme is activated. Circuit breaker control switch is released but the synchro check scheme remains activated. The scheme remains activated until the circuit breaker closes and/or the selector switch is turned to Off position. If synchronism check is unsuccessful within an adjustable preset time an alarm is activated.

Switch in Manual position

The Contractor shall design the synchronism check scheme accordingly and submit to the Employer for approval.

6.12.6.7 Breaker Failure Protection

The breaker failure relays shall be numerical type back-up protection for circuit breaker failure. The breaker failure relay shall be four element relay three for phase and one earth element. In case of non-availability of earth fault element in the standard relay separate relay may be used as earth fault element. It shall be possible to make separate setting for phase and earth faults. The relay range shall be at least 0.1 In to 2. In for overcurrent and 0.02 In to 1 In steps of 0.01 for earth fault. Protection shall provide two stage tripping with an initial trip to its own breaker and time staged tripping to the adjacent breakers. The relay shall be capable of carrying continuously not less than double the rated current on all taps. The measuring relays shall be fast operate - fast reset with drop-off to pick up ratio nearly 96%. The timers shall be of fast pickup and fast reset static/digital design. The time range shall cover 0-500 msec for stage-1 time and 50 to 500 msec for stage-2 in a suitable scale for as precise setting as possible. In the breaker failure, provision shall be made for direct transfer tripping of remote end breaker in case of failure of local circuit breaker. The direct transfer trip shall be provided

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

as coded signal. Provisions shall also be made to prevent the scheme operating incorrectly on unbalanced load current when one pole is open during single pole auto-reclose cycle.

For the protection equipment which function is not necessarily dependent on a certain level of current (e.g. Buchholz) or the relays for which level operation is usually less than the level of the BFR, the starting of the breaker failure will be performed by logical circuit instead of the usual overcurrent starting.

When circuit breaker opening is blocked due to loss of pressure or spring not charged etc. breaker failure protection should issue stage-2 trip without unnecessary time delay.

The breaker failure relay shall be provided for each individual breaker at 132kV level.

6.12.6.8 Bus Differential Relays Protection

Bus differential protection shall be low impedance centralized type. The bus differential relays shall be high speed and of the low impedance type connected for protection of both phase and ground faults. There will be two busbar protection relays. One will protect busbar-I, while other will protect busbar-II. The bus-bar protection scheme shall also look into faults taking place between C.Ts. and circuit breakers. The protection shall be insensitive to C.T saturation, and shall have high through fault stability even for nearby faults. The protection shall be insensitive to transients and harmonics. The scheme shall work satisfactorily on C.T's which may not have identical transformation characteristics on the same tap. The speed of operation shall be less than one cycle if the symmetrical fault current exceeds a value twice the pick-up level. The overall time shall be less than 0.1 sec. It shall be capable of picking up under the minimum bus-bar fault current conditions.

Suitable number of auxiliary contacts shall be provided for remote indications and alarms such as for annunciators, and events recorders, SCADA functions etc.

6.12.6.9 Stub Protection

For generator transformer connection two over-current relays shall be provided for stub protection. The relays shall be as specified in Clause 6.12.6.4.

6.12.6.10 Lockout Relays

Lockout relays, shall be Electro-Mechanical, draw-out, high burden, hand and electrically reset, high speed and of multi-contact construction.

The relay coil shall be designed for continuous operation on 110V with tolerance of +20% and -15%. The operating time shall not be greater than 10ms at rated voltage. The high burden relays shall be immune to AC and capacitance discharge current.

Lockout relays shall have at least five (5) year field proven experience and shall be designed, tested and manufactured in accordance with IEC standards. The contact arrangement shall consist of 7 NO and 2 NC contacts. Number of relays shall commensurate with the requirement of the protection scheme. The contact rating shall not be less than the following:

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Contract Rating	Make and Carry Continuously	Make and Carry for 3 seconds	Break
AC	1250 VA with maxima of 15A and 660V	7500VA with maxima of 30A and 660V	1250VA with maxima of 5A and 660V
DC	1250 W with maxima of 5A and 600V	7500W with maxima of 30 A and 660V	100W resistive 50W inductive with maxima of 5A and 660V

The relays shall be suitable for flush or semi-flush mounting on the front of the cubicle with connection made at the rear of the case or for internal surface panel mounting. If the unit does not have an integral indicating target or if it is mounted at the rear of the panel a separate and reset push button shall be provided on the front of the panel.

The mechanical durability shall be 10,000 operation (minimum) with load contact.

Standard lockout relay shall be Alstom make, type MVAJ 21 or approved equivalent

6.12.6.11 High Speed Tripping Relays

(1) Tripping relays shall be Electro-Mechanical, draw out, high burden, self-reset, high speed and of multi-contact construction with indication target to be reset manually.

The relay coil shall be designed for continuous operation on 110VDC with tolerance of +20% and -15%. The operating time shall not be greater than 10ms at rated voltage. The high burden relays shall be immune to AC and capacitance discharge current.

Tripping relays shall have at least Five (05) years filed proven experience and shall be designed, tested and manufactured in accordance with IEC standards. The contact arrangement shall consist of 7NO and 2 NC contacts. Numbers of relays shall commensurate with the requirement of the protection scheme. The contact rating shall not be less than the following:

Contract Rating	Make and Carry Continuously	Make and Carry for 3 seconds	Break
AC	1250 VA with maxima of 15A and 660V	7500VA with maxima of 30A and 660V	1250VA with maxima of 5A and 660V
DC	1250 W with maxima of 5A and 600V	7500W with maxima of 30 A and 660V	100W resistive 50W inductive with maxima of 5A and 660V

The mechanical durability shall be 10,000 operations (minimum) with loaded contact. Standard tripping relay shall be Alstom make, type MAVJ21 or approved equivalent.

(2) The CB fail inter trip direct transfer trip receive relay, and the CB fail inter trip direct transfer trip· transmit relay, shall be self-reset type, with manually reset targets, high burden, high speed tripping relays of multi-contact construction suitable for flush or semi- flush mounting on the front of the cubicle with connections made at the rear of the case. Alternative rear of panel mounted relays may be used but a separate front panel hand reset target relay shall also be provided.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

6.12.7 Phase Arrangement

The standard phase arrangement on all relay boards when facing the front-of-the panels shall be R-Y-B, from left to right, from top to bottom, and from front-to-back. All relays, instruments, other devices, buses and equipment involving three-phase circuits shall be arranged and connected in accordance with the standard phase arrangement. Similar devices shall be wired alike. Positive terminals shall be located at the top, left and front position, relative to the corresponding negative terminals, as viewed from the front-of panels.

6.12.8 Connections

The line, power transformer and bus bar protection relays shall be connected as indicated in Conceptual Drawings included in Volume-II Part-III of these Specifications. The 110 V DC system circuits shall be separate for each control function and for each protection.

6.12.9 Factory Tests

All equipment furnished by the Contractor under these Specifications shall be subjected to tests in the shop in the presence of Employer for conformity with the requirements of the Specifications. Certified type test reports on identical units shall be provided. Type test shall not be repeated if manufacturer can present satisfactory test reports from an independent laboratory. Independent laboratories are specified in the Employer Requirements. Two copies of the type test reports and six copies of the routine test reports shall be submitted to the Employer for review. The tests shall be in accordance with relevant IEC Standards and include, but not necessarily be limited to the following:

6.12.9.1 Factory Design Tests (Type Test)

1) Limits error test.
2) Temperature rise test.
3) Overload test.
4) Mechanical durability test.
5) Temperature test/heat cycle test.
6) Surge withstand capability test.
7) Test for operation at minimum and maximum voltage.
8) Make and carry current rating test for tripping contacts.
9) Dielectric tests across open contacts.
10) Sensitivity tests for the following faults:
    - Phase to earth.
    - Phase to phase.
    - Three phase.
11) Operating time under transient conditions.
12) Stability tests.

6.12.9.2 Factory Production (Routine) Tests

1) Limits error test.
2) Resetting values test.
3) Dielectric tests between circuits and relay frame.
4) Operating test.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

6.12.10 Relay Panels

The panel layout and equipment arrangement on the relay panels shall be based, as far as possible, on the relevant Specification Drawings.

6.12.10.1 Protection Panels for 132kV Lines

Panels for 132kV Lines

a) Distance protection tripping and auxiliary relays as specified.
or Numerical Line distance cum differential protection (87L) and auxiliary relays as specified (For short lines only).
b) Four element over current and earth fault relays for line protection as specified.

6.12.10.2 Bus Bar Protection Panel

(1) Low impedance centralized bus bar differential relays.
(2) Lock out relays as specified in Section.

6.12.10.3 Breaker Failure Protection Panels

(1) Breaker failure relays as specified.
(2) Lockout and trip relays as specified.

In addition to relays described above, the relay board shall accommodate, synchro-check relays, all other auxiliary relays and devices required for complete protection scheme for the switchyard. Independent relays in accordance with protection single line diagram of contract Volume-II, Part-III shall be provided.

6.12.11 Drawings and Descriptive Data

Data to be furnished with the Proposal shall include outline drawings, catalogues and descriptive internal details for the type of relays to be supplied. Data supplied with protective relays shall include engineering application and all necessary operating characteristic curves for each type of relay.

6.12.11.1 Approval Drawings

Approval drawings and data shall include all the data requested above plus single line diagrams, three line diagrams, panel connection diagrams, interconnection diagrams, switch board outline and equipment arrangement drawings, equipment data, protective relaying system computations. Relay settings, instruction and maintenance manuals, all wiring and schematic diagrams, circuit diagrams with their functional description in detail.

The Contractor shall submit sufficient evidence supported by relay setting calculations based on line surge impedance loading (SIL), line parameters, load flows and fault levels to show that the offered starting relays have the required reach on each transmission line section where it shall be applied without load encroachment. The Contractor shall furnish appropriate evidence to show that the time setting range(s) and current setting range(s) of the offered overcurrent relays and breaker failure relays have been selected in order to coordinate the proposed relays with the existing protection schemes on adjacent lines.

(1) For distance relays the following curves shall be submitted:

(a) Operating characteristic curves of measuring units in the form of R-X diagram including curves of starter units.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

(b) Curves for operating time against fault impedance (percentage relay setting) for constant voltages.

(c) Constant operating time characteristic curves for various times up to the limit of operation showing relay setting against system impedance ratio. These curves shall be for single phase as well as for three phase faults.

(2) Time current characteristics for overcurrent relays.

(3) Operating characteristics of other relays.

(4) Curves showing the variation in the errors of the relays with changes in ambient temperature, frequency and auxiliary D.C. Voltage.

6.13 SUBSTATION AUTOMATION SYSTEM

6.13.1 General

This section covers the design, supply, installation, testing and commissioning of Substation Automation System (SAS) for 132 kV Attabad Lake HPP Switchyard. Substation Automation System (SAS) for 132kV Switchyard shall include control, monitoring, fault recording, events recording and supervision functions complete with equipment interfaces for the entire substation including but not limited to:

- Control of substation equipment including circuit breakers, disconnectors and earthing switches.
- Interfacing with protection relays
- Measurements of voltages, currents, frequency, watts, and VARs through transducers.
- Measurement of status indications.
- Alarm annunciations.
- Interface with secured energy metering system.
- Interfacing with station voltage regulation equipment for indication and control.
- Event logging and fault recording functions based on inputs from relays and other substation devices/equipment and BCUs.
- All SCADA functions including communication interface with National Power Control Centre (NPCC)/Regional Control Centre (RCC).

The SAS shall be modern computerized (microprocessor-based) flexible and freely extendable open architecture control and monitoring system consisting of programmable controller(s) and shall be designed, manufactured, installed, tested and commissioned for the safe and reliable operation of the substation.

The SAS shall be offered from a manufacturer who shall have designed, manufactured, type tested, installed and commissioned Substation Automation System (SAS) that shall be in satisfactory operation on 132 kV. Only those manufacturers having adequate Project and Client references and proven SAS shall be considered. Proof of experience in 132kV or above outdoor substations shall be submitted. SAS hardware shall have at least Three (03) years of operating experience at similar substation Projects.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

6.13.2 System Design

6.13.2.1 General Design Requirements

The system shall be state of the art based on IEC 61850 and suitable for operation under electrical environment present in MV substations, follow the latest engineering practice, and ensure long-term compatibility requirements and continuity of equipment supply and the safety of the operating staff.

BCUs shall be installed in the SAS and shall be modular in design based on open architecture and shall interface to field devise or instrumentation.

The system shall incorporate the control, recording, monitoring and protection functions, self-monitoring, signalling and testing facilities, measuring as well as memory functions, event recording and evaluation of disturbance records as specified.

All components shall be of approved and reliable design. The highest degree of uniformity and plug and play interchangeability shall be attained. The design shall facilitate easy maintenance, fault diagnosis and repair of the components. Maintenance, modification or extension of components may not cause a shutdown of the whole SAS. Self-monitoring of components, modules and communication shall be incorporated to increase the availability and the reliability of the equipment and minimize maintenance.

The equipment shall be completely assembled as far as possible at the Manufacturer's premises prior to shipment to site.

All components shall be suitable for the local climate, and the cubicles and panels shall be dust and moisture-proof to withstand prevailing climatic conditions. The specified maximum ambient temperature shall be taken into consideration in closed rooms, as the perfect operation of the air-conditioning system in the rooms shall be assumed as not guaranteed. The Contractor shall design the systems and select equipment accordingly.

All instrumentation and control equipment shall be capable of continuous satisfactory operation within the specified variation in supply voltage and frequency.

No batteries shall be used in the storage of configurations within electronic devices, as this would necessitate changing of batteries within the equipment over its useful service life. All memory storage shall be based on flash memory or non-volatile storage.

It shall be possible to carry-out all modification works off-line with appropriate provisions to verify/validate the changes for correctness before implementation. Such activities shall be bump-less.

All the central and the common units and input/output/analogue modules shall be provided with a 30% spare capacity after completing the Scope of Work in accordance with this specification. However, for main computers (database servers), the equipment shall be supplied with adequate memory of the required task with 100% spare capacity for future use. The hard disk capacity should be adequate to satisfy the requirements of the operating system support and diagnostic and application software with 100% spare capacity.

The Substation Automation System (SAS) have provision for remote monitoring and control from NPCC/RCC via SCADA gateways.

The system shall be designed such that personnel without any background knowledge in microprocessor-based technology are able to operate the system. The operator interface shall

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

be intuitive such that operating personnel shall be able to operate the system easily after having received some basic training.

Future extensions shall be possible by the simple addition of hardware at bay level and configuration of database at station level. The SAS design and performance shall include all the necessary provisions for signal allocation, display mimic etc. for possible future extensions.

All required hardware and software shall be provided, including all wiring, panels and necessary auxiliaries, even though not every item may be specified in detail herein.

The future availability of equipment spares for at least Fifteen (15) years from the date of commissioning shall be guaranteed.

The Data Points / Tele Information Points for exchange of information between NPCC/RCC and SAS shall be sent in the form of Application Service Data Units with Information Object Address (IOA) should be prepared for each bay to enable the NPCC/RCC to extend their database for networking the SAS. All engineering, including Factory Acceptance Tests (FAT) and Site Acceptance Tests (SAT) shall be carried out by the manufacturer. The SAT shall include end-to-end test with NPCC/RCC for all information points (signal, tele-measurement, command etc.). The Data Points/ Tele information Points list and grouping shall be prepared according to NTDC Standards and the Contractor shall obtain explicit approval of these documents.

The following capabilities shall be supported by all BCUs unless specific exceptions are noted:

- BCUs shall support IEC 61850 communication standards.
- BCUs shall be open architecture based. They shall support time synchronization over the SCADA network.
- Each BCUs shall maintain version control for its software/firmware and configuration files

The range limits for measurement values shall be applied as follows:

- ‘Normal’ Operating Region: The ‘high’ and ‘low’ limits shall be used to define this region. Values for power system variables are expected to fall within this region.
- ‘Warning’ Operating Region: The ‘high-high’ and ‘low-low’ limits shall be used to define this region. Values in this region indicate that some kind of operational correction is required.
- ‘Emergency’ Operating Region: The ‘min’ and ‘max’ limits shall be used to define this region. Values in this region indicate exceptional conditions requiring immediate attention.
- Out-of-Range: ‘Min’ and ‘Max’ represent the boundaries for measurements within process limits. Data outside these limits is questionable and may indicate equipment failure. Accordingly, data quality shall be marked ‘questionable’ and ‘out-of-range’. When an analog data value transitions into an out-of-range region, the last reasonable value shall be retained in the Repository. It shall not be updated again until the value leaves the out-of-range region.

All events shall be time-tagged at the time of occurrence, as detected/determined by the monitoring/processing source (e.g., BCU or other IED). Time-tagging resolution shall be a maximum of 1 ms, relative to the internal clock of the monitoring/processing source.

Contact inputs: Changes in signal state shall be time-tagged at the time of transition, although such changes shall be validated before they can be accepted, processed, and reported. Validation shall be achieved by applying digital filtering to ensure changes persist for at least a user-defined period of time before they are accepted as genuine.

BCUs / IEDs shall be able to detect a quick sequence of multiple changes in status for the same point and ensure that all those changes are reported. This assumes that individual status transitions persist sufficiently long to qualify for validation.

6.13.2.2 System Architecture

The SAS shall be based on open system architecture. The main process information of the station shall be stored in distributed databases. Historical data shall be automatically archived/backed-up and stored into hard disks.

The system architecture shall be structured in the following levels:

- NPCC/RCC level - System shall have the necessary equipment to connect with this level for monitoring and control purpose.
- Station level - Operator Workstation in the Substation Control Room; to view data and perform switching and other control actions locally.
- Bay level - Bay Control Cubicles installed in the switchyard control room.

For 132kV substation, BCUs shall provide all functions regarding control, monitoring and protection, inputs for status indication and outputs for commands. The process data (voltages, currents, frequency, power factor, MW, MVAR etc.) from circuit breakers and their associated disconnectors, line disconnectors, earthing switches and instrument transformers shall be acquired through transducers and fed to the BCU.

The BCUs along with the SCADA Interface Cabinet (SIC) shall be installed in the substation control room. The protection relay panels will be installed in the relay room.

The data exchange between the electronic devices on bay and station level shall take place via the communication infrastructure. This shall be realized using duplicated fiber-optic cables, thereby guaranteeing disturbance free communication. Data exchange is to be realized using IEC 61850 protocol with a redundant managed switched Ethernet communication infrastructure using duplicated LAN. The communication shall be made in fault tolerant ring in redundant mode such that failure of one set of optical fiber shall not affect the normal operation of the SAS. However, failure of optical fiber cable shall be alarmed in SAS.

The BCUs shall be interfaced with operator workstation that shall enable substation personnel to view data and perform switching and other control actions locally. The operator workstation shall be able to display real-time (live) substation data (current, voltage, active and reactive power, etc.) in a variety of formats, including tabular format and graphical format. It shall be possible to superimpose real time data on a static background, such as a substation mimic. Abnormal data shall be highlighted using special colors or symbols to report each condition. Gateway devices shall be used for remote monitoring and control at NPCC/RCC via DPLC and Fiber Optic links.

At station level, the entire station shall be controlled and supervised from the station HMI. It shall be possible to control and monitor the bay from the bay level equipment, in the event that the communication link fails. The station-wide interlocking shall also be available when the Central Control Unit fails.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

To provide highest reliability, the operator workstation and the gateways shall work completely independently. Additionally, the gateway and the operator workstation shall be configured fully redundant to ensure full functionality in case of single point of failure.

Clear control priorities shall prevent operation of a single switch at the same time from more than one of the various control levels i.e., operator workstation, or apparatus level (LCC). The priority shall always be on the lowest enabled control level.

A dedicated redundant master clock for the synchronization of the entire system shall be provided. This master clock shall synchronize all devices in the system.

Operator workstation, monitor, printers and other peripheral devices shall remain operational in the event of station AC supply failure, drawing auxiliary power from a redundant sinewave UPS connected to a dual input supply from both the 110V station batteries via their respective DC distribution board buses and an incoming AC supply.

The following equipment, as a minimum, shall be designed, supplied, installed, integrated, tested and commissioned as part of SAS:

- Bay Control Unit
- Redundant Operator Workstation complete with key board, redundant video display units or LCDs, mouse etc.
- Engineering Workstation complete with keyboard, video display unit or LCD, mouse etc.
- Redundant GPS Master Clock complete with antenna and interface ports
- Alarm and Events Printer and Hard Copy laser jet printer
- Local Area Network (LAN) comprising switched Ethernet or fiber communication infrastructure Control room furniture including desks and chairs for Operator Workstation.
- Redundant Gateways for remote control via industrial grade hardware (to NPCC/RCC) through IEC60870-5-101/104 protocol.

Panels housing BCUs and SIC shall be provided as part of the respective equipment/system as specified elsewhere in these Technical Specifications. However, interfacing of the relay and control panels with the BCU and all other adaptation works shall be included in the scope of work of SAS.

The conceptual SAS Configuration is shown in the Specifications-Drawings.

6.13.3 Functional Requirements

6.13.3.1 Overall Control Philosophy

The substation equipment shall operate from any one of the following locations:

- National Power Control Center (NPCC) Islamabad/Regional Control Center (RCC) via SCADA system.
- Operator's Workstation in the switchyard Control Room.
- Bay Control Units (Bay Control IED along with Bay Mimic Panel/Devices) in the switchyard Control Room.
- Bay Local Control Cubicles (LCCs) installed in the switchyard and control panels installed on/or adjacent to the respective equipment.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

A selector switch shall be available for selection between operator workstation or to control from bay mimic control panels so that operation of the equipment is possible from only one control level. The priority shall always be on the lowest enabled control level. The data transmittal from the substation to NPCC/RCC shall continue irrespective of the position of this selector switch.

The Substation shall normally be controlled and monitored from the operator workstation associated with the BCU panel. In case of failure of BCU, the control of the respective equipment shall be possible from its related bay mimic control panel. The operation from the Bay Control Cubicles is limited to testing and maintenance purposes.

The operation shall always depend on the conditions of other functions, such as interlocking, synchro check, etc. For security reasons the command is always to be given in two stages: selection of the object and command for operation under all modes of operation. Final execution shall take place only when selection and command are actuated.

SAS shall be equipped with capability to generate dynamic and static graphic displays to assist the operator to easily control and monitor the entire substation. The graphics shall also include dynamic replica of the synchro scope function, there shall be a dedicated graphic display comprising voltage and frequency measurements and synchro scope for synchronizing.

All the circuit breaker, disconnector and earthing switch interlocking should be hardwired and shall be implemented to the maximum extent possible in the respective Bay Control Cubicles of the substation. The hardwired interlocking is to be provided to ensure that inadvertent incorrect operation of switchgear causing damage and accidents in case of failure of BCU does not take place.

It shall be possible to start, load, operate, unload and stop the Emergency Diesel Generator (EDG) from the Operator's Workstation / Station HMI. The main parameters of the EDG including speed, voltage, frequency, power, currents etc. shall be monitored at the operator workstation. The faults in the EDG system shall also be alarmed at the Operator Workstation.

a) Position indication and interlocking scheme for operation from Bay Mimic Panel

The position indication scheme shall be as follows for the bay mimic panel:

This scheme consists of indication of the operational status of power circuit breakers, disconnectors and earthing switches.

The status of circuit breakers, disconnectors and earthing switches shall be indicated by the indicating lamps of the discrepancy type control switch having Off Command-OFF-ON-On command positions. An OFF status of control switch lamp indicates that position of both the control switch and respective circuit breaker are in agreement with each other. A disagreement in their position's initiates flickering of control switch lamp/LEDs.

Circuit breakers, disconnectors and earthing switches shall be interlocked with each other and with the relevant control and protection functions for safety of equipment and personnel and to prevent inadvertent operation. The interlocking scheme shall include but not be limited to the following:

Electro-Mechanical interlocking shall be supplied with each breaker. Electro-Mechanical interlocking shall be provided to prevent operations of the associated disconnectors when circuit breaker is closed. It shall not be possible to operate a bay with outer breakers open and centre breaker closed. However, a key operated switch shall be provided on the control board for each Bay breaker to bypass this interlock whenever required.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Necessary Electro-Mechanical interlocks shall be furnished for disconnectors for lines and circuit breakers.

The Electro-Mechanical interlocks shall perform the following functions:

1) Prevent operation of each circuit breaker disconnectors when associated circuit breaker is closed.
2) Prevent operation of line disconnector when associated breaker (s) is (are) closed.
3) Prevent remote/local operation of disconnectors when associated circuit breaker is being maintained (whether open or closed).
4) Prevent closing of earthing switch when line disconnector is closed.
5) Prevent closing of line disconnector when earthing switch is closed.
6) The arrangement shall be made to ensure that the disconnector cannot be operated mechanically with manual operating handle when the associated circuit breaker(s) is (are) in closed position.
7) Arrangement shall be made to ensure that the line earthing switch cannot be closed when line is energized from the remote end.

6.13.3.2 Bay Level Functions

The following functions shall be allocated at bay level:

- Bay control functions
- Bay protection functions
- Data collection functionality

The main functions at bay level are:

a) Control mode selection (Local- Bay Mimic)

As soon as the operator receives the operation access of the substation, the operation is normally performed via the operator workstation. During normal operation the operator workstation allows the safe operation of all switching devices via the Bay Controller Units (BCUs)/IED. The control mode selection switch shall be placed in “Local” position to perform any operation from the operator workstation.

In the event that the BCU fails, the operator shall be able to operate the respective bay circuit breakers, disconnectors and earthing switches from the adjacent Bay mimic panel by placing the Local-Mimic-Remote in the “Bay Mimic” position.

b) Control of circuit breakers, disconnectors and earthing switches

All the substation circuit breakers and associated isolators, disconnector and earthing switches shall be able to be controlled from the BCU as well as from the related Bay mimic control panel.

c) Select-before-execute principle

For security reasons, the command is always to be given in two stages: selection of the object and command for operation under all modes. Final execution shall take place only when selection and command are actuated.

d) Command supervision

Software Interlocking is to be provided to ensure that inadvertent incorrect operation of switchgear causing damage and accidents in case of false operation does not take place. In addition to software interlocking hardwired interlocking is to be provided as specified above.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

e) Synchro-check, voltage selection

The synchronism and energizing check functions shall be bay-oriented. These features are:

- Settable voltage, phase angle, and frequency difference
- Energizing for dead line-live bus, live line-dead bus or dead line- dead bus with no synchro-check function
- Synchronizing between live line and live bus with synchro-check function

The voltages relevant for the Synchronism check functions are dependent on the station topology, i.e., on the positions of the circuit breakers and/or the relevant disconnectors. The correct voltage for synchronism and energizing is derived from the auxiliary switches of the circuit breakers and the disconnecting switches, and shall be selected automatically by the BCU and operator workstation.

f) Transformer tap changer control

Raise and lower operation of OLTC taps of transformer shall be facilitated through BCU.

g) Circuit breaker, Disconnector and earthing switch position indications

The open / close status of each pole of circuit breaker, disconnector and earthing switch shall be monitored and displayed on the operator workstation associated with the BCU. The open/close status of each circuit breaker, disconnector and earthing switch shall also be indicated on the associated bay mimic panel.

h) Alarm annunciation

All substation related alarms shall be annunciated on the operator workstation interfaced with the BCU.

i) Measurement display

Analogue inputs for voltage and current measurements shall be connected to the voltage transformers (VT) and the current transformers (CT) through intermediate transducers. The values of active power (W), reactive power (VAR), frequency (Hz), power factor and the rms values for voltage (U) and current (I) shall be calculated in the BCU. All the measurements related to substation components shall be displayed at the operator workstation of the BCU.

j) Local HMI

Each BCU shall have its Local HMI. It shall be possible to control and monitor the complete bay from here. The Local HMI shall display the bay mimic/single line diagram and shall dynamically display the equipment status and all its related measurements and alarms.

i) Interface to the station HMI

The BCU shall communicate with the central control units utilizing IEC 61850 protocol

ii) Data storage for at least 200 events

Each BCU shall have a data storage capability of at least 200 events.

6.13.3.3 Station Level Functions

a) Status supervision

The position of each switchgear including circuit breaker, disconnector, earthing switch, transformer tap changer etc., shall be supervised continuously. Every detected change of position shall be immediately displayed in the single-line diagram on the station HMI/Operator workstation screen, recorded in the event list and a hard copy printout shall be produced. Alarms shall be initiated in the case of spontaneous position changes. The switchgear positions shall be indicated by two auxiliary switches, normally closed (NC) and normally open

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

(NO), which shall give ambivalent signals. An alarm shall be initiated if these position indications are inconsistent or if the time required for operating mechanism to change position exceeds a predefined limit. The SAS shall also monitor the status of sub-station auxiliaries. The status and control of auxiliaries including emergency diesel generator shall be done through separate I/O module/card of BCU and all alarm and analogue values shall be monitored and recorded through this module.

b) Measurements

The analogue values acquired/calculated in bay control/protection unit shall be displayed locally on the operator workstation and selected values shall be communicated to Remote end substation. The abnormal values shall be discarded. The analogue values shall be updated every two (2) seconds. Threshold limit values shall be selectable for alarm indications.

c) Event and alarm handling

Events and alarms are generated either by the switchgear, control and protection devices or by the BCU. They shall be recorded in an event list in the operator workstation. Alarms shall be recorded in a separate alarm list and appear on the screen. All, or a freely selectable group of events and alarms shall also be printed out on an event printer.

d) Operator Workstation Monitor

1) Substation HMI Operation

On the operator workstation monitor the object has to be selected first. In case of blocking conditions or if interlocking conditions are not met, the selection shall not be possible and an appropriate alarm annunciation shall occur. If a selection is valid the appropriate control execution button shall be pressed in order to close or open the corresponding object. Control operation from other places shall not be possible in this operating mode.

2) Presentation and Dialogues

The operator workstation shall be redundant with hot standby and shall provide basic functions for supervision and control of the substation. The operator shall give commands to the switchgear on the screen via mouse clicks. The operator workstation shall give the operator access to alarms and events displayed on the screen. Aside from these lists on the screen, there shall be a printout of alarms or events in an event log. An acoustic alarm shall indicate abnormalities, and all unacknowledged alarms shall be accessible from any screen selected by the operator. The following standard display graphics shall be available from the operator workstation:

- Single-line diagram showing the switchgear status and measured values
- Control dialogues with interlocking or blocking information details (This control dialogue shall tell the operator whether the device operation is permitted or blocked.)
- Measurement dialogues
- Alarm list, station/bay-oriented
- Event list, station/bay-oriented
- System status

3) Operator Workstation Software Design Principles

Consistent design principles shall be adopted with the operator workstation software concerning labels, colors, dialogues and fonts. Non-valid selections shall be dimmed out. The object status shall be indicated using different status colors for:

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- Selected object under command
- Selected on the screen
- Not updated, obsolete values, not in use or not sampled
- Alarm or faulty state
- Warning or blocked
- Update blocked or manually updated
- Control blocked
- Normal state

4) Process Status Displays and Command Procedures

The process status of the substation in terms of actual values of currents, voltages, frequency, active and reactive powers as well as the positions of circuit breakers, disconnector, earthing switches and transformer tap-changers shall be displayed in the station single-line diagram. In order to ensure a high degree of security against undesired operation, a "select-before-execute" command procedure shall be provided. After the "selection" of a switch, the operator shall be able to recognize the selected device on the screen, and all other switchgear shall be blocked.

As communication between Operator's Workstation and device to be controlled is established, the operator shall be prompted to confirm the control action and only then final execute command shall be accepted. After the "execution" of the command the operated switching symbol shall flash until the switch has reached its new position. The operator shall be in a position to execute a command only, if the switch is not blocked and if no interlocking condition is going to be violated. The interlocking statements shall be checked by the interlocking scheme implemented at bay and station level. After command execution the operator shall receive a confirmation that the new switching position has been reached or an indication that the switching procedure was unsuccessful with the indication of the reason for non-functioning.

5) System Supervision and Display

The SAS shall be comprehensively self-monitored such that faults are immediately indicated to the operator, possibly before they develop into serious situations. Such faults are recorded as a faulty status in a system supervision display. This display shall cover the status of the entire substation including all switchgear, BCUs, communication infrastructure and communication links, etc.

6) Event List

The event list shall contain events that are important for the control and monitoring of the substation. The operator shall be able to call up the chronological event list on the monitor at any time for the whole substation or sections of it. A printout of each display shall be possible on the hard copy printer. The events shall be registered in a chronological event list in which the type of event and its time of occurrence are specified. It shall be possible to store all events in the computer for at least one month. The information shall be obtainable also from a printed event log.

The chronological event list shall contain:

- Position changes of circuit breakers, disconnectors and earthing devices
- Indication of protective relay operations
- Fault signals from the switchgear

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- Indication when analogue measured values exceed upper and lower limits. Suitable provision shall be made in the system to define two level of alarm on either side of the value or which shall be user defined for each measure and
- Loss of communication
- Filters for selection of a certain type or group of events shall be available. The filters shall be designed to enable viewing of events grouped per:
- Date and time
- Bay
- Device
- Function e.g. trips, protection operations etc.
- Alarm class

7) Alarm List

Faults and errors occurring in the substation shall be listed in an alarm list and shall be immediately transmitted to the Operator's workstation. The alarm list shall substitute a conventional alarm tableau, and shall constitute an evaluation of all station alarms. It shall contain unacknowledged alarms and persisting faults. The date and time of occurrence shall be indicated.

The alarm list shall consist of a summary display of the present alarm situation. Each alarm shall be reported on one line that contains:

- The date and time of the alarm
- The name of the alarming object
- A descriptive text
- The acknowledgement state

Whenever an alarm condition occurs, the alarm condition shall be shown on the alarm list and shall be displayed in a flashing state along with an audible alarm. After acknowledgement of the alarm, it should appear in a steady (i.e., not flashing) state and the audible alarm shall stop. The alarm should disappear only if the alarm condition has physically cleared and the Operator has reset the alarm with a reset command. The state of the alarms shall be shown in the alarm list (Unacknowledged and persistent, Unacknowledged and cleared, Acknowledged and persistent).

Filters for selection of a certain type or group of alarms shall be available as for events.

8) Object Picture

When selecting an object such as a circuit breaker, disconnector, earthing switch, on-load tap changer etc. in the single-line diagram graphic, and the associated bay picture shall be presented first. In the selected object picture, all attributes like

- Type of blocking
- Authority
- Bay Mimic control
- Errors etc., shall be displayed

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

9) Control Dialogues

The operator shall give commands to the system by means of mouse click located on the single-line diagram graphic. Data entry is performed with the keyboard. Dedicated control dialogues for controlling at least the following devices shall be available:

- Breaker, disconnector and earthing switch
- Transformer tap-changer

10) User-Authority Levels

It shall be possible to restrict activation of the process graphics of each object (bays, apparatus) within a certain user authorization group. Each user shall then be given access rights to each group of objects, e.g.:

- Display only
- Normal operation (e.g. open/close of switchgear)
- Restricted operation (e.g. by-passed interlocking)
- System administrator

For maintenance and engineering purposes, the following authorization levels shall be available at the Engineering Workstation:

- No engineering allowed
- Engineering/configuration allowed
- Entire system management allowed

The access rights shall be defined by passwords assigned during the log-in procedure. Only the system administrator shall be able to add/remove users and change access rights.

11) Reports

The reports shall provide time-related follow-ups of measured and calculated values. The data displayed shall comprise:

i) Trend reports:

- Day (mean, peak)
- Month (mean, peak)
- Semi-annual (mean, peak)
- Year (mean, peak)

ii) Historical reports of selected analogue values:

- Day (at 15 minutes interval)
- Week
- Month
- Year

It shall be possible to select displayed values from the database in the process display on-line. Scrolling between e.g., days shall be possible. It shall be possible to select the time period for which the specific data are kept in the memory.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Following printouts shall be available from the printer and shall be printed on demand:

- Daily voltage and frequency curves depicting time on X-axis and the appropriate parameters on the Y-axis. The time duration of the curve is 24 hours.
- Weekly trend curves for real and derived analogue values.
- Printouts of the maximum and minimum values and frequency of occurrence and duration of maximum and minimum values for each analogue parameter for each circuit in 24 hr. period.
- Provision shall be made for logging information about switchgear (breaker, disconnector and earthing switch etc.) status like number of operations with date and time indications along with the current value it interrupts (in both conditions i.e., manual opening and fault tripping)
- Equipment operation details shift wise and during 24 hours.
- Printout on adjustable time period as well as on demand for MW, MVAR, Current, Voltage on each feeder and transformer as well as Tap Positions, temperature and status of pumps and fans for transformers.
- Printout on adjustable time period as well as on demand system frequency and average frequency.

Format of all the Reports shall be acceptable to the Employer.

12) Trend Display (Historical Data)

It shall be possible to illustrate all types of process data as trends–input and output data, binary and analogue data. The trends shall be displayed in graphical form as column or curve diagrams with a maximum of 10 trends per screen. Adjustable time span and scaling ranges shall be provided. It shall be possible to change the type of value logging (direct, mean, sum, or difference) on-line in the window. It shall also be possible to change the update intervals on-line in the graphic display as well as the selection of threshold values for alarming purposes.

6.13.3.4 NPCC / Regional Control Center (RCC) Gateway

The SAS shall have the capability to support simultaneous communications with remote NPCC/ RCC for which it shall have two ports.

The communication interface shall allow scanning and control of defined points within the SAS. The SAS shall simultaneously respond to independent scans and commands from remote centre. The Gateway shall use industrial grade hardware and IEC 60870-5-101/104 protocol for communication with remote centre.

The gateway shall be able to send to the remote NPCC/RCC centre:

- Single point indication with time
- Double point indication with time
- Transformer tap-position with time
- Measurement value with time
- Integrated total (counters)
- Disturbance record files

The gateway shall be able to receive from NPCC/ RCC:

- Single control, either direct or as a select / execute sequence

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- Double control, either direct or as a select / execute sequence
- Clock synchronization
- Counter freeze

For further details, refer to section on SCADA in “Telecommunication and SCADA System”.

6.13.3.5 System Hardware

The Contractor shall provide redundant operator workstation/HMI in hot-standby mode. The servers used in these workstations shall be of industrial grade. It shall be capable to perform all functions for entire substation including future requirements as indicated in the Single Line Diagram. It shall use industrial grade components. Processor and RAM shall be selected in such a manner that during normal operation not more than 30% capacity of processing and memory are used. Supplier shall demonstrate these features. The capacity of hard disk shall be selected such that the following requirement should occupy less than 50% of disk space:

- Storage of all analogue data (at 15 minutes interval) and digital data including alarm, event and trend data for thirty (30) days,
- Storage of all necessary software,
- 1TB space for Employer’s use.

Supplier shall demonstrate that the capacity of hard disk is sufficient to meet the above requirement.

a) Operator Workstation Visual Display Units (VDUs)

The VDU shall show overview diagrams (Single Line Diagrams) of the switchgear with a color display. All event and alarm annunciation shall be selectable in the form of lists. Operation shall be by a user-friendly function keyboard and a cursor positioning device. The user interface shall be based on WINDOWS concepts with graphics and facility for panning, scrolling, zooming etc.

The display units shall have high resolution and reflection protected graphics screen. High stability of the picture geometry shall be ensured. The screen shall be at least 27" diagonally in size and capable of color graphic displays. The display shall accommodate resolution of 1920 x 1280 pixels.

b) Printer

It shall be robust and suitable for operation with a minimum of 220 characters per line. The printing operation shall be quiet with a noise level of less than 45dB suitable for location in the Attabad Lake HPP substation control room. Printer shall accept and print all ASCII characters.

The printer shall have in-built testing facility. Failure of the printer shall be indicated in the operator workstation. The printer shall have an off-line mode selector switch to enable safe maintenance. The maintenance should be simple with provisions for ease of change of print head, ribbon changing, paper insertion etc.

All reports and graphics prints shall be printed on laser printer. One dot matrix printer shall be exclusively used for hourly log printing. All printers shall be continuously online.

c) Mass storage unit

The mass storage unit shall be built-in into the operator workstation. All operational measured values and indications shall be stored in a mass-storage unit in form of DVD RW. The unit

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

should support at least Read (48X), Write (24X), and Re-Write (10X) operations, with Multi-Session capability. It should support formatting and use under the operating system provided for operator workstation. The monthly back-up of data shall be taken on disc. The facility of back-up of data shall be inherent in the software.

d) Substation LAN

Redundant substation LANs shall provide the principal means for data exchange among station components at the substation. Each LAN shall consist of Ethernet or Fiber network segments, switches and TCP/IP communications software.

e) Bay Level Unit

The bay level unit shall be of industrial grade. The unit, based on microprocessor technology, shall use numerical techniques for the calculation and evaluation of externally input analogue signals. They shall incorporate select-before-operate control principles as safety measures for operation via the operator workstation. They shall perform all bay related functions, such as control commands, bay interlocking, data acquisition, data storage, event and disturbance recording and shall provide inputs for status indication and outputs for commands. They shall be connected to the switchgear via transducers. The BCU shall acquire and process all data from the substation components (equipment status, fault indications, measured values, protection/alarm signals etc.) and not only display these on the associated operator workstation but also transmit them to NPCC/ RCC via redundant DPLC and Fiber Optic links. In addition, this shall receive the operation commands from operator workstation. The BCU shall have the capability to store all the data for at least 24 hours. **Each BCU of 132kV substation bays shall cater for one (01) circuit breaker at 132kV level and their associated disconnectors, line disconnectors, earthing switches and instrument transformers and reactors, as applicable.** The BCU shall be equipped with analogue and binary inputs/outputs for handling the control, status monitoring and analogue measurement functions. All bay level interlocks shall be hardwired and shall be implemented to the maximum extent possible in the Bay Control Cubicles so as to permit control from the bay mimic panel, with all bay interlocks in place, during maintenance and commissioning or in case of contingencies when the Station HMI is out of service.

The BCU along with the SCADA Interface Cabinet (SIC) shall be installed in the control room of Attabad Lake HPP substation control building.

The BCU shall meet the requirements for withstanding electromagnetic interference. Failure of any single component within the equipment shall neither cause unwanted operation nor lead to a complete system breakdown.

The I/O modules shall form a part of the BCU and shall provide coupling to the substation equipment. The I/O modules shall acquire all switchgear information (i.e., data coming directly from the switchgear or from switchgear interlocking devices) and transmit commands for operation of the switchgear. The measured values of voltage and current shall be from the secondary of instrument transformers.

Field connection circuits for I/O points, communications, and power require special consideration to protect equipment against damage and to protect I/O processes against corrupting influences. This is important for maintaining reliability and operational integrity. These issues are addressed by three standards listed under the Specific Relevant Standards clause: IEEE C37.1-1994, IEC 60870-2-1, and IEC 60870-2-2. System and circuit design related to field connection circuits shall comply with these standards. Where they overlap, the more stringent clause shall prevail.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

The BCU shall meet the requirements for withstanding electromagnetic interference according to relevant provisions of IEC 61850. All IEDs including BCUs shall have parallel redundant Ethernet two (02) nos. multimode fibre optic ports + multimode IRIG-B compliant with IEC-61850 to facilitate data communication. Failure of any single component within the equipment shall neither cause unwanted operation nor lead to a complete system breakdown.

In summary, I/O interfaces shall provide high integrity for the detection and measurement of acquired signals. They shall also prevent damage, maintain safe conditions for personnel, and prevent bad data caused by the secondary effects of lightning, operation of power switchgear, abnormal electrical power behaviour, and so on. Under no circumstances shall these effects cause an unintended control action.

Bay Control Unit shall provide at least two serial data server port for gathering I/O data from other sources within the station or from satellite facilities.

f) Extendibility in future

The SAS shall be suitable for extension in future for additional bays. During such requirement, all the drawings and configurations, alarm/event list etc. displayed shall be designed in such a manner that its extension shall be easily performed by the Employer. During such event, normal operation of the existing parts/systems of substation shall be unaffected and system shall not require a shutdown. The contractor shall provide all necessary software tools along with source codes to perform addition of bays in future and complete integration with SAS by the Employer. These software tools shall be able to configure BCUs, add additional analogue variable, alarm list, event list, and modify interlocking logics etc. for additional bays/equipment which shall be added in future.

6.13.3.6 Software Structure

The software package shall be structured according to the SAS architecture and strictly divided in various levels. Necessary firewall shall be provided at suitable points in software to protect the system. An extension of the station shall be possible with lowest possible efforts. Maintenance, modification or an extension of components of any feeder may not force a shut-down of the parts of the system which are not affected by the system adaptation.

The Contractor shall provide each software in two copies in DVD to load into the system.

a) Station Level Software

1. Human-machine interface (HMI)

The base HMI software package for the Operator Workstation shall include the main SAS functions and it shall be independent of Project specific hardware version and operating system.

The software for Engineering Workstation shall include tools for graphics editing, engineering and system configuration. The system shall be easy to use, to maintain, and to adapt according to specific user requirements. Systems shall contain a library with standard functions and applications. The fault/ disturbance analysis and evaluation software shall also be included as part of Engineering Workstation.

IEC 61850-based configuration control, using the SCL tools shall be provided by the contractor for off-line operation.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

2. Network Management System (NMS):

The Contractor shall provide network management system (NMS) software for following management functions:

(a) Configuration Management
(b) Fault Management
(c) Performance Monitoring

This system shall be used for management of communication devices and other IEDs in the system. This NMS can be loaded in Engineering Workstation and shall be easy to use, user friendly and menu based. The NMS shall monitor all the devices in the SAS and report if there is any fault in the monitored devices. The NMS shall:

(a) Maintain performance, resource usage, and error statistics for all managed links and devices and present this information via displays, periodic reports and on demand reports.
(b) Maintain a graphical display of SAS connectivity and device status.
(c) Issue alarms when error conditions occur
(d) Provide facility to add and delete addresses and links

3. Disturbance & Fault and Events Recording Software:

The software shall be supplied to allow access to the disturbance and events recording functions via Engineering Workstation. The software shall as a minimum include the following features

- Event recording
- Trending
- Continuous oscillography
- Continuous monitoring of frequency, phase and RMS/peak parameter value
- Time tagging of discrete events
- Display events in the order of occurrence
- Configurations including input and editing of event identification text/ messages.

Software shall be compliant with IEEE standard C37.111. It shall adhere to a common format for data files and an exchange medium used for the interchange of various types of fault, test, or simulation data for electrical power systems. The sources of transient data such as digital protective relays, the sampling rates, filters, and sample rate conversions for the transient data being exchanged shall be as per COMTRADE. (Common Format for Transient Data).

4. Central Control Unit Multiple Roles:

The central control units shall have multiple roles described below:

Principal Station Client: The Central Control Unit being the principal station client shall be responsible for collecting and maintaining the various data and files that comprise the station information base. BCUs, Bay Protection Units, and other IEDs are expected to report a large amount of their data through use of IEC 61850 report services. The central control units will need to poll for any remaining data, using IEC 61850 services, or calculate it from other available data, using local automation applications.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

5. Local Repository / Compatibility with IEC 61850:

The central control units provide a Local Repository for the storage of station data. This is directly related to its role as principal station client. The information stored in the Repository shall include real-time data and closely related support data (e.g. operational parameters, configuration parameters, text-based descriptions), as provided by the IEC 61850 information models. Repository data may include diagnostic and maintenance data if it is included in the IEC 61850 information models. IEC 61850 provides information models for most of the available system data, and those models can be extended to include new components. The results produced by automation application functions shall be stored in the Repository if other clients subscribe them. The Local Repository shall have interfaces that are interoperable with all other system devices (i.e. servers and clients) using IEC 61850 communication services, information models, and object references. The central control units shall implement all of IEC 61850's ASCI service models. The Repository shall be maintained in a replaceable flash memory module. Battery power is an unacceptable approach to maintaining non-volatile data memory.

6. Proxy Server:

The central control units play both client and server roles in the station system. They act as a client to populate the Repository with data from other server IEDs (e.g. Bay Control Units). In turn, they act as a 'proxy' server by satisfying client requests with data directly from the Repository. They shall prevent access contention and congestion that may potentially disrupt the operation of field IEDs, simplify access mechanisms, and provide accountability (i.e. an audit trail) for past operations.

7. Control Command Processing:

The central control units are responsible for coordinating the execution of all control commands initiated by system clients. This shall ensure that the Local Repository and system logs are kept up to date for system clients.

Only one control command at a time shall be executed. All attempted control operations, whether successful or not, shall be entered into the Command Log. IEC 61850 enables all control operations to be tracked to the initiating party; this information shall be made part of each Command Log entry.

b) Bay Level Software

1. System software

The system software shall be structured in various levels. This software shall be placed in a non-volatile memory. The lowest level shall assure system performance and contain basic functions, which shall not be accessible by the application and maintenance engineer for modifications. The system shall support the generation of typical control macros and a process database for user specific data storage. In case of restoration of links after failure, the software along with hardware shall be capable of automatically synchronizing with the remaining system without any manual interface. This shall be demonstrated by the Contractor during integrated system test.

2. Application software

In order to ensure robust quality and reliable software functions, the main part of the application software shall consist of standard software modules built as functional block elements. The functional blocks shall be documented and thoroughly tested. They form part

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

of a library. The application software within the control/protection devices shall be programmed in a functional block language.

3. IEC 61850 Support

Bay Control Units and Bay Protection Units shall represent all data as IEC 61850 object references, using Logical Nodes and Common Data Classes that are appropriate to the specific data sources.

Parallel Redundancy Protocol (PRP) shall be followed in compliance with IEC 62439-3 Standard for Industrial Communication Networks. PRP and High Availability Seamless Redundancy (HSR) is required to achieve zero/seamless switchover time, avoid loss of frames, seamless failover against failure of any component, zero time recovery and provision to check redundancy continuously in order to avoid failures. Moreover, all the protection relays, Bay Control Units (BCUs) and IEDs etc. shall be compatible with PRP in compliance to IEC 62439-3.

Simple Network Time Protocol (PTP) interface for GPS time synchronization shall be provided in order to achieve network clock synchronization accuracy in the sub-microsecond range. Moreover, all the relays, bay control units (BCU) and intelligent devices (IEDs) etc. shall be compatible with SNTP.

All of IEC61850's ACSI service models shall be implemented and ready for use. In particular, it is expected that Bay Control Units and Bay Protection Units will use Report Control Blocks to send data subscribed by central control units and Operator Interface [HMI]. Report Control Blocks will be absolutely necessary for the transmittal of SOE data. Operator Interface [HMI] will exchange data with IEDs only for maintenance, equipment mode control, and diagnostic purposes.

Bay Control Units and Bay Protection Units shall need to transmit and receive GOOSE messages in support of the heartbeat application

Each data component shall be accompanied by its associated data quality, as defined by the IEC 61850 Common Data Classes. All constituent bits of data quality shall be used and supported (as appropriate) by the Bay Control Units and Bay Protection Units.

Each BCU and Bay Protection Unit shall provide an IED Capabilities Description (ICD) file that describes the IEC 61850 information models, service models, and related communications capabilities supported by the device. It shall also fully support the SCL process described under the heading titled System Configuration. As the result of that process, a downloadable CID file shall be created for each BCU.

Bay Control Units and Bay Protection Units ports shall support IEC 61850 object references in the object base.

Bay Control Units, Bay Protection Units, and other IEDs are expected to report a large amount of their data through use of IEC 61850 report services. The central control units will need to poll for any remaining data, using IEC 61850 services, or calculate it from other available data, using local automation applications. Data shall be acquired and stored according to the System Performance Requirements.

The BCUs and Protection Relays shall have been submitted/passed a test to certificate compliance with the IEC 61850 part 10 Conformance Testing such as the following:

- Basic Exchange

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- Data Set Definition
- Unbuffered Report
- GOOSE Publish
- GOOSE Subscribe
- Time Synchronization
- File Transfer

The tests to certificate compliance with IEC 61850 Part 10 have to be certified by international accredited testing laboratories which are independent of the Proposer and Supplier.

6.13.3.7 System Performance

The key performance requirements to be met for the SAS are:

- The Sequence of events shall have 1 ms resolution
- Each graphic screen shall be completely generated (and all data fields filled in with current data) within 1 second from the time it is called.
- All active data on a screen shall be updated at least once every second
- The total time from the instant an open/close command is executed and the instant when verification of its execution at the breaker is indicated on the graphic display shall not exceed 1.5 seconds.
- The time period between the operator entering an open/close command and the breaker closing/opening shall not exceed 1 second.
- The change of status of any event shall be indicated on the appropriate display within a maximum of 1 second of its occurrence.
- Peer-to peer data-exchange through IEC 61850 protocol shall be less than 30ms, i.e., between the changing input on one bay and an output execution on any other bay
- Measurement accuracy for EHV / HV bays shall be 0.2% for RMS current and voltage values up to 15% and 0.5% harmonic for active and reactive powers. For MV feeder the accuracy of the RMS current shall be 0.5%

6.13.3.8 Reliability and Availability

The SAS shall be designed so that the failure of any single component, processor, or device shall not render the system unavailable. The SAS shall be designed to satisfy the very high demands for reliability and availability concerning:

- Mechanical and electrical design
- Security against electrical interference (EMI)
- High quality components and boards
- Modular, well-tested hardware
- Thoroughly developed and tested modular software
- Easy-to-understand programming language for application programming
- Detailed graphical documentation and application software
- Built-in supervision and diagnostic functions
- Security
  - Experience of security requirements
  - Process know-how
  - Select before execute at operation
  - Process status representation as double indications

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- Distributed solution
- Back-up functions
- Panel design appropriate for the harsh electrical environment and ambient conditions
- Panel grounding immune against transient ground potential rise

The SAS shall provide a high MTBF (mean time between failures) and a low MTTR (mean time to repair) rate, the values to be indicated by the Proposer. The Proposer shall clearly define how the offered architecture meets the availability requirements. A system block diagram shall therefore be submitted with the offer.

6.13.3.9 Power Supply

The 110VDC, 230VAC Normal and 230VAC Essential power supplies for various panels and equipment of the SAS shall be taken from the respective boards as follows:

a) DC power supply

Two 110VDC feeders, one each from buses A and B of the 110VDC Distribution Board shall be taken for the SAS. Internal distribution to various BCUs and other equipment shall also be Contractor's responsibility for which DC distribution sub panel(s), cabling, DC/DC Converters shall be supplied.

Two 110VDC feeders, one each from the buses A and B of the 110 VDC Distribution Board shall be taken for each Bay Control Cubicle located in the bays within substations.

Two 110VDC feeders, one each from the buses A and B of the 110VDC Distribution Board shall be used for each Bay Mimic Panel to be provided as part of SAS and located adjacent to the respective BCU compartment.

b) 230VAC essential power supply

Two 230VAC feeders from the Essential Distribution Board fed from the Inverters and Essential AC Sub-distribution Board shall be taken for the SAS. Internal distribution to various equipment such as Operator Workstation, Printers, and other equipment of the SAS requiring 230VAC supply shall be provided for which distribution sub panel(s), cabling etc. shall be supplied.

c) 230VAC power supply

230VAC supplies for heating and lighting within the Bay Control Cubicles, BCUs and other panels of the SAS shall be supplied from AC Station Service System.

6.13.3.10 Bay Controller Unit (BCU) Panels

Each BCU and Bay Mimic (BM) and their associated wiring and terminal blocks (SIC) shall be installed in either separate panels or in one panel divided in two compartment, one each for BCU and BM. The dimensions and appearance of the two panels shall be the same.

The Panels shall be vertical, indoor type, free standing with rear access, suitable for floor mounting and shall provide for bottom entry of cables via vermin proof plate. The panels design shall conform to IEC 60529, protection class IP51. Each Panel shall be constructed of sheet steel not less than 2.5mm unless otherwise approved by the Employer. The panels shall have a front Plexiglas door closed by key and a swing frame. There shall be unobstructed direct access to any component.

The panels shall remain rigid and retain their structural integrity under all operating and services conditions with and without the doors closed. The panels shall be grounded with

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

16mm² conductors. The BCU shall be housed in 19" rack. The panels shall be equipped with hygro-statically and thermostatically controlled anti-condensation heaters.

All panels shall have door operated strip light for interior illumination. Three pin single phase, 230V AC receptacles shall be provided in each panel. There shall be separate MCBs for lighting and power receptacles. MCBs shall be equipped with normally closed contact for alarm

The arrangement and mounting of all indicating devices, control switches, relays and other equipment in the BCU and SIC panels and exterior finish and color shall be subject to the approval of the Employer.

The synchronism-check relays and voltage detecting relays shall also be provided for the manual closing of the breaker and for the remote closing by the remote supervisory system.

6.13.3.11 Disturbance and Fault Recording and Sequence of Event Recording Functions

a) Disturbance and fault recording functions

The software shall be supplied to allow access to the disturbance and events recording functions via Engineering Workstation. The software shall as a minimum include the following features:

- Event recording
- Trending
- Continuous oscillography
- Continuous monitoring of frequency, phase and RMS/peak parameter value
- Time tagging of discrete events
- Display events in the order of occurrence
- Configurations including input and editing of event identification text/messages.

Software shall be compliant with IEEE standard C37.111. It shall adhere to a common format for data files and an exchange medium used for the interchange of various types of faults, test, or simulation data for electrical power systems. The sources of transient data such as digital protective relays, the sampling rates, filters, and sample rate conversions for the transient data being exchanged shall be as per COMTRADE (Common Format for Transient Data)

System shall have a disturbance recording function with a minimum of 10 seconds recording time for at least ten (10) disturbances and shall provide the user with time-tagged disturbance records. The pre-fault and fault currents and voltages shall be recorded for each disturbance and be made available for further evaluation purposes.

The substation monitoring system shall provide all relevant information for fault-finding, analysis, and troubleshooting. Suitable and user-friendly fault evaluation software shall be included in the scope of supply, providing short fault summaries and automatic printouts of the fault history and fault location. These functions should be available at the Engineering Workstation.

The broad category of disturbance recording functions shall include:

- Recording and display of Transient Fault Records (Oscillography)
- Recording and display of Sequence of Event Records
- Recording and display of Disturbances (Triggered Data Logs).

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

The disturbance recording shall be based on acquiring inputs across the substation. Station Operators shall be able to use this to retrieve and archive operational data (currents, voltages and frequency) acquired from substation appurtenances including relays, transformers and other equipment to help analyse the system, identify potential equipment failures for preventative maintenance planning. At the least, the following substation parameters shall be monitored and recorded:

- Frequency and waveforms including magnitude of power swings and amplitude surges for the three voltages and four currents as well as neutral current of each autotransformer and shunt reactor before and during the fault
- The operation of protection relays, trip relays and status of each circuit breaker

The disturbance recording function shall be able to establish and display the chronological correlation between occurrence of faults and operation of protective relays and opening of circuit breaker (s).

b) Sequence of events recording functions

BCU should contain an event recording function capable of storing at least 512 time-tagged events extendable up to 1000 events. Events shall be generated either by the switchgear, by the control and protection devices, or by the station level unit. They shall be recorded in an event list in the station HMI. All, or a freely selectable group of events, shall also be printed out on an event printer.

The event list shall contain events that are important for the control and monitoring of the substation. The time has to be displayed for each event. The operator shall be able to call up the chronological event list on the monitor at any time for the whole substation or sections of it.

A printout of each display shall be possible on the hard copy printer.

The events shall be registered in a chronological event list in which the type of event and its time of occurrence are specified. The information shall be obtainable also from a printed event log.

The chronological event list shall contain:

- Position changes of circuit breakers, disconnectors and earthing devices.
- Indication of protective relay operations
- Fault signals from the switchgear
- Indication when analogue measured values outside upper and lower limits
- Loss of communication.

Filters for selection of a certain type or group of events shall be available. The filters shall be designed to enable viewing of events grouped per:

- Date and time
- Bay
- Device
- Function

The sequence of events recording function shall include the following capabilities:

- Perform events sorting and search (multiple-criteria) by specific signals, priority levels, alarm class as well as current status

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- Ability to sort and search data by specifying date/time range (Start date/time - End date/time).
- Ability to import/export data for use with standard Microsoft applications for further manipulation or presentation.
- Ability to maintain an Alarm Summary Record that provides listing of all Current Alarms.
- Stations point description Database shall be capable of import/export from a Microsoft Excel format file.

The software shall be supplied to allow access to the disturbance and events recording functions via Engineering Workstation as described under Station level Software.

6.13.3.12 Alarm Annunciations

Alarms shall be generated either by the switchgear, by the control and relay panels, or by the BCU. Alarms shall be recorded in a separate alarm list and appear on the screen. All, or a freely selectable group of alarms, shall also be printed out on an event printer. Faults and errors occurring in the substation shall be listed in an alarm list. The alarm list shall substitute a conventional alarm tableau, and shall constitute an evaluation of all station alarms. It shall contain unacknowledged alarms and persisting faults. The date and time of occurrence shall be indicated.

The alarm list shall consist of a summary display of the present alarm situation. Each alarm shall be reported on one line that contains:

- Date and time of the alarm
- Name of the alarming object
- Descriptive text
- Acknowledgement state.

The operator shall be able to acknowledge alarms, which shall be audible and displayed on Operator's Workstation. Acknowledged alarms shall be marked in the list.

Filters for selection of a certain type or group of alarms shall be available as for events.

Minimum number of alarms required for each function has been listed below. The final alarm list shall however be subject to approval of the Employer:

A) Circuit breaker

1) Circuit breaker trip
2) Trip circuit faulty/DC failure
3) AC supply fail
4) DC supply fail
5) Control supply fail

B) Breaker Failure Protection

6) Bus breaker failure protection trip
7) DC supply off
8) AC supply off

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

C) Line Protection

9) Distance protection pick-up
10) Distance protection red phase trip
11) Distance protection yellow phase trip
12) Distance protection blue phase trip
13) PLC faulty
14) CCVT MCB trip
15) Line over current and earth fault protection trip
16) Auto reclosure out of order
17) Over voltage protection trip

D) Transformer Protection

18) Differential protection operated.
19) Transformer overall protection operated.
20) Overcurrent protection operated.
21) Neutral overcurrent protection operated (auto-transformers).
22) REF protection operated (auto-transformers).
23) Overload protection operated (auto-transformers).
24) Tertiary protection operated (auto-transformers).
25) Over flux/overvoltage protection operated (auto-transformers).

E) Busbar Protection

1) Busbar protection trip
2) Busbar CT open

F) Common Alarms

1) Annunciator supply fail
2) Control board DC MCB trip
3) Control board AC MCB trip
4) Metering board AC supply fail
5) 110V DC distribution incoming
6) AC distribution incoming
7) Earth fault DC system
8) 110V Battery discharged
9) Protection Panel AC MCB Trip
10) AC distribution incoming fail
11) Telecom equipment failure

10% spare annunciator windows shall be provided for future alarms

The standard legends for annunciations shall be as required below by the use of the following colors:

For trip -- red
For alarm -- amber
For indication -- white

The lamp test facilities shall also be provided to check the lamp failure.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

6.13.4 Construction

6.13.4.1 General

The Panels shall be of the vertical type of construction as defined in relevant IEC Standards.

The Panels shall be fabricated from sheet steel not less than MSG 2.5mm thick seam welded at corners and ground smooth. However, in case of type tested rigid frame design, the thickness of the steel sheets may be reduced according to manufacturer's standard design. The panels shall have front door with glass window.

Panels shall be bolted at the bottom to suitable steel channel sills with which necessary framing shall form a self-supporting dead-front type of structure. Suitable grouting and anchor bolt holes shall be provided in the channel sills.

All screws and bolts used for assembling panels shall be provided with lock washers or other locking devices.

Flat surfaces on the face of any panel shall not deviate more than 1.5mm from a true plane. To prevent warping of panels, all heavy devices shall be adequately supported by means of rear mounted brackets or straps. The panels trim doors and frames shall match and shall present a neat appearance when assembled. Electrical clearance shall conform to the applicable standards and shall be provided without cutting away to adjacent steel frame-work. The Panels shall be adequately ventilated.

The Panels shall have fixed panels on the front and hinged doors on the rear.

6.13.4.2 Equipment Arrangement and Device Marking

The arrangement of equipment and the design of panels shall be such that adequate space is provided for inspection and maintenance of wiring, terminals and equipment. Equipment on the rear of the panels shall be accessible without removing any device.

The name and IEC standard device number shall be marked on the rear of the panels near the corresponding device. Wire numbers of wires connected to each stud of each device shall also be marked near the stud, on the device case or on the rear of the panel. Terminal markings shall not be obstructed by wires. Each terminal designation shall be printed legibly with permanent marking fluid that shall form a contrast with the panel finish. Each stud terminal of the device shall be marked with a permanent identifying character.

The installation of equipment shall start from the top of the panels, such that any unused areas shall be at the bottom of the panel. Any unused areas of panels shall be kept free of wiring to permit the installation of possible future components. No equipment shall be mounted less than 300mm above the floor.

6.13.4.3 Door Hardware

The hinges for all panels' doors shall be of the fully concealed type and shall allow the doors to swing through not less than 120° from the closed position.

Stops or restraining chains shall be provided where required. Each door shall be provided with a handle and a three-point latch with lock.

6.13.4.4 Lighting and Receptacles

Fluorescent lamp fixtures shall be provided in panels for interior lighting. A door operated switch shall be provided with each door. A three pin single phase, 230V AC service

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

receptacles shall be provided in each panel. The lighting and receptacle circuits shall be completely wired in conduits and terminated in suitable junction boxes near one end of the panels, with provision for future extension.

6.13.4.5 Grounding

A ground bus of copper bar not less than 7mm by 25mm shall be provided along the back of panels. The ground buses shall be bolted to the frame of each panel in such a way as to make good electrical contact with the panel. Solder less type connectors shall be provided at both ends of board for connection of the panel ground buses to 95mm^{2}cable.

6.13.4.6 Finish

All metal surfaces shall be painted with one coat of metal primer and two coats of finishing paint. The interior finish of all panels shall be matt white. A quart of paint shall be supplied for "on-site" touch up work.

6.13.4.7 Wiring

6.13.4.7.1 Component Wiring

All internal wiring shall be made in accordance with IEC Standards, with annealed copper conductor, thermoplastic insulated with an overall flame-retardant insulation. Wiring for current transformer circuits shall not be smaller than 2.5mm^2. Wiring associated with potential transformer and protection circuit shall be done with 2.5mm^2 wire. Wiring associated with electronic circuitry shall not be less than 1.5mm^2.

The Proposer shall check the voltage drop before finalizing the size of all internal CT/PT and Electronic Circuitry Wires.

Wiring between terminals of various devices shall be point to point (no splicing or 'T' connection shall be allowed). All internal wiring shall be neatly truncated in wiring troughs bound and anchored. Sufficient slack shall be left at component terminals to permit rearrangement of connections between the terminals of any particular component. Wiring troughs shall terminate not lower than 300mm above the floor of the panels.

Groups of exposed wires shall be run straight, horizontally or vertically with short radius right angle bends. Each wire shall be properly protected where it leaves a channel or duct.

Outgoing wiring shall be connected to terminal blocks suitable for connection to multi-conductor twisted pair cables. Generally, one wire but not more than two wires shall be connected to any device terminal or terminal block.

All wires shall be identified at both ends according to the wiring diagrams.

Wherever wiring is routed to components which are not installed at the time of manufacture, sufficient length of wire shall be provided to ensure that any wire can be terminated on any point of the component.

6.13.4.7.2 Terminal Blocks and Terminals

Terminal blocks shall be designed according to adequate rating requirements and IEC Standards.

Terminal blocks shall be arranged with sufficient room for each connection of incoming cables. Parallel rows of terminal blocks shall be spaced at least 200mm apart.

Blocks shall be mounted in vertical columns along the sides of cubicles or on vertical panels specially provided for terminal blocks. Not less than 25% spare terminals shall be provided on each block or group of blocks.

Cabling for indicating instruments using transducers outputs shall be by means of individually shielded wires and one (1) extra stud shall be provided per pair of terminals for grounding of the shield.

Provisions shall be made to terminate and ground the overall copper shields of all incoming cables.

White marking strips shall be provided for circuit designation. Each connected terminal of each block shall have the circuit designation or wire number printed on the marking strip with permanent contrasting marking fluid. Marking strip shall be strong enough to last up to life of equipment and marking shall not fade. Spare marking strips shall be furnished with each block.

6.13.4.7.3 Test Blocks

Test blocks and test plugs shall be provided for testing instruments and protective devices, while in service, without causing any undesired tripping.

The test blocks shall be of the back connected, semi flush mounted, switchboard type with removable covers.

All test blocks shall be provided with suitable circuit identification. The cases shall be dust tight and shall have a black finish.

Test blocks shall be rated not less than 250V, 10A and shall be capable of withstanding a dielectric test of 1500V, 50 Hz for one minute.

All test blocks shall be arranged to isolate completely the instruments from the instrument transformers and other external circuits so that no other device will be affected, and means shall be provided for testing either from an external source of energy or from the instrument transformers by means of multi pole test plugs.

6.13.4.7.4 Miniature Circuit Breakers (MCBs)

All MCBs shall be provided with auxiliary contacts wired to annunciation system to indicate breaker tripping. The breaker shall be designed for continuous duty and shall carry the rated current continuously without exceeding the specified temperature rise.

6.13.5 Bay Mimic Panel Devices

6.13.5.1 General

The Bay Mimic (BM) Panels or compartments in BCU panels shall contain all the equipment necessary to control and monitor the working of the respective substation bay. Provision shall be made for future extension. All components of the BM panel/compartment shall be suitable for continuous operation at 110V DC in the range of +10%and-15%.

The front of BM panel/compartment shall contain but not be limited to the mimic diagram, control switches for circuit breakers, disconnectors and earthing switches and status indication lights. Synchronism-check selector switches shall also be provided.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

6.13.5.2 Mimic Buses and Equipment Symbols

Mimic buses and equipment symbols shall show the single line diagrams of the circuits. Mimic buses and symbols shall be made of anodized Aluminium or other non-ferrous metal finished in chip and stain- resistant colored lacquer.

6.13.5.3 Control and Instrument Switches

Contacts of all switches shall be self-aligning and shall operate with a wiping action.

Control switches shall be spring return to neutral or maintained contact type, and instrument switches shall be maintained contact type, both with handles. Compression springs shall not carry current. Synchronism-check switch and kirk key interlock switches shall be provided with removable keys.

All switches shall have 10A, 440V continuous rating and shall be capable of withstanding a life test of a least 10,000 operations with rated current flowing in the switch contact. The temperature rise at rated current should not exceed 30°C.

Control switches for circuit breaker, disconnectors and earthing switches shall be discrepancy type.

Each switch shall be clearly marked to show each operating position. Identification shall be engraved on separate name plates.

6.13.5.4 Indicating Lamp Assemblies

Indicating lamp assemblies shall be of the switch board type, rated for 1.5A, 110V DC with appropriate colored caps. Lamp shall be replaced from the front of the panels and any special tools required for lamp replacement shall be furnished.

Lamp test facilities shall be provided so that all indicating lamps on each panel can be tested simultaneously by operation of a common push button.

The lamp fittings shall allow adequate ventilation and shall not incorporate materials subject to deterioration under high ambient temperatures. The lamps shall be higher rated voltage and long life type.

6.13.5.5 Indicating instruments

A) General

All indicating instruments shall be transducer-fed unless otherwise specified. The instruments shall be designed, constructed, supplied and tested in accordance with latest edition of IEC Publication 60051 and the requirements listed herein. All instruments shall be tropicalized.

The analog type indicating instruments shall be flush mounted, dust-proof, switchboard type, having a removable transparent dust-tight window cover with a dull black finish. The instruments shall have 240° circular scale and accuracy of one percent of full scale value except frequency meter whose accuracy shall be 0.05Hz. The scale plates shall have permanent white finish with black graduations and numerals. The meter shall have scale appropriate for the CT/CVT to which they are connected. The true range of input signal shall be indicated on scale. The zero adjustment knob shall be provided.

For the multiple ratios CT, scale plate corresponding to each ratio shall be provided.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

AC instrument potential coils shall be designed for continuous operation at 1.2 times rated voltage and withstanding 2 times rated voltage for 10 minutes. AC instrument current coils shall be capable of continuous operation at 1.5 times rated current and withstanding 35 times rated current for one half second or 20 times the continuous additional rating of the coil for 3 seconds without damage to the coil.

B) Ammeters and voltmeters

The AC ammeters shall have full scale range corresponding to 150% of the rated current which is required to be measured.

The voltmeters shall have full scale values corresponding to 150% of the rated voltage which is required to be measured.

Separate ammeters shall be provided for each phase current. Single ammeter with phase selector switch will not be accepted. Ammeters for R and Y phases shall be of the analog type. Digital ammeter shall be provided for the Y-phase.

C) Wattmeters and varmeters

The Wattmeters and varmeters shall have a full scale range corresponding to about 125% of the rated power that will be required to measure. This rated power shall be based upon the rated primary current of the current transformers. The full scale range shall be chosen from the preferred values specified in relevant IEC Publication.

The Wattmeters and Varmeters shall have a centre zero scale. Power flowing into the bus shall be shown on the left hand side of the scale and this scale shall be marked "IN". Similarly, the power flowing out of the bus shall be shown on the right hand side and marked "OUT". The Varmeter shall show lagging VARs on left hand and leading VARs on right hand side. Each part of the scale shall be marked with the full range.

D) Frequency meters

Frequency meters shall be self- contained. Frequency meter shall be connected directly to the source without transducer. The instruments shall be of digital type with four digit display. The digit height shall be 2.5cm minimum. The frequency meter shall have accuracy of 0.05Hz.

E) Transducers

Transducer fed indicating instruments shall be used instead of simple analog meters for measurement of voltages, currents, frequency watts, and vars. Transducers shall convert secondary quantities from instrument transformers to proportional DC-milli ampere. The DC milli ampere generated shall be 10mA for rated input AC quantities. Transducer output for unidirectional quantities shall be 0/20mA and for bi-directional quantities shall be -10/0/10mA. Output shall be linear throughout the input.

The burden imposed on the instrument transformers shall not exceed 3VA per element. Transducers shall be powered from 110V DC supply. Transducers shall be of modern solid state design for maintenance free operation and protected against surge voltages on inputs and outputs. Accuracy shall be within 1%. Current, watt, and VAR transducers shall be capable of withstanding overcurrent of up to 40x normal rated current for not more than 1 second.

Screw or stud type barrier terminal blocks shall be provided for input side terminals and separate terminal blocks for the output circuits together with a means to ground the screen of the output cable and the transducer shall be provided.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

6.13.5.6 Panel Devices

The panels shall include, but not be limited to the equipment shown on Conceptual Drawings in given documents. Given in Volume-II Part-III of these Documents.

6.13.5.7 Watt-Hour and VAR-Hour Meters / Energy Boards

Energy meters shall be of digital design and shall fulfil the requirements laid down in IEC standard 60687 and other applicable IEC standards. The meters shall be flush mounted, back connected, switchboard type with built-in test facilities. The meter cases shall be dust-tight with removable covers and transparent windows. The meters shall be of protection Class IP54. They shall be suitable for connection to secondary of potential devices and secondary of current transformers.

The draw out feature shall permit the meters to be withdrawn from the cases without opening current transformer secondary circuits, disturbing service or requiring disconnection of leads or the voltage measuring circuit terminal with cubicle shall have opening facilities and current measuring circuit terminal shall have shorting facilities. The built- in test facilities shall permit the meters to be tested in place without requiring other switchboard mounted test devices.

Energy meter shall be capable of recording active and reactive energy imported and exported.

The meter shall have a test output device accessible from the front and capable of being monitored with suitable testing equipment. Energy meter shall be indelibly marked with a diagram of connections. The diagrams shall also show the phase sequence for which the meter in intended. Marking of the meter terminals shall appear on the drawing.

The relation between the test output and the indication in display shall comply with the marked meter constant on the name plate of the meter.

Watt-hour (Wh) and Volt-ampere-reactive hour (VARh)- meters shall be of accuracy class 0.2S. The meters shall have an electronic display with minimum retention time of four months. In case of multiple values presented by a single display it shall be possible to display the content of all relevant memories. When displaying the memories, the identification of each tariff applied shall be possible. The active tariff shall be indicated. The principal unit for the measured values shall be the kilowatt-hour (KWH) or the megawatt-hour (MWH).

Means of communication with the meter for programming, retrieval of data etc., shall be provided. The meters shall have password and telemetering facilities.

6.13.5.8 Outdoor Local Control Cubicles

6.13.5.8.1 General

Each breaker will have marshalling kiosk/local control cubicle. Each local control cubicle shall have mimic pertaining to complete bay (it is intended for) or respective bay as applicable with control switches of circuit breakers, disconnectors/earthing switches, local/remote selector switches, ON/OFF push buttons all necessary relays, contactor, MCBs etc. The detail of mimic equipment to be installed in each cubicle is shown in Volume-II Part-III of Employer Requirements.

These panels shall be installed on foundations and so positioned that the face of the operator should be towards the equipment for which that cubicle is meant.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

6.13.5.8.2 Construction

Each panel shall be duplex type i.e., it shall be accessible on both sides. Front side shall show mimic diagrams and control switches whereas the rear side shall contain terminal blocks. The cables shall be entered from the bottom of the panels. The panels shall be designed for protection class IP55.

The panels shall be fabricated from sheet steel not less than MSG 2.5 mm thick. However, in case of type tested rigid frame design, the thickness of steel sheets may be reduced, but not below 2mm, according to manufacturer's standard design. The paint on the outer surface shall withstand the temperature variations. It should be vermin proof, dustproof and waterproof.

6.13.5.8.3 Lighting and Receptacles

Fluorescent lamps fixtures shall be provided in each outdoor local control cubicle, one on each side. These lamps shall be door-operated type.

A three pin single phase 230VAC service receptacle shall be provided in each cubicle. The lighting and receptacle circuits shall be completely wired.

Separate MCBs shall be provided in each panel for lighting and power sockets. MCBs shall have earth leakage device.

6.13.5.8.4 Space Heaters

Each compartment of each cubicle shall be provided with space heaters of adequate sizes, controlled with thermostats and humidistats. These heating circuits shall be completely wired. Separate MCB shall be provided for the heating circuit. MCBs shall have sensitive earth fault protection for personnel safety.

6.13.5.8.5 Sockets

Each outdoor local control cubicle shall be provided with telephone socket, completely wired and connected to closed circuit telephone system of the substation.

6.13.5.8.6 Name Plates

Each item of equipment mounted on the panels shall be provided with an engraved name plate.

Name plates shall be made on laminated sheet plastic 1.6mm thick or of anodized aluminium 0.8mm thick engraved to provide white letters on a black background. Name plates forming a part of the mimic bus layout shall be of the same thickness as the mimic bus. The name plates shall be fastened to the panels at proper positions with black finished round head screws.

Samples of engraved nameplates shall be submitted for the approval of the Employer. Manufacturer's trademarks or nameplates shall be subject to approval and shall not be mounted on the front of any panel. A nameplate list and detail drawing shall be furnished to indicate the size of each type, number of characters per line and number of lines for each size.

6.13.6 Tests

All equipment furnished by the Contractor under the specifications shall be subjected to tests in the Shop in the presence of the Employer for conformity to the requirements of these specifications. The tests shall be in accordance with the applicable standards and include but not necessarily limited to the following:

a) Functional tests of all control circuits.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

b) Component wiring checks.
c) Mechanical tests.
d) Dielectric tests.
e) Other tests as specified herein

The test requirement for all equipment furnished shall be proved by certified test reports of actual tests performed previously on equipment of the same design. The test data shall be complete and clearly indicate the date of performance of the tests.

The SAS offered by the Proposer shall be subjected to following tests for 132kV Substation equipment installed in the outdoor substation and specified ambient conditions:

6.13.6.1 Generic System Tests

The manufacturer shall, on demand, be able to show the tests plan and tests result executed on the system architecture similar to the one needed in the Project.

6.13.6.2 Type Test Certificates and Reports

Type test certificates demonstrating successful results for the control devices and communication equipment shall be furnished at the time of Proposal submittal. Type test reports shall be submitted during detail design review stage for approval by the Employer.

6.13.6.3 Factory Acceptance Tests

The supplier shall submit a test procedure for factory acceptance test (FAT) of the SAS for approval. For the individual bay level devices applicable type test certificates shall be submitted. The manufacturing and configuration phase of the SAS shall be concluded by the FAT. The purpose is to ensure that the Contractor has interpreted the specified requirements correctly. The general philosophy shall be to deliver a system to site only after it has been thoroughly tested and its specified performance has been verified, as far as site conditions can be simulated in a test lab. During FAT the entire SAS including complete control and protection system to be supplied under present scope shall be tested for complete functionality and configuration in factory itself. The extensive testing shall be carried out during FAT. The purpose of Factory Acceptance Testing is to ensure trouble free installation at site. No major configuration should be carried out at site. At least three (03) representative of the Employer/ Employer's representatives will inspect/witness the manufacturing and factory testing at manufacturer's shop for a period of approximately seven (07) days each trip.

6.13.7 Spares

All spare parts shall be new, strictly interchangeable with the parts by which they are intended to be replaced and shall conform to the relevant Specifications.

For each separate piece of equipment, the Contractor shall provide a spare parts book. This spare parts book shall contain an assembly drawing of the equipment which shall show all parts of the equipment marked and designated.

The spare parts shall be treated and packed for storage for a long time in the climatic conditions specified. Each spare part shall be clearly marked or labelled on the outside of its packing with its description and purpose. When more than one spare part is packed in a single case or container, a general description of its contents shall be shown on the outside of such case or container and detailed list enclosed.

The Contractor shall supply commissioning spares as necessary.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

The Contractor shall furnish a detailed list based on the list of mandatory spares with itemized prices at the time of submission of his Proposal. In addition to mandatory spares as listed below, the Proposer shall furnish a list of recommended spare parts with itemized prices for three years of substation operation

6.13.7.1 List of Mandatory Spares

- Bay Controller Unit /BCU Modules
- Operator Workstation /Modules
- SCADA Gateway Cards/Modules/Routers
- GPS Mater Clock
- Monitors/VDUs
- Keyboard and mouse
- Laser Jet Printer
- Hardcopy Unit
- Hard disc drive
- Ethernet/LAN Switches
- Electrical power supply units /
- DC to DC Converters:
- Auxiliary and control relays
- Control and selector switches, etc.
- Indicating lamps

6.13.8 Drawings and Descriptive Data

6.13.8.1 Proposal Drawings

- Complete filled-in Specific Facilities Data in the format included in Employer Requirements.
- Type test reports for the components and devices included in SAS
- Client's certificates and reference list of Projects on which the proposed SAS has been commissioned and operating satisfactorily.
- Block schematic showing the SAS configuration.
- Manufacturer's detailed technical description/brochures for each component and device included in the Substation Automation System.

6.13.8.2 Approval Drawings / Documents

Complete panel wiring diagrams, overall schematics and technical data and manufacturers' detailed information on operation, testing, commissioning and maintenance of each component and device used in the SAS, shall be provided by the Contractor for review and approval of the Employer.

The following documents shall be submitted, as a minimum, for Employer approval during detailed engineering stage:

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- List of Drawings
- Block Diagrams
- System Architecture Drawing
- Hardware Specification
- Functional Design Document
- Clear procedure describing how to add Device/bay/diameter in future.
- Guaranteed technical parameters
- Guaranteed availability and reliability calculations
- Calculation for power supply sizing
- I/O Signal lists
- Cable schedule
- Schematic diagrams
- Interconnection and wiring diagrams
- List of equipment
- List of labels
- Logic diagram (hardware and software)
- Panel layout drawings
- Control room layout
- Test procedures/protocol for Factory Acceptance Test (FAT)
- Test procedures/protocol for Site Acceptance Test (SAT)
- List of spare parts.
- Product manuals
- Assembly drawings
- Operation and Maintenance Manual
- Complete documentation of implemented protocols between various elements
- List of software and loadable in CD ROM
- Other documents as may be required during detailed engineering

Two (2) sets of hard copy and four (4) sets of CDS ROM containing all the above documents and as built documents/drawings shall be provided.

6.13.8.3 Consumables

All consumables such as paper, cartridges shall be supplied by the Contractor till the Substation Automation System is taken over by the Employer.

6.13.9 Training

6.13.9.1 General

Training shall be imparted by the Manufacturer's experts to Employer's Design Engineers, Field Engineers and also to Field Operation staff. Contractor personnel who are experienced instructors and who speak understandable English shall conduct training.

The Contractor shall provide all necessary training material including presentations, manuals, and practical guides. Each trainee shall receive individual copies of all technical manuals and all other documents used for training. These materials shall be sent to Employer at least two (2) months before the scheduled commencement of the particular training course. Class

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

materials, including the documents sent before the training courses as well as class handouts, shall become the property of Employer.

6.13.9.2 Computer System Hardware Course

A computer system hardware course shall be offered. The training course shall be designed to give Employer's hardware personnel sufficient knowledge of the overall design and operation of the system so that they can correct obvious problems, configure the hardware, perform preventive maintenance and run diagnostic programs. The following subjects shall be covered:

(a) System Hardware Overview: Configuration of the system hardware.

(b) Equipment Maintenance: Basic theory of operation, maintenance techniques and diagnostic procedures for each element of the Bay Control, Workstations, Communication Equipment and Protocols, LANs, router and printers.

(c) System Expansion: Techniques and procedures to expand and add equipment

(d) System Maintenance: Theory of operation and maintenance of the redundant hardware configuration, failover hardware, configuration control panels, and failover switches. Maintenance of protective devices and power supplies.

(e) Subsystem Maintenance: Theory of design and operation, maintenance techniques and practices, diagnostic procedures, and (where applicable) expansion techniques and procedures. Classes shall include hands-on training for the specific subsystems that are part of Employer's equipment or part of similarly designed and configured subsystems. All interfaces to the computing equipment shall be taught in detail.

(f) Operational Training: Practical training on preventive and corrective maintenance of all equipment, including use of special tools and instruments. This training shall be provided on Employer's equipment, or on similarly configured systems.

6.13.9.3 Computer System Software Course

The Contractor shall provide a computer system software course that covers the following subjects:

(a) System Programming: Including all applicable programming languages and all stand-alone service and utility packages provided with the system. An introduction to software architecture, effects of tuning parameters (OS software, Network software, Database software etc.) on the performance of the system.

(b) Operating System: Including the user aspects of the operating system, such as program loading and integrating procedures; scheduling, management, service, and utility functions; and system expansion techniques and procedures

(c) System Initialization and Failover: Including design, theory of operation, and practice.

(d) Diagnostics: Including the execution of diagnostic procedures and the interpretation of diagnostic outputs,

(e) Software Documentation: Orientation in the organization and use of system software documentation.

6.13.9.4 Application Software Course

The Contractor shall provide a comprehensive application software course covering all applications including the database and display building course. The training shall include:

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

(a) Overview: Block diagrams of the application software and data flows. Programming standards and program interface conventions.

(b) Application Functions: Functional capabilities, design and major algorithms, associated maintenance and expansion techniques.

(c) Software Development: Techniques and conventions to be used for the preparation and integration of new software functions.

(d) Software Documentation: Orientation in the organization and use of functional and detailed design documentation and of programmer and user manuals

6.14 TELECOMMUNICATION AND SCADA SYSTEM

6.14.1 General

This section includes the works for the Telecommunication (Telecom) and SCADA systems required in connection with Design, Supply, Installation, Testing and Commissioning of Plant for 132 kV Attabad Lake HPP Substation Project.

The design shall also consider the equipment required for speech and data communication from 132 kV Attabad Lake HPP substation to remote substations including National Power Control Centre (NPCC) / Regional Control Centre (RCC) and the provision of protection signalling over the 132kV overhead transmission line circuits emanating from 132kV Attabad Lake HPP substation.

6.14.2 Scope of Work

The Contractor shall be responsible for the design, manufacture, works testing, supply, storage at Site, installation, site testing, commissioning, guarantee and making good defects of fully functional Telecommunication and SCADA systems, required to fulfil the speech, data and protection signalling requirements. The main works shall include:

Establishment of redundant data communication links between 132 kV Attabad Lake HPP substation and remote end substations, which primarily comprises of establishment of end-to-end Digital Power Line Carrier (DPLC) and digital protection signalling equipment (DPSE) and Fiber optic System. The Contractor shall carry out the survey of the existing facilities and connecting sub-stations to determine the required interface works for the design of SCADA & Telecom necessary for 132 kV Attabad Lake HPP substation, and shall supply all such equipment to establish end-to-end digital power line carrier (DPLC) and digital protection signalling equipment (DPSE) and Fiber Optic System for 132 kV Attabad Lake HPP substation and all connecting sub-stations to implement SCADA & Telecom connection to NPCC/RCC.

The scope of work shall include the following:

a. Power line coupling equipment for coupling the DPLC equipment to the overhead transmission lines, and the adjacent substations for complete integration with NPCC/RCC.

b. Operational telephone (PAX) system at 132 kV Attabad Lake HPP substation including interconnecting and interface equipment required at 132 kV Attabad Lake HPP substation and the peripheral substations for complete integration with NPCC/RCC telephone network.

c. Substation Automation System (SAS) for remote monitoring and control of Attabad Lake HPP 132kV substation from NPCC/RCC.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

d. Interconnection of SCADA equipment, telephone PAX and protection relays to the DPLC & Fiber Optic terminal equipment.

e. New 48V DC power system at 132 kV Attabad Lake HPP substation and connection to existing 48V DC systems at peripheral stations for powering the telecom/SCADA equipment.

f. Survey shall be carried out by the Contractor of the existing facilities or adjacent sub-stations to determine the required interface works for the design of SCADA & Telecom. In case of award, Contractor shall carry out detailed survey and submit the Report within six weeks of Contract Award.

g. Engineering, design and supply of any devices required for proper interface and working of fully functional telecommunication and SCADA systems even if not specifically mentioned in Scope of Work/Price Schedules.

h. Co-ordination with other contractor(s) shall also be deemed to be included in Contractor's scope of work.

i. Scope of work is further elaborated in Volume-II, Part III (Conceptual drawings).

6.14.3 Detailed Requirements

6.14.3.1 Protection Signaling

For the 132kV transmission line circuits, provision of duplicated coded channels for transmission of at least two (2) commands on DPLC and Fibre Optic links.

6.14.3.2 Telephony

a. Speech communication for operational traffic and integration with the remote end substations and NPCC/RCC shall be provided.

b. The Contractor shall carry out survey of the existing status of the network during the detailed engineering phase of the Contract. Direct speech communication shall be provided between control room and other locations within 132 kV Attabad Lake HPP substation premises.

6.14.3.3 Data Communication

Data channels shall be provided between 132 kV Attabad Lake HPP substation and NPCC on new DPLC and Fibre Optic Links to be established under this contract, after carrying out the survey of the existing status of the links. The exact data routes shall be finalized in consultation with NGC (Telecom) during design stage.

6.14.4 Equipment Requirements at 132 kV Attabad Lake HPP Substation

6.14.4.1 Digital Power Line Carrier and Protection Signaling Equipment

6.14.4.1.1 Attabad Lake HPP Substation – 132/66 kV Aliabad Substation (Double Circuit)

a. For each circuit separately: Redundant (two units) digital power line carrier (DPLC) terminal (≥ 40W) and digital protection signaling equipment (DPSE) installed in swing rack cabinet at 132 kV Attabad Lake HPP substation.

b. Two sets (each set comprising two units) of Line Traps for phase-phase coupling.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

c. Two sets (each set comprising two units) of LMUs for phase-phase coupling with coupling filters, hybrid transformer, protection circuits, interface for through connection of existing PLC channels and all materials required for a complete installation.

d. One length of coaxial cable to connect LMU with associated DPLC terminals and between both LMUs.

e. Tele protection interconnection cables between DPSE and the relay panels and terminated at both ends.

f. All other ancillary material comprising cables, connectors, MDF modules, jumpers, harnesses, mounting frames, fuses, relays, nuts, bolts etc. required for complete installation and fully functional DPLC and PSE links.

6.14.4.2 Optical Fiber Terminal Equipment

6.14.4.2.1 Attabad Lake HPP Substation – 132/66 kV Aliabad Substation

a. OLTE equipment in (1+1) configuration with equipment rack and installed in a swing rack cabinet.

b. Digital Access Multiplexer ((DAM) & CC/Add-Drop Multiplexer ADM) equipped with specified user interfaces and installed in OLTE cabinet.

c. DPSE for transmission over OLTE and installed in OLTE/separate swing rack cabinet for tele-protection.

d. One length approach fiber optic cable (FOC) with 24 fibers.

e. Optical distribution frame (ODF) for termination of 48 fibers.

f. Tele protection interconnection cables between DPSE and the relay panels and terminated at each end.

g. Amplifies/ Repeater (if required).

h. All other ancillary material comprising cables, connectors, MDF modules, jumpers, harnesses, mounting frames, fuses, relays, nuts, bolts etc. required for complete installation and fully functional fiber optic link.

6.14.4.3 PAX Equipment

a. One lot of digital telephone exchange (PAX) to fully integrate with the NPCC/RCC telephone network and equipped with at least:

   i. 08 No. analogue trunks and 32 No. analogue subscribers.

   ii. 2 x 2 Mbps digital trunks with Q Sig/4 No. digital subscribers.

   iii. 02 No. long line extensions.

   iv. 05 No. desk mounted telephone sets.

   v. 05 No. executive telephone sets.

   vi. 01 No. Industrial Router to establish link for remote maintenance of 132 kV Attabad Lake HPP substation's PAX from NPCC/RCC.

   vii. Standard subscriber cables for all users.

   viii. Swing rack cubicle, equipment rack and ancillary equipment required for a complete installation and fully functional telephone system.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

b. One Main Distribution Frame (MDF) cabinets, floor mounted equipped with MDF frames, Krone quick-connect modules and protection equipment (for external circuits) to terminate 600 pairs with an expansion capability of 50% for additional internal and external circuits.

6.14.4.4 SCADA System

a. Interfacing of Gateways with DPLC and Fiber Optic terminals. Availability of SCADA signals and programming in Gateways shall be done by the Contractor.
b. Redundant Time synchronizing system comprising GPS receiver and necessary interface equipment for synchronizing the clock systems at NPCC/RCC and 132 kV Attabad Lake HPP substation.
c. Testing of SCADA functions of 132 kV Attabad Lake HPP substation with NPCC/RCC. This includes end to end verification of all SCADA Signals at remote end substations.
d. Establishing end to end DPLC data links between 132 kV Attabad Lake HPP substation and NPCC/RCC.
e. Establishing end to end Fiber Optic communication links between 132 kV Attabad Lake HPP substation and NPCC/RCC.
f. Ancillary equipment not specifically mentioned herein but required for equipment interface and a fully functional SCADA system.

6.14.4.5 48V DC Power System

a. Two lead acid Plante type battery banks,
b. Two battery chargers in (1+1) configuration,
c. Instrumentation and DC distribution with MCBs,
d. All other ancillary equipment required for a complete installation and fully functional 48V DC power system.

6.14.4.6 Spare Parts

All modules with finite MTBF shall be provided as essential (mandatory) spare parts. Essential Spare Parts shall be supplied in accordance with the following:

a. Two (2) number of each module/sub-assembly for DLPC/DPSE
b. Two (2) number of each module/sub-assembly for OLTE/MUX, DPSE/PSE.
c. One (1) number each module/assembly for PAX equipment including 1 No. of each type of telephone sets (Desk, Wall, Executive).
d. One (1) number of each module/sub-assembly for SCADA and 48V DC Power Supply equipment including lead acid battery cells.
e. One (1) number each of LMU set, ODF, router, transducer (each type) and telephone sets (each type).
f. Ten percent (10%) of interface cables, connectors, circuit breakers, fuses, indication lamps, MDF Krone quick-connect modules.
g. 500m of approach fiber optic cable.
h. Ten percent (10%) spares for adaptation equipment.

Unit price of each item and complete lists of Essential Spare Parts covering the above shall be provided for telecommunication, SCADA and 48V DC power equipment.

Additionally, a list of Recommended Spare Parts for Five (05) years operation shall also be included.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

6.14.4.7 Erection and Testing Equipment and Maintenance Tools

Special equipment required for service, test and maintenance shall be offered and listed in detail. The mandatory Erection and testing equipment and maintenance tools shall include:

a. Equipment for configuration and testing/commissioning of DPLC, OLTE/MUX, DPSE/PSE and PAX comprising 2x Laptop PCs (no less than core i5) loaded with system and application software with backup DVDs.
b. Equipment for PLC link measurements i.e. signal generator (50Hz–2MHz) and selective level meter (50Hz-2MHz).
c. Equipment for generation and measurement of trip commands i.e. Tele protection test box.
d. Equipment for testing of end-to-end data communication links i.e. Data link tester.
e. Equipment for transducer measurements.
f. Equipment for testing of battery chargers.
g. Equipment for measuring the battery capacity while in service and accessories provided with the batteries.
h. Engineer's Optical service toolkit.
i. Engineer's Maintenance service toolkit.

A complete list of Mandatory Erection and Testing Equipment and Maintenance Tools stating the make and model number of each item shall be included in the Proposal.

Additionally, a list of Recommended Erection and Testing Equipment and Maintenance Tools shall also be provided.

6.14.5 132/66 kV Aliabad Regional Grid Station – Digital Power line Carrier Equipment (Double Circuit)

a. Redundant digital power line carrier (DPLC) terminal (≥ 40W) and digital protection signaling equipment (DPSE) installed in swing rack cabinet at 132/66 kV Aliabad Regional Grid Station. One set (each set comprising two units) of LTs for phase-phase coupling.

b. One set (each set comprising two units) of LMUs for phase-phase coupling with coupling filters, hybrid transformer, protection circuits, interface for through connection of existing PLC channels and all materials required for a complete installation.

c. One length (1000 m) of coaxial cable to connect LMU with associated DPLC terminals and between both LMUs.

d. Teleprotection interconnection cables between DPSE and the relay panels and terminated at both ends.

e. All other ancillary material comprising cables, connectors, MDF modules, jumpers, harnesses, mounting frames, fuses, relays, nuts, bolts etc. required for complete installation and fully functional DPLC and PSE links.

6.14.6 132/11 kV Alilabad Regional Grid Station – Fiber Optic System Equipment

a. OLTE equipment in (1+1) configuration with equipment rack and installed in a swing rack cabinet.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

b. Digital Access Multiplexer ((DAM) & CC/Add-Drop Multiplexer ADM) equipped with specified user interfaces and installed in OLTE cabinet.

c. DPSE for transmission over OLTE and installed in OLTE/separate swing rack cabinet for tele-protection.

d. One length (1000m) approach fiber optic cable (FOC) with 24 fibers.

e. Optical distribution frame (ODF) for termination of 48 fibers.

f. Teleprotection interconnection cables between DPSE and the relay panels and terminated at each end.

g. All other ancillary material comprising cables, connectors, MDF modules, jumpers, harnesses, mounting frames, fuses, relays, nuts, bolts etc. required for complete installation and fully functional fiber optic link.

6.14.7 Telecom System Specifications

6.14.7.1 Digital Power Line Carrier (DPLC)

6.14.7.1.1 General

Digital Power line carrier (DPLC) communication shall be established via the overhead power transmission lines.

The DPLC equipment shall consist of:

a. DPLC terminals with interfaces for connecting to voice, data and protection signaling equipment.
b. Line traps, coupling capacitor voltage transformers, line matching units and coaxial cable for coupling the carrier signal to the overhead transmission lines.

The equipment shall be suitable for operation in the frequency band of 40-1000 kHz. Swing frame cubicles of 19” rack design shall be used to house the DPLC terminal racks. The cubicle shall be designed as per the specifications given in Specific Facilities Data.

6.14.7.1.2 Frequency Allocation Plan

In order to avoid frequency congestion, the Contractor shall, after award of contract, survey the existing installation and submit a carrier frequency allocation plan (FAP) for the new DPLC links. The Contractor shall obtain from the concerned authorities the latest frequency allocation plan for the sites included in the Contract and of those sites that are located at a distance that meets the under-mentioned criteria. The concerned authorities shall approve the proposed frequencies. The criteria to be used in frequency planning shall be:

a. Two-line sections separation at the same voltage level.
b. One line section and transformer section separation at different voltage levels.
c. While proposing the frequencies it shall be ensured that no interference is caused with the communication services of other administrations. Frequencies shall be allocated such that cross-talk due to coupling through the substation bus bars or due to the links operating over parallel overhead lines is kept to a minimum as per IEC standards.

The frequency setting of a link shall be programmable in the field.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

6.14.7.1.3 Signal to Noise Requirements

The DPLC shall automatically adapt its data transmission rates to ensure minimum BER under adverse weather conditions keeping the Tele protection signals at the highest priority.

For voice communication, signal to noise ratio of not less than 25dB in the speech band under adverse weather conditions and not less than 35dB in normal operating conditions. The Contractor shall provide calculations in line with IEC 60663– “Planning of (single sideband) power line carrier systems" detailing coupling equipment, line attenuation and any other losses. Relevant assumptions on the transmission lines noises and on the VF levels adjustments shall be stated clearly.

Signal to noise calculations shall be provided by the Contractor during detailed design. Any assumptions made in the calculations shall be clearly stated.

6.14.7.1.4 DPLC Equipment Features

The design and performance of the DPLC unit shall guarantee the reliable operation of the equipment under all common operation conditions encountered on the EHV power network and shall conform to the latest revision of IEC 60495 - "Single Sideband Power Line Carrier Terminals". The equipment shall be used for the transmission of the following types of information:

a. Speech for voice communication.
b. Telephone signaling.
c. Data communication.
d. Tele-protection signals.

The offered equipment shall have been type tested, field-proven and working successfully in telecom network operated by power utilities for at least three years and installed on minimum three Projects. Evidence in this regard shall be submitted with the Proposal in the form of reference lists, client’s certificates and type test reports.

The DPLC equipment shall have following features:

a. Field-programmable carrier frequency selection in increments of 4 kHz from 40 kHz to 1000 kHz, including filters.
b. Power amplifiers available in a range of power output ratings suitable for selection to match link transmission loss. HF power increments shall be 40 and 80 watts.
c. Automatic gain control (AGC) to prevent transmitter overload and receiver AGC from pilot signal. Receiver AGC to limit voice frequency output level to ±1.0dB or better over a 40dB dynamic range of input carrier level.
d. Provision in the receiver for equalization of line frequency attenuation distortion.
e. Transit filters, if required, for pass-through connection to equipment.
f. Provision for selectable matching balanced or unbalanced cables at the transmission frequency interfaces to impedances of 75 and 150 ohms. Impedance matching to 125, 150, and 250 ohm terminations will also be required. The nominal PLC output impedances shall be 75 ohms for unbalanced grounded circuits and 150 ohms for balanced ungrounded circuits.
g. Provision for input and output connections for voice, for telephony signaling and decoupled individually adjustable data channels as well as protection signaling in each channel unit.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

h. Programmable to provide speech, tele-protection and 4800bps data services or any combination of these services e.g. 2xspeech+data+tele-protection, 3xspeech+tele-protection, 1xspeech+2xdata etc. The Proposer shall give details of all possibilities available in the equipment. Also, the supplied equipment shall have no restriction on the use of full range of its services by the Employer in future.

i. Interface ports to provide universal connection to existing telephone systems with 2-wire FXO, 2-wire FXS, 4-wire, and 4-wire/E&M terminations (irrespective of existing type and country of manufacture).

j. Provision of an internal tone generator for inserting and measuring test tones.

k. Test jacks and/or test points for diagnosing trouble. Important metering points, control elements and visual indicators shall be on the front of the modules or front panel.

l. Alarms shall provide dry relay contacts for forwarding alarms. Self-loop back features shall be provided.

m. Equipment operation from a nominal 48V (-15%, +20%) positive earthed DC battery supply, connected to a battery charger with internal regulation.

n. Provision in each cabinet for service telephone, with audible and visible calling annunciators.

o. Carrier oscillators accurate within ±20 Hz. The maximum allowable frequency difference between transmit and receive on any link over the specified environmental range shall not exceed ±2 Hz with suppressed carrier. With reduced carrier, the aforesaid frequency difference shall be zero. RF stability requirement shall be better than 1 Hz within the specified temperature range.

p. Equipment operation within the specified environmental conditions.

q. Provision of a self-diagnostic (loop back) to be controlled both locally and remote.

r. Software programmable without physical change of equipment modules or strapping.

s. Interface to transmit data on both 101 and 104 links.

t. Alarm monitoring provided through LEDs and dry alarm contacts.

u. Capable of easy integration into digital networks, LAN/IP connectivity, remote management and compatibility with legacy systems.

6.14.7.1.5 DPLC Equipment Architecture

The equipment shall be of the single sideband, suppressed carrier type being considered on a modular basis, with the modules plugging into 19" (480 mm) shelves. The equipment shall utilize solid state integrated devices with a minimum of discrete components. Each channel shall have a bandwidth of 4/8 kHz, allowing simultaneous bilateral transmission of mixed type information (telephone, signal and data).

The information type to be accommodated on a channel shall be programmable to include any combination of speech, data and tele-protection signals.

Routine testing and fault location of the equipment shall be facilitated by means of built-in testing equipment and LEDs etc. The functions to be controlled by the equipment shall be stated by the Proposer.

The basic architecture of DPLC equipment shall include the following three parts:

a. Input/output interfaces of varying types.

b. Multiplexer and digital signal processor.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

c. RF power amplifier.

6.14.7.1.6 Input / Output Interfaces

Each DPLC link shall be configured for the particular application on that link. As a minimum, each unit shall be equipped with:

a. 1 x 2/4 wire speech interface.
b. 1 x 2-wire remote subscriber (FXS/FXO) interface.
c. 1 x LAN interface.
d. 4x RS 232 V.24/V.28 interface.
e. 1 No. integrated DPSE for connection to protection relays.
f. 1 No. service interface for service tool (Laptop PC) connection.
g. 1 No. service telephone interface plus telephone for testing and maintenance.
h. 1 No. set of status and alarm indication LEDs.
i. 1 No. interface for power supply, 48V DC and 220V AC.
j. 1 No. interface for time synchronization.
k. Interface to transmit data on both 101 and 104 links

6.14.7.1.7 RF Power Amplifier

The RF power amplifier shall be modular and easily replaceable. It shall be possible to add stages of identical power amplifiers to obtain RF PEP power output of 40 W, 80 W or higher wattage.

Selection of the required power output for each link shall be made by the Proposer after considering the transmission line parameters. However, it shall not be less than 40W.

The RF power amplifier section shall receive RF signal from the digital signal processor which is fed to a voltage controlled amplifier to obtain the desired RF output.

Switching operations in the high-voltage network, in addition to climatic conditions, can lead to an alteration of the impedance in the high-voltage line. This affects the output current and the output voltage of the amplifier adapted to the line. The RF power amplifier shall thus be dynamically controlled for its power output.

In order to prevent overdriving when the amplifier is driven to full output, the RF power amplifier shall be controlled through a feedback control loop.

Similarly monitoring circuits shall be provided to prevent failure of any component due to exceeding of design limits.

For supervision of the equipment, alarm contacts shall be available along with LEDs on the front panel indicating status and alarms.

The RF power amplifier section shall also house necessary filters and hybrids for:

a. Separating the transmitted RF signal from the received signal.
b. Allowing connection of additional stages of amplification.
c. Matching the output to the coupling filters connected to the transmission line.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

6.14.7.1.8 Multiplexer and Digital Signal Processor

The input signals of all interfaces shall be multiplexed and digitally processed to form an SSB modulated signal of the desired RF band. For this purpose, the analogue input signals shall be first converted into a digital signal (a serial sequence of bits) by an analogue to digital converter. The digital input signals shall be processed by digital signal processor (DSP) circuits using suitable software algorithms, so as to get another digital data stream. The data streams thus obtained shall be converted through suitable modulation techniques to give an SSB modulated RF signal.

Reverse procedure shall be employed for demodulation. The entire signal processing technique shall be aimed at achieving user flexibility. Thus, by changing few software parameters settings of carrier frequencies, pilot frequencies, orientation of the spectrum etc. shall be possible to change.

Each asynchronous digital interface shall be adjustable in the range of 1200 to 9600 bit/s. The synchronous digital shall be able to be parameterized as clock master (DCE) or clock slave (DTE). The bit rate shall be adjustable from 9.6 to 64 kbps.

6.14.7.1.9 Digital Protection Signaling Equipment

Digital protection signalling equipment shall be provided for secure and dependable transmission of protection trip signals over the DPLC. The equipment shall be designed in accordance with the following:

a. Coded commands for trip signals to prevent inadvertent signal transmission.

b. Possibility for transmission of four bi-directional trip commands.

c. Selectable and programmable security, dependability and transmission speeds.

d. 1+1 path protection available as a standard feature. A switch-over of the protection signal command shall be guaranteed in less than 5 ms.

e. Possible to drop and insert commands, transfer commands at a transit station and have AND- and OR- connections between commands. The equipment shall be able to support T-node configurations.

f. Signals adjustable from 24 to 250V DC by means of software. All inputs and outputs shall be isolated and with EMC immunity for harsh environment.

g. Provided with an integrated non-volatile event-recorder that can be synchronized internally and by Global Positioning System (GPS) and a command counter for recording trip commands.

h. Provision of individual command counters external to the equipment and manually resettable for each trip command. The equipment shall include at least the following counters:

    I. Command counter at transmitter input for memorizing the input trip command.

    II. Command counter for memorizing the trip command at the receiver.

Provisions shall also be available for remote signalling of the received and transmitted commands.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

6.14.7.2 Power Line Coupling Equipment

6.14.7.2.1 Method of Coupling

In order to connect the DPLC terminal to the transmission line, coupling equipment comprising line traps, coupling capacitor voltage transformers, line matching units and coaxial cable shall be provided.

Coupling of the power line carrier signals to the transmission circuits shall be by means of line matching units, coupling capacitor voltage transformers and line traps. The method of coupling used shall be phase to phase (centre-outer).

6.14.7.2.2 Line Traps

The minimum inductance of the line traps shall be 0.315 mH. Detailed specifications are included in Section 6.11 of these Technical Specifications.

6.14.7.2.3 Capacitor Voltage Transformers

Detailed specifications are included in the Technical Specifications / Contract Document.

6.14.7.2.4 Line Matching Unit (LMU)

The LMU shall couple and decouple the high-frequency signals of the power line carrier unit from and to the transmission system. The LMU shall work like a high-pass filter for coupling to the overhead transmission lines.

Broad-band units shall be provided for each phase. The tuning range of the LMUs shall cover transmit and receive frequencies of the new DPLC links and shall be field programmable. The composite loss over the range shall not be greater than 2 dB. The line side and equipment side return losses shall preferably be greater than 12 dB over the available bandwidth of the filter. The line side impedance of the device shall be suitable in the range 200-600 ohms for phase to phase coupling. The equipment side impedance shall be in the range of 75 ohms (unbalanced) to 150 ohms (balanced). The LMU shall be programmable for various coupling capacitances, line and equipment side impedances.

The units shall provide for impedance matching, filtering and operation safety and shall comply with IEC 60481. The LMUs shall be adaptable for either, centre phase to outer phase or inter-circuit coupling. For phase to phase coupling, it shall be possible to earth either of the LMUs and continue with carrier transmission on phase to ground basis using the other filter. All tuning elements shall be factory-tuned to the selected frequency band, impedances shall be factory adapted to the line and HF cable impedances.

All components shall be suitable for outdoor operation in the prevailing climatic conditions. Cubicles shall be of steel sheet material with weather proof door and cable inputs seals, adequately protected against condensation and shall be designed to a protection class of IP55 or better. They shall be suitable for mounting on CVT rectangular lattice type steel support structures.

The unit shall be designed to ensure the safety of operators and the protection of the carrier equipment against the effects of the network high voltage, and of transient over-voltage conditions. Full compliance with IEC recommendations shall be provided.

The unit shall have surge arresters and an earth switch. The terminal of the device connected directly to the substation earth shall be clearly marked.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

All elements such as coupling filters drain coils or protective devices shall be suitable for the coupling capacitor to be applied. A drain coil shall earth the 50 Hz current so that the applied voltage meets the prevailing safety requirements i.e.:

a. The unit shall withstand without damage a shock-wave 1.2/50 µs of 6 kV peak value applied on the power line side.

b. Insulation level shall be of 5 kV rms applied for one minute between each coil and earth and between each coil and screen.

The connecting cable between the coupling unit and the coupling capacitor shall be included. It shall have a diameter of at least 8 mm and shall be isolated and fixed sufficiently to withstand the mechanical and electrical stresses in case of HV faults.
The coupling box, the earth switch, the main surge arrester and the drain coil shall be equipped with name plates of weather-resistant material, placed so that it is easily visible, with irremovable inscriptions. They shall indicate as a minimum:

a. Manufacturer's name, type and serial number.

b. Rated voltage and current for the earth switch.

c. Rated voltage and the rated discharge current for the surge arrestor.

An arrangement diagram with weather-resistant inscriptions shall be fixed inside the door of the unit housing box. It shall in particular indicate the references of the carrier frequency cable outputs, the value of the tuning coil and the ratio of the adaptation transformer in relation to the connections used. Various connections of the filter and of the matching transformer shall be shown in a visible and practical way.

6.14.7.2.5 Coaxial Cable

High frequency cable of coaxial type shall be used as connection cable between coupling unit and the DPLC terminal and between the set of coupling units (connected in phase-phase and inter-circuit configuration).

The cable shall be PVC insulated, galvanized steel tape armored (two layers) with a further outer sheath of PVC and shall be suitable for direct laying in the earth/trenches and for use in tropical climates (temperature -10-70°C and humidity approaching 100%). The inner conductor shall be copper with a diameter of 1-2 mm whereas the outer conductor shall be bare copper braid.

Following electrical parameters shall be considered in cable design:

a. Impedance 75±5 ohm (unbalanced)

b. Attenuation at:

c. 100kHz ≤ 1.8dB/km

d. 300kHz ≤ 2.8dB/km

e. 500kHz ≤ 4.1dB/km.

f. Capacitance ≤ 66nF/km

g. Insulation resistance > 5 GΩkm

h. DC resistance at 20oC ≤ 26Ω/km

i. DC resistance of braid at 20oC ≤ 4.5Ω/km

j. Test voltage ≥ 6kV 50Hz/1min.

k. Bending radius with load ≤ 12xouter cable dia.

l. Maximum tensile strength Proposer shall state

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Cross-section layout and technical data of cable mechanical and electrical characteristics shall be included in the Proposal.

The laying in trenches, burying in ground, back-filling, termination and protection pipes shall be included in the works. The protection pipes, if used, shall be properly closed at the ends with a suitable compound to prevent against vermin attack. The cable shall be suitable for laying in the trenches with the HV power cables. The distance between the two cables shall be at least 400 mm. Bending radius requirements shall be strictly adhered to during installation and any damage thereof shall be the Contractor's responsibility.

Complete lengths of cable shall be provided, with drum lengths according to requirement but not less than 1000 m. However, if straight through joints are required on any link, this shall be deemed to be included in the works.

6.14.7.3 Fiber Optic Link

These specifications pertain to the following items:

a. Fiber Optic Line Terminal Equipment (OLTE)
b. Digital Protection Signaling Equipment (DPSE)
c. Approach Fiber Optic Cable.

6.14.7.3.1 Fiber Optic Terminal Equipment

The fibre optic terminal equipment shall be provided to establish complete fibre optic links. This section presents the specifications of the equipment to be employed on these links.

The required fibre optic terminal equipment shall have a successful track record in telecom networks operated by power utilities. Thus, it shall be suitable for operation in harsh environment with electromagnetic interference and high temperature/humidity and shall have a high reliability and security. The equipment shall be field proven for installation and operation in power utilities, evidence of which shall be provided with the Proposal in the form of reference lists, Clients' certificates and type test reports.

6.14.7.3.2 Design Based on Hierarchical Structure

The design of fibre optic terminal equipment shall be based on the SDH structure defined in ITU-T G. 707 and G. 783. The hierarchy, from top to bottom, shall comprise:

a. Optical Line Terminal Equipment (OLTE).
b. SDH-STM-4 multiplexer upgradeable to higher levels (STM-16) by vendor independent means and fully equipped for connection to sixty-three (63) vendor independent E1 lines.
c. Digital Access Multiplexer and Cross Connect (DAM&CC) and Add-Drop Multiplexer (ADM) as required on various nodes to meet the user interface requirements defined herein.

The user interfaces shall provide following facilities:

a. Data transmission.
b. Speech communication.
c. Alarm transmission.
d. Becoming a WAN node.
e. System and network management.
f. Protection signals transmission.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

6.14.7.3.3 Design Features

The equipment configuration shall be flexible to enable implementation of either point to point communication (1+1 configuration) or the ring topology among substations.

OLTE/SDH and DAM&CC/ADM shall be installed in racks that are Electro Magnetic Compatible (EMC) and suitable to work in EHV substation environment. The equipment shall be modular in structure and housed in completely enclosed, vermin/dust proof standard 19" swing rack cabinets.

The OLTE/SDH equipment shall operate in the 1550nm or 1310nm wavelength window depending on link budget calculations and shall be suitable for use on OPGW and underground fibre optic cables.

The equipment shall be able to perform both line terminating and multiplexing functions and shall be able to accommodate signals generated from various levels of PDH. The transmitter equipment shall use laser optical source with power output suited to the requirement of the links. All transmitter equipment shall use the same laser type with attenuation being provided to suit the optical performance of the link.

The SDH Equipment (Terminal Equipment, Add/Drop Multiplex, and Synchronous Digital Cross-Connect) shall meet the following:

a. It shall have at least all the functions outlined in ITU-T G.783.

b. The PDH electrical tributary interfaces to the SDH equipment shall conform to ITU-T G.703.

c. The SDH electrical and optical interfaces shall conform to ITU-T G.703 and G.957.

d. The cross-connect offered shall be capable of providing non-blocking connection between virtual containers.

e. The Optical Power shall be such that under normal operating condition, the BER of the system at the receiver is better than 1x10-10.

f. The multiplex structure shall conform to ITU-T G.707/Y1322, G.711, and G.712. Details shall be included in the Proposal and shall include the usage of the overhead bits.

g. The synchronous optical interface protection shall be achieved by having 1+1 protection. The protection at 2 Mbps level (working/access boards) shall also be provided.

h. The laser shall automatically cut-off when the link is disturbed.

i. Redundant cross connect, where failure on either one shall not cause link outage, and Path protection (Linear Trail Protection) on the traffic interface and 2Mbps levels shall also be provided.

j. It shall have 2Mbps inputs/outputs that can be directly connected to PCM, digital telephone exchanges, protection signaling equipment, protection relays, etc.

k. The equipment shall automatically switch to another clock if the reference timing is lost and automatically revert back upon restoration. Proposer shall provide details in the technical Proposal.

l. The accuracy of the internal clock as well as the details of the clock distribution shall be stated in the offer.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

m. Error performance versus the receive signal shall be verified during the factory acceptance tests.

The SDH equipment shall provide the following:

a. Engineer's order–wire (EOW) which shall have conference and selective calling features. EOW handset shall be located in the OLTE cubicle.

b. A Craft interface in accordance with ITU-T G.773 to allow a local terminal to access the network element.

c. A data communication channel interface for connection to the Network Management System, in accordance with ITU-T G.773.

d. Performance monitoring in accordance with ITU-T G.784 and G.826.

6.14.7.3.4 Optical Budget Calculations

The Proposer shall submit the preliminary power budget calculations to justify that the proposed equipment shall operate on each link with acceptable BER $\geq 10^{-10}$. The calculations shall state the following:

a. Transmitter power
b. Attenuation over the link
c. Receiver sensitivity @ BER $1x10^{-10}$
d. Connector loss (0.3dB)
e. Splice loss (≤ 0.05dB)
f. Power penalty (Chromatic dispersion and LD reflection loss) (1dB)
g. Maintenance margin (2 dB)
h. System margin (1dB)

6.14.7.3.5 Equipment Sizing

The STM-4 SDH equipment shall be equipped and wired to its maximum useable capacity (63xE1). Simple connection to vendor independent E1 lines shall only be required for expansion to full capacity in future.

Proposer shall explain in detail in the Proposal, as to how the above functions will be achieved.

External booster amplifiers/preamplifiers shall be provided as and where required, to achieve the desired optical power budget.

The number of user interfaces shall be decided by the Proposer according to the technical solution proposed in the Proposal. However, the number of user interfaces and spare capacity shall not be less than the following:

a. At least 30% spare slots for future addition of interface modules in SDH and Multiplexer racks.

b. At least 21x E1 interfaces in OLTE/SDH equipment and 4x 2Mb/s interfaces in the DAM&CC/ADM, fully wired up to the MDF.

c. 4/2W E&M interface for at least 8 ports.

d. LAN interface for 1+1 configuration.

e. Alarm interface for at least 4 ports.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

f. V.24/V.28 RS 232 interface.

g. All channels shall be fully wired up to the MDF.

h. The capacity of the control/cross connection units shall be able to cater for a fully equipped rack.

i. Power supply modules shall be sized to sustain 50% additional load.

Control/cross connection and power supply cards in SDH/OLTE and DAM&CC/ADM racks shall be duplicated (1+1) to prevent the equipment from going out of service owing to failure of a single card.

The Proposer shall provide a detailed list of the modules supplied at each node in the Proposal.

Protection signalling equipment shall be in 1+1 configuration.

6.14.7.3.6 Power Supply

The OLTE/SDH and DAM&CC/ADM equipment shall be powered from 48V DC (power supply voltage range shall be from -40 to -58V DC). The duplicated power supply modules shall share the load during normal operation; however, upon failure of either one the other shall not be affected and cater for the total equipment load.

6.14.7.3.7 Optical Distribution Frame (ODF)

An ODF shall be provided to act as an interface between the approach fibre optic cable and the optical line terminal equipment for performing optical isolation, which might be required either during testing/ commissioning or during the routine maintenance.

The equipment shall consist of a distribution frame, which can be either a shelf inside the OLTE cubicle or a separate wall mounted cabinet. Each fibre of the approach fibre optic cable shall terminate in a suitable connector and be available for use either on this contract or for future use. All connectors shall be of the same type within the frame. The connectors of unused fibres shall be protected against dust and dirt with a retained cap. The terminations shall be contained in an airtight, dust free container provided with means of securing the strain relief members of the cable. The pigtails with single fibres shall also contain strain relief members and shall be spliced to the external cable fibres using the fusion technique.

The distribution frame shall be suitable for termination of 24/48 fibres according to that stated in detailed requirements. All external cables shall be properly glanded.

Optical patch cords of suitable lengths shall be provided for connection between the ODF and OLTE. Capacity of the optic distribution frame shall allow free assignment between each fibre and the relevant optical I/O ports of the OLTE.

The optic distribution frame shall be equipped with low loss optical connectors (<0.3 dB). Auxiliary connectors shall be provided to facilitate testing and maintenance of the fibres/equipment.

6.14.7.3.8 Digital Protection Signaling Equipment

Standalone/integrated digital protection signalling equipment (DPSE) shall be provided for secure and dependable transmission of protection trip signals over the SDH/OLTE. The equipment shall be designed in accordance with the following:

a. Command addressing (minimum 8 bit) for trip signal to prevent inadvertent signal transmission.

b. Possibility for transmission of four bi-directional trip commands.

c. Selectable and programmable, security, dependability and transmission speeds.

d. 1+1 path protection available as a standard feature. A switch-over of the protection signal command shall be guaranteed in less than 5 ms.

e. Possible to drop and insert commands, transfer commands at a transit station and have AND- and OR- connections between commands. The equipment shall be able to support T-node configurations.

f. Signals adjustable from 24 to 250V DC by means of software. All inputs and outputs shall be isolated and with EMC immunity for harsh environment.

g. Provided with an integrated non-volatile event-recorder that can be synchronized internally and by Global Positioning System (GPS) and a command counter for recording trip commands.

h. Provision of individual command counters external to the equipment and manually resettable for each trip command. The equipment shall include at least the following counters:

   I. Command counter at transmitter input for memorizing the input trip command.

   II. Command counter for memorizing the trip command at the receiver.

i. Provisions shall also be available for remote signaling of the received and transmitted commands.

j. An automatic and periodic loop test (< 100s) provided for a signal delay measurement.

k. Configuration tool for the DPSE integrated into the test and maintenance software.

l. No false trip commands generated in the event of power supply failure or when the equipment is put into or taken out of service.

m. Power supply voltage in the range 48V DC (-15%, +20%).

n. The input/output interface between the protection relays and the DPSE by means of reed relays and the input/output rack wiring carefully segregated from other wiring.

o. The transmitter command initiated by the use of clean contacts on the protection relay which shall switch the 48V DC tele-protection supply to the reed relay.

p. DPSE receiver shall provide at least two output contacts per command for primarily operating the 220V DC protection and control supply.

q. Contacts wired to a separate terminal strip, which shall be specially labelled accordingly.

r. In addition, necessary auxiliary contacts supplied for alarm and indication purposes.

6.14.7.3.9 Alarm and Test Functions

All of the important system parameters shall be continuously monitored and an alarm signal shall be initiated whenever any system parameter deviates from the set limits. Alarms shall be indicated on the equipment and shall be made available on voltage free normally open contacts that shall be connected to the Gateway equipment for monitoring by the SCADA and SAS systems.

The alarm functions shall include but not be limited to:

- Alarms shall be classified critical, major, minor, and information.
- Indication of loss of incoming signal/high BER>10-3.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- Loss of incoming signal (2,048 Kbit/s).
- Loss of frame alignment.
- Alarm indication signal (AIS) detection.
- Failure of 64 k bits/s interface (signalling only).
- Failure of power supplies.
- Visual and audible indication of alarms.
- Test function of alarm indicators to ensure workability of alarm indicators.
- Alarm functions shall be detailed by the Contractor. Test functions of the equipment shall include as minimum:
- Transmit output.
- Receiver sensitivity.
- BER.
- Protection switching.
- Engineer's order-wire.
- Alarms.
- Supply voltages.
- Test loops.

The Contractor shall give details of all other functions available on the equipment/system.

6.14.7.3.10 Approach Fiber Optic Cable

The fibre optic cable shall be designed to withstand all prevalent environmental conditions including the effects of high electric and magnetic fields produced in proximity of live power cables.

A service life of at least 25 years is required, and test evidence to support Supplier's claim in this respect shall be submitted with the Proposal.

6.14.7.3.11 Cable Type

The fibre optic cable shall be of the single mode type equipped with at least 24 fibres complying with ITU-T recommendation G.652 and shall be suitable for underground installation and laying in trenches/cable trays.

6.14.7.3.12 Fiber Optic Cable Requirements

a. Water-Tightness

The cable shall be fully moisture-resistant and meet the longitudinal water-tightness test requirements.

b. Electrical withstand

Considering there is a potential danger through fault or leakage currents, the cable shall be non-metallic.

c. Mechanical withstand

The cable shall suitably withstand the mechanical radial stresses and shall be protected against rodents and termites. The crush resistance shall be at least 2kN/10cm.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

d. Temperature withstand

The operating temperature range shall be -10 to +70°C and the cable shall be suitable for operation in tropical climate with humidity approaching 100%.

6.14.7.3.13 Fiber Characteristics

The main features of the optical fibre shall be as follows:

- Fibre type: Single mode according to ITU-T G.652.
- Wavelength: 1310nm and 1550nm.
- Max. Attenuation: 0.35dB/km at 1310nm and 0.2dB/km at 1550nm.
- Max. Splicing loss: 0.05dB.
- Max. End-connector loss: 0.3dB.
- Mode field diameter: 8.1-9.7µm.
- Cladding diameter: 125µm ± 2µm.
- Max. Concentricity error: 1µm.
- Max. Cladding non-circularity: 2%.
- Max. Chromatic dispersion: 4ps/nm.km at 1310nm and 20ps/nm.km at 1550nm.
- Cut-off wavelength: < 1270nm.
- Operational temperature range: -10 to +70°C

Inside the buffer tube the reserve length of fibres shall be at least 0.45% against the linear length of the complete OPGW to prevent the fibres from coming under stress. To prove this a sample of at least 80m shall be pulled up to endurance tensile strength while a continuous optical measurement of fibre length and attenuation is done simultaneously.

6.14.7.3.14 Cable Construction

A loose tube, minimum strain configuration, which provides protection from external forces and possesses high tensile strength/resistance to crushing, shall be supplied. The 24 fibres shall lie loosely inside plastic tubes filled with a gel to protect the fibres from the ingress and propagation of moisture. The maximum number of fibres inside any one tube shall be 8. Each tube and fibre shall be color coded to be distinguishable from the other.

The cable construction shall comprise a dielectric central strength member surrounded by loose buffer tubes and fillers covered by moisture-resistant wrapping. The interstices among the loose tubes shall be filled with water blocking jelly compound. The wrapping shall be covered with thermoplastic sheath surrounded by aramid or glass yarn reinforcement. Anti-rodent protection shall be applied around the reinforcement layer by means of glass tape. The outer jacket of the cable shall be made of rugged non-metallic material of thickness not less than 1.5mm and covered with anti-termite coating.

Full constructional details of the cable offered shall be submitted with the Proposal.

6.14.7.3.15 Ending Rules

After factory acceptance, the inner end of the cable shall be fitted with an end cap to ensure water-tightness; the outer end shall be fitted with a water-tight head compatible with cable pulling. Caps (material and implementation) shall comply with applicable standards. They shall not be removed until immediately prior to optical jointing.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

6.14.7.3.16 Cable Installation

The fibre optic cable shall be laid in a 50mm PVC duct from/to the terminal joint boxes either directly buried or installed in trenches. Within building premises, it shall be laid in a flexible duct on cable trays. Drawings showing the installation details shall be submitted to the Employer for approval.

Any damage to the cable which is laid and exposed but not protected and during installation shall be made good by the Contractor at his expense and to the satisfaction of the Employer.

For buried PVC duct, a trench 0.5m wide x 1m deep shall be excavated with provision of manholes at bends for cable pulling and future maintenance. PVC duct shall be laid on a sand bed of at least 100mm thickness and shall be covered by sand layer of 300mm thick. A cable warning tape shall be placed on the top of sand layer. It shall be bright yellow in color and of plastic material 300 mm wide by 0.1mm thick shall be supplied. The tape shall be continuously and indelibly marked in English and Urdu with the words:

CAUTION CAUTION CAUTION

FIBRE OPTIC CABLE 700 mm BELOW

The lettering shall be black on yellow.

The excavated material shall be used for the remaining back filling of the trench.

The openings to the ducts shall be closed with a suitable compound after the cable has been laid. A 10m loop shall be kept in manholes.

6.14.7.3.17 Cable Drums

Fibre optic cables shall be delivered on drums of wooden reels. The lengths of the cable drums shall be such that intermediate jointing is kept to a minimum on any of the cable routes. The minimum drum length shall be 1000m.

6.14.7.3.18 Labelling

All cables and cable ends should be labelled clearly in accordance with the specification. The meter run should be marked on the outer sheath. These speeds up localization of faults which are detected during calibration of cable.

Drums shall be fitted with securely attached, unalterable identification plate bearing the following information:

a. Employer’s name.
b. Supplier’s name.
c. Contract number
d. Content (including drum no.).
e. Manufacturing date.
f. Length of cable on drum.
g. Direction of rotation of the drum.
h. Position of the cable nose.
i. Weight of drum.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

6.14.7.3.19 Storage and Transport

The permissible mechanical stress values (tensile force, bending radius) shall be adhered to during transport and storage. The barrel diameter of the shipping drums shall be at least 30 times the outer diameter of the cable, but not less than 400 mm.

The transportation and storage shall not be done in conditions exceeding the permissible temperature limits.

6.14.7.3.20 Joint Box

Joint boxes shall be provided to protect the splices and shall be suitable for underground installation in harsh environment. The units shall be weather-proof type of protection Class IP65 made of non-corrosive Aluminium alloy or similar material. All necessary hardware to terminate, protect and fix 24 no. spliced fibres shall be included. The cover shall be provided with a long-life neoprene gasket to provide a seal against moisture and dust. The cable inlets shall be similarly sealed. Entry for four cables shall be available. A name plate giving important information shall be attached to the joint box. This name shall have embossed characters and shall be made of weather-proof material. Operating temperature range shall be -10 to +70°C and relative humidity range 5-95%.

The underground joint boxes shall be supplied as spares for future splicing to meet the contingency in case of a cable cut.

6.14.7.4 Digital PAX Equipment

The digital PAX shall cater to the specified operational speech requirements for the Project. The equipment shall be field proven and already working satisfactorily in telecom networks operated by power utilities. Thus, it shall be suitable for operation in harsh environment with electromagnetic interference and high temperature/humidity and shall have a high reliability and security. Evidence shall be provided with the Proposal in the form of reference lists, Clients' certificates and type test reports regarding installation and operation of proposed PAX in power utility environment.

In the event that the Contractor and Manufacturer are different, the Manufacturer's representative shall commission the PAX in strict accordance with established installation practices.

6.14.7.4.1 Operational Requirements

1) Network Organization

PAX shall become an integral part of the operational telephone network for NPCC/RCC in which the first priority of communication is with the despatcher positions at NPCC. Users of the network are classified in following four categories in order of their importance.

a. Level A: Despatchers at NPCC.
b. Level B: Control Rooms at 132kV substation.
c. Level C: All other subscribers.

The despatchers are able to communicate with any station in the network as and when they desire. The connection of the Power Station and other substations with the despatchers is via dedicated "Hot-line".

A number of different types of service restrictions have been incorporated into the network for Levels B to D in order to minimize the flow of unwanted traffic in the network.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

The Contractor shall be responsible for fully integrating the offered PAX into the above operational telephone network. Complete integration requires that the exchange supports all network facilities (in particular priority intrusion and forced release) over the digital and analogue trunks. The compatibility of the new PAX shall be demonstrated in the field before formal approval can be accorded. This shall take place before site testing and commissioning.

2) Numbering Scheme

The new PAX shall use a closed numbering scheme in which a singular number shall be dialled for a given extension irrespective of the calling party. The numbering scheme shall be uniform and consist of four digits. The selection of appropriate trunk lines shall be as flexible as possible and shall be made through the analysis of the dialled number. Only digits that are required for determination of the call direction shall be analysed.

Changes in the numbering plan by the Employer shall be possible in a flexible and easy manner without any modifications in hardware or wiring.

3) Channel Routing

Whenever several routes are possible within the meshed network for connecting to NPCC/RCC, the PAX equipment shall allow free line selection, so that when one trunk or a group of trunks (route) is busy/occupied, the call is automatically transferred to the next available line according to a pre-programmed sequence. Such selection shall be programmed in the PAX according to traffic considerations and network topology. Whenever extra equipment is required for this purpose, it shall be stated and if not stated shall be deemed to be included in the Proposal.

4) Caller Number Identification

The existing PAX equipment has the capability of transferring the caller number identification throughout the network to enable the appearance of this information (on a per call basis) on the despatcher control telephone at remote control center. The new PAX shall similarly have this facility.

6.14.7.4.2 Technical Requirements

1) General

The PAX shall be state-of-the-art digital, non-blocking type utilizing pulse code modulation (PCM), time division multiplexing (TDM) and stored program control (SPC). The transmission shall conform to the ITU-T A-Law Companding standard (ITU-T Rec. G.711 and G.712). Centralized circuits shall be provided for tone generation and detection. The system shall use digital technology and microelectronics, with minimum 32bit main processor control, and fully modular hardware to allow future expansion in extension and trunk lines. The software of the system shall be written in open standard software architecture and a high level programming language recommended by ITU-T.

The proposed system shall comprise integrated and discrete components of a high level of reliability to guarantee a system availability of 99.98% over a fifteen year operating period.

The PAX shall be suitably designed to operate over any kind of transmission media such as DPLC, FO, digital microwave and pilot cable. The Contractor shall provide details of the signalling schemes, in accordance with the ITU-T standards.

Plug-in printed circuit boards shall have gold plated connectors, if applicable, and shall be connected by means of printed back panels.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Line terminals shall consist of solderless connectors of well-proven design for easy wiring, testing etc.

Extensive and adjustable time-out facilities shall be available in the PAX to enable the time-out and release in the following cases:

a. When a call is not answered in a predefined period.
b. When while dialing, the inter-digit time period is exceeded.
c. When an incomplete or invalid number is dialed.
d. When a station user attempts to access a feature, he is not allowed.

The PAX shall incorporate a backup memory on flash ROMs/magneto optical disk to protect the system against loss of memory due to power failure or breakdown of the system. Upon restoration of power to the system, the backup memory shall automatically reload the required system and customer data files into the active memory area within a period of less than ten seconds whereas in case of a complete blackout requiring reload of the operating system, the PAX would be operational within a period of less than two minutes.

The programs and data of the system shall also be stored on removable disks which can be used to load the system in case of a main system disk failure.

The PAX system shall incorporate a wide range of self-initiating diagnostic routines for the monitoring of the system performance and identification of errors i.e., major and minor hardware and software faults, faulty line/trunk card, power supply, etc. Details of hardware and software covered by self-diagnostics shall be explained with the Proposer's proposal.

2) Interface Circuits

The various types of interface circuits shall be in accordance with the following standards/ protocols:

Analogue Extension	Two wire Dial Tone Multi-Frequency (DTMF) according to ITU-T Q.23
Digital Extension	Standard BRA 4 wire ISDN S0 bus (ITU-T I.430) UPn 2 wire interface (in 1B+D or 2B+D modes), Uk0 2 wire interface
Analogue Trunk	2 wire/4wire E&M Interface with MFCR2 (ITU-T Q.400 TO Q.490) 2 wire loops disconnect Interface
Digital Trunk	30B+D interfaces conforming to ITU-T G.703/G.704 with 1TR6, DPNSS and QSIG protocols 2 MB/s CAS protocol 2B+D interface conforming to ITU-T I.430 with 1TR6, DPNSS and QSIG protocols

3) Software Features

The PAX system shall possess, as a minimum, the following software features. The features shall be fully transparent to the network.

a. Call Priority

Call priority can be assigned to certain extensions or Network Tie Lines as a fixed attribute; calls originated by these extensions or on these lines will always have priority over routine calls. Alternatively, extensions may be given a Service Class which allows them to obtain Priority on a call-by-call basis when needed. During the application of priority, priority intrusion is used to intrude upon an established call when congestion is encountered upon initiating a

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

call to another extension. The Priority feature is a mandatory function which shall function over the PAX network. It may be inhibited either manually or automatically.

b. Automatic Priority Intrusion

If a call is initiated with Priority, a busy line in the first choice route will be selected once congestion has been detected in the alternative routes. The caller will then automatically enter into a conference with the parties in conversation on this line, after a short intrusion tone has been provided to all parties, including the intruding party. The duration of this conference is limited to a configurable amount of time (default duration of thirty seconds), after which the intruding party will be disconnected.

c. Manual Priority Intrusion

If the call has not been initiated with Priority and congestion is found on the line, the caller shall receive an audible and visual indication of this. The caller shall then have the option of upgrading the call's priority. This is accomplished by pressing the appropriate PRIORITY key on his telephone within a configurable period of time (default duration of fifteen seconds), otherwise, the caller will be disconnected.

Once manual intrusion has been performed, a busy line is selected and a conference established as described above for Automatic Priority Intrusion. At this time, the call will be tagged as a Priority call in each node along the route to the destination, as the intrusion order is transmitted from node to node.

d. Forced Release of Call

A Forced release order is used by the intruding party to forcibly release the parties in an established call which has been intruded on, in order to free the line for use by the intruding party. Once the caller has intruded on an established call, he may initiate a Forced Release Order by pressing the PRIORITY key before the maximum duration of the intrusion has elapsed.

After application of the Force Release Order, the intruding party will be either automatically connected to its destination without any redialling or further dialling by the NPCC despatcher/intruding party or by redialling of some number or code to establish the connection. The Proposer will state the provision available in the proposed PAX.

e. Hot-line Extension

This type of extension shall have the facility to automatically call a pre-designated number by only lifting the handset.

f. Call Diversion on Busy

Calls to an extension are diverted to a predefined directory number when the extension is busy.

g. Call Diversion on No-answer

Calls to the extension are diverted to a predefined Directory Number (DN) when the call is not answered within a specified period of time (default duration of ten seconds).

h. Call Transfer

Allows an extension user on any two party call to Hold the existing call, originate a call to a third party and then transfer the call to a third party. The station user can then consult privately with the third party before completing the transfer, or can return to the original caller.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

i. Call Forward

All incoming calls to a station user can be automatically forwarded to another pre-selected destination within or outside the PAX to which the station user is connected.

j. Call Waiting

Alerts the station user, busy with an established call that additional calls are waiting to be transferred.

k. Ring Again

Allows a station user, on encountering a busy connection, to be alerted when a called party or trunk route becomes free. The system will then automatically redial the desired destination.

l. Call Pick-up

Enables the definition/programming of specific call pick up groups whereby a station can pick up an incoming call for another station in his call pick up group by lifting his handset and dialling a pre-designating call pick up code.

m. Conference

Allows a station user to establish a three-party conference. Conferences may be inside or outside the PAX to which the station user is connected.

n. On-hook Dialing

Enables a station user to originate a call without lifting the handset.

o. Privacy

When a station user is engaged in a two party conversation, no other party can enter the conversation.

p. Authorization Code

For the purpose of overriding the access restrictions, a specific two to three digit pre-programmed code is dialled by a designated station, to enable him to gain free access to the network. Dial tone is returned to the station user after dialling the code and he is able to call the destination without restriction.

4) Equipment Design

The equipment configuration shall be flexible to enable implementation of point to point, tandem as well as ring topology communication with other substations. The PAX system shall be expandable without any interruption in service.

The proposed PAX equipment shall incorporate at least a 30% spare equipped capacity in the user interfaces and shall be expandable to 100% of the equipped capacity by simple addition of plug-in modules. The equipped capacity shall be fully wired up to the MDF.

The PAX system structure shall be based upon a multi-processor hierarchy, in which the processing requirements are subdivided on the basis of both the type of function to be carried out and the time limits set. The architecture shall allow for the optimum use of system resources by use of a combination of advantages of distributed processing with the low costs and efficiency of centralized management. The system shall consist of the following functional units.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

a. Common control group

In order to avoid the duplication of information and allow for a setup of a reliable and flexible structure, this group centralizes the decisional-management system functions, operator interface functions and system functions such as down-loading programs to processing subsystems (peripheral equipment modules). This group collects all pertinent information relating to the state of the various parts of the PAX system, activating, if necessary, alarm procedures and regulating access to the system's memory areas in order to optimize their use.

It contains all the system programs, semi-permanent system data, subscriber categories and features, numbering schemes, network characteristics and all other information used to provide services.

The Input/output communication shall be achieved via a terminal (VDU) which displays/prints on request all system information, alarm messages, traffic and call recording data.

b. Switching group

This portion of the system performs the switching functions of the communication channels in a non-blocking mode, with a bit transfer rate according to ITU-T standards. It consists of the appropriate digital/analogue converters for the subscriber and trunk modules/cards plus a memory time switch for establishment of the connections required by the Common Control Group.

The data exchange between the Switching Group and the Common Control Group shall be via the high speed data bus incorporating a bidirectional V.24 interface, through which the Common Control unit gives instructions for;

a. Controlling the switching operations.
b. Injecting audible signals.
c. Setting up conferences.
d. Peripheral equipment group

This group shall consist of the various types of line and trunk modules and associated bus extension units. It shall be possible to incorporate both the analogue and digital versions of the line and trunk cards.

c. Operation/maintenance ports

The PAX system shall incorporate at least two EIA RS232C serial ports for connection of input/output terminals to enable the program of customer data information and recording and monitoring of traffic data.

d. Operation/maintenance facilities and alarms

An adequate range of alarm and test facilities shall be provided to enable the maintenance personnel to rapidly access and localize the fault conditions. The exchange shall be supplied with system management & diagnostic software.

The facility of remote access of the PAX for operation and maintenance purposes shall also be available.

The system shall also contain appropriate hardware and software for the audible and visual display of the whole range of alarms from the PAX equipment to enable the local maintenance personnel to undertake corrective action immediately upon the occurrence of a fault.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

The Proposer shall provide complete technical details of the operation/maintenance facilities and alarm display and rectification.

5) Equipment Cubicle

The exchange equipment shall be installed in racks mounted in a free-standing swing rack cubicle, of completely enclosed type with a protection class of IP 54 and shall preferably not require any rear access. The cubicle shall be dust and vermin-proof with suitable dust filters and ventilation provided. Accessibility shall be provided from the front for testing, commissioning and maintenance purposes. The cubicle shall have the provision of being locked from the outside. Entrance of the cables shall be through a gland plate provided at the bottom of the cubicle.

All modules shall be identified as to their shelf location and it is preferred that coded key slots are used in the edge connectors in order that modules cannot be plugged into the wrong shelf position.

6) Telephone Sets

a. Desk telephone set

Desk telephone shall be a standard single line push button analogue tone dialling set. The keypad and the dialling from the telephone set shall conform to the ITU-T Q23 standard. It shall be possible to attach a hands-free unit, if required.

b. Wall mounted telephone set

Wall mounted telephone shall be a push button analogue tone dialling set designed for installation on the wall only. The keypad and the dialling from the telephone set shall conform to the ITU-T Q23 standard.

c. Executive telephone sets

Executive telephone shall be a push button tone dialling set with display of at least 2x24 characters to show Names and CLIP, at least 24 programmable memories, digit display, provide full hands-free operation, have programmable function keys with LED indication, support context sensitive features, name dialling and display as well as Message display.

7) Cabling

All cabling, between the telephone sets and the PAX and between the PAX and MDF/communication equipment shall be supplied and installed by the Contractor in trenches/ducts and/or cable trays. The telephone cables shall be multi-pair, twisted and screened with suitable protection against vermin/rodent attack.

8) Power Supply

The PAX equipment shall be powered from the 48V DC power system.

6.14.7.4.3 Main Distribution Frame (MDF)

The termination frames shall be housed in a self-standing 19" cabinet (separate from the PAX cubicle) lockable from the outside. The cabinet shall be dust and vermin proof, designed to a protection class of IP54. Provision shall be made to bond and earth the cabinet to the grounding system within the substation in accordance with the approved earthing scheme. The entry of cables shall be from the bottom through suitable glands provided in the plates and care shall be exercised that the glands are tightly closed after the installation of cables.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

The connecting blocks shall be of the quick-connect type, each capable of accommodating at least 10 pairs. It shall incorporate over-voltage and over-current protection on all external trunk and subscriber circuits. These protectors shall be either carbon or gas tube type. Access to the connecting blocks shall be from the front. One (1) quick connect tool shall be provided with the MDF cabinet.

6.14.8 Substation SCADA System Specifications

6.14.8.1 General

This section pertains to the specifications for SCADA system required for establishing the connection between NPCC/RCC and SAS system at 132 kV Attabad Lake HPP substation. The detail specifications / functional description shall be in the Substation Automation System chapter in the Technical Specifications. / Contract Document.

6.14.8.2 Operational and Control Philosophy

Substation shall be under the control of two separate control centres arranged in a hierarchical configuration:

National Power Control Centre (NPCC)/ Regional Control Centre (RCC),

SAS at the substation control room.

The NPCC/RCC shall be responsible for the overall monitoring of 132 kV Attabad Lake HPP substation, and the SAS shall be responsible for the detailed station control requirements.

6.14.8.3 Operational Requirements and Control Authorization

The 132kV circuit breaker, disconnect or/earthing switches shall be monitored/controlled from following locations:

a. NPCC/RCC.
b. Substation control room.
c. Bay control cabinet / Equipment own control cabinet

A two position selector switch shall be installed on bay control panel for selection of operator workstation and bay control panel. The control will be shifted to desired location in accordance to switch position.

Status of all equipment shall be provided on NPCC/RCC and substation control room.

6.14.8.4 SCADA System & Functions

The SCADA System shall have following major functions:

a. Acquisition and processing of network data,
b. Processing and indication of status signals, alarms, measurements,
c. Visualization of process information and logging (Human Machine Interface),
d. Processing of commands and set point values,
e. Storage and retrieval of archive data including disturbance data processing,
f. Topology calculation and dynamic network coloring,
g. Equipment statistics,
h. Load shedding,
i. Check before execute function.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

6.14.8.5 Energy Management System (EMS) Functions

a. Short term load forecast (STLF).

b. Schedules management system (SMS) with following modules:
   i. Interchange transaction scheduling (ITS),
   ii. Transaction evaluation (TE),
   iii. Generation scheduling (GS),
   iv. Unit commitment (UC)

c. Real-time Dispatching functions:
   i. Interchange transaction monitoring (ITM)
   ii. Reserve Monitoring (RM)
   iii. Automatic generation control (AGC)
   iv. Energy Accounting (EA)
   v. Economic Dispatch (optional)

d. Network application (NA) functions (network oriented EMS functions):
   i. State estimation (SE) incl. network model builder (NMB)
   ii. Bus Load Forecast (BLF)
   iii. Dispatcher power flow (DPF)
   iv. Optimal power flow (OPF)
   v. Contingency analysis (CA)
   vi. Outage scheduler (OS)

6.14.8.6 Performance Requirements

The SCADA equipment to be supplied shall be built with high performance, reliability, availability and environmental characteristics.

Time tagging of events and alarms will take place at the substation for both events/alarms list as well as sequence of events recording. The manufacturer shall propose suitable input cards to provide time tagging between events. Provision shall be made to include all measured values, indications and alarms in the sequence of events list, although selected parameters shall be included in the actual list.

6.14.8.7 SCADA Equipment

The solution comprises redundant data links between the 132 kV Attabad Lake HPP substation SAS and the NPCC/RCC to meet the SCADA requirements; provided that the intent of these Specifications is met.

6.14.8.8 Gateway Controller

A gateway controller, especially tailored for data interchange between the SAS computers and the SCADA master system installed at NPCC/RCC, shall be installed at 132 kV Attabad Lake HPP substation for monitoring of the station equipment under SCADA.

The amount and type of information (scope of signals) to be exchanged between the main SCADA computers at NPCC/RCC and the SAS process computers shall be controlled by software blocking/authorization in the gateway controller and the SAS system; such that, in

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

future, if any additional information is required to be transmitted, it can be done with minimum work.

6.14.8.9 Dual Processor Configuration

The design of the gateway controller shall be based on dual processors with duplicated database and operating system. These processors shall be configured in a "hot-standby" mode with switch-over from one processor to the other without any interruption to the SCADA system. The gateway controller shall have built-in hardware/software diagnostic facility which will be able to diagnose the fault at least up to the PCB level. The status of the gateway controller shall be continuously monitored by the SAS operator workstation and any fault/malfunction in the gateway shall be reported to both the operators' consoles and the event/alarm lists of the station.

6.14.8.10 Communication with NPCC / RCC

The gateway controller shall communicate with the main SCADA equipment at the remote NPCC/RCC via the front end computers utilizing duplicated data channels, preferably on separate physical routes. The data exchange between the NPCC / RCC and the SAS shall include appropriate message coding and security. Errors detected shall cause the data concerned to be invalidated and retransmitted.

6.14.8.11 Communication Interfaces

a. The Gateway controller shall supply all necessary hardware for connection of gateway controller with the communication equipment.

b. For communication with NPCC/RCC, redundant RS-232 and RJ-45 Ethernet ports shall be provided in the Gateway controller for connection to duplicated data channels. The selection of a communication path to the Gateway controller shall be controlled by the SCADA.

c. The serial interfaces shall individually selectable and support a data rate up to 38400 bps using 4-wire, full-duplex communications.

d. The Gateway Controller shall support the following communications protocols:

   I. IEC 60870-5-104 to communicate with NPCC/RCC.

   II. IEC 60870-5-101 to communicate with NPCC/RCC.

e. The Contractor shall provide and implement the communication protocols for each communication port in the Gateway controller. The Employer shall be authorized to disclose the Gateway protocol implementation to third-party suppliers of the Employer equipment.

6.14.8.12 Time Synchronization

For accurate time synchronization satellite based redundant Global Positioning System (GPS) receiver shall be provided at 132 kV Attabad Lake HPP substation. This shall communicate with the GPS installed at NPCC/RCC master clock system.

a. The Gateway Controller shall have an internal clock for data collection coordination and time tagging. This shall include support for sequence of events and disturbance data reporting.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

b. The resolution of the clock shall be 1ms, and the clock shall drift by no more than 100ms per day. SAS at 132 kV Attabad Lake HPP substation shall synchronize its internal clock from the Global Positioning System (GPS) receiver.

6.14.8.13 Cabling

Cables between equipment shall be terminated with quality connectors. Shielded cables shall follow the single point grounding system to prevent ground loops. Insulation of all wires shall be non-combustible, flame retardant type. All cables shall be terminated in color and core number order at both ends for easy identification.

6.14.8.14 Power Supply

The SCADA equipment shall be powered from the 48V DC supply or 230V AC UPS.

6.14.9 48V DC Power System Specifications

6.14.9.1 Basis of Design

The 48V DC system at 132 kV Attabad Lake HPP substation shall be designed in accordance with IEC 60146, 60478 and 60896 and shall consist of:

a. Duplicated battery chargers.
b. Duplicated half battery banks.
c. DC distribution.

The design of the DC unit shall minimize the risk of short circuits and shall ensure personnel and operational safety at all times.

The design and selection of equipment and components shall be based on achieving a lifetime of at least 15 years, when operating under the specified service conditions.

The DC power supply shall be rated 48 V. Both "half" battery banks in parallel shall be able, when fully charged, to supply the total load (comprising the delivered load with 30% spare for future use) for at least 10 hours in the event of failure of the AC mains.

The chargers shall be completely suitable for parallel operation and shall have facilities for manual boost charging over a pre-determined period. Each charger shall be capable of supplying the total load independently.

For maintenance purposes it shall be possible to disconnect one "half" battery and associated charger whilst the other "half" system supplies the load.

The DC power supply shall limit the output voltage to within (+20%,-15%) of the nominal value, provided that these voltages do not exceed the voltage guarantee of the load equipment. The power supply positive output shall be connected to the station earth.

The Contractor shall submit load calculations for the battery banks and battery charger ratings, taking into consideration the loads of the proposed equipment.

In the event of AC mains failure causing the batteries to become discharged, each charger shall be rated to:

a. Fulfill the total load requirements (comprising the delivered load plus 30% spare for future use), and charge its battery from the discharge condition to 95% normal capacity within 20 hours, with the output voltage maintained within (+20%,-15%) of the normal value.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

b. Rapid charge its battery, at a higher rate (typically 2.4 V per cell) from the discharged condition to 100% nominal capacity within 10 hours.

At the peripheral stations augmentation in existing 48V DC distribution boards shall be provided to power the telecom equipment supplied under this Contract.

6.14.9.2 Configuration

The power supply installation for 132 kV Attabad Lake HPP substation shall be a duplicated system and shall comprise two charging sources and two "half" batteries. The load shall be fed from two DC distribution boards by means of miniature circuit-breakers (MCBs). For the Peripheral station one battery and one DC distribution board shall be provided.

The primary power shall be fed from the essential services busbar.

6.14.9.3 Mode of Operation

In normal operation, the chargers shall operate in parallel and each charger shall be able to float charge its own battery as well as supply the total load.

In the event of a mains failure, both "half" batteries shall be able, when fully charged, to supply the total load, for not less than the specified standby time whilst maintaining the output voltage within permissible limits.

For maintenance purposes it shall be possible to disconnect one "half" battery from the load so that it can be boost charged by its associated charger whilst the other charger supplies the load and floats its "half" battery. When the first "half" battery is fully charged it shall be possible to switch it to feed the load while the other half battery is connected for boost charging. If the AC supply fails during boost conditions the two "half" batteries shall be automatically connected in parallel by "no volt" contactors. It shall not be possible for the load to become disconnected from both batteries and chargers simultaneously.

It shall also not be possible to connect a "boosted" battery to the load until its terminal voltage has fallen below the upper limit of float charge voltage.

6.14.9.4 Requirements

The battery chargers and DC distribution boards shall be located in the telecom room of the substation control building. The battery banks shall be installed in the battery room.

6.14.9.5 Battery Chargers

6.14.9.5.1 General

Two identical industrial chargers for operation in the substation environment shall be supplied for 48V DC system. Evidence shall be provided with the Proposal for five years satisfactory operation of similar units in power utility/substation applications. The units shall be modular in structure and switched mode power supply (SMPS) type. The chargers shall incorporate measures to limit the distortion caused by the unit on the AC mains.

6.14.9.5.2 Technical Characteristics

The chargers shall, in normal operation, maintain the battery normally floating so that no discharge occurs under normal loading and the battery remains fully charged. The operation of the chargers shall follow the I-U characteristics according to the latest IEC recommendations.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

The chargers shall be designed for three phase AC supplies with nominal voltages of 400V ± 10% respectively, at a frequency of 50Hz ± 5%. The units shall maintain the float charge automatically irrespective of the variations in the voltage/ frequency of the AC supply and the DC load within the specified limits.

The voltage/current characteristics of boost charge shall have tapering characteristics in order to minimize gasification. The Contractor shall state the float and boost charge voltages.

The chargers shall have protection against overloads and limit the output typically to 125% of its maximum rating on short- circuit of the DC output. A current limit circuit shall protect a discharged battery from overcharging when connected to the charger.

Fast acting fuses shall be incorporated in the charger to protect the equipment from damage.

The charger efficiency shall not be less than 90%. For all chargers, Proposer shall specify the efficiency and input power factor at both full and lightly loaded conditions.

6.14.9.5.3 Requirements

The battery chargers shall be designed in accordance with relevant IEC standards and requirements listed hereunder:

- Nominal system voltage :48V
- Float voltage :2.2-2.23V/cell
- Boost voltage :2.35-2.4V/cell
- Rated current :100A (30A at Peripheral stations)
- Duty class (as per IEC 60146) :1
- Number of chargers :2
- Guaranteed temperature range: -10 to 50°C

6.14.9.5.4 Float Charging Conditions

The output voltage regulator shall be adjustable within limits, approved by the Employer, and shall be so designed that special tools are not required for any adjustment.

The voltage reference point for control of the charger output voltage shall not be obtained from a source external to the charger.

The output of the charger on float charge shall be equal to the normal battery standing load plus the recommended finishing charge rate.

The charger shall have electronic protection to avoid discharging the battery through the charger should the latter become defective.

6.14.9.5.5 Boost Charging Conditions

Under boost charging conditions the charger shall fully recharge the battery after a heavy discharge without gassing or damage to the battery. A suitable boost timer switch shall be included in the circuit.

The boost voltage and boost timer settings shall be chosen to ensure that a discharged battery can be fully charged within the period specified above.

Manual boost charging facility shall be required in the following instances:

a. During the initial charging of the battery, prior to it being put into operation.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

b. During a prolonged AC mains shutdown.
c. Prior to performance of the battery capacity tests.

6.14.9.5.6 Controls and Alarms

Each charger shall be equipped with a switch fuse for the incoming AC supply and either a circuit-breaker or fuse for the DC output. Potential free changeover contacts shall be provided for external alarm extension of these fuses/circuit breakers in the telecom room/control room.

The following alarms shall be provided, as a minimum:

a. AC mains failure.
b. Charger failure.
c. High output volt.
d. Low output volts.
e. Charger on manual boost.

Potential free changeover contacts shall be provided for external extension of the above alarms.

6.14.9.6 Instrumentation and 48V DC Distribution

6.14.9.6.1 Instrumentation

Common control and interlocking shall be kept to a minimum. Instrumentation for the system shall comprise, but shall not be limited, to the following:

a. DC voltmeter for each charger output and the distribution busbar.
b. DC ammeter for each charger output.
c. DC ammeter for each battery marked "charge" and "discharge".
d. DC voltmeter for each battery.
e. DC ammeter for total load current.

6.14.9.6.2 48V DC Distribution

The distribution section for 132 kV Attabad Lake HPP substation shall be designed for both incoming and outgoing 48V supplies as follows:

a. Two independent 48V supplies incoming from the batteries and associated chargers. Each battery negative supply shall be connected to the cubicle busbar through a blocking diode and a single pole switch.

   The 48V DC battery positive leads shall be connected directly to the station earth.

b. Each load equipment shall be connected to a distribution outlet. The use of teed supplies to more than one load equipment will not be permitted.

c. Double pole miniature or molded case circuit-breakers to IEC 60157 shall be supplied, fitted with auxiliary contacts which shall raise both local and remote alarms, for loss of supplies.

d. The outlets shall be rated to meet the requirements of the loads and shall be labelled with the destination of the output. Outgoing connections shall be brought to terminals mounted in the cubicle, provided with strip connectors and cable lugs. The number of outlets shall cater for the quantity of load equipment items plus 50%, with a minimum of 10 outlets being provided in each distribution board. Space shall also be available for the installation of 50% extra outlets with terminals for future use.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

6.14.9.7 Alarms

An alarm indication shall be provided if the busbar voltage falls below the battery cut-off voltage or deviates from the float/boost values. The actual alarm limits are to be determined during detailed engineering. All alarms shall be extendible from potential free contacts to an external alarm monitoring system.

6.14.9.8 Housing

The battery chargers and the control/distribution equipment shall be housed in separate cubicles (total 3 cubicles) at 132 kV Attabad Lake HPP substation; installation in single cabinet shall not be accepted.

The charger cubicles shall be of strong steel, floor mounted type, completely vermin-proof and suitable for installation in tropical climates. The DC distribution cubicle shall preferably be wall mounted. The entry of the cables shall be from the bottom, with suitable cable glands being provided at the entry points. Provision shall be kept for separate earthing of the cubicles.

The cubicles shall be adequately ventilated for self-cooling by natural convection. Forced cooling shall not be permitted.

Access to the components shall be from the front of the cubicle. Ease of access for operation and maintenance shall be kept in the design. In case rear access is required, the steps taken shall be identified. Cubicles shall be lockable from the outside.

6.14.9.9 Batteries

6.14.9.9.1 General

Lead acid vented cells of the Plante type shall be provided. Containers shall be of stout glass or high impact plastic.

Cells shall be permanently marked with the following information:

a. Manufacturer's name, reference number and code.
b. Year and month of manufacture.
c. Voltage and nominal capacity at the specified discharge rate.
d. Cell number.

6.14.9.9.2 Construction

The batteries shall be of compact design with a small weight to capacity ratio. The construction shall ensure minimum self-discharge and low internal resistance.

Adequate measures shall be taken for prevention of internal short circuits and protection of the element against mechanical damage.

6.14.9.9.3 Requirements

The battery bank shall be designed in accordance with relevant IEC standards and requirements listed hereunder:

Nominal system voltage	48V22
Nominal voltage per cell	2V
Aging factor (minimum)	1.25

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Rated capacity at 10 hours discharge rate	540AH at 132 kV Attabad Lake HPP substation 170AH at Peripheral stations
Number of Batteries	2 at 132 kV Attabad Lake HPP substation, 1 at Peripheral stations

The Contractor shall submit load calculations to fully justify the battery chargers and battery ratings.

6.14.9.9.4 Battery Mounting

The batteries shall be mounted on wooden or metal stands or racks in a manner such that all the plates of each cell are visible for inspection, test and maintenance purposes. Stands or racks shall have a maximum of two tiers. In all cases adequate space shall be left between the tiers for maintenance purposes and to permit the topping up of the electrolyte. Stands or racks shall have a protective finish of not less than two coats of electrolyte resisting enamel or gloss paint. Alternatively, an epoxy resin sintered finish may be used.

Cell containers shall be accurately set up in alignment on the stand or rack with lead and/or rubber discs under the feet molded on each container. Cell lids shall be so positioned that at least one topping-up aperture is on the access gangway side of the cell and not obstructed by any inter-cell connecting arrangements. Each battery shall be labelled together with the appropriate cell numbers.

6.14.9.9.5 Battery Main Fuses

Bolted cartridge fuses shall be provided in both positive and negative leads and positioned as close to the battery as possible. The fuses shall be rated at five (5) times the charger float output rated current. Monitoring of the battery fuses shall be provided on the DC distribution, and an alarm (red LED) shall be generated in the event of blowout of the fuse. A cartridge fuse shall be provided in the charger-input lead to the negative pole of the battery and rated at twice the charger float output rated current. These fuses shall be mounted preferably on the end of the battery stand or rack. The fuse links shall be mounted in fuse carriers with an insulated barrier between the poles.

The cable or busbar to the battery shall be firmly supported at a point near the cell terminal pillar. Where two cables are used, they shall be terminated one on either side of the terminal pillar. These cables shall be arranged as to allow some flexibility and to avoid any forces being applied to the cell terminal pillar.

6.14.9.9.6 Connections

The positive pole of the battery shall be connected to the station earth via a single bolted link at the distribution cubicle. Low resistance inter cell connectors shall be used. Connections between tier of cells and between end cells and fuses shall be made with insulated copper rod that shall be of equivalent cross-section to the distribution busbars.

Connections from the battery fuses to the chargers and distribution cubicles shall be made with insulated cable of equivalent cross-section to the distribution busbars. The positive and negative terminals of each cell shall be clearly indicated. Red and black marking respectively shall indicate the positive and negative terminals of the complete battery.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

6.14.9.9.7 Accessories

All accessories required for installation, connection, service and maintenance shall be provided. The accessories shall include, but not limited to; one portable hydrometer syringe, one portable thermometer, one cell-lifting device for each battery, one digital voltmeter and battery acid in two containers.

Lead plated copper inter cell connectors shall be supplied to provide 1.25cm spacing between cells when installed with plates at right angles to the rack rails.

6.14.9.9.8 Life

The end of service life shall be the time when the battery no longer delivers 80% of its rated capacity. The batteries shall have a minimum of Fifteen (15) years of guaranteed life.

6.14.10 Factory Acceptance Tests

6.14.10.1 Type Tests

Evidence shall be given that the proposed Telecommunication and SCADA equipment have been subjected to type tests certified by an internationally recognized testing laboratory. If deemed necessary, Employer will decide whether additional tests are necessary to be performed by the Contractor.

The telecom and SCADA equipment (i.e., DPLC, OLTE/MUX, DPSE/PSE, LMUs, PAX, and Gateway Controller) shall have successfully undergone, as a minimum, the following type tests:

a. Dry heat test (according to IEC 60068-2-2).
b. Damp heat test (according to IEC 60068-2-78).
c. Vibration test (according to IEC 60068-2-27).
d. Shock test (according to IEC 60068-2-6).
e. Insulation tests (according to IEC 60950-1).
f. EMC immunity tests (according to IECTS 61000-6-5/EN-61000-6-2).
g. EMC emission tests (according to CISPR22/EN 61000-6-4).

The following type tests shall be made on the line traps in accordance with the latest issue of IEC 60353. However, duly certified and complete test reports for type tests carried out by an independent authority/laboratory on same type of line traps shall be acceptable in lieu of performing the actual tests. Independent laboratories are specified elsewhere in these Specifications.

a. Temperature rise test.
b. Measurement of radio influence voltage.
c. Insulation tests.
d. Short-time current tests.
e. Measurement of the rated inductance of the main coil.
f. Measurement of power frequency inductance of the main coil.
g. Measurement of blocking resistance and blocking impedance.
h. Measurement of tapping loss and tapping loss based on the blocking resistance.

The Proposer shall submit certified copies of type test reports covering the above equipment. Type tests reports shall be considered acceptable if they are in compliance with the relevant Standards and the following:

a. Type tests conducted at an internationally recognized laboratory approved by Client.
b. Type tests performed at manufacturer's laboratory and witnessed by representative(s) from an internationally recognized laboratory.

Failure to provide the type test reports or if the presented reports are not in accordance with the above requirements, then the type tests shall be carried out in the Manufacturer's premises or other places subject to the approval of the Client in the presence of Employer's and Employer representatives and at no additional cost to the Employer. These tests shall be performed in the presence of an internationally recognized laboratory representative, who shall issue the relevant type test reports upon successful tests.

6.14.10.2 Routine Tests

Routine Tests shall be performed, comprising, as a minimum, the following:

6.14.10.3 General

a. Visual checks.
b. Checks of wiring and labelling.
c. Verification of material and quantities for each equipment.
d. Test of cubicles internal illumination.
e. Check of spare parts and quantities.
f. Check of calibration of test equipment.

6.14.10.4 Power Line Carrier Equipment

a. Functional checks on simulated 80W DPLC links for communication of speech, data and Tele protection signals.
b. Measurement of regulated power supply outputs.
c. Measurement of transmit and receive frequencies.
d. Measurement of transmitter power.
e. Measurement of receiver sensitivity.
f. Tuning/adjustment of transmit and receive filters.
g. Level adjustments for transmitter, teleoperation and telephony.
h. Automatic gain control (AGC) and equalization settings.
i. Frequency response over the specified bandwidth.
j. Measurement of cross-talk.
k. Verification of configuration and diagnostics (if any) software.
l. Functional check of indications and alarms.
m. Check of service telephone.

6.14.10.5 Analogue and Digital Protection Signaling Equipment

a. Measurement of voltage at regulated power supply outputs.
b. Measurement of transmit and receive levels.
c. Check of various codes.
d. Check of correct transmission of trip commands.
e. Measurement of command transmission times.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

f. Tests to demonstrate equipment dependability and security, in the presence of interfering signals or noise at levels likely to be encountered in the grid stations.

g. Functional check of indications and alarms.

6.14.10.6 Line Matching Unit (Coupling Filter)

a. Drain Coil:

I. Measurement of impedance at power frequency,

II. Current carrying capacity at power frequency of 1 A rms continuous,

III. Current carrying capacity at power frequency of 50 A rms for 0.2 seconds.

- Composite loss over the working range of the coupling filter.
- Return loss over the working range of the coupling filter.
- Power frequency voltage tests on the balancing transformer of 5kV rms for 1 minute between each coil and earth, and between each coil and screen.

6.14.10.7 Coaxial Cable

a. Visual check of drum and cable sample.

b. Measurement of characteristic impedance.

c. Measurement of attenuation in frequency range 40-500 kHz.

d. Measurement of conductor resistance.

e. Measurement of insulation resistance.

f. Measurement of mutual capacitance.

g. High voltages withstand capability.

6.14.10.8 SDHOLTE / Multiplexer Equipment

a. Measurement of voltage at regulated power supply outputs.

b. Measurement of optical transmitted power and received level.

c. Measurement of receiver sensitivity.

d. Redundancy checks in OLTE, power supplies and control units and multiplexer section protection.

e. Verification of configuration and diagnostics (if any) software.

f. Functional check of indications and alarms.

g. Check of EOW service telephone.

h. Functional checks including synchronization checks and path protection etc.

i. Functional checks of available channels.

j. Verification of configuration and diagnostics software.

k. Check of Management system.

6.14.10.9 Telephone (PAX) Equipment

a. Functional test of trunks and extensions.

b. Check of all types of tones in the system.

c. Tests of system reloading and resetting capabilities in the event of occurrence of

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

various categories of faults.

d. Tests to ensure correct receipt and logging of alarms and correct functioning of automatic diagnostic routines.

e. Verification of the configuration and diagnostic software.

f. Check of Management system.

6.14.10.10 48V DC Power Equipment

g. Tests to record DC output voltage variation under float/boost charge conditions for the various settings of the DC current output variation from zero to maximum values.

h. Tests to record DC output voltage variation under float/boost charge conditions for the various settings of the DC output current switch variation in AC mains voltage from 313 to 452V for 3-phase chargers.

i. Tests to confirm maximum temperature rise of main transformer and other components of the battery charger.

j. Capacity test of battery bank, according to IEC 60896-1.

6.14.11 Drawings And Documentation

6.14.11.1 General

a. A comprehensive set of drawings and associated documents shall be provided for each substation. The station name shall appear in the title block of each drawing and the use of drawings common to several substations shall be avoided. When the drawings are finalized, the Contractor shall provide for each drawing an electronic file on CD/DVD.

b. Drawings shall be on ISO 'A' size sheets. The preferred size shall be A3 (297 x 420 mm).

6.14.11.2 Information to be included with the Proposal

The Proposal shall be accompanied with following information:

a. Completely filled-in Specific Works Data sheets.

b. Type test reports for offered DPLC, SDHOLTE/MUXDPSE/PSE, PAX, Gateway Controller and 48V DC charger equipment.

c. Documentary evidence (Project lists, Client's certificates etc.) for DPLC, SDHOLTE / MUX DPSE / PSE, PAX, Gateway Controller and 48V DC chargers / batteries.

d. Manufacturer's booklets giving technical details of all equipment included in Proposer's offer.

6.14.11.3 Approval Drawings and Data

Approval drawings/documents shall be submitted after Contract award that shall show detailed physical arrangements and connections. The information, as a minimum, shall include:

6.14.11.4 For Base Design

Following documents/drawings shall be submitted:

a. Site survey report of existing facilities,

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

b. Telecommunication network layout.
c. Telephone network layout.
d. Tele protection interconnection concept.
e. Schematic layout of DPLC data channels between 132 kV Attabad Lake HPP substation and NPCC/RCC.
f. SNR calculations for the DPLC links.
g. Frequency allocation plan for the DPLC links.
h. Optical budget calculations for fiber optic links.
i. Cabinet and rack layout drawings for DPLC, SDHOLTE / MUX, DPSE/PSE, PAX, Gateway Controller, GPS.
j. SCADA point count details.

6.14.11.5 For Detailed Design

Following documents/drawings shall be submitted after finalization of Base Design:

a. Overall station arrangement drawings.
b. Functional specifications of DPLC / PSE, SDHOLTE / MUX / DPSE, PAX, Gateway Controller, GPS, 48V DC Power, systems including technical details for each equipment item.
c. Wiring charts / diagrams, cable schedules and lists of apparatus.
d. MDF cross-connection termination details.
e. Tele protection interconnection drawings.
f. Telephone numbering and routing plan.
g. Layout of equipment in control building.
h. Interconnection drawing (with termination details) showing the end-to-end route of each data channel between 132 kV Attabad Lake HPP substation and NPCC/RCC.
i. List of spare parts and unit rates.
j. List of erection and testing equipment and maintenance tools.
k. Details of maintenance and testing facilities.

6.14.11.6 For Testing/Commissioning:

Following documents shall be submitted at least three months prior to holding the FAT/SAT:

a. Factory Acceptance Test (FAT) procedures/protocols.
b. Site Acceptance Test (SAT) procedures/protocols.

6.14.11.7 Prior to taking over by Employer:

a. As-built drawings, schematic and wiring diagrams.
b. Operation and maintenance (O&M) manuals.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

6.15 CONTROL AND POWER CABLES

6.15.1 General

These Specifications cover the requirements for design, manufacture, and installation of control and power cables. The cables shall be used for AC and DC supplies, protection & measurement, control & annunciation and lighting circuits.

The cables shall be suitable for continuous operation at conductor temperature of 90 deg. C. The cables shall be designed, manufactured and tested according to the latest issue of the relevant IEC Publications.

6.15.1.1 Services

(1) **AC Power Supply Circuits:** The AC cables shall be used for connections between auxiliary transformers and AC panels, connections related to auxiliary services such as supply of transformer fans, power receptacles, lighting etc. and power supply to equipment, such as motors for breakers, heaters in local control cubicles, etc.

(2) **DC Power Supply Circuits:** DC power supply circuits constitute the connections between batteries, chargers, DC distribution boards and DC loads.

(3) **Protection and Measurement Circuits:** AC protection and measurement circuits are the connections between voltage and current transformers and equipment such as protective devices, meters and recorders.

(4) **Control and Annunciation Circuits:** These circuits consist of all AC/DC supply circuits between control boards, marshalling boxes, relay panels etc. for control and annunciation of different activities in the switchyard.

(5) **11 kV Power Cables:**11kV XLPE insulated cables suitable for 8.7/15 (17.5) kV voltage class for interconnection between the two outgoings of 11kV switchgear to two Nos.11kV/400V station auxiliary power transformers and 11kV switchgear power house to the 11kV switchgear incoming-I & Incoming-II.

6.15.1.2 SELECTION OF CABLE SIZE

(1) The Contractor shall provide detailed design calculations to determine the exact size and number of cores for each circuit. The voltage drop in the cable at load terminal shall not be more than 2.5% of voltage at main distribution board. At least 25% spare cores shall be provided in addition to the required cores where multicore cable of more than for (4) cores is used.

(2) The derated values of current ratings of cable obtained after applying all applicable derating factors shall be greater than load currents for which those cables are selected.

The cable shall be of adequate size to withstand the short circuit current equal to the interrupting current of the circuit breaker protecting the circuit.

6.15.1.3 SPECIFICATIONS

6.15.1.3.1 General

All cables shall have copper conductor, XLPE insulation and extruded PVC sheath. All control and power cables shall be armored as specified. Protection and measurement cables shall be shielded with metallic screen. Control and annunciation circuit cables shall have bundle helical wrapping of MYLAR tape and shielding of metallic screen. All cables shall have overall black PVC jacket.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

6.15.1.3.2 Applicable Standards

All cables shall be designed, manufactured and tested in accordance with latest revision of the applicable standards listed below, unless otherwise stated in these specifications:

(1) IEC 60228 — Conductors of insulated cables.

(2) IEC 60502 — Power cables with extruded insulation and their accessories for rated voltage from 1kV to 30kV (Um=36kV):

a) Part-1: Cables for rated voltages of 1 kV (U_m=1,2kV) and 3 kV (U_m=3,6 kV).

b) Part-2: Cables for rated voltages from 6 kV (U_m=7,2kV) up to 30 kV (U_m=36 kV).

c) Part-4: Test requirements on accessories for cables with rated voltages from 6 kV (U_m=7.2 kV) up to 30 kV (U_m=36 kV).

(3) IEC 60811 — Insulating and sheaths material of electric and optical cables. Common test methods

6.15.1.3.3 Control and Small Power Cables

(a) **Conductor:** The cores of the cable shall be of circular annealed stranded copper conductor. The minimum size for control circuit cables shall be 2.5 sq. mm. However, the minimum size of cable acceptable for current transformer output connections shall be 6 sq. mm. The copper conductor shall conform to IEC 60228. The size and number of individual conductor strands shall be as specified in the applicable standards.

(b) **Insulation:** The insulated sheath of conductors shall be cross linked polyethylene (XLPE) suitable for maximum operating class of 600/1000V in accordance with latest IEC Publication 60502. It shall be capable of being isolated easily from the conductor. The insulation over the conductor shall be applied by extrusion process. The insulation shall be heat and moisture resistant.

(c) **Assembly:** The insulated cores shall be assembled and padded in an extruded PVC sheath, which shall have no harmful influence on the components, nor propagate the flame.

(d) **Screen:** The metallic screen shall be superimposed directly on the conductor assembly for shielding. The metallic screen shall be seamless copper or aluminum or other non-magnetic material as recommended by IEC.

(e) **Armor:** The armor shall be "Aluminum wires or aluminum strips with a minimum thickness as specified in the standards, applied over the conductor's assembly.

(f) **External** Protective **Jacket:** The conductors shall be sheathed in black PVC applied by extrusion methods. The Jacket shall have flame retardant properties and shall be compounded for maximum resistance for sunlight. It shall conform to thickness and physical properties as specified in IEC Publication 60502.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

6.15.1.4 15 kV XLPE Power Cables

(a) Composition: The 1 core cable shall be suitable for 8.7/15 (17.5) kV voltage class to be used for 11000 volts A.C. 50 Hz supply and shall conform to the following. The size of cable shall be as per Clause 6.15.1.2:

1. Conductors shall consist of circular stranded copper of electrical grade purity. It shall be covered by an extruded semi-conducting layer which shall adhere firmly to it.
2. The insulation shall be made of cross linked polyethylene. The insulation shall be applied over the semi-conducting layer and shall be permanently and completely bonded to it without any voids. The thickness of insulation shall be in accordance with IEC 60502-2.
3. A semi-conducting layer or tape shall be supplied over the surface of the insulation and shall adhere firmly to the surface. However, it shall be capable of being removed cleanly and conveniently for jointing purposes.
4. Annealed copper shielding tape shall be applied helically to the surface of the insulation with an overlap of 50 percent of the tape width.
5. The cable shall be covered with an Inner Jacket made of 105 deg. C polyvinyl chloride compound which shall be formed tightly around the cable.
6. A bedding tape made of rubberized cotton or shall be applied over the inner PVC jacket.
7. Armour shall be applied over the bedding. The armour shall consist either of two layers of galvanized steel tape or a single layer of interlocked galvanized steel tape or Aluminium wire. The armour shall be sized to sustain short- circuit current for 5 seconds.
8. Applicable IEC standards to be followed.

(b) Service Conditions

1. The cables shall be suitable for operation in 11000 volts, 50 Hz, three phase distribution system. Cables shall be operated in a three phase three wire system with the power transformer neutral solidly grounded.
2. The cables shall be suitable for direct burial or installation in ducts. The duct and soil conditions vary from dry to wet. Highly corrosive salts are encountered in the soil. The ambient temperature ranges from-5 deg C. to 50 deg C.
3. The cross-linked polyethylene cable shall be suitable for conductor operating temperatures as follows:

Continuous operation	90°C
Emergency overload	130°C
Short Circuit (5 seconds)	250°C

4. The cables shall be designed to withstand the emergency overloading conditions without loss of life for emergency operating periods of approximately 100 hours per annum.
5. The cables shall be laid in complete lengths. Jointing of cables shall not be allowed.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

(c) Dimensions and Characteristics

1. The cables shall be of sizes as per Clause 6.15.1.2.
2. The dimensions of the conductors, test voltage etc; shall be in accordance with IEC 60228 and IEC 60502 Part-1 and Part-2.
3. The cross-sectional area of the conductor shall be the sum of the area of its component wires at any point. It shall not be less than 98 percent of the area specified.

(d) Insulation

Cross-linked polyethylene: The cross-linked polyethylene insulation shall be suitable for use in wet and dry locations, and a continuous conductor operating temperature of 90 deg C throughout its life and for service under the conditions described in Clause 6.2.2 of these Specifications.

(e) 15KV Heat Shrinkable Cable Termination: The heat shrinkable cable and terminations for XLPE cables shall be in accordance with relevant standard.

The heat-shrinkable material shall be either extruded or molded polymeric material which shall be cross-linked, either by eradication or by chemical means, such that when their temperature is raised beyond the normal base polymer crystalline melting point, they shall be held in expanded state.

(f) Service Requirements: Components shall be suitable for use in high voltage cable joints and terminations and shall be suitable for indoor or outdoor applications as required. Components shall be suitable for use in XLPE insulated cables manufactured in accordance with IEC Publication 60502-2. Components shall not be adversely affected in any manner by contact with other materials normally used in the construction of cable joints and terminations, and shall not increase the rate of corrosion of any metal with which they may come into contact. Assembled components forming part of the supply system shall perform without distress under the following conditions:

1. **Normal Conditions:** Polymeric Insulated Cables - Continuous operation at a conductor temperature of 90°C.
2. **Fault Conditions:** XLPE Insulated Cables - Operation at a conductor and screen / earth wire temperature of 250°C.

(g) Identification and Packaging: For the purposes of identification, gloves shall be marked clearly and permanently in a prominent position with the supplier's name and reference number.

Electrically conducting components shall be marked ‘conducting' clearly and permanently.

Components shall normally be supplied in a package as a complete joint of termination which shall be clearly marked with the supplier's name, reference number, batch references, voltage, application and cable size.

Packaging shall be designed to protect against ingress of moisture and mechanical damage.

Components supplied individually shall be packaged in accordance with the above.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Where the Employer requires tubing to be supplied on reels these shall have adequate flanges to contain fully the length of tubing. Reels shall be packaged in accordance with the above.

Components supplied with adhesive coatings shall have means to prevent coated surfaces from adhering to each other.

(h) **Storage:** Components shall be capable of being stored without deterioration within the temperature range -10°C to +45°C.

Components or materials, if subject to a shelf life limitation, shall have the final date of use, prominently and permanently shown on all package.

(i) **Tubing Components**

1. **Internal Insulating Tubing:** A heat-shrinkable flexible polymeric tubing, preferably clear or colored white, for use in internal construction of cable joints and terminations at installations where it will not be exposed to daylight.

2. **Stress Control Tubing:** A heat-shrinkable flexible polymeric tubing, permanently colored black, possessing properties to provide electrical stress control over insulated cores in cable joints and terminations, at installations where it will not be exposed to daylight.

3. **Anti-track Tubing (Indoor):** A heat- shrinkable flexible polymeric tubing, easily distinguishable by color from non-anti- track material, but preferably colored brown, possessing anti-track and erosion- resistant properties for use as an external covering of insulated cores in cable joints and terminations in situations where it will not be exposed to direct sunlight.

4. **Anti-track Tubing (Outdoor):** A heat- shrinkable flexible polymeric tubing, easily distinguishable by color from non-anti- track material, but preferably colored red, possessing anti-track and erosion-resistant properties for use as an external covering of insulated cores in cable joints and terminations at indoor and outdoor installations.

5. **External Protective Tubing:** A heat- shrinkable flexible polymeric tubing, preferably colored for protecting exposed metallic sheaths and sheath/earth connections on cable joints and terminations at indoor and outdoor installations.

(j) **Molded Components**

1. **Anti-track Insulating-Glove (Indoor):** A heat-shrinkable flexible polymeric molding, easily distinguishable by color from non- anti-track material, but preferably colored brown, possessing anti-track and erosion- resistant properties, for sealing a prepared crotch in cable joints and terminations at installations where it will not be exposed to direct sunlight.

2. **Anti-track Insulating Glove (Outdoor):** A heat-shrinkable flexible polymeric molding, easily distinguishable by color from non- anti-track material, but preferably colored red, possessing anti-track and erosion- resistant properties, for sealing a prepared crotch in cable joints and terminations at indoor and outdoor installations.

3. **Conducting Glove:** A heat-shrinkable flexible polymeric molding, permanently colored black possessing electrical conducting properties, or for sealing a prepared crotch in cable joints and terminations at indoor and outdoor installations.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

4. **Anti-track Shroud (Indoor):** A heat- shrinkable flexible polymeric molding, easily distinguishable from non-antitrack material, but preferably colored brown, possessing anti-track and erosion-resistant properties, for enclosing and sealing prepared cable-core connections at installations where it will not be exposed to direct sunlight.

5. **Anti-track Weather Shed:** A heat-shrinkable flexible polymeric molding, easily distinguishable from non-antitrack material, but preferably colored red, possessing anti-track and erosion-resistant properties, for application over prepared cable cores.

(k) **Sealants:** Where required, sealants shall be used in conjunction with heat-shrinkable components to affect seals on joints and terminations, and shall be able to accommodate the creep or relaxations that may occur with recovered heat- shrink materials.

The sealants shall have adhesive properties to maintain hermetic seals between components at all times when used on polymeric.

6.15.2 Cable and Core Identifications

6.15.2.1 Cable Identification

The following information shall be permanently marked at the interval of 1 meter on the outer PVC jacket of each cable:

(a) Name of manufacturer.
(b) Cable Type
(c) Year of manufacturer
(d) Running length of cable in meters after every meter of length.

6.15.2.2 Core Identification

The identification of the insulated cores shall be made by color compound and surface printing of number.

2	cores	Red, Black
3	cores	Red, Yellow, Blue
4	cores	Red, Yellow, Blue, Black
5	cores	to the colors of the insulation
6	cores	shall be black and coding shall consist of printed digits and number written in text.

The color shall be clearly distinguishable under all normal conditions of illumination and shall remain legible under all normal conditions of usage. Numbers shall be clearly imprinted using character as large as possible considering the conductor size. The material used shall not interact with the insulation or the associated fillers or binders used in the cable construction in any way such as might produce deterioration of the insulation or fading or blurring of the imprinted characters.

This identification number shall be repeated along the length of the conductor with a gap of approximately 300 mm.

6.15.3 Flame Retardancy

The finished cables shall be flame-retardant and suitable for direct burial in earth.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

6.15.4 Cable Terminations

Contractor shall provide all materials for termination of power and control cables. Control cables terminal lugs shall be clamp type ring terminals, or crimped connectors suitable for stud termination or approved equivalent.

Power cable terminal shall be rectangular tongue type suitable for compression crimp method of installation or approved equivalent.

Cable glands of appropriate sizes shall be used at cable entrance into control panels, relay panels, marshalling boxes etc. Cable shield and armor shall generally be grounded on the both ends of cable.

Cable identification tags, sleeves shall be provided at cable terminations.

Identification labels for panel's internal wiring, cable cores termination at terminal blocks and cables shall be provided as per the following examples.

There shall be cross ferruling containing local as well as destination addresses. The ferrules shall be slip over type of high quality material suitable for the specified climatic conditions.

a) Panel Internal Wiring

Example: Wire between terminal 4 of device -S11 and terminal 46 of terminal block -X201.

At device -S11:

:4	/	- X201	46	/	16
Terminal number of -S11	/	Terminal block No.	Terminal No. in terminal block	/	Sheet No. in Schematic Diagram
			Destination		

At terminal Block -X201:

:46	/	- S11	4	/	16
Terminal number in terminal block	/	Device	Terminal No. of device	/	Sheet No. in Schematic Diagram
			Destination		

b) Cable Core Termination Identification

Example:

:011	/	- X501	/	35
Cable number	/	Terminal Block Number	/	Terminal No. in terminal block

c) Cable Number Identification

Example: Cable between Marshalling Kiosk +S11 and Control Panel +WC02 of bay feeder G021

At Marshalling Kiosk:

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

: G021	/	356	/	+WC02

Bay Number / Cable Number / Destination

At Control Panel:

: G021	/	356	/	++S11

Bay Number / Cable Number / Destination

6.15.5 Cable Installation

All power and control cables shall be installed in cable trenches or on cable trays, cable racks or in metallic conduits. The Contractor shall provide and install all cable trays, cable racks and cable conduits as approved by the Employer.

6.15.6 Cable Conduits

The Contractor shall furnish and install all conduits, boxes, wire ways, and fittings required for the electrical power, control, annunciation, instrumentation, communication systems as required or as directed. All necessary hardware such as screws, bolts, hangers, concrete, clamps, locknuts, bushings, sealing bushings, couplings, pulling- in irons, identification tags, etc., shall be included.

Rigid, flexible steel conduits shall be hot dip galvanized steel conforming to the specified standards. Flexible liquid tight conduits shall conform to the specified standards. These shall be used in wet locations or where exposed to weather.

Metal conduit fittings and covers shall be of standard manufacture and shall be galvanized. Long radius bend and expansion joint fittings shall be provided where required while gaskets shall be provided where required to prevent ingress of moisture.

Junction, outlet, and pull boxes and covers made of sheet steel or cast metal shall conform to the specified standard. Covers shall be secured with screws, except for boxes 0.5 sq.mm or larger which shall have hinged covers. All outdoor boxes shall conform to protection class IP55.

Installation of all conduits, boxes, fittings, and accessories shall conform to IEC insofar as these are applicable. Conduits shall be inspected before conductors are installed and thoroughly cleaned of water and dirt by means of compressed air, swabs or other approved methods. Conduits shall be checked for freedom from obstructions by pulling a wooden mandrel of the proper size through the conduit, wherever required or directed. All boxes and fittings shall be kept closed and free from dirt, moisture and debris.

Exposed conduit, minimum size 18 mm, shall be supported at not more than 1.5 m intervals, and conduits 25 mm and larger shall be supported at not more than 2.5 m intervals. Embedded conduits shall be 25 mm except that 19 mm conduit may be used for communication circuits. Embedded conduit shall be slopped towards drain points and shall be rigidly supported and braced to avoid shifting during placement of concrete. A minimum spacing of 50 mm shall be maintained except where conduits enter boxes, equipment or hand holes.

6.15.6.1 Cable Trays, Racks and Supports

The Contractor shall design, furnish and install all equipment including brackets, steel supports or transit barriers, hardware, and special fittings for routing of power and control cables in the

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

switchyard and building(s), as required. Complete cable trays layout and tray support drawings shall be prepared by the Contractor and submitted for Employer's review and approval.

Tray support brackets shall be steel ladder type of required width with 225 mm rung spacing and a minimum of 75 mm inside depth and shall conform to the requirements of specified standards. Steel trays and fittings shall be hot-dip galvanized after fabrication.

Tray support brackets shall be mounted on steel supporting structures anchored to the wall, floor or ceiling.

Supporting structures shall permit a certain degree of flexibility for adjustment in position of the trays or racks. Embedded sections shall be used for better appearance. All steel fittings, bolts, and nuts shall be hot-dip galvanized.

A grounding conductor shall run in the cable tray which will be grounded with the main grounding mash at a regular interval of 20m. The conductor shall also be clamped with the cable trays at a regular interval of 10m.

The Contractor shall furnish certified test reports of the tests covered by the specified standards for cables and accessories.

6.15.7 Tests

a) 0.6/1(1.2) kV Cables

The following routine tests shall be carried out as per IEC 60502-1:

1. Routine Tests

The following routine tests shall be carried out on each manufactured length of cable as per IEC 60502-1:

a) Measurement of the electrical resistance of conductors.
b) Voltage test.
c) Insulation resistance test.

2. Sample Tests

a) Conductor examination
b) Check of dimension
c) Hot set test for XLPE insulations and elastomeric sheaths.

3. Type Tests, Electrical

a) Insulation resistance measurement at ambient temperature.
b) Insulation resistance measurement at maximum conductor temperature.
c) Voltage tests for 4h.

4. Type Tests, Non-Electrical

a) Measurement of thickness of insulation.
b) Measurement of thickness of non-metallic sheaths including extruded separation sheaths, but excluding inner coverings.
c) Tests for determining the mechanical properties of insulation before and after ageing.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

d) Tests for determining the mechanical properties of non-metallic sheaths before and after ageing.

e) Additional ageing test on pieces of completed cables.

f) Loss of mass test on PVC sheaths of type ST2.

g) Pressure test at high temperature on insulations and non-metallic sheaths.

h) Test on PVC insulation and sheaths at low temperatures.

i) Test for resistance of PVC insulation and sheaths to cracking (heat shock test).

j) Ozone resistance test for EPR and HEPR insulations.

k) Hot test for EPR, HEPR and XLPE insulations and elastomeric sheaths.

l) Oil immersion test for elastomeric sheaths.

m) Water absorption test on insulation.

n) Flame retardance test.

o) Measurement of carbon black content of black PE over sheaths.

p) Shrinkage test for XLPE insulation.

q) Special bending test.

r) Determination of hardness of HEPR insulation.

s) Determination of the elastic modules of HEPR insulation.

t) Shrinkage test for PE over sheaths.

b) 8.7/15 (17.5) kV XLPE Cables

The following tests shall be carried out as per IEC 60502-2:

1. <u>Routine Tests</u>

The following routine tests shall be carried out on each manufactured length of cable:

- Electrical resistance of conductors.
- Partial discharge test.
- Voltage test.
- Insulation resistance test

2. <u>Sample Tests</u>

- Conductor examination.
- Check of dimensions.
- 4h voltage test.
- Hot test for EPR, HEPR and XLPE insulations and elastomeric sheaths.

3. <u>Type Tests, Electrical</u>

- Bending test followed by a partial discharge test.
- Tan δ measurement.
- Heating cycle test, followed by a partial discharge test.
- Impulse test, followed by a voltage test.
- Voltage test for 4h.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- Resistivity of semi-conducting screens.

4. Type Tests, Non-Electrical

Non-electrical tests shall be carried out as per Table 16 of IEC 60502-2, second edition 2005-03 or the latest edition thereof.

Duly certified and complete test reports for the type tests carried out on the same type of cable as offered satisfying the conditions specified in Clause 18 of IEC 60502-2 shall be acceptable in lieu of actual tests. Six copies of the test reports shall be submitted for Employer's review.

6.15.8 Drawings, Technical and Descriptive Data

The Contractor shall submit the following information for each size and type of power and control cables for Employer's approval:

(1) Technical data of control and power cables as per the Specific Facilities Data format provided in Employer Requirements.

(2) Type of cable, conductor diameter, insulation thickness, jacket thickness and overall dimensions.

(3) Calculations for selection of cable size for different circuits.

(4) Current rating, maximum voltage, resistance per 100 meters.

(5) Physical characteristics and type of the insulation, sheath, armor and jacket.

(6) Cross-section of each type of cable showing the construction.

(7) Maximum pulling resistance, bending radius, and weight/meter.

(8) Size and type of end connectors for conductor and all other information that shall be of interest to the Employer

(9) Cable trays and accessories construction detail.

(10) Cable layout drawings.

6.15.9 Grounding System

6.15.9.1 Scope of Work

These specifications cover the requirements for design, supply, installation, testing and commissioning of 132kV switchyard grounding system. The E&M contractor shall only be responsible for their own equipment earthing protective connections, either connection from already installed embedded copper plates or directly through earthing mesh.

The Contractor shall supply, install and make the joints between the switchyard equipment and the earthing mat supplied and installed by the Civil Contractor. The Civil Contractor will not backfill any earthing trenches until the equipment grounding connections are made and tested by the E&M Contractor for the approval of the Employer/Employer's Representative.

Lightning protection shall be provided by the overhead earth wires connected to the tops of the switchyard gantries. The overhead shielding shall be provided as specified in the relevant section of this document. The provision of lightning protection for the buildings at switchyard shall be a part of civil works contractor.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

6.16 EQUIPMENT GROUNDING

The work under this section consists of design supply, and installation, of all materials and complete protective earthing connections for Switchyard equipment as specified herein.

All grounding conductors shall be copper, stranded, soft-drawn, and of adequate cross-sectional area to safely carry the maximum prospective earth fault current without damage.

(1) **Switch racks and Structural Steel:** Switch racks and steel structures shall be grounded with 185 sq.mm conductor from two different diagonally opposite legs. A square structure shall be grounded at two points diagonally opposite to each other. In case of structures consisting of several bays each leg shall be grounded.

(2) **Metallic Conduit:** All metallic conduits shall be connected to the grounding grid by connections at each manhole or terminating point. Conduits terminating in metal junction boxes located adjacent to each other, a 20 sq.mm wire may be used to interconnect them together and at one point connected to the grounding grid. Cable trays and racks in trenches shall be grounded as well.

(3) **Circuit Breakers:** The metal structure supporting the circuit breaker shall be grounded by two connections of 185 sq.mm at diagonal corners. One grounding conductor of 185 sq.mm shall be extended to the breaker operating mechanism.

(4) **Disconnectors:** The housing of all disconnectors and earthing switches and their operating mechanism(s) shall be grounded at a point as near to the operating handle as possible. The switch operating platform shall be grounded as specified under in relevant section. The grounding conductor shall be connected to the base of each switch from two separate points of grounding grid.

(5) **Instrument Transformers:** Every metal structure supporting current and voltage transformer shall be grounded with 185 sq.mm cable by two connections at diagonal corners. Metal cases shall be independently grounded. Secondary connections of voltage and current transformers shall be grounded where required by copper conductor.

(6) **Surge Arresters:** Surge arresters shall be connected to the grounding grid by insulated cable of appropriate size, which shall be able to conduct the lightning and switching surges to ground effectively without generating any potential gradient. A 185 sq.mm conductor shall ground the supporting structure. Additional grounding rods shall be driven adjacent to the surge arresters connected to the grounding grid.

(7) **SMS Room:** One ground conductor shall accompany each group of cables entering the SMS room/control room of 132kV switchyard and terminate at the ground buses of all the boards/panels to be installed inside the room ground bus. The cable trays inside the 132kV control room shall have a 185 sq.mm ground conductor with each of them.

The Contractor shall ground all metallic equipment supplied inside Control room such as Control Board, Recorder Board, Relay Board, A.C. and DC distribution Boards, PLC panels, chargers, cabinets, metallic piping, metallic supports of equipment, cable trays etc. with the station grounding grid. The Contractor shall submit the design of the grounding system to the Employer for approval.

(8) **Cable Trays in Trenches:** A grounding conductor shall be laid in the trench and shall be connected to the main mesh at a distance of 20-25 meters. All the cable racks shall be connected to the running grounding conductor.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

(9) **Cable Shield Grounding:** In general, the shield and armor of power and control cables shall be grounded properly at both ends.

(10) **Metallic Pipes:** All water pipes and other piping in the station shall be tied to the station grounding grid by 35 sq.mm copper conductor.

(11) **Overhead Shield Wire:** The overhead shield wire shall be directly connected to the station grounding grid/mesh

6.17 AC AND DC AUXILIARY SUPPLIES

6.17.1 General

These Technical Specifications cover the requirements for the design, manufacture, supply, erection, testing and commissioning of the AC and DC auxiliary supplies system at Attabad 132 kV switchyard.

All equipment under these Technical Specifications shall be manufactured and tested in accordance with the latest revision of the relevant IEC standards.

6.17.2 Scope of Work

Separate D.C. auxiliary supply system shall be provided for 132kV switchyard. The system shall comprise two set of batteries and High Frequency charger will be acceptable in addition to SCR type charger. If high frequency charger offered, then n+2 module shall be provided with each charger and if SCR offered, then three No of chargers with automatic change over to third charger (stand-by) in event of fault shall be provided."

For 132kV system batteries and chargers shall be rated for 110V, 600AH and 60A respectively. The systems shall consist of batteries, battery chargers, D.C. distribution boards, battery mounting racks and all accessories necessary for the proper operation and maintenance of the systems. The batteries, battery chargers and distribution boards etc. to be supplied under this Contract shall be installed in 132kVswitchyard Control Building. as specified in the Specification Drawings. Single Line Diagram indicating the scope of work has been provided in Volume-II Part-III of the Employer Requirements.

A 400/230V distribution board complete with switchgear and other accessories, as specified in section 6.17.4.1 of these Technical Specifications shall be provided in the 132kV switchyard control house building. AC sub- distribution boards, indoor and outdoor, wherever required, shall also be installed.

The Contractor shall design the complete AC and DC system according to the basic requirements mentioned herein and submit design calculations to justify the ratings and characteristics of the offered equipment including MCBs, MCCBs.

All materials and equipment required for providing AC and DC auxiliary supplies to the equipment to be supplied under this Contract and otherwise necessary for proper functioning of the systems shall be supplied and installed by the Contractor.

6.17.3 D.C. Distribution Boards

The distribution boards shall be of modular, robust and sturdy design constructed in conformity to the relevant part of IEC 60439. Each distribution switchboard shall be mounted adjacent to its associated charger control panel and shall be of cubicle type. Care shall be taken to make the cubicles dust and vermin proof. Each distribution cubicle shall be provided with copper

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

bus bar arranged so that the bus bars can be joined together to form a common bus for connection to main grounding system. Each D.C. distribution board shall consist of a two pole battery circuit breaker, bus tie breaker for providing interconnection with the other DC board and a two pole circuit breaker for each outgoing feeder circuit. All circuit breakers shall be designed, constructed and tested in conformity to relevant IEC standards. All circuit breakers shall be manually operated by an operating lever having three positions of "ON" "OFF" and an "INTERMEDIATE" which shall indicate auto-tripping of the circuit breaker on overload or short circuit. However, MCB shall be provided with two positions “ON” and “OFF”. Battery circuit breaker and bus tie breaker shall be molded case heavy duty type. Each circuit breaker shall have thermal and instantaneous magnetic trip devices for overload and short circuit protection of the circuits. The incoming circuit from the batteries to each board shall be provided with an ammeter with a center zero scale of suitable range. All circuit breakers shall be provided with auxiliary contacts for local and remote annunciations to indicate tripping.

6.17.4 A.C. System

6.17.4.1 Low Tension (400 Volts) Switchgear

a) General

The low tension switchboard shall be indoor, totally enclosed, floor mounted type. It shall be connected to a 400/230 volts, 3 phase, 4 wire, 50 Hz AC System. The system highest voltage shall be 600V. The low tension switchboard shall comprise of two 600 Volt, 3-phase, 4 wire buses. One of these buses will be the `NORMAL' bus. The other bus will feed loads of essential nature. This bus will be named 'ESSENTIAL' bus. A Bus Tie circuit breaker shall be provided which shall couple the two buses under certain conditions only. It shall normally remain open.

b) Incoming Supplies

The bus A (Normal Bus) shall receive its supply from power plant source-1.

The bus B (Essential Bus) shall receive its supply from power plant source-2.

From Emergency Diesel Generating Set through Generator Breaker GB when the supply A is cut off or both sources are faulty. In this case the bus tie breaker shall remain open.

The circuit breaker MB1, MB2 and TB shall be interlocked such that TB cannot be closed when both MB1 and MB2 are closed. Conversely when TB is closed, only MB1 or MB2 can be closed.

c) Incoming Circuits

1) The incoming supply from source A shall comprise:

   i) One 3 pole, 415 Volt, motorized air circuit breaker MB1 with rating of 400 A, adjustable thermal overload of 60-100% and appropriate short circuit protection.

   ii) Current transformers as described in clause 6.17.4.1 c) 1) i) hereafter. The current transformation ratio shall be 400/5A.

   iii) An Ammeter with range 0-600 Amps.

   iv) An Ammeter phase selector switch.

   v) A Voltmeter with range 0-500 volts

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

vi) A Voltmeter phase selector switch.

vii) Cable and boxes as required.

2) The incoming supply from source B to Bus B comprising of incoming circuit breaker MB2 similar to MB1 and all other equipment same as described above.

The incoming circuit from Diesel Generating Set to `Bus B shall comprise of:

i) One 3 pole, 415 volt motorized air circuit breaker GB with current rating of 400 Amps with adjustable thermal overload for the DG set as per price schedule and appropriate short circuit protection.

ii) Current transformers as discussed in section 6.17.4.1 c) 2) i) hereafter the current transformation ratio shall be 1600/5A.

iii) An ammeter with range 0-400 Amps.

iv) An ammeter phase selector switch.

v) A voltmeter with range 0-500 volts to indicate bus voltage.

vi) A voltmeter selector switch.

vii) A wattmeter with range 0-600 kW.

d) Bus Coupler Panel

The bus coupler shall comprise One three pole, 415 volt, motorized air circuit breaker [hereinafter called Tie Breaker (TB)] with current rating of 400 Amps without thermal over load and short circuit protections.

e) Outgoing Circuits

The rating and number of outgoing circuits from the Bus A and bus B have been shown on the A.C. Station Service System single line diagram in Volume-II Part-III of Employer Requirements.

The outgoing circuits shall be comprised of three pole, molded case circuit breaker (MCCBs) suitable for the connected loads.

f) Enclosure

The enclosure for the low tension switch board shall be suitable for indoor installation. It shall be totally enclosed, floor mounted type.

The enclosure shall be made of high grade sheet steel of minimum thickness not less than MSG 2.5mm thick. However, in case of type tested rigid frame design, the thickness of steel sheet may be reduced but not below 2mm according to manufacturer's standard design. All live parts shall be suitably enclosed. Access to bus bars, main connections, current transformers and all other items of the equipment for all normal maintenance operations shall be through the doors at the rear of the panels, provided with locking facilities. Vents shall be provided for adequate air circulation.

Provision shall be made for grounding of the metal housing of the switchboard. Doors shall be connected to the enclosure by means of separate flexible earthing straps. The enclosure shall be connected to the station ground through 185 sq.mm copper cable from the grounding bus of the enclosure to the nearest system ground available.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

All interior and exterior surfaces of the enclosures shall be thoroughly cleaned and painted with one coat of metal primer and two coats of finishing paint. Light grey paint shall be provided for on-site touch-up work.

Each item of the equipment mounted on the panels shall be provided with a nameplate of approved design.

g) Busbars

The busbars of the switchboard shall consist of suitable bare copper bars, of at least 98% IACS conductivity and of rectangular cross section, suitable for carrying rated currents. The buses shall have provision for future extension. The buses shall be capable of withstanding short circuit current equal to the rated short-circuit currents of breakers installed in the switchboard.

The bus bars shall be air insulated and rigidly mounted on insulators placed at suitable intervals. The insulation shall be rated at 600V. All the joints shall be tin plated and firmly jointed.

The maximum temperature rise of the busbars and their joints, above the ambient temperature, shall not exceed 30 deg. C. under normal conditions.

h) Main Circuit Breakers

1. General

The main circuit breakers MB1 and MB2, Bus Tie Breaker TB and Generator Breaker GB shall be air-break type, 3 pole, 415 V, suitable for indoor installation. The breakers shall be connected at of 400V sides and diesel generating set. The main breaker shall be rated at 1000 A and Generator Breaker shall be rated at 400 A. MB2 breaker will be equipped with syncheck relay.

The breakers shall be manufactured in accordance with IEC 60157.1 Standard. The circuit breakers shall be suitable for installation in a three phase four wire distribution system of the following characteristics:

-	Nominal Station Service Voltage, V.	400/230
-	System Highest Voltage, V.	600/345
-	Frequency, Hz.	50

2. Ratings

The standard rating of breakers shall be as under:

-	Rated voltage, V.	415
-	Rated nominal current, A.	As per Specifications Drawings
-	Rated frequency, Hz.	50
-	Rated symmetrical breaking current at 415 volts, one sec. kA.	25
-	Rated making current, kA.	50

3. Operating Mechanism

The circuit breaker operation shall be a quick-make and quick- break mechanism which shall operate by compressing springs in the first part of the make or break operation, which shall then assist in completing the operation independently of the operator's efforts. The operation

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

shall be continuous and the mechanism shall not hold in an intermediate position in any case. The mechanism shall be so designed that a fault on one phase, shall trip all three phases simultaneously. Linkage mechanism should be simple for ease in maintenance.

The circuit breakers shall be trip free. Breaker position indication shall be provided. Circuit breakers shall be designed for continuous duty and shall carry the rated current for indefinite period of time without exceeding the temperature rise limits. Suitable arrangement shall be provided to lock the breaker in open position.

4. Tripping Devices

The circuit breakers shall be equipped with two direct operating; one overcurrent and one magnetic release for each phase for overload and short circuit protection respectively.

The overload release shall be adjustable and shall have the following characteristics:

Operating current as multiple of rated current	**Tripping Time**
120%	about 1 Hr.
150%	80 to 120 sec.
200%	20 to 30 sec.

Fast operating magnetic release shall be of the instantaneous type for short circuit protection and shall have adjustable setting range from 200% to 600% of rated current.

The instantaneous and overcurrent release shall be completely independent of each other. Suitable CTs may be incorporated for overload protection, if necessary. An under voltage release to indicate loss of voltage and to operate after a suitable time lag shall be provided with incoming circuit breakers.

5. Contacts

The contacts shall be heavy duty spring loaded type and shall be silver plated. The breaker shall be provided filled with replaceable arcing contacts and shall be removable for inspection of contacts.

6. Tests

The following type and routine tests shall be carried out:

a) Type Tests

Making capacity, breaking capacity, short time current test, mechanical and electrical life tests, temperature rise and voltage tests to determine that the insulating parts have sufficient insulation resistance.

The test reports shall be supplied to the Employer for approval.

b) Routine Tests

Visual, operational, power frequency and millivolt drop tests shall be performed and test report shall be supplied to the Employer.

i) Current Transformers

Current transformers for measurement of current at incoming circuits from transformers and emergency diesel generator set shall be single pole, single ratio and of dry type. There shall be a circular window opening for the primary winding.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

j) Rating

The current transformation ratios shall be as identified separately for each incoming circuits. Rated Burden shall be 15 VA. The rated short time current shall be 25 kA. The rated dynamic peak current which the CT can withstand without being damaged electrically or mechanically shall be 63 kA.

The current transformers shall be manufactured and tested in accordance with IEC Publication 60044-1 or latest equivalent International Standards.

k) Outgoing Circuit Breakers

1) The outgoing circuit breakers shall be molded case, 3 pole, automatic, air break type with nominal voltage of 415 V as shown in the single line diagram of AC Station Service System. The interrupting capacity of the breakers at rated nominal voltage shall be not less than 35 kA symmetrical current.

   The terminals shall be adequate for rear connections to ensure adequate and durable contact and they shall be capable of receiving aluminum or copper cables of suitable sizes.

2) The following information shall be marked on the nameplate of each outgoing circuit breaker. This information shall also be provided with the Proposal:

   a) Rated current.
   b) Voltage.
   c) Interrupting capacity.
   d) Thermal setting.
   e) Magnetic setting.

3) All circuit breakers shall be provided with auxiliary contacts for local and remote annunciations to indicate tripping.

l) Instruments

The instruments shall be manufactured and tested in accordance with IEC Publication 60051 Standard.

Measuring and indicating instruments shall be flush mounted back connected, dust proof, switchboard type having transparent dust tight covers.

Scale plate will have a permanent white finish with black graduations and numerals.

The zero adjustments shall be provided outside the instrument. All instruments shall be tropicalized.

m) Ammeters

Ammeters shall be of specified range, moving iron, spring controlled, with a pressed steel case. One ammeter for each phase shall be provided. The ammeter shall be able to withstand the momentary large currents encountered during operation without damage or loss of accuracy.

n) Voltmeters

The Voltmeters shall be 0-500 V range, moving iron, spring controlled in a pressed steel case. Only one voltmeter shall be provided for measuring line and phase voltages, with a voltmeter selector switch.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

o) Wattmeters

Wattmeters shall be capable of indicating the demand up to 1000 kW. The meters shall be suitable for 400/230 V, 3-phase, 4 wire unbalanced load service. The current coils of the meter shall be suitable for use in conjunction with secondaries of current transformers specified.

6.17.4.2 Remote Controls and Synchronizing Equipment for Diesel Generating Set

To facilitate the paralleling route, controls of diesel generator set consisting of the start/stop push buttons, voltage regulator and frequency (speed) control will be provided on the 'B' Bus panel as well as on Control Board to be installed in the Control Room as indicated on the relevant drawing included in Volume-II Part-III of Employer Requirements. Remote closing / tripping switch for breaker mounted in the generator cubicle will also be provided on the Bus 'B' panel as well as on Control Board to be installed in the Control Room. It shall be possible to start, load, operate, unload and stop the emergency diesel generator (EDG) from the Operator's Workstation / Station HMI. The main parameters of the EDG including speed, voltage, frequency, power, currents etc. shall be monitored at the station level. The faults in the EDG system shall also be alarmed at the Operator's Workstation.

Synchronizing instruments consisting of synchroscope and double voltmeter and double frequency meter will be installed on the 'B' Bus panel of Low Tension Switchboard and Control Board.

6.17.4.3 Alarms, Indications and Controls

Visual indications and audible alarms shall be annunciated at the control board, in case of loss of voltage and shall continue to operate until acknowledged by the operator. The visual indication shall remain `ON' till the supply is restored. Audible alarm shall indicate availability of supply on restoration.

A permanent red visual indication shall be produced at the Control Board when Diesel Generating Set is in operation.

Audible and visual alarms shall be simultaneously produced at the Generator Control Cubicle and the Control Board when generator fails to start or the generator fails during normal operation. The alarms shall continue to operate until acknowledged.

Instruments/controls alarms for diesel generator required to be provided on the Control Board in the Control room are indicated on the relevant drawing included in Volume-II Part-III of Employer Requirements. Design details and schematics shall be subject to approval by the Employer.

6.17.4.4 Remote Metering

Voltmeters shall be installed at the Control Board for remote metering of following voltages: -

1. `NORMAL' 400V Bus A.
2. `ESSENTIAL' 400V Bus B.

The voltmeters shall be of the same ranges as installed at respective apparatus. Their design shall match with other meters installed at the Control Board.

6.17.4.5 Operating Sequence of A.C. Station Service System

A) System Normal

i) Both supplies named as 'A' and 'B' shall be available to incoming panels.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

ii) Incoming breakers MB1 and MB2 shall be closed.
iii) Tie breaker TB shall be open.
iv) Generator breaker GB shall be open.

B) 1) Loss of Voltage on One incoming panel

i) Visual and audible alarms at the Control Board indicate loss of supply. Visual indication shall remain ON till supply is restored.
ii) No volt release, trips breaker MB1 and closes breaker TB.
iii) Breaker MB2 remains closed.
iv) Breaker GB remains open.

2) Restoration of incoming supply A

i) Audible alarms at the Control Board indicates restoration of supply.
ii) Breaker TB is tripped manually.
iii) Breaker MB1 is closed manually.
iv) Breaker MB2 remains closed.
v) Breaker G.B. remains open.

C) 1) Loss of incoming supply B

i) Visual and audible alarms at the Control Board indicate loss of supply. Visual indication shall remain ON till supply is restored.
ii) No volt release trips breaker MB2 and closes breaker TB.
iii) Breaker MB1 remains closed.
iv) Breaker GB remains open.

2) Restoration of incoming supply B

i) Audible alarms at the Control Board indicates restoration of supply.
ii) Breaker TB is opened automatically and Breaker MB2 is closed simultaneously.
iii) Breaker MB1 remains closed.
iv) Breaker GB remains open.

D) 1) Loss of Both Incoming Supply Circuits

i) Visual and audible alarms at the Control Board indicate loss both supply. Visual indication shall remain ON till supply is restored.
ii) Breaker MB1 and MB2 are opened by under voltage release.
iii) Breaker TB trips automatically if in closed position.
iv) Diesel Generating Set starts automatically after sensing loss of voltage on both `NORMAL/A' and `ESSENTIAL/B' bus and then runs up to rated speed in a short time (less than 60 sec.).
v) Breaker GB shall close automatically to connect the generator to `ESSENTIAL' Bus.

A suitable time lag shall be provided for the operation of under voltage releases on breakers MB1 and MB2 so that sequence is not initiated due to momentary voltage dips on the system.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

2) Restoration of Supply

i) Audible alarms at the Control Board indicate restoration of supply.
ii) Breaker MB1 is closed manually.
iii) Breaker TB remains open.
iv) Diesel Generating Set is synchronized with supply B through circuit breaker MB2.
v) Breaker GB is opened manually.

The diesel generating set will be able to start automatically in case of both supplies' failure. The generator once started will run for a minimum of one hour even if normal "A" supply is restored after a short time.

6.17.4.6 A.C. Sub-Distribution Panels

These panels shall be required for power and lighting distribution circuits. The actual number of outgoing circuits in different sub-distribution panels shall be determined by the Contractor according to actual requirements of the design and the panel shall be designed to ensure safety during operation, inspection and maintenance.

The lighting and power sub-distribution panels to be installed in the Control room, shall be indoor, wall mounting or free-standing type as required. The sub- distribution panels required in the switchyard shall be outdoor type, having weather proof enclosure and shall be mounted on galvanized metal frames in vertical position.

The general lighting and power panels shall be connected to the `NORMAL/A' bus of 400V Switchboard while the essential lighting and power panels shall be connected to the 'ESSENTIAL' bus of the 400V Switchboard.

The enclosure of the sub-distribution panels shall be made of 14 SWG sheet steel and shall be finished light grey. Necessary holes with knockouts shall be provided for conduit entries. Access to busbar clamps and fuse bases shall be through the doors at the front of the panels provided with locking facilities. Adequate vermin proofing shall be provided in the design.

All lighting and power panels shall have a set of four copper bus- bars, three for the phases and one for neutral connection. The bus bar shall be of adequate current carrying capacity. The maximum temperature rise of the busbars shall be 30 deg. C above the ambient temperature.

The single phase lighting and power loads shall be uniformly divided amongst the three phases. Cartridge fuses of required ratings shall be installed in the panels to protect each lighting and power circuit.

6.17.5 DC / AC Inverters

Two DC/AC inverters shall be installed to provide power supply to the following un-interruptible essential load of the switchyard:

- Motors of chart recorders.
- Transient fault data recorders.
- Sequential event recorders.
- Emergency lighting.

Each inverter shall have the following minimum ratings:

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- Rated power 2000 VA
- Input 110 VDC
- Output 230 VAC, 1-phase, 50 Hz.

Under normal conditions, the essential load shall remain connected to any one inverter with the other as standby. Provisions shall be made through a selector switch to shift the load from one inverter to the other in case of failure of one inverter and to connect the same load to the normal AC supply in case both the inverters are out of service.

The Contractor shall design complete essential load requirements to finally determine the size of the inverters and provide calculations in support thereof.

Panel heating and door-operated lighting facilities shall also be provided in the inverter panels. The panel protection should fulfill the requirements specified in Clause 6.3.10.1 of these Technical Specifications.

Ample provision shall also be made to add future loads on the inverters, if required.

6.17.6 Drawings, Technical and Descriptive Data

Detail drawings, descriptive data and technical data of 400V Switchboard panels, sub-distribution panels, circuit breakers, relays instrument, transformers, instruments, and other components of the A.C. system as per the format of the Specific Facilities Data provided in Employer Requirements.

Detailed drawings, descriptive data and technical data of DC batteries, chargers, DC distribution boards, DC circuit breakers, instruments, and relays used in DC system.

6.17.7 Approval Drawings, Technical & Data

Detail dimensions drawings and technical data showing the construction, operation features, technical data rating, wiring and schematic drawings and layout of all equipment associated accessories and auxiliaries offered under AC and DC auxiliary supply systems.

6.17.8 Emergency Diesel Generating Set

6.17.8.1 General

6.17.8.1.1 Equipment Description

The emergency diesel generating set shall consist of a brushless, self-exciting, self-regulating synchronous generator directly coupled to a diesel engine complete with all the required auxiliaries including lubricating oil system, engine cooling system, fuel system, starting system, excitation system, auxiliary power system, and complete controls. The unit shall be furnished with adequate guards to protect personnel from rotating and moving parts and from hot surfaces. The engine alternator shall be direct-coupled to form a single robust mechanical unit. They shall be mounted on heavy base frame of all welded design with correct alignment, and the base frame shall be drilled for holding down bolts or anti-vibration mountings whichever is most suitable.

6.17.8.1.2 Rating

The Diesel Generating Set shall have a continuous rating of 200 kVA i.e. 160 kW at the given ambient temperature. The alternator shall be designed for operation at 400 Volt phase/phase and 230 V phase/neutral, 3 phase, 4 wire 50 Hz, 0.8 power factor A.C. supply.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

The diesel engine driven generating set shall be of fully automatic main failure electric start type. That is, it should have a system in its control panel containing automatic start/stop relay systems designed to accept a signal from phase failure detection equipment. Following a loss of voltage on the station service bus, the machine shall be capable of starting from a remote signal and reach synchronous speed within 60 seconds. The set shall continue to feed the load until mains supply is again available, and then it shall automatically stop and shall remain in readiness for the next emergency. This unit shall also be capable of being operated in parallel with another unit of the same rating to be installed in future by others.

In addition, this diesel generating set shall also be required to run in the operating sequences specified in Section 14 of these technical Specifications.

Work included in the supply

The following equipment and works shall be included in the scope covered by these specifications:

a) Sensing of loss of voltage on station service bus with automatic transfer arrangement for the electrically operated breaker.

b) Inlet to combustion air intake system.

c) Outlet for exhaust of the set from the silencer unit to the outside of the building.

d) Exhaust for air from radiator of the set to the outside of the building with wall mounted louver arrangement.

e) DG set room ventilation in coordination with HVAC design.

f) AMF and monitoring control panels completely installed and connected.

g) Reserve fuel oil tank installed outside of the building.

6.17.8.1.3 Grounding Terminals

Grounding terminals and 4/0 stranded grounding copper cable shall be furnished with copper grounding lugs complete with connectors and connected to the grid station grounding grid system.

6.17.8.1.4 Finish

All metal parts shall be cleaned properly and one coat of metal primer with one coat of base paint and one coat of finish paint shall be applied. Special attention shall be given to welded seams to ensure that the rough surfaces are thoroughly protected by the proper covering of paint.

6.17.8.2 Diesel Engine

6.17.8.2.1 Design

The engine covered by these specifications shall be able to operate on a diesel fuel oil as described by ASTM or ISO Specifications for vibration test.

The DG set shall be installed DG set room.

The engine shall be provided with required auxiliaries, guarantees of fuel consumption, parallel operation, acceptance tests, torsional vibration characteristics.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

6.17.8.2.2 Governing

The Contractor shall assume full responsibility for selection, design and adjustment of the governing systems for stable governing i.e. without hunting and also for parallel operation of the machine.

The speed of the unit shall be adjustable over a range of + 5% from the normal engine operating speed. The speed drop characteristic over the load range from zero load to full load shall be adjustable from 0 to 5% of rated speed at 50Hz. Means for remote speed control shall also be provided.

Means shall be provided on the engine to shut down the engine automatically in the event that the engine speed exceeds the "shutdown" speed.

6.17.8.2.3 Starting

The set shall include all equipment necessary to start and run the Diesel unit without any external source of AC or DC power and shall be capable, at all ambient temperatures, of starting and assuming full load at rated frequency in 60 seconds of the receipt of a start signal.

The diesel generating set shall be supplied complete with its own lead-acid battery, battery charging equipment and trays fitted on the base frame for holding the batteries.

6.17.8.2.4 Air Intake System

Combustion air for the diesel unit shall be taken from inside the building. Coordination shall be done with building architecture design for air intake requirement of DG set. All necessary pipe work, flexible couplings, fittings and supports shall be supplied to extend from the heavy duty air filter to the air inlet manifold on the Diesel engine. The filter assembly shall be constructed of non-corrosive materials.

6.17.8.2.5 Exhaust System

The exhaust system shall use an industrial type silencer. The exhaust shall extend from the diesel engine and terminate outside the building. All necessary. Thermal insulations of silencers, pipe work, flexible couplings, fittings and supports shall be supplied to extend from the diesel exhaust manifolds to the silencers and then to the outside of the building.

6.17.8.2.6 Cooling System

The diesel engine cooling system shall employ a radiator to cool the circulating water. All connecting pipe work shall be provided with the unit.

Exhaust air from the radiator shall be ducted to a wall opening in front of the radiator. Radiator flexible ducting, flange and all necessary ductwork, flexible connections, fittings and supports shall be supplied to extend from the radiator to the exhausts louvers so that hot air from the radiator escapes freely to the outside of the building.

6.17.8.2.7 Fuel System

A fuel oil system for the unit shall be provided. The tank shall hold fuel for the engine for 12 hours of continuous operation.

The reserve fuel tank shall be mounted on a concrete base at a level as specified by the engine manufacturer. The tank shall comply with NFPA-31 "Installation of Oil Burning Equipment" latest edition and shall be in accordance with the rules and standards referred to therein for outside above ground tanks.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

All necessary piping, flexible couplings and fittings shall be supplied to extend from the reserve fuel tank to the Diesel engine. The tank shall be complete with all necessary fittings including regulation valve, gooseneck vent, outlet fuel filter, sediment drain and safe type of fuel level indicator. All openings shall be screened to prevent entry by insects.

The system shall not require any manual or electric priming before starting.

A manual fuel pump shall be fitted so that fuel can be transferred to the set mounted fuel tank from reservoir, if required to do so.

6.17.8.2.8 Lubricating Oil System

The lubricating oil system shall be of the full flow, pressure type, allowing oil to the parts of the engine. The system shall be complete with a full flow oil filter with replaceable element.

6.17.8.3 AC Generator

6.17.8.3.1 General

The generator shall be directly coupled to the diesel engine. The generator shall conform to the applicable standards.

6.17.8.3.2 Rating

The generator shall be rated as follows:

Capacity	:	200 kVA
Voltage	:	400/230 V
Phases	:	3 Phase, 4 wire, grounded neutral
Frequency	:	50 Hz
Power Factor	:	0.8 lagging
Exciter	:	Rotating, direct connected

The generator shall be suitable for continuous operation at 10% above or below rated voltage.

6.17.8.3.3 Enclosure

The generator shall be self-ventilated and drip proof, Air shall be drawn in from the end opposite the engine drive so that cooling air drawn into the generator does not come from the vicinity of the driving engine where it may contain oil or other contaminants.

6.17.8.3.4 Damper Winding

A damper winding shall be fitted to laminated pole generator. The generator shall be fitted with inter polar damper connections. The damping characteristics shall be adjusted to provide stability for parallel operation with the station service bus or other generator of the same rating.

6.17.8.3.5 Temperature Rise

Generator temperature rises at continuous rating in an ambient of 50 degree C shall not exceed 70 degree C by resistance measurement on the field. The exciter temperature rise shall not exceed 50 degree C by resistance measurement on field or armature when the main generator is on continuous rating.

6.17.8.3.6 Generator Stator Insulation and Windings

The stator winding shall be Class B. All winding materials and slot wedges shall be non-hygroscopic and be classified as Class B also.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

All connections, rings and joints shall be sized such that their temperature rises are within Class B limits and all insulation materials, varnishes and impregnates shall be fully compatible.

The winding design and insulation processes shall be such as to eliminate coil or wedge migration due to Diesel engine vibration.

6.17.8.3.7 Generator Field Insulation And Windings

The field winding shall be Class-B. Field coils shall be pressed at a pressure at least equal to the pressure obtained at the recommended "shut-down" speed and shall be braced to withstand engine vibration and over speed.

6.17.8.3.8 Vibration And Balance

The vibration level of the generator when coupled to the engine shall not exceed the ISO Specifications or equivalent.

6.17.8.3.9 Bearings

The bearings shall preferably be grease lubricated and anti-friction type and shall be selected to provide for long trouble free service.

6.17.8.3.10 Voltage Dip and Recovery

Contractor/Manufacturer's calculations to meet the above voltage dip, voltage rise and voltage recovery performance shall take into account diesel engine steady and momentary speed changer, generator impedances and excitation system forcing characteristics at 400 V.

The generator and excitation system shall be designed to start station auxiliaries induction motors direct on line. When starting 100 H.P. motor having maximum of 500 kVA starting load, the following transient performance shall be met:

a) Minimum generator terminal voltage 75% of initial voltage.
b) Maximum voltage recovery time to 90% initial voltage, 1.5 seconds.
c) Maximum voltage recovery time to 97% initial voltage, 3.0 seconds. When suddenly removing the above motor with a base load in the range 300 to 500 kVA, the following transient performance shall be met:
    i) Maximum generator terminal voltage, 125 % of initial voltage.
    ii) Maximum voltage recovery time to 110% of initial voltage; 1.5 seconds.
    iii) Maximum voltage recovery time to 103% of initial voltage, 3.0 seconds.

The generator shall be supplied with a rotating direct connected exciter.

6.17.8.3.11 Generator Starting Panel

The generator starting panel shall provide sufficient indicating, regulating and control functions necessary for safe and efficient operation of the generator. Complete layout and dimensions for control panel shall be submitted with the Proposal. Requirement regarding remote controls of the diesel generator set and synchronizing facilities are specified in relevant section.

The starting panel enclosure shall conform to NEMA or equivalent General Purpose Enclosure requirements and the equipment therein shall be suitable for operation in room temperature of 50 degree C.

The panels shall include but not be limited to the following equipment:

1. Synchronized panel shall be a standard one. It shall be equipped with but not limited to the following:

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- Synchro scope
- Frequency meters
- Voltmeters
- Phase angle meter

2. All relays, timers, etc. required to permit the manual or automatic start, run up to load and stopping of the engine generator set.

   The engine control system shall be supplied from the starting battery and shall be able to ride through the voltage dip during cranking.

3. A front panel mounted window type annunciator together with lamp test, acknowledge and reset push-buttons and panel mounted audible alarm device shall be provided.

Functions annunciated shall include but not limited to the following:

a) Impending trouble alarm points displayed a white illuminated window:

   i) Low oil pressure.
   ii) Low fuel level.
   iii) High coolant temperature.
   iv) Generator over-temperature.
   v) Low battery voltage.
   vi) Excessive low frequency.
   vii) Excessive high frequency.
   viii) Excessive low voltage.
   ix) Excessive high voltage.

Each annunciator trip point shall be provided with an extra auxiliary contact wired in parallel with its mates to provide a contact which closes when any alarm condition exists.

b) Shut down or lockout alarm points displayed by a red illuminated window:

   i) Very low oil pressure.
   ii) Extreme high coolant temperature.
   iii) Protective relay trip.
   iv) Failure to start (over crank).
   v) Over speed trip.

Each annunciator alarm point shall be provided with an extra auxiliary contact connected as above to provide a contact which closes whenever a trip or lockout condition exists.

The annunciator shall operate from one of the 220V DC station batteries.

Spare points shall be supplied complete with relays, lamps and blank windows:

Front panel mounted devices shall include:

a) Generator output voltmeter 0-500 V.
b) Generator output frequency meter 47 to 53 Hz.
c) Generator output ammeter 0-1600 A.
d) Engine hours elapsed time meter 0-9999 hrs.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

e) Battery voltmeter.

f) Battery ammeter.

g) Operation mode selector switch, four position, to permit running transfer between manual and automatic.

- Off.
- Manual (local no-load) control.
- Manual (remote) control.
- Automatic control.

h) Engine control push buttons:

- start (black).
- stop (red).
- emergency stop (red mushroom head).

The emergency stop button circuit shall include provision for tripping the remote line circuit breaker.

i) Engine speed control switch, three position spring return to off:

- lower.
- off.
- rise.

j) Generator winding temperature indicator.

6.17.8.3.12 Voltage Regulating Equipment

A set of static voltage regulating equipment designed to meet the requirements of this specification. The regulator shall include but not be limited to:

1) A series boost current operated device to maintain excitation under fault and over load conditions.

2) Any necessary cross-compensating circuits to permit stable, parallel operation with the other engine, while running isolated from the power system.

3) Any necessary devices to permit stable parallel operation of the engine with the power system under manual/remote control.

4) Generation winding temperature relay with alarm contact and front panel mounted indicating meter.

6.17.8.4 Control Enclosures and Components

6.17.8.4.1 General

The Manufacturer shall provide a metal clad, NEMA 12, or equivalent dust tight general purposes floor mounted vermin proof, cabinet for the diesel generator to house the indicating alarm devices, auxiliary contacts and all other necessary mechanical and electrical apparatus and accessories required for the Emergency Diesel Generating Set.

Electrical interconnection between the cabinet and the remote control shall be provided by the Contractor.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Equipment for mounting in the diesel room shall be of dust tight NEMA 12 or equivalent enclosed construction and suitable for operation at the temperature which may reach in the Generator room when the outside ambient air reaches 50 degree C and the engine is operating at full load rating.

6.17.8.4.2 Control Panels

All necessary sub-panels frames, supports, harnesses, etc. that may be necessary to install the equipment shall be provided.

The interior of the cabinet shall be painted white and provided with a 230V, 50Hz light and door operated switch.

There shall be wire troughs for the main grouping of wires. No equipment shall be mounted less than 150 mm (6") above the floor of the cubicle or 150 mm (6") below the roof.

Each cubicle shall be equipped with hinged door. The door shall have its edge best inwards for rigidity. There shall be a three point latch and activating handle. The handle and door shall have matching Projects with a 1/2" diameter hole suitable for locking the cubicle door with a pad lock.

A copper ground bus bar 6mm x 25mm (1/4" x 1") shall be provided at the lower section of all panels. The bus shall run continuously across all panels in the cubicle.

Lugs for terminating a 95mm2 bare ground conductor shall be provided at both ends of the bus.

6.17.8.4.3 Nameplates and Tags

Engraved nameplates of stainless steel shall be provided on all panels for clearly identifying panels and devices mounted inside of panels.

Standard nameplate with black lettering shall be provided.

Cables and capillary tubing shall be tagged with a neoprene disc or approved equivalent, stamped with the cable number or tube function for easy identification.

6.17.8.4.4 Terminal Blocks and Terminals

Terminal blocks for control wiring shall be General Electric Type Eb stud terminal blocks or approved equivalent. Terminal studs and wires shall be numbered or otherwise marked in accordance with the applicable schematic and wiring diagrams.

Terminal blocks shall be arranged with sufficient room for each connection of incoming cables. Parallel rows of terminal blocks shall be spaced at least 150mm (6") apart.

Blocks shall be mounted in vertical columns as for as possible along the sides of cubicles or on vertical panels specially provided for terminal blocks. Where vertical space is not available, horizontal space be used. 20% spare blocks distributed over the columns of terminal blocks shall be provided.

Terminals shall be suitable for screw terminals and shall be sized according to the wire being terminated.

Provisions shall be made to terminate and ground the overall copper shields of all incoming cables by a suitable method approved by the Employer.

6.17.8.4.5 Component Wiring

All internal wiring shall be in accordance with IEC or VDE Standards with annealed copper conductor, thermo-plastic insulated with an overall flame- retardant braid. Wire sizes for control wiring in no case shall be smaller than 2.5 mm2. The wire ends shall be permanently fitted with compression type connectors before attaching to terminal studs.

Wiring between terminals of various devices shall be point to point. All internal wiring shall be neatly trunked in wiring troughs bound and anchored.

All groups of bundled conductors to hinged doors and panels shall use extra-flexible wire arranged so that a twisting rather than a bending motion is imparted to the moving conductor bundle. Each bundle shall be anchored to the fixed member at the opposite end of the hinge axis to the anchoring point on the moving member so that the moving bundle length is the maximum available without loops.

All wires shall be identified at both ends according to the schematic diagram.

6.17.8.5 Maintenance Equipment and Tools

The Manufacturer shall bring equipment and tools in new and unused condition to install the equipment and hand over the same to the Employer for the maintenance including disassembly and assembly, of the Emergency Diesel Generating Set during its useful life. Equipment and tools shall include but not be limited to the following.

Any special tools, instruments, meters, case-hardened wrenches and any other special wrenches, if required lifting devices, steel cable slings and other equipment. The wrenches and tools for maintenance, in-so-far as practicable, shall be mounted on suitable hardwood for steel boards arranged for wall mounting and provided with means or ready identification.

6.17.8.5.1 Tests

6.17.8.5.1.1 General

The set furnished by the Contractor under this Contract shall be subject to tests in the shop and at site in the presence of the Employer for conformity to requirements of the Specifications.

6.17.8.5.2 Diesel Engine

All mechanical parts shall be run under simulated operating conditions at the Manufacturer's works.

All tests shall be conducted in accordance with the appropriate codes for testing. The tests to be carried out shall include, but not be limited to, the following:

i) Dynamic balancing together with overspeed tests of the generator exciter and rectifiers.
ii) Bench testing of all accessories.
iii) Zero load operation of the diesel engine assemblies to test the following:

- Vibration.
- Lubricating system.
- Fuel system.
- Governor system.
- Temperature control system.
- Overspeed trip.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- Individual accessories.

The diesel engine and AC generator shall be test-run continuously for 24 hours to ensure smooth running and satisfactory operation of the machines and accessories. The above tests will be witnessed by the Employer.

The contractor shall state in his proposal the performance and reliability tests to be carried out in the Works.

Tests on the unit shall not be less than the minimum requirements of ISO standard Practices for equipment.

6.17.8.5.3 Generator

1. **Shop Tests:** All test procedures shall be carried out in accordance with IEEE 11501 or UTE C51 100.

2. **Routine Tests:** Routine tests on the generator shall be performed. Routine tests shall include:

   a) Resistance of armature and field windings.
   b) Polarity of field coils
   c) Check of mechanical balance
   d) Check of no-load field current or exciter field current.
   e) Voltage balance
   f) Phase sequence
   g) No-load saturation curve
   h) Insulation and high potential tests
   i) Over speed test at 125% speed for 1 minute

Where the generator is not completely assembled in the factory, tests (d) to (i) above inclusive may be carried out with the generator coupled to Engine Test (a) to (d) shall also apply to the exciter.

3. **Type Tests:** The generator shall have the following tests performed and certificates provided to the Employer (for the similar model and type):

   a) Short circuit saturation curve.
   b) Temperature test.
   c) Segregated losses.
   d) Voltage deviation factor.
   e) Three phase lines to line short circuit test at any convenient voltage in the 0.4 to 0.5 p.u. volts.

4. **Characteristics Test Curves:** Following completion of type tests, Manufacturer shall provide characteristics curves of the brushless excitation system. These curves shall show:

   a) Exciter field amps and volts versus generator line current at 0.80 Pf. and maximum and minimum temperature rises.
   b) Exciter field amps and volts versus generator line current at 1.0 Pf and maximum and minimum temperature rises.
   c) As for (a) above, but with one diode failed.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

The above six curves shall be plotted from no-load to maximum rated load at rated generator voltage. Following approval of curves by the Employer, they shall be incorporated by the Manufacturer into the Emergency Diesel Generating Set Maintenance Manual.

6.17.8.5.4 Performance Tests

At the conclusion of installation of the Emergency Diesel Generating Set at site, commissioning tests shall be carried out by the Contractor/Manufacturer to demonstrate the satisfactory operation of the equipment and to verify the guaranteed performance figures of the diesel unit. The tests shall comprise:

1. Preliminary tests on individual components.
2. Continuous one-hour heat run at 50 percent load rating in parallel with the system.
3. Continuous one-hour heat run at 75 percent load rating in parallel with the system.
4. Continuous four-hour heat run at 100 percent load rating in parallel with the system.
5. Part load heat runs to demonstrate satisfactory operation and establish fuel consumption at the respective loads.
6. The tests shall also include:
   a) Performance of governing characteristics and protective systems.
   b) Stating characteristics of the units. The units shall start at least five (5) times in six (6) consecutive starting attempts.
   c) Starting power requirements to demonstrate the ability of the machine to start the specified number of times without need to recharge the batteries.

The instrumentation supplied as standard with the equipment will be used during the commissioning tests for measurement of voltage, frequency, temperatures, pressures, etc. normally recorded during commercial operation. Additional instruments required for the measurement of electrical output, fuel flow, vibrations, etc. shall, at no extra charge, be provided by the Contractor.

Tests to be carried out manufacturer's work and at the site shall be to the satisfaction of the Employer. Seven copies of test certificates shall be forwarded to the Employer immediately following each test. The site test report shall include a list of final settings and adjustments carried out during commissioning.

If the tests show that the set does not reasonably comply with Proposal, the Contractor/Manufacturer shall, at his own expense, make all necessary corrections to the unit. Additional tests shall then be made to demonstrate the effectiveness of these corrections. Until the necessary corrections have been made, the conditions of the contract shall not be considered fulfilled.

6.17.8.5.5 Spare Parts

The Contractor shall submit a list of manufacturer's recommended spare parts including prices. The list shall contain parts which are identical to the original equipment installed. Spare parts for five year or 4000 hrs. operation & maintenance of the diesel generating set shall be supplied with the set. He shall also in addition provide the following items as indicated below:

1. Four fuel oil filter elements

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

2. Four air filters
3. Two spare starting batteries without acid. Acid in separate containers for two fillings of batteries.
4. Two sets of each type and size of belts
5. Fifty control panel indicating lamps
6. Fifteen sets of color caps for indicating lamps
7. Fifty sets of fuses
8. Two sets of blank nameplates

6.18 POWER TRANSFORMER (10/13 MVA, 132/33KV)

6.18.1 Scope of Work

The scope of work covers design, manufacture, works testing, delivery, erection, site tests and commissioning of one (1) number of three-phase power transformer complete with their accessories. The LV Side of transformers shall be connected to 33 kV voltage busbar.

This shall be three-phase, 10/13 MVA, with 132/33kV voltage ratio, and with on-load tap changers complete with transformer purpose made supports and anti-vibration pads. The cooling type shall be ONAN/ONAF, and the transformers shall be provided with fire detection, alarm and protection system.

6.18.2 Service Conditions

See Section “General Electrical Requirements given in Vol-II part-I”.

6.18.3 Standards

The transformers shall conform to the applicable requirements of the latest edition of the following international standards:

- IEC Publication 60076
- IEEE C57.12.00
- IEEE C57.12.10
- IEEE C57.12.70
- IEEE C57.12.80
- IEEE C57.12.90
- IEEE C57.13
- IEC Publication 60076-10
- IEC 60060
- IEC 60085
- IEC 60354
- IEC 60529
- IEC 60567
- IEC 60814
- IEC Publication 60076-7
- IEC Publication 60137 (Bushing)
- IEC Publication 61869
- IEC Publication 60811, 60230, 60502, 60228
- IEC TC37, WG-4
- IEC Publication 60214
- IEC Publication 60071
- IEC 61181
- IEC 61198
- IEC 60296-2003
- IEEE 62
- IEEE 637
- IEEE 1538
- NTDC P-46:2008 (Including amendments)

6.18.4 Functional Specifications

Power transformer shall be oil-immersed, (ONAN/ONAF), with the oil preservation system of the constant pressure conservator type with a flexible diaphragm to preclude direct contact of oil with air, complete with accessories, and spare parts, suitable for outdoor operation. The star points of the 33 kV windings shall be solidly earthed.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

The core of each transformer shall be of high grade, non-ageing electrical silicon steel of low hysteresis loss and high permeability. The Low Voltage side bushings shall be suitable for connection to 33 kV bus.

The high voltage bushings shall be condenser type, free from partial discharges up to the test voltage.

All bushings shall comply with IEC 60137. The HV bushings shall be inside an oil box adequate for HV connection. The LV bushings shall be air insulated. The neutral terminals shall be provided with outdoor type bushing insulator.

Each transformer case shall be capable of withstanding, without leakage or distortion, an internal gas pressure of 0.7 bar and essentially a full vacuum and shall be designed and constructed for vacuum filling in the field.

Each transformer oil tank shall be provided with an approved self-resetting pressure relief device for the release of any pressure that may be generated in the tank to save it from damage. It shall operate at a static pressure lower than the hydraulic test pressure and outlets shall be arranged to face away from the bushings. The device shall be provided with two sets of normally open signaling contacts. These contacts shall be used to operate alarms/trips.

The transformer shall be equipped with bushing type current transformers for the high voltage and neutral terminals. The transformer shall be protected by a water deluge system with all the accessories i.e., pipe, deluge valve, sensors, nozzles etc.

The transformers shall be equipped with a motor-operated on-load tap changer (OLTC) on the HV side. The OLTC shall be manually controlled by the operator, not having an automatic voltage regulator so that when interacting with the excitation voltage regulator they do not oscillate against each other.

6.18.5 Key Technical Parameters

6.18.5.1 Transformer (10/13 MVA,132/33 kV)

- No. of phases. — Three-phase unit
- No. of windings. — 2
- Vector Group. — Dyn11
- Frequency, Hz. — 50
- Rated voltage of
  - Windings (Ur), kV, rms.
  - High Voltage Winding — 132
  - Low Voltage Winding — 33
- Rated voltage ratio, kV, rms — 132/33
- Voltage tapping Range percent of Rated voltage (by on- load tap changer) — ± 10% in steps of 1.5%

High voltage winding.	275
Low Voltage winding.	70
iii) Rated long duration induced AC (ACLD) withstand voltage as per Clause 12.4 of IEC 60076-3, kV.	U_1 = 151 U_2 = 134
iv) Separate source power Frequency withstand voltage, for neutral kV, rms.	70

6.18.5.2 H.V Surge Arresters

• Material type	Zinc Oxide
• MCOV (maximum continuous operating voltage)	not less than 145 kV

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- Standard Nominal Discharge Current rating 10 kA (IEC 60099)
- Insulation impulse withstand voltage 650 kV
- Insulation wet power frequency Withstand voltage 275 kV

6.18.6 Overload Requirements

The overload rating and operation shall be in accordance with IEC 60076-7. The overload capability of any ancillary equipment such as bushings, CTs, oil expansion tanks, leads etc. shall not be less than the transformer overloads rating. The transformers shall also be capable of withstanding momentarily, without injury, a voltage of 20% greater than the rated generator voltage, when the generator full load is rejected.

6.18.7 Short Circuit Capability

The transformer and its accessories shall be capable of withstanding mechanical and thermal stresses caused by short circuit fault currents without mechanical deformation or impairing electrical capabilities. The sudden pressure relay and other alarm initiating devices will not respond to the effect of the through fault short circuit currents.

6.18.8 Transformer Fire Protection System

Transformers shall be equipped with fire protection systems.

6.18.9 Tests

6.18.9.1 General

Each transformer shall be subjected to the routine shop and quality control tests and all applicable tests required by IEEE C57.12.90, in addition to any special test required in accordance with this Specification. Test procedures shall be submitted to the Employer prior to any tests being performed. The Contractor shall submit test procedures and notify the Employer sufficiently in advance of tests, giving the date and place where such tests shall be made. The Contractor shall furnish to the Employer certified copies of all test results in electronic PDF format. The results of each test shall be recorded in the form of test certificates or reports as specified.

6.18.9.2 Type Tests

Type tests shall be made on one unit of each type of different equipment at the Contractor's expense in presence of the Employer and the actual type test report shall be submitted to the Employer for approval. Instead of carrying out the type tests, the Contractor may submit duly certified and complete type test reports for tests carried out by an independent, accredited authority on similar equipment of the same type. However, the Employer reserves the right of accepting these certificates or to reject them partially or totally.

The Power Transformer shall be subject to the following type tests:

- Noise level test in accordance with IEC 60076-10,
- Zero phase sequence impedance measurement in accordance with IEC 60076-1
- Short-circuit test in accordance with IEC 60076-5.
- A temperature rise test, in accordance with IEC 60076-2. The test shall be conducted on the tapping corresponding to the maximum losses.
- Dielectric Type Tests in accordance with IEC 60076-3.
- Type tests shall be carried out on bushings in accordance with IEC 60137.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- Type test shall be carried out on one tap changer of each type in accordance with IEC 60214.

6.18.9.3 Transformer Routine Tests

Usual non-destructive tests shall be performed on the tank welds. The tank welds shall be given a pressure test by filling the tank with dry nitrogen, dry carbon dioxide, or dry air to the highest pressure for which the tank is designed and exploring all welded seams with a suitable leak detector. There shall be no perceptible leaks and the transformer shall hold the test pressure for four hours without leakage. Any alternative pressure test shall be submitted to the Employer for approval.

The transformer tank shall be vacuum tested to a negative pressure of 25 mm Hg absolute or less prior to filling the tank with oil. The pressure rise shall not exceed 25 mm Hg in 30 minutes while the vacuum pump is not operating. This test may be performed as part of the filling procedure.

All test equipment shall be supplied for the specified shop tests in accordance with the latest issue of the applicable international standards. Calibration of all test equipment shall be traceable to the National Institute of Standards and Technology (NIST), and calibration certificates shall be submitted for approval. Certificates shall be renewed in accordance with the Quality Control Plan. For the loss tests, the instrumentation shall be calibrated for power factor.

Insulation resistance shall be measured at 1000 V and shall indicate a minimum resistance of 50 MΩ to ground.

The following tests shall be made at the completion of winding, at the conclusion of all other tests, and prior to shipment.

- Resistance of high voltage and low voltage windings, including all taps.
- Applied and induced voltage tests.
- Exciting current and no-load loss curves on rated voltage connections at 90%, 100% and 110% of rated voltage.
- Impedance and load loss test at rated current on the rated voltage connection and on the tap extremes of the transformer.
- Heat run on the transformer at lowest and highest MVA ratings.

Pressure tests at 25% above maximum nameplate rating shall be performed for the duration of 6 hours and shall be made immediately following the temperature rise test while the oil is hot.

On completion of all other tests and prior to shipment, the transformer shall be subjected to a one hour excitation loss run at 110% voltage. The current and power recorded at the conclusion of this test shall compare favorably with previous test results.

The following tests, described in cited sections of IEEE C57.12.90, unless otherwise indicated, shall be included:

- Resistance Measurement, Section 5.
- Polarity and Phase Relation, Section 6.
- Ratio, Section 7.
- No-Load Losses and Excitation Current, Section 8.
- Impedance Voltage and Load Losses, Section 9.

- Dielectric Tests, Section 10.
- Temperature Rise, Section 11.
- Audible Sound Emission, Section 13.
- Measurement of zero-sequence impedance.
- 1 minute power frequency separate source AC withstand voltage test on auxiliary wiring and function tests on auxiliary equipment/devices. The functional tests of all auxiliaries including tap changer shall be performed.

6.18.9.4 Additional Transformer Tests per IEEE C57.12.90

The following additional transformer tests shall be performed per IEEE C57.12.90:

- Insulation Power Factor, IEEE C57.12.90, Section 10.
- Bushing Power Factor, IEEE C57.19.00.
- Impulse Tests, IEEE C57.12.90, Section 10.3 (Full and Chopped Wave Test).
- Switching Impulse Voltage Tests, IEEE C57.12.90, Section 10.6.
- Bushing Capacitance, IEEE C57.19.00.
- Short-Circuit Tests

6.18.9.5 Site Tests

Following tests shall be performed on Power Transformer at site:

- Visual inspection,
- Insulation resistance,
- Winding resistance and continuity on all taps,
- Polarity,
- Dielectric test of oil, and
- Functional test of all control and protection apparatus.
- Transformer turn ratio test.
- Load tests.
- Sweep Frequency Response Analysis (SFRA) Test

6.18.10 Spare Parts, Maintenance Equipment and Tools

Spare Parts and Tools mentioned herein are the minimum required. Any other necessary spare parts and tools required for maintenance of the equipment shall be provided by the Contractor.

Table 6-1: Spare Parts and Tools

Sr. No.	Description	Unit	Qty.
Mandatory Spare Parts			
1	132 kV bushings, complete with gasket, terminal connector and oil.	Set	3
2	11 kV bushings, complete with gaskets and terminal connectors.	Set	3
3	Neutral bushings, complete with gaskets and terminal connectors.	Set	3
4	Complete set of gaskets for 132 kV Power Transformer. Each set	Set	3

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Sr. No.	Description	Unit	Qty.
	consists of one of each size and type of gaskets furnished and one liter can of lubricating grease.		
5	Contacts and coils for each type and size of relay and contactor.	Set	2
6	Replacement parts for pressure relief devices.	Set	2
7	Pressure gauge of each type and size for the heat exchanger.	Set	2
8	Gas and oil actuated relay of each type, complete.	Set	2
9	Oil thermometer of each type, complete.	Set	2
10	Oil gauge of each type, complete.	Set	2
11	Air breather for conservator tank, complete.	Set	2
12	Thermal relay of each type, complete.	Set	3
13	Tapping switch assembly for 132 kV transformer.	Lot	2
14	Complete spares for oil preservation system for 132/11 kV Power Transformer.	Set	1
15	Winding temperature indicating device, each type.	Set	2
16	Current transformer, associated with temperature indicating device, each type.	Set	2
	Maintenance Equipment		
1	10% transformer oil in addition to net quantity required for filling the transformer.	Set	1
2	Consumable items such as filters, oils, etc. for 3-years of operation	Set	1

6.19 POWER TRANSFORMER (6.3 MVA, 33/11KV)

6.19.1 Scope of Work

The scope of work covers design, manufacture, works testing, delivery, erection, site tests and commissioning of one (1) number of three-phase power transformer complete with their accessories. The LV Side of transformers shall be connected to 11 kV voltage busbar.

This shall be three-phase, 6.3 MVA, with 33/11kV voltage ratio, and with off-load tap changers complete with transformer purpose made supports and anti-vibration pads. The cooling type shall be ONAN and the transformers shall be provided with fire detection, alarm and protection system.

6.19.2 Service Conditions

See Section “General Electrical Requirements given in Vol-II part-I”. The specifications of transformer in respect of material, testing and other requirements shall be in accordance with Section 6.18.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

6.19.3.1 H.V Surge Arresters

• Material type	Zinc Oxide

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- MCOV (maximum continuous operating voltage) not less than 36 kV
- Standard Nominal Discharge Current rating 10 kA (IEC 60099)

6.20 35 KV METAL-CLAD SWITCHGEAR

6.20.1 Circuits and Equipment

The following switchgear and equipment shall be mounted in the indoor type 35 kV metal-clad Switchgear:

- 35 kV circuit breakers
- 35 kV current transformers
- 35 kV voltage transformer
- 35 kV common bus

6.20.2 Enclosure

a) Type

The 35 kV switchgear shall be of indoor installation, metal-clad type switchgear assemblies and shall be installed on a concrete foundation in the building.

b) Construction Requirements

The enclosures for the 35 kV switchgear shall be suitably designed and constructed for Indoor installation in compliance with the following particular requirements:

The indoor type enclosures shall be of dust-tight and splashing water-proof Construction conforming to the degree of protection at least IP54 of IEC 60529.

A fluorescent lamp shall be fitted under the canopy of each cubicle. A manual operation switch for the lamp shall be provided at a convenient location accessible from the outside.

Measuring instruments, position indicators, pushbuttons, selector and control switches and test blocks shall be mounted on a hinged inner panel. A glass window shall be provided on the front panel of the indoor type enclosure and it shall be arranged so that such instruments should be visible from the outside through the glass window.

The external surface of the indoor type enclosures shall be finished with gloss paint.

The withdrawal type equipment compartment shall be provided with an automatic shutter to prevent exposure of stationary live contacts when the equipment is in the disconnected, test or removed position.

The enclosure shall be provided with suitable cable terminal compartments for all necessary power and control cable connections. Suitable means to support the cables and terminals shall also be provided.

The secondary circuits of instrument transformers shall be brought out to the terminal blocks for connecting the control cables to the measuring instruments and protective relays.

A copper ground busbar with ample size shall be provided in the cubicle. Clamp type grounding terminals shall be provided for connecting the ground busbar to the 95 mm2 stranded copper conductor of the station grounding system.

Each enclosure shall be provided with an interior illumination lamp suitable for the Sri Lankan fluorescent lamp and space heaters to prevent moisture condensation. A door switch for the interior illumination lamp and a manual switch for the space heaters shall also be provided in the enclosure.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Other requirements for the enclosures shall be referred to Clause A.24 (Enclosures for Electrical Equipment) of Chapter A.

c) Accessories

Each enclosure shall be provided with the following accessories.

- Nameplates for the equipment to be housed
- A floor sill for the enclosure
- Eye bolts or lifting lugs
- Foundation bolts and nuts
- Grounding pads suitable for 95 mm2 stranded copper conductor
- Other necessary accessories

6.20.3 Busbars and Connections

a) Type

Three-phase busbars shall be arranged in each 35 kV metal-clad cubicle.

The busbars and electrical connections shall be of electrolytic copper, air insulated, and shall be sufficiently insulated from ground and from each other. Oil or compound filled bus will not be acceptable.

The busbars, connections and their insulated supports shall be of mechanically strong, and shall withstand all the stresses to be imposed on them by vibration, temperature changes and short-circuit fault and other conditions to which they might be subjected during the operation at site, transport and handling.

All busbars including ground buses shall be electrolytically plated with nickel or suitable material and all the connections shall be silver coated and contacted securely.

b) Ratings

The 35 kV busbars shall be rated as follows:

- Rated voltage: 39 kV
- Rated insulation level

- Lightning impulse, 1.2 x 50 μs : 170 kV

- Power-frequency for one minute : 70 kV

- Rated normal current: 100 A
- Rated short-time withstand current: 8 kA for one (1) second
- Allowable temperature rise limit: 50 K

6.20.4 35 kV Circuit Breaker

a) Type

The 33 kV circuit breakers shall be three-pole, vacuum circuit breaker and shall be designed for withdrawable construction suitable for mounting in the indoor type, 35 kV metal-clad cubicles. The circuit breaker shall be electrically and mechanically trip free in any position and shall be provided with anti-pumping feature.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

The operating mechanism shall be designed for local and remote electrical controls as well as local manual operation.

b) Ratings

The 35 kV circuit breaker shall be rated as follows:

- Rated voltage : 39 kV
- Rated insulation level

- Lightning impulse, 1.2 x 50 µs : 170 kV

- Power-frequency for one minute : 70 kV

- Rated normal current : 630 A
- Rated short-circuit breaking current : 8 kA
- Rated break time : 60 ms
- Rated operating sequence : CO - 15s - CO
- Rated control circuit voltage : 110 V DC

The DC control source for the circuit breaker shall be DC 110 V to be supplied from the DC panel to be provided by the Contractor.

c) Operating Mechanism

The circuit breaker shall be designed for a stored energy operation by DC motor-charged spring with DC shunt coils for tripping and closing, and shall be capable of opening immediately following the closing operation with the rated short-circuit making current. The stored energy operation shall be capable of opening immediately following the closing operation with the rated short-circuit making current, in accordance with the rated operating sequence specified in Paragraph (2) (f) above.

The operating mechanism shall be designed for remote and local electrical controls as well as local manual operation. Test operation at test position shall also be available.

Power source for the operating mechanism, trip coils and close coils shall be DC 110 V to be supplied from the DC distribution panel to be provided by the Contractor.

d) Accessories

Each 35 kV circuit breaker shall be provided with the following accessories:

- Rating plates
- Pushbuttons “ON” and “OFF” for local electrical control
- Position indicators; red and green
- Operation counter
- Necessary number of auxiliary switches for control
- Limit switches to detect the circuit breaker’s positions; at the operating position and at
- the test position
- Draw-out unit with handle and guide
- Close coil condition indicator
- Manual charging handle

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- Necessary terminal connections
- Other necessary accessories

In addition, the following item shall also be provided for common use to all the circuit

breakers:

- One (1) moving cart

6.20.5 35 kV Current Transformers

a) Type

The 35 kV current transformers shall be of single-phase, epoxy-resin mold, ring-core or wound winding type protective current transformers and shall be installed in the indoor type, 35 kV metal-clad cubicle.

b) Ratings

The 33 kV current transformers shall be rated as follows:

- Highest system voltage : 39 kV
- Rated insulation level

- Lightning impulse, 1.2 x 50 μs: 170 kV

- Power-frequency for one minute: 70 kV

- Rated current ratio (Rated primary) Current/rated secondary current) : 12.5/1 A
- Rated output : Not less than 15 VA

The rated output of each current transformer shall be determined by the Contractor to suit the actual burden required for the protective relays, energy meters, cables and wires, however, the minimum output shall be 15 VA for each transformer. The detailed calculation sheets for the rated output shall be submitted for approval.

- Rated short-time thermal current: : 2.5 kA for one (1) second
- Accuracy class

- for measuring : 0.5

- for protective relaying : 5P20

c) Accessories

The following items shall be provided for the current transformers:

- Rating plates
- Necessary terminal connections
- Other necessary accessories

6.20.6 35 kV Voltage Transformers

a) Type

The 35 kV voltage transformers shall be of single-phase, epoxy-resin mold, inductive type with residual voltage winding and shall be installed in the indoor type, 35 kV metal-clad cubicle.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

b) Ratings

The 35 kV voltage transformers shall be rated as follows:

- Highest system voltage: 39 kV
- Rated primary voltage: 35/ √ 3 kV
- Rated secondary voltage: 110/ √ 3 V
- Rated residual voltage: 110/3 V
- Rated output: Not less than 25 VA

The rated output of each voltage transformer shall be determined by the Contractor to suit the actual burden required for the protective relays, measuring instruments, transducers, cables and wires, however, the minimum output shall be 25 VA for each transformer. The detailed calculation sheets for the rated output shall be submitted for approval.

- Rated voltage factor: 1.2 for continuous 1.9 for 30 seconds
- Rated insulation level

- Lightning impulse, 1.2 x 50 µs: 170 kV

- Power-frequency for one minute: 70 kV

- Accuracy class

- For measuring : 0.5

- For protective relaying : 3P

c) Accessories

Each voltage transformer shall be provided with the following accessories:

- Rating plates
- Necessary terminal connections
- Fuse for secondary circuit
- Other necessary accessories

6.20.7 Tests

6.20.7.1 Factory Tests

The following tests for the 33 kV metal-clad switchgear shall be carried out at the manufacturer's works before shipment in accordance with the manners and procedures specified in Clause A.30 of Chapter A.

a) 35 kV Switchgear Assemblies

- Dielectric tests for switchgear cubicle assembly
- Design and visual checks

b) 35 kV Circuit breakers

- Dielectric test on the main circuit
- Tests on auxiliary and control circuits

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- Measurement of the resistance of the main circuit
- Tightness test
- Design and visual checks
- Mechanical operating tests
- Measurement of making and breaking time

In addition to the above, the certificates of type tests for the following tests shall be submitted with the factory test reports for the above-mentioned tests:

- Certificates of type tests
- Temperature-rise test

i) Short-time withstand current and peak withstand current tests

ii) Short-circuit current making and breaking tests

c) 35 kV Disconnectors

- Dielectric test on the main circuit
- Tests on auxiliary and control circuits
- Measurement of the resistance of the main circuit
- Design and visual checks
- Mechanical operating tests

In addition to the above, the certificates of type tests for the following tests shall be submitted with the factory test reports for the above-mentioned tests:

- Certificates of type tests
- Temperature-rise tests

i) Short-time withstand current and peak withstand current tests

ii) Operating and mechanical endurance test

d) 35 kV Current Transformers

- Verification of terminal marking
- Power-frequency withstand tests on primary windings and partial discharge measurement Power-frequency withstand tests between sections of primary and secondary windings and on secondary windings
- Inter-turn overvoltage tests
- Design and visual checks
- Determination of errors

In addition to the above , the certificates of type tests for the following tests shall be submitted with the factory test reports for the above-mentioned tests:

- Certificates of type tests

i) Short-time current tests

ii) Temperature-rise test

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

iii) Impulse tests on primary winding

e) 35 kV Voltage Transformers

- Verification of terminal markings
- Power-frequency withstand tests on primary windings
- Power-frequency withstand tests on secondary windings
- Check of relative polarity
- Test for accuracy
- Measurement of capacitance and tangent loss angle
- Spherical gap spark-over voltage test
- Design and visual checks
- Determination of errors

In addition to the above, the certificates of type tests for the following tests shall be submitted with the factory test reports for the above-mentioned tests:

- Certificates of type tests

  i) Temperature-rise test

  ii) Impulse tests on primary winding

6.20.7.2 Site Tests

The Contractor shall carry out on site the following inspections and tests for the 33 kV metal-clad switchgear, in accordance with the manners and procedures as specified:

a) Inspections during Installation Work

The following checks and inspections shall be carried out in the course of the installation work or immediately after the installation work has been completed, to demonstrate that the Plant or part thereof has been correctly assembled and installed in accordance with the approved drawings.

- Level and alignment check of cubicles before fixing to the foundation
- Visual check for cubicle assemblies and installations
- Inspections for installation of cables including their terminations and connections

b) Routine Tests on Site

Separately from the tests at the manufacturer's works, the following routine tests shall be carried out on site immediately after the installation work has been completed.

- Switchgear assemblies

  i) Measurement of insulation resistance

  ii) Dielectric test

- 35 kV circuit breakers

  i) Measurement of resistance of each pole

  ii) Measurement of closing and opening time

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

iii) Minimum coil operation voltage check

iv) Trip free operation test

v) Anti-pumping function test

vi) Local operation test

vii) Check of operating sequence

viii) Check of interlock circuit

ix) Operation check of relays and limit switches on the circuit breaker

x) Calibration check of pressure gauge, if applicable

- 35 kV current transformers

  i) Check of polarity

  ii) Measurement of ratio

  iii) Measurement of actual burden of current transformer circuits

- 35 kV voltage transformers

  i) Check of polarity

  ii) Measurement of ratio

  iii) Measurement of actual burden of voltage transformer circuits

The routine tests on site shall be all completed prior to the commencement of Pre-commissioning.

6.21 HIGH TENSION SWITCHGEAR

6.21.1 General Requirements

The scope of work covers design, engineering, manufacture, works testing, delivery, erection, site testing and commissioning of HT switchgear for colony and power Intake and surrounding areas feeders. The switchgear shall be indoor type, metal clad and floor mounted. The switchgear shall be designed in accordance with latest revision of IEC 60298. In case the requirements laid down herein differ from those given in the standards, the switchgear shall comply with the requirements listed herein.

The HT switchgear shall be connected to 11/0.4 kV, 200 kVA Station Auxiliary Transformers, located outside the Control House Building and shall supply power to the AC Distribution Board to be placed in Control Building. The short-circuit kA rating of switchgear shall be as specified.

The 11 kV panels shall comprise a draw out type, motor operated vacuum circuit breaker and all its associated equipment. It shall be self-contained and self-supporting and shall be capable of being connected to the switchgear on either side.

In each panel the busbars, circuit breakers, voltage transformers, current transformers, instruments, meters, relays etc. and all live parts shall be enclosed and separated by ground metal barrier. Bus bars and their connections shall be covered with insulation.

The clearance between bus bars and between line and ground part shall be designed for the specified voltage levels short circuit capacity and other safety consideration during normal operation.

All outgoing circuits shall have numerical type overcurrent and earth fault protection which shall have inverse as well as definite time and instantaneous features.

A mimic diagram indicating the single line of 11 kV circuit shall also be provided on the front of the panel using durable, non-fading material.

6.21.2 Ratings for 11 kV Switchgear

The switchgear shall be suitable for installation in 11 kV three phase A.C. supply system of the following characteristics:

-	Nominal system voltage, kV	11
-	Rated voltage, kV	17.5
-	Frequency, Hz50	
-	Rated short-time (1 sec.) withstand current, kA, rms.	25
-	Rated peak withstand current, kA	63
-	Lightning impulse withstand voltage, kV, crest	95
-	One minute power frequency withstand voltage, kV, rms.	38

6.21.3 Protection and Metering

6.21.3.1 Overcurrent Protection

All panels shall have overcurrent and earth fault protection which shall be provided by means of numerical type relays with two over current elements and one earth fault element. The relay shall have three instantaneous elements.

For the 25 kA incoming panels, in addition to the DC protection scheme, a backup AC series protection scheme shall also be provided. The backup AC series protection shall be operated by a separate earth fault relay. The characteristics of earth fault relay for back up protection shall be same as for earth fault unit in the main overcurrent and earth fault relay. For AC back up protection the trip coils shall be energized directly from the CTs without requiring any external source.

6.21.4 Differential Protection

All incoming panels shall be provided with three additional CTs for differential protection.

The Differential protection zone of power transformer is required to trip the 11kV incoming breaker.

6.21.5 DC Supply and Trip Indications

Supervision relay shall be provided for continuously monitoring the healthy conditions of breaker trip circuit and presence of DC supply on all applicable panels. The presence of healthy trip circuit shall be indicated by the continuous glow of a yellow lamp. The indicating

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

lamps shall be of neon type with screwed base. The rating shall be 5 watts at 150V or 260V DC depending on control and auxiliary supply voltage.

One hooter and its acknowledge and cancelling arrangement shall be installed in the incoming panel to indicate failure of DC mains supply, DC supply to any panel and failure of healthy trip circuit and tripping of any breaker. This arrangement should be self-contained and securely fixed to the panel. The alarm cancelling arrangement shall be flush mounted on the front of the panel.

6.21.6 Metering

Arrangements for metering shall be provided. The voltage coils of all energy meters of the outgoing panels shall be connected to the voltage transformer of the corresponding bus section.

6.21.7 Construction

All metal parts of individual panels shall be efficiently bonded together. Hinged doors shall be connected to the panel body by means of flexible copper earthing straps. Each panel shall be provided with a copper earth strip of a minimum cross-section of 95 sq.mm to which all earth parts shall be bonded and arranged so that the bars of adjacent panels can be connected to form a common earth bus, which shall be connected to the station ground.

Each outgoing panel shall have provision for mounting one cable box suitable for copper cable as specified in relevant Section of the Technical Specifications.

6.21.8 Outgoing Panels

Each outgoing panel shall be of 25kA breaking capacity and shall comprise but not limited to the following:

i) A circuit breaker rated 630 Amps. 3-pole.
ii) Three single phase current transformers, ratio: 150-75/5-5 Amps.
iii) Three single phase overcurrent relays as specified.
iv) One outgoing cable box as required.
v) One ammeter, range 0-150A, with phase selector switch.
vi) One supervision relay for DC monitoring.

6.21.9 Incoming Panels

Each incoming panel shall be of 25kA breaking capacity and shall comprise but not limited to the following:

i) One circuit breaker rated minimum 630A, 3 poles.
ii) Three single phase current transformers, ratio: 700:350/5-5A for over-current protection and metering and three current transformers for differential protection.
iii) Three single phase metal oxide gapless type surge arresters, 15kV, 10kA. (The Contractor shall submit calculations to justify the rated voltage of the surge arrester).
iv) One three phase voltage transformer of ratio 11,000/110 volts.
v) One voltmeter 0-15kV with selector switch.
vi) Three ammeters 0-700 Amps. One in each phase.
vii) One kWh meter with MDI.
viii) One kVARH meter.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

ix) One power factor meter.
x) One over-current relays.
xi) One supervision relay.
xii) One earth fault relay.
xiii) Hooter, signalling lamps & cable termination pad.

6.21.10 Switchboard Enclosures

The enclosure shall be vermin proof. All live parts, including busbars, connections, circuit breaker, voltage transformer, current transformers etc. shall be suitably enclosed and designed to minimize chances of accidents to operating personnel during normal operation and maintenance.

Suitable provision shall be made for connection of switchboard copper earth bus to grounding conductor stub. The earthing sheaths of the outgoing cables shall also be properly terminated.

All interior and exterior surfaces of the enclosures shall be thoroughly cleaned and painted with one coat of metal primer and two coats of finishing paints. Light grey paint shall be used for exterior metal surfaces. The interior finish of panels shall be mat- white. A quart of paint shall be provided for on-site touch-up work.

Suitable arrangement shall be made for labelling of each circuit.

The 11 kV panels shall be installed in the 11 kV Switchgear Room of the new Control Building. The Contractor/Manufacturer shall supply drawings of the switchboard for approval of the Employer.

6.21.11 Bus bars

A set of three busbars made of 98% IACS electrical conductivity copper of current rating of 2500 Amps. shall be provided.

The busbars shall be air insulated and supported on epoxy cast resin insulators. The busbars shall be completely covered with insulation capable of withstanding the full line to line maximum service voltage.

All busbars at joints shall be tin plated and firmly jointed. A drawing showing clearly the details and methods of jointing shall be provided.

The busbars shall be capable of being extended without difficulty on either side and provision shall be made for expansion and contraction of the busbars and connections.

The maximum temperature rise of the busbars and their joints above the ambient temperature, shall be 30°C under normal conditions. The busbars and connections shall be so protected or screened as to permit cable jointing and other connections to be carried out safely when the busbars are alive.

6.21.12 Circuit Breakers

The circuit breakers shall be of vacuum type with 25 kA breaking capacity. They shall be triple pole, draw out type. They shall be manufactured and tested according to latest revision of IEC 62271-100. All the three poles shall be coupled so as to operate simultaneously. The breaker shall have the following characteristics and ratings:

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

1.	Rated voltage, kV, rms.	17.5
2.	Rated insulation levels:	
	a) Rated one minute power frequency withstand voltage, kV, rms.	38
	b) Rated lightning impulse withstand voltage kV, peak.	95
3.	Rated frequency, Hz.	50
4.	Rated normal current at 50 Hz and at an ambient temperature of 50˚C, A, rms	630
5.	Rated short-time withstand current, kA	25
6.	Rated peak withstand current, kA, peak	63
7.	Rated duration of short-circuit, second	1
8.	Rated short-circuit making current, kA, rms.	63
9.	Rated short-circuit breaking current at rated voltage kA, rms.	25
10.	Operating duty	O-0.3 sec.-CO-3 min-CO
11.	Closing time, msec.	130
12.	Opening time, msec.	70

The circuit breaker shall be vertically or horizontally isolating and shall have mechanical interlocking devices, arc control devices and disconnecting devices, under carriage and automatic safety shutters with locking facility.

At least following mechanical interlocks shall be provided:

i) To prevent moving the circuit breaker to or from the connected position when the breaker is closed.

ii) To prevent closing the circuit breaker unless the primary disconnecting devices are in full contact or separated by a safe distance and the shutters are closed.

iii) To prevent switching when the auxiliary plug of the draw out CB is unplugged.

In addition, the Contractor/Manufacturer shall provide a sufficient number of interlocks to provide full safety for the operator when parts of the circuit breaker or its mechanism malfunction during the operation of the switchgear. A list and mode of operation of all such interlocks shall be supplied.

The breakers shall have mechanical "ON" and "OFF" position indicators.

The design shall be such that even after repeated fault interruptions, the capability of the circuit breaker to carry its rated current continuously is not impaired. The Contractor/Manufacturer shall provide literature and technical data in this regard.

The circuit breakers shall be capable of interrupting any current from zero to its rated breaking current when used on a predominantly resistive or inductive circuit. The break time at all currents less than the rated breaking current, shall not exceed the rated break time.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

The arc interrupting mechanism shall be designed with ample mechanical and electrical factors of safety in all its parts. These parts shall consist of a minimum number of assemblies arranged for convenient installation and readily removable for repair or inspection.

Silver plated; self-aligning isolating contacts shall be provided for separating the breaker from the busbars. They shall be adequately interlocked and protected by manually operated shutters with locking facility.

Silver plated plug contacts shall be provided between separable units to complete the secondary circuits. They shall be of the pressure loaded self-aligning type.

The temperature rise of the main contacts of a circuit breaker shall not exceed the value given in IEC Publication 62271-100 minus 10 K˚ to take into account specified ambient temperature of 50˚C against 40˚C ambient temperature considered in IEC.

The operating mechanism shall be spring charged power mechanism with manual push buttons for closing and opening the breaker. The closing springs shall be charged by a 220 Volt D.C. motor. The power mechanism shall be completely independent of the operator and shall consist of springs charged in readiness for closing operation.

The mechanism shall be trip-free. It shall be possible to prevent operation of the operating mechanism when maintenance is in progress on the circuit breaker.

The closing mechanism shall not prevent or delay the opening of the circuit breaker beyond the standard interrupting time.

The operating mechanism shall incorporate the following safety features:

i) The closing springs, if charged should not be capable of release while the circuit breaker is closed.
ii) Interlocks to prevent slow closing or slow opening of the circuit breaker in its service position.

The circuit breakers shall be provided with 220 volts. D.C. trip coils for operation with protection relays.

The circuit breakers shall be designed and constructed to operate without replacement of mechanical parts due to breakage, excessive wear or adjustment, for 2000 operations each consisting of a complete opening and closing operation of the circuit breaker.

Testing: The circuit breakers shall be tested in accordance with IEC 62271-100.

The circuit breakers shall be provided with a nameplate in accordance with IEC 62271-100.

6.21.13 Current Transformers

The current transformers shall be manufactured and tested in accordance with IEC 60044-1 and particulars listed herein.

Single pole, epoxy resin insulated, dry type, self-contained`, indoor current transformers suitable for mounting in the switchgear shall be supplied. The protective current transformers shall have the following ratings:

- Transformation ratios 150-75/5A for outgoing panels

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

		700-350/5-5A for incoming
-	Accuracy class	10P20
-	Output, VA	30

The measuring current transformers shall have the following ratings:

-	Transformation ratios	150-75/5A for outgoing panels 700-350/5-5A for incoming
-	Accuracy	0.5
-	Instrument security factor	5
-	Output, VA	15

The rated short time thermal current ratings of the 11 kV current transformers shall be 25 kA.

The rated dynamic peak current which the current transformers will withstand without being damaged electrically or mechanically shall be 108 kA.

Insulation Levels: The insulation levels for the current transformers shall be as given below:

i)	Rated Voltage, kV, rms.	17.5
ii)	One minute power frequency withstand voltage kV, rms.	38
iii)	Impulse withstand voltage, kV, peak.	95

The current transformers shall be tested according to latest revision of IEC 61869-2 for all ratios and taps.

6.21.14 Voltage Transformers

Voltage transformers shall be manufactured and tested in accordance with IEC Publication 60044-2 and requirements listed herein.

Three single phase, self-contained, indoor draw out type voltage transformers shall be supplied per bay. The voltage transformers shall be epoxy resin insulated.

The rated frequency shall be 50Hz and all rated output, accuracies and tests shall be for this rated frequency

The voltage ratio shall be 11000/110 Volts. The tests shall be carried out for above voltage ratio.

The characteristics of the voltage transformers shall be as follows:

-	Accuracy classification	0.2
-	Rated burden, VA	25 per phase

The voltage transformers shall withstand for one second the mechanical and thermal stresses resulting from a short circuit on the secondary terminals with full voltage maintained on the primary terminals. Provisions shall be made to protect the voltage transformers from faults in secondary side.

The dielectric test voltage shall be as follows:

-	Rated maximum primary	17.5

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

	voltage, kV, rms.	
-	One minute power frequency withstand voltage, kV, rms.	38
-	Lightning impulse withstand voltage, kV, peak.	95

The terminal markings shall be in accordance with IEC Publications.

Voltage transformers shall be wound type and tested in accordance with the methods of IEC Publication 61869-2.

A stainless steel diagrammatic nameplate shall be attached above the terminal box or to an alternate location if the alternate location is more readily accessible when the transformer is mounted. The nameplate shall include, as a minimum, the following information:

i) Serial number.
ii) Type and form designation.
iii) Rated primary voltage and ratio.
iv) Thermal burden rating at 50°C ambient temperature.
v) Rated insulation class.
vi) Impulse level, full wave in kV.
vii) Rated frequency.
viii) Name of manufacturer and year of manufacture.
ix) Connection diagram and polarity markings.

6.21.15 Instruments

The instruments shall be manufactured and tested in accordance with latest revision of IEC Publication 60051 and the requirements listed herein in Technical Specifications.

The indicating instruments shall be semi-flush mounted, back connected dust proof switchboard type, having a removable transparent, dust tight window cover with a dull black finish to match in appearance with relays and meters. Scale plates shall have a permanent white finish with black graduation and numerals and with the instrument transformer ratio for which instrument will be provided graduated prominently marked. The zero adjuster will be provided outside the instrument. All instruments shall be tropicalized.

Ammeters shall be suitable and robust enough to withstand the momentary large currents arising in the circuit during short circuit conditions without damage or loss of accuracy.

The marking of terminals of instruments should preferably be the same as those of the terminal of the instrument transformer to which they are to be connected.

A diagram of connection giving the following particulars shall be supplied with the instruments.

1. The current disposition of the connections carrying current to and from the instrument.
2. Diagram explaining internal wiring of the instrument.

The accuracy of instruments shall be of class 1.5 for ammeters and voltmeters.

The preferred full-scale value of ammeters for use with current transformers shall be as follows:

i) Ammeters:

Rated Primary Full Scale

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Current of CT (Amps)	Value, (Amps)
700-350	700-350
150-75	150-75

ii) Voltmeters: The voltmeters scale range shall be 0-15 kV.
Relevant data shall be marked on instrument to clarify the rating and make.

iii) kWh Meter and kVARH Meter: kWH meter shall be 3 phase 3 wire. It shall have maximum demand indicator to indicate in kilowatts. The potential coils shall be of 110 volts rating. The current coils shall be of 5 Amp rating. This meter shall be supplied and tested in accordance with IEC Recommendation 60043.

kVARH meter shall also be of the above-mentioned ratings for measuring the reactive energy. It shall be tested as per IEC Recommendation 60043.

The kWH and kVARH meters may be built into one case or may have independent cases and shall be mounted side by side.

The nameplates of the meters shall be in accordance with IEC Recommendation 60043.

6.21.16 Relays

Protective relays shall be of the back- connected dust proof, semi-flush, for operation in climatic conditions specified in Section-2 of Technical Specifications. The indicated temperatures may, however, be exceeded considerably in the immediate surroundings of the relays. Relays shall be tropicalized.

Relays shall be capable of 5000 electrical operations when tested at rated values of energizing quantities and at a rate which will not result in overheating. Withdrawable plug-in units and test plugs and sockets shall withstand 500 mechanical operations without suffering damage.

The relays shall withstand a test voltage of 2000 volts rms for 1 minute. All insulated parts and terminals shall be tested to earth. All circuits insulated from one another shall be tested with voltage applied between the circuits.

The overcurrent protection relays for 11 kV system shall be numerical type having definitive, inverse and instantaneous features.

Operation indicators shall be provided on all phases of relays and shall be designed for hand resetting. The operated position shall be clearly distinguished from the unoperated position. The color of the operation indicator flag shall be red on white background.

The relays shall incorporate test devices which shall be in front of panel mounted so that testing can be carried out from the front of the panels using test plugs. The test devices shall be so arranged that the current transformer secondary circuits cannot be open-circuited or voltage transformer circuits short-circuited at any position while test plugs or covers are being inserted or removed. A test device integral with a meter or relay is satisfactory if provision is made for testing each device. Sufficient number of test plugs shall be furnished.

The type tests listed below are specified. Certified "type test reports" on identical units shall be acceptable. The Contractor/Manufacturer shall indicate clearly the method of testing and test values for the limits of error test which shall be subject to approval. The relays shall meet the requirements of these Technical Specifications.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Type Tests

i) Limits of error.
ii) Temperature rise test.
iii) Overload test.
iv) Contact rating test.
v) Mechanical durability test.
vi) Variation of characteristics with ambient conditions.

The overcurrent relays shall have a rating plate marked with the following information:

i) Make.
ii) Type of relay.
iii) Serial number.
iv) Frequency.

6.21.17 Control and Termination

All control wiring shall be done with 600V grade, single core PVC insulated copper wire with 90°C operating temperature. All potential connections shall be made with 2.5 sq.mm. wire and all current connections with standard 4 mm^2 wire.

The control wires shall be tested with an A.C. voltage of 2 kV for 1 minute.

The ends of each wire shall be identified by suitable method.

In case of hinged panels matching terminal blocks shall be provided on both sides of the hinged section.

6.22 ERECTION, TESTING AND MAINTENANCE EQUIPMENT AND SPARE PARTS

6.22.1 General

These Specifications cover the requirements of testing, maintenance & erection equipment and spare parts.

All testing, maintenance and erection equipment shall be new & unused and shall conform to test, maintenance and erection (including assembly and disassembly) requirements of the various equipment offered during its useful life.

Erection equipment shall be manufactured especially for use with the equipment offered.

The testing equipment shall be lightweight, portable, compact, rugged and shall provide operating convenience and reliability for field testing. The testing equipment shall include meters, operating controls, safety devices, cables, toolkit, all accessories and spare parts. Contractor shall submit instruction, operation and maintenance manuals for all the testing equipment. The Proposer shall list in the Proposal, optional features available in the testing equipment offered.

6.22.1.1 Special Maintenance Equipment

SF6 Circuit Breaker Consisting of:

(1) Pipe clamping and grooving tool to obtain a good seal in the fittings of control circuit.
(2) Pipe crimping block.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

(3) SF6 refilling device.
(4) Module head lifting device.
(5) SF6 leak detector with complete accessories.
(6) Sets of single-end torque wrenches to fit every type of nut and bolt head, used for the circuit breakers and erection equipment.
(7) Sets of screw drivers, pliers and other normal tools.
(8) Sets of any other special tools required in the operation of the circuit breakers.

6.22.1.2 Erection and Maintenance Equipment, and Tools for Disconnectors

The Proposer shall provide erection and maintenance equipment and tools required for erection and maintenance of disconnectors.

6.22.1.3 Testing Instruments

These shall be robust; state of art numerical instruments conforming to IEC standards and have proven experience.

1. Universal Relay Test Set Omicron CMC 356, Fareja-549or ISA DRTS 64with complete accessories along with dedicated latest laptop computer, laser jet colored printer or any other compatible approved set, suitable to test distance and other relays.
2. Latest Laptop Computer along with laser jet colored printer having provision of A4& A3 prints along with both sides printing facility and complete accessories as specified for uploading and downloading the setting for testing.
3. Primary Current Injection Test Set (0-3000A).
4. Three phase secondary injection test set with input voltage 400V, 3Ø, 50 Hz output range 0-50A, 110-120V.
5. Phase sequence indicator 3ø, voltage range 100 to 500V, 50 Hz.
6. Digital phase angle meter type Multiamp Model 175A or approved Equivalent.
7. High voltage insulation resistance tester.
8. Digital type Standard Multi-range, Multimeter with DC/AC current, voltage and ohm Scales, Fluke or approved equivalent.
9. Single phase Variac input 230V, Output 0-260V, 8A/2kVA.(10)
10. Three phase Variac input 400V, 50HZ, Output 0-450V, 2A/500VA.
11. Digital standard multi-range clip-on meter.
12. Contact resistance measurement set Program type Micro Ohmmeter MOM200A or approved equivalent.
13. Dielectric Test Set for Insulating Oil 90kV as per WAPDA Specification P-156:81.
14. Capacitance and Dissipation Factor (C & DF) Test Set 12 kV.
15. Battery Ground Test Set Multiamp BGL or equivalent.
16. Battery capacity/discharge test system TORKEL 900 complete with Extra Load TXL870 and software and printer or equivalent.
17. Test equipment for verification of magnetization characteristics of current transformers etc. (Omicron CT Analyzer) or approved equivalent.
18. Battery cell terminal voltage measurement and recording test set.
19. Resistance bridge for accurate measurement of low resistance such as of CT & VT windings and cables.
20. Earth resistance tester for measurement of the earth resistance, soil resistivity and ohmic resistances.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

21. Portable Circuit Breaker Analyzer/Chronograph system Program type TM1760 complete.
22. DC Hipot test set 0-80 kV as per WAPDA Spec. P-157:81.
23. AC Hipot test set 130 kV Phoenix USA Type BK130 or equivalent.

6.22.2 Mandatory Spare Parts for Switchyard

6.22.2.1 General

All spare parts shall be new, strictly interchangeable with the parts by which they are intended to be replaced and shall conform to the relevant Specifications. In case the Proposer's estimates differ from the specified quantities, the Proposer shall furnish his own supplementary list of additional recommended spare parts for maintenance for Five (05) years under specified environments.

a) 132kV Circuit Breaker

Circuit breaker along with operating mechanism complete as specified/used type, but without supporting structure.	Set	1
Seals, gaskets, washers, O-rings and other consumable parts required for lifetime maintenance of the circuit breaker as recommended by the manufacturer.	Set	2
Contactors, switches, push buttons, indicators, relays, timers, gas density meters, MCBs etc.; one of each type used for circuit breaker control and monitoring systems.	Set	1
SF6 in standard containers	kg	100

b) 132 kV Disconnectors

Three pole disconnectors along with operating mechanism complete as specified but without supporting structure.	Set	1
Three pole disconnectors with earthing switch along with operating mechanism complete as specified but without supporting structure.	Set	1
Main contacts (complete set), MCBs, contactors, relays, timers; one of each type used in control system of the disconnector/earthing switch.	Set	2

c) 132 kV Surge Arrester

132 kV surge arrester, single pole, complete with discharge counter but without steel supporting structure.	Set	1

d) 132 kV Insulators

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

	Suspension insulator disc.	Each	100
	Station post insulator stack, complete, without supporting structure.	Set	3
e)	**Control Board and Metering Board**		
	Switch board indicating lamps, of each type used.	Each	20
	Color caps for indicating lamps of each type used.	Each	20
	Resistor for 230V DC indicating lamp.	Each	20
	Resistor for 230V AC indicating lamp.	Each	20
	M.C.B.'s of each type used.	Each	3
	Control and instrument switches (one for each type used).	Each	2
	Terminal block with marking strip and cover (25% of the quantity installed).	Lot	1
	Test blocks and plugs of each type used.	Set	3
	Test switches.	Set	3
	Digital multimeter	Set	2
	Indicating and recording instrument set consisting of one of each type of instrument used.	Set	1
	Semaphore indicators.	Set	1
	DC annunciator relays units complete one of of each type used.	Set	1
	Indicator meter of each type	Set	1
	Energy meter of each type	Set	1
	AC annunciator unit complete including annunciator relay each type used	Set	2
f)	**Relay Boards and Relays**		
	Line Protection Relays		
	Distance cum differential relay of used type.	Set	1
	O/C relay and earth fault relay of used type used.	Set	1
	Miscellaneous Protection Relays		
	Breaker failure relay one of each type used.	Set	1
	Synchronism check relay of each type used.	Set	1
	Bus bar low impedance centralized relay	Each	1
	Auxiliary relays consisting of one of each type		

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

	used.	Set	1
	Test plug for relays and meters, one of each type used.	Set	2
	M.C.B's of each type used in the relay panels.	Set	2
	Supervision relay for D.C. supply	Each	2
g)	**132 kV Capacitor Voltage Transformer**		
	132 kV CVT& SMS VT Complete as Specified/used without steel support structure.	Each	1
	M.C.B's one of each type used.	Set	2
	Drain coil	Each	2
h)	**132kV Current Transformer**		
	Current transformer (bay & SMS), single pole as Specified/used without steel supports structure.	Each	1
	Gaskets of each type used.	Set	2
i)	**AC/DC Auxiliary Supplies**		
	MCB's of each type used.	Set	1

6.22.3 Mandatory Spare Parts for Remote End Line Bays (Aliabad)

All spare parts shall be new, strictly interchangeable with the parts by which they are intended to be replaced and shall conform to the relevant Specifications. In case the Proposer's estimates differ from the specified quantities, the Proposer shall furnish his own supplementary list of additional recommended spare parts for maintenance for Five (05) years under specified environments.

Table 6-2 Spare Parts

Sr. No.	Description	Unit	Qty. for One Line Bay
A	**145kV Circuit Breaker**		
a)	Single Pole Circuit Breaker (excluding Base Frame)	No	1
b)	Closing Coils	No	1
c)	Trip Coils	No	2
d)	SF6 gas in standard container of 40kg	No	1
e)	Complete set of control and shut off valves along with seals	Set	1
f)	Gas density monitor	No	1
g)	SF6 gas filling kit containing control valve for connection to gas container and 20m gas filling hose with connector	Set	1

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Sr. No.	Description	Unit	Qty. for One Line Bay
h)	Handles for manual charging of closing spring	No	1
B	**145kV Disconnector**		
a)	Interlocking coils for disconnector and earthing switch	No	2
b)	Operating mechanism complete	No	1
c)	Set of moving and fixed contact or contact blades for disconnector and earthing switch	Each.	1
C	**120kV Surge Arrester**		
a)	120kV surge arrester, single pole, complete with discharge counter, without steel suppor structure	No	1
D	**Control and Energy Meter Panels**		
a)	MCB's of each type	Set	1
b)	Control and instrument switches (one of each type used)	Set	2
c)	Test blocks and plugs (one set of each type used)	Set	2
d)	Test switches of each type used	Set	2
e)	Watt and VAR transducers of each type used	Set	2
f)	Indicating and recording instruments consisting of following:		
i.	Ammeter	No	2
ii.	Voltmeter	No	2
iii.	MW meter	No	2
iv.	MVAR meter	No	2
v.	Selector switch for voltmeter	No	2
vi.	Frequency meter	No	2
vii.	PF meter	No	2
viii.	Energy meter	No	2
g)	Semaphore indicator	No	2
h)	DC hooter	No	2
i)	DC siren	No	2
j)	AC bell	No	2
k)	DC annunciator relay unit complete, one for each type i.e., 4W, 6W, 8W, 12W, 24W	Set	1
l)	Fuses (25% of quantity installed)	Lot	1
m)	AC annunciator unit complete including annunciator relay etc.	No	1
n)	Discrepancy type control switch	Each	2
E	**Relay Panels**		
a)	Distance relay (one of each type used)	Each	1

e)	Supervision relays for trip coil circuit	Set	1
f)	Tripping relay (one of each type used)	Set	1
g)	MCB's and fuses (25% of quantity installed)	Lot	1
h)	Auxiliary relays (one of each type used)	Set	1

6.22.4 Spare Parts Books

For each separate piece of equipment, the Contractor shall provide a spare parts book. This spare parts book shall contain an assembly drawing of the equipment which shall show all parts of the equipment marked and designated.

6.22.5 Packing

The spare parts shall be treated and packed for storage for a long time in the climatic conditions specified in other Sections of these Specifications. Each spare part shall be clearly marked or labeled on the outside of its packing with its description and purpose. When more than one spare part is packed in a single case or container, a general description of its contents shall be shown on the outside of such case or container and detailed list enclosed.

6.22.6 Paint

For field touch up work, 30liters of paint lacquer as used on various equipment under these Contract Documents shall be provided.

6.23 ERECTION, TESTING AND COMMISSIONING

6.23.1 General

The Contractor shall complete the erection, testing and commissioning of the switchyard and shall hand over in proper working order in accordance with the Contract Documents. All work of assembly, construction and erection shall be done in a neat, first-class workmanship manner according to the best practice applicable and as approved by the Employer

The Contractor shall submit a detailed description of the field tests he intends to carry out on his equipment, comprising test protocols, testing and commissioning procedures etc. for Employer's review well before starting of the field tests.

The Contractor shall be responsible for satisfactory field testing and commissioning of equipment to the satisfaction of the Employer prior to the energization. Employer may also ask the Contractor to perform additional tests, which may not be listed, to prove that particular equipment is fit for commissioning and energization.

A record of all performance tests shall be embodied in a report to be submitted by the Contractor upon completion, to the satisfaction of the Employer of the tests described herein

together with such other tests as may be agreed between the Contractor and the Employer, which collectively shall constitute the Commissioning Tests.

The Employer may, at his option, require that tests be made after the equipment has gone into service in order to demonstrate that all performance guarantees have been met. The Contractor will be permitted to have his representative present at his own expense and make all necessary corrections. Additional tests shall then be made under the directions of the Employer to demonstrate to his own satisfaction the effectiveness of these corrections. These additional tests shall be at the Contractor's expense. Until the necessary corrections have been satisfactorily made, the conditions of the Contract shall not be considered fulfilled.

Upon completion to the satisfaction of the Employer, of the tests specified hereafter together with such other tests as may be agreed between the Contractor and Employer shall collectively constitute the commissioning tests. The Contractor shall certify in writing to the Employer that the equipment or part of the equipment has been installed and tested to the satisfaction of the Employer and is ready for energization.

All instruments and test equipment required for complete installation, testing and commissioning of plant shall be arranged by the Contractor.

6.23.2 Erection and Installation

6.23.2.1 High Voltage Bus-Work

6.23.2.1.1 General

The Contractor shall install the conductor, insulators and the hardware for strain and tubular buses and overhead shield wire in accordance with approved drawings.

6.23.2.1.2 Conductor and Buses

Buses which are used in tension shall be free of joints or splices. All bus connectors shall be clamped firmly and locked securely. The equipment and methods used for stringing the conductors shall be approved by the Employer and shall be such that the conductor will not be damaged during the stringing operation.

Tubing’s used for bus work and connections to equipment shall be shaped and formed prior to installation to reduce the possibility of damaging equipment terminals. All tubing shall be installed in such a fashion that stresses between connecting terminals will be reduced to a minimum. If connection is made to the equipment on another foundation or structure then the tubing shall have flexible connectors at one end.

The radius of tubing bends shall not be less than four times the diameter of the tubing, and such bends shall be free from kinks, indentations, or flattened surfaces. Tubing shall be utilized in such a manner as to minimize the necessity of splicing. Splicing will not be allowed unless unavoidable. All terminals shall be bolted securely and locked. All connections shall be thoroughly cleaned to remove oxide film. An oxide retarding compound of approved type shall be used at all connections and precautions shall be taken to seal moisture out of the joint to avoid galvanic corrosion.

6.23.2.2 Circuit Breakers

The circuit breakers shall be assembled, placed, leveled, aligned and grouted on their concrete foundations and connected in accordance with approved drawings.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

The circuit breaker control panels shall be factory wired. The control and power cables shall be terminated at terminal blocks. Connections to control mechanism shall be with control cables running through conduit from cable trench to mechanism cabinets.

6.23.2.3 Disconnectors

The Contractor shall assemble, mount and connect all gang operated switches. Each pole of the disconnector shall be installed so that the base shall not be stressed unequally when bolted to the supporting member. The poles of the disconnector shall be aligned accurately and leveled on the supporting steel structures and shall be adjusted to permit a smooth and completely controlled movement through the entire operating cycle.

The bearing and the operating mechanism shall be lubricated properly. All contacts of the switches shall be adjusted and aligned for proper contact pressure and coated with corrosion inhibiting grease.

6.23.2.4 Surge Arresters

Surge arresters shall be mounted as close as possible to the apparatus being protected.

6.23.2.5 Instrument Transformers

Instrument transformers shall be mounted and connected in accordance with standard practice. Secondary connections to current transformers shall be made with minimum 6 sq.mm conductors and to voltage transformers with minimum 4 sq.mm conductors. Separate cable against each core/winding shall be provided.

All taps of each core shall be provided in CT junction box.

The connecting cables shall run in metallic conduits from trench to instrument transformers.

6.23.2.6 Switchyard Protection System

Switchyard relay panels shall be erected on channel iron bases. The channel irons shall be leveled and grouted in place and the bay Contract units and relay board panels mounted thereon. The Contractor shall mount all equipment and shall make all necessary connections and interconnections to the panels in accordance with the approved standard practices.

All instruments and relays shall be properly installed, connected and tested to meet the technical specifications in the presence of the Employer.

6.23.2.7 Telecommunication and SCADA Systems

Proper care shall be taken to avoid mechanical joints, shocks or vibrations to the equipment. If any soldering etc. on site is necessary, the person making these connections and tools will be properly grounded during the entire operation. Commissioning shall include operational tests to verify all possible modes of operation of SSB, protection and switching equipment. Signal to noise ratios will be monitored and demonstrated to be equal or better than design values.

6.23.2.8 Control and Small Power Cables

Cables shall be installed on cable supports, in cable trenches or in conduits. Cables shall be installed with sufficient slack to allow for expansion and contraction and tied at each support point. If laid in trenches, the cables shall rest on cable supports suitably spaced, and shall be

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

fastened at appropriate points, using bolted galvanized straps, which should not press tightly against the insulation nor damage the outer sheath.

Where group of cables enter or leave the trench, each shall be identified with stenciled metal tags. Each tag shall indicate the terminal location to which it is attached. At each cable termination, the cables shall be clamped below the terminal block. Cable glands of appropriate sizes shall be used at cable entrances into control panels, relay panels and marshalling boxes.

Cable runs shall be continuous from terminal to terminal to the extent permitted by available commercial lengths. Splicing shall not be permitted.

Insulated wire and cable shall be handled with care so as to avoid kinking and damage to insulation and outer jackets. Cables shall not be bent around a radius less than that recommended by the manufacturer.

Each wire terminating in a terminal block shall carry a permanent identification tag (ferrule) bearing the same identification number as given on the drawings. Slip-in type ferrules should not be used for this purpose.

The Contractor shall install all lugs, terminal blocks and terminals required and shall make all connections required to provide a complete installation ready to operate. Cable identification tags of a permanent type shall be provided and installed on both ends of each power and control cable.

Connections in lighting wires and cables shall be insulated with layers of plastic insulating tape or with high grade rubber tape over which friction tape shall be applied.

Sufficient slack shall be allowed in each run where a number of cables or wire comprising a circuit are trained through a pull box, terminal box, trench or tray and shall be neatly placed and tied together. Lacing shall also apply from the point of leaving a cable-tray or raceway to the point of attachment on the terminals of the Switchgear, switchboard or other devices unless the run is in conduit.

6.23.2.9 Switchyard AC Power

The Contractor shall install all required power and auxiliary apparatus, cables and make all connections.

6.23.2.10 AC and DC Auxiliary Supplies

The Contractors shall install and connect the equipment under these specifications as specified in Section 6.17.

6.23.3 Testing and Commissioning

6.23.3.1 HV Bus-Work / Equipment Connections

1) Verification of tightness of nuts/bolts as per the recommended torque.
2) Verification of sag and tension of the overhead conductors.
3) Measurement of contact resistance of the HV connections.
4) Thermo vision survey of the HV connections after energization at high voltage.
5) Check of visible corona after energization.
6) Voltage drop test with a minimum 100 A.

6.23.3.2 Circuit Breakers

a) Measurement of insulation resistance (Megger tests).

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

b) Measurement of air content and humidity in SF6 gas in the cylinder before its filling into the breaker.

c) Measurement of air content in SF6 at four times after filling in the breaker up to completion of maintenance period.

d) Recording of humidity content of the SF6 gas at four times after filling in the breaker up to completion of maintenance period.

e) SF6 leakage tests.

f) Verification of ac and dc auxiliary supplies in respect of magnitude and phasing/polarity.

g) Verification of pick-up and drop-off of each of the SF6 pressure switches at rising and dropping pressures.

h) Verification for each hydraulic/pneumatic pressure switch in respect of pick-up & drop-off

i) Verification of operation of pressure relief valves.

j) Verification of pressure thresholds for pump start/stop, breaker automatic tripping/ blocking/lockout of close, trip and auto reclose operations.

k) Measurement of starting and running currents, and direction of rotation of hydraulic/compressor motors.

l) Measurement of time to reach the pump cut-off pressure:

- From zero pressure
- After close operation
- After open operation
- After CO operation
- After OCO operation

m) Measurement of loss of hydraulic pressure over 24 hour period.

n) Measurement of current in the tripping/closing coils.

o) Measurement of operating times:

- Measurement of operating time at minimum, nominal and maximum dc supply voltage.
- Measurement of operating times at maximum, nominal and minimum hydraulic pressures.
- Measurement of time for "O", "C", "CO" and "OCO" operations

While performing the timing tests, in addition to the numerical printout, traces of contact travel and close/open positions i.e. graphical recording of times should be appended to the test reports.

Timing of each interrupter and each pre-insertion resistor shall be separately recorded and shall be graphically visible on the timing strips.

p) Verification of pre-insertion time of closing resistors.

q) Verification of time variation between opening of series contacts on any one phase.

r) Verification of time variation between opening of contacts of any two phases.

s) Measurement of contact resistance.

t) Verification of functioning of auxiliary contacts.

u) Verification of setting of the hydraulic motor thermal protection relay by secondary injection.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

v) Verification of functioning/calibration of every timing relay used in the control system.
w) Verification of trip free operation and pole discordance functions.
x) Functional tests in respect of local/remote controls, interlocking, anti-pumping, annunciation, fault & events recording, SCADA functions etc.
y) Functional tests of heating and lighting for the panels and cubicles.
z) Verification of grounding connections and continuity.
aa) Check of visible corona after energization.

6.23.3.3 Disconnectors / Earthing Switches

a) Measurement of insulation resistance (Megger tests).
b) Verification of ac and dc auxiliary supplies in respect of magnitude and phasing/polarity.
c) Verification of mechanical adjustments. Field measurements should be compared with the manufacturer's recommended adjustments and tolerances.
d) Measurement of contact resistance of the main contacts.
e) Verification of limit switch operation.
f) Verification of operation of auxiliary switches.
g) Measurement of operating times for opening and closing operations.
h) Measurement of starting and running currents of motors of disconnecting and earthing switches at minimum. nominal and maximum auxiliary supply voltage.
i) Verification of functioning of motor protection devices by secondary injection.
j) Functional tests in respect of local/remote controls, interlocking, annunciations, fault & events recording, SCADA functions etc.
k) Functional tests of panels'/cubicles' humidity control, ventilation, internal illumination
l) Verification of grounding connections.
m) Check of visible corona after energization.

6.23.3.4 Surge Arresters

a) Test of insulation resistance:
- HV-Ground/Base
- Base-Ground
b) Verification of grounding connections and continuity.
c) Measurement of ground resistance.
d) Verification of surge counter operation.
e) Functional tests of surge arrester remote signaling, annunciations, events and fault recording facilities which ever available with surge arrester.
f) Measurement of leakage current with leakage current analyzer subsequent to energization of surge arrester.
g) Check of visible corona after energization.

6.23.3.5 Current Transformers and Current Circuits

a) Verification of insulation resistance (Megger test):
   - Primary to ground
   - Each secondary winding to ground

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- Primary to each secondary winding
- Between secondary windings

b) Measurement of winding resistance of each secondary winding.

c) Measurement of capacitance and dissipation factor.

d) Verification of winding polarities by flick test.

e) Verification of magnetization characteristics and knee-point voltages at each tap.

f) Verification of ratios.

g) Verification of current circuits:

Following checks and tests shall be made for the current circuits fed from the bay CTs and transformer bushing CTs:

- Each CT circuit shall be verified for grounding at one point.
- Phase-N loop resistance values shall be measured and recorded.
  * Loop resistance measurements shall also provide lead resistance values.
  * Resistance measurements shall be with wheat stone bridge.
- Verification of all current circuits associated with bay CTs
  * Primary injection shall be carried out for at least the following combinations:
  * Each CT:
    R-G
    Y-G
    B-G
    R-Y
    R-B
  * Busbar 1 CT and Mid CT in series:
    R-G
    Y-G
    B-G
  * Secondary current measurements at each test block shall include recording of current magnitude as well as relative phase angle.
  * Burden volts across each CT core shall be recorded during primary injection.
  * In addition to measurement of magnitude of current and its relative phase angle at each test block during primary injection, current in panels' internal wiring shall be checked.

h) Verification of operation of protective devices at the final (fault) settings during primary injection.

i) Dissolved gas analysis (D.G.A) and measurement of moisture content of oil samples from each current transformer for future reference.

j) Functional tests of panels'/cubicles' humidity control, ventilation, internal illumination

k) Verification of grounding connections and continuity.

l) On-load tests on current transformer circuits:

- Secondary current measurements at each test block in respect of current magnitude as well as relative polarity.
- Measurement of burden volts across each CT core.
- Measurement of current magnitude in panels' internal wiring.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

m) Check of visible corona after energization.

6.23.3.6 Coupling Capacitor Voltage Transformers (CCVTs) / Capacitor Voltage Transformers (CVTs) and Voltage Circuits

a) Tests of insulation resistance (Megger tests):
   - Primary winding-ground
   - Primary to each secondary winding
   - Secondary to ground and between secondary windings

b) Measurement of winding resistance at each tap

c) Verification of polarities:
   - In case polarity of CCVT/CVTs/VTs windings cannot be verified with the flick test, phase angle meter shall be used to check the phase angle between the primary injected voltage and secondary output.

d) Verification of voltage ratio at each tap by primary injection.

e) Capacitance and dissipation factor measurements.

f) Verification of voltage circuits:
   - Verification of grounding of each voltage circuits at one point
   - If voltage circuits associated with CCVTs/CVTs/VTs cannot be verified with primary injection, secondary injection shall be made from the terminal box of the voltage transformers
   - Measurement of related burden amperes for each core
   - Voltage selection for synchronizing system for each combination of circuit breakers' and disconnectors positions shall be checked

g) Functional tests of panels'/cubicles' humidity control, ventilation, internal illumination

h) Dissolved gas analysis (DGA) and measurement of moisture content of oil samples from each voltage transformer for future reference.

i) Verification of grounding connections and continuity.

j) On-load/post energization tests shall be in respect of voltage magnitude, phase angle and phase rotation at the test blocks; voltage magnitude and phase rotation at the terminals of the major devices in the panels; measurement of burden current for each core.

k) Check of visible corona after energization.

6.23.3.6.1 Metering Boards

a) Measurement of insulation resistance (Megger tests)

b) Verification of AC&DC auxiliary supply magnitude and polarity/phasing.

c) Verification of grounding connections.

d) Verification of MCBs operation at settings of thermal/magnetic releases.

e) Verification of calibration of each energy meter and MW/MVAR/Voltage recorder by secondary injection:
   - Injected quantities for recorders shall correspond to at least 25%, 50%, 75%, 100%, 125% and full scale of the instrument
   - For MW and MVAR recorders and energy meters, tests shall also be carried out for at least the following combinations of magnitude and power factor of the measurands:
     * 100% Load: Angle 0, +30, +60, +90, -30, -60, -90 degrees

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

* 50% Load: Angle 0, +30, +60, +90, -30, -60, -90 degrees
* 25% Load: Angle 0, +30, +60, +90, -30, -60, -90 degrees

f) Functional tests of panels'/cubicles' humidity control, ventilation, internal illumination.

g) On-load tests:

- Current circuits: Measurement of current magnitude, relative phase angle, burden volts
- Voltage circuits: Measurement of voltage magnitude, phase angle, phase rotation and burden amperes
- Directional checks of power recorders and energy meters.

6.23.3.6.2 Outdoor Marshalling Kiosks and Cubicles

a) Measurement of insulation resistance (Megger tests)
b) Verification of AC&DC auxiliary supply magnitude and polarity/phasing.
c) Verification of grounding connections.
d) Verification of calibration of adjustable devices such as timers
e) Verification of MCBs operation at settings of thermal/magnetic releases.
f) Functional tests to verify alarms, indications, annunciations.
g) Functional tests of humidity control, ventilation, internal illumination.

6.23.3.6.3 Protection Boards

a) Measurement of insulation resistance (Megger tests)
b) Verification of AC&DC auxiliary supply magnitude and polarity/phasing.
c) Verification of grounding connections.
d) General tests on each protective device including contactors, timers, auxiliary relays etc. as per the manufacturers' recommended procedures and tests protocols.
e) Verification of protective devices' calibration at the final settings.
f) Verification of protective devices' characteristics.
g) Verification of MCBs operation at settings of thermal/magnetic releases
h) Functional tests of protective devices including operation of power swing blocking relays, auto reclosers etc.
i) Functional tests of protection tele-signaling.
j) Functional tests of complete protection schemes.
k) Functional tests of indications, alarms, annunciations.
l) Functional tests of panels'/cubicles' humidity control, ventilation, internal illumination.
m) On-load tests:

- Verification of current circuits
- Verification of voltage circuits
- Directional tests
- Tests of differential protections by de-stabilizing the current circuits.

6.23.3.7 Telecommunication and SCADA Equipment

Site Tests shall be performed comprising, as a minimum, the following:

6.23.3.7.1 Power Line Carrier System

a) Installation checks.
b) Wiring, termination and earthing checks in accordance with interconnection drawings.
c) Return loss measurement for each PLC link.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

d) Line attenuation measurement for each PLC link.
e) Functional tests on end to end DPLC/DPSE terminals. The tests shall be determined from the Factory Test Procedures.
f) Setting of system functions i.e., AF signal levels, equalization etc.
g) Interfacing to RTU, PAX, Power supply etc.
h) Local and functional tests in conjunction with protection system.
i) Functional tests of command transmit and receive counters.
j) Verification of remote tripping of circuit breakers with direct transfer trip commands.

6.23.3.7.2 Telephone (PAX) System

a) Installation checks.
b) Wiring, termination and earthing checks.
c) Check all connections with the external MDF.
d) Functional tests of trunks and extensions.
e) Check of all types of tones in the system.
f) Check of BER (in case of 2 Mbit/s trunks), AF signal levels, etc.
g) Verification of trunk routes (direct & alternative).
h) Testing of all software features and facilities (local and network). Proper working of network facilities (priority cut-in, forced release, section dialling…) over analogue and digital trunks shall be successfully demonstrated.
i) Tests of system reloading and resetting capabilities in the event of occurrence of various categories of faults.
j) Tests to ensure correct receipt and logging of alarms and correct functioning of automatic diagnostic routines

6.23.3.7.3 48V DC Power System

a) Installation checks.
b) Functional tests and settings on the 48v battery chargers to demonstrate that they maintain their float and boost characteristics within the power supply variations and meet the requirements of the specifications.
c) Capacity test on the batteries at a discharge rate to be approved by the Employer.

6.23.3.7.4 SCADA System

6.23.3.7.4.1 Remote Terminal Unit

a) Installation checks.
b) Wiring, earthing and termination checks.
c) Local testing of each tele information point between RTU and Process.
d) Test of each tele information point between RTU and SCADA/EMS at NPCC.
e) End to end test of each tele information point between the Process and SCADA/EMS (point to point test).

6.23.3.7.4.2 Data Communication links

a) Installation checks.
b) Functional tests, on end to end basis, to determine the quality of each data link between Rahim Yar Khan and NPCC.

6.23.3.7.4.3 Station Direct Wire Telephone System

a) Installation checks.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

b) Wiring, earthing and termination checks.

c) Functional tests, to check the voice communication between subscribers and control room operator and between the subscribers.

6.23.3.7.4.4 Public Address System

a) Installation checks.

b) Wiring, earthing and termination checks.

c) Functional tests, to check the voice communication between loud speaker locations and the control room operator.

6.23.3.8 Test Equipment

The Contractor shall arrange the test equipment for the above tests. The Contractor shall ensure that is calibrated and suitable for these tests. Calibration certificates valid for at least one year shall be provided.

6.23.3.8.1 Control and Power Cables

6.23.3.8.1.1 MV Cables

a) Verification of insulation resistance (Megger test):
   - Core-Ground/Shield/Armor
   - Core-Core

b) Verification of core(s) continuity.

c) High voltage/Dielectric tests.

d) Verification of shield continuity and grounding.

e) Verification of armor continuity and grounding.

f) Verification of tightness of connections.

6.23.3.8.1.2 LV Cables

a) Verification of insulation resistance (Megger test):-core-core, core-ground/shield

b) Verification of core(s) continuity

c) Verification of shield/armor continuity.

d) Verification of shield/armor grounding

e) Dielectric tests: 2000V ac, one minute

f) Verification of tightness of connections.

6.23.3.9 Grounding and Lightning System

6.23.3.9.1 Grounding System

a) Visual verification of each grounding connection

b) Verification of tightness of grounding connections as per recommended torque.

c) Verification of effectiveness of switchyard grounding system by an appropriate method commensurate with installations involving large mesh.

d) Continuity tests of each grounding connection

e) Ground grid integrity test

f) Measurement of grounding resistance with earth resistance tester:
   - Each neutral connection of transformer.
   - Each neutral connection of shunt reactor
   - Each surge arrester connection

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- Building grounding
- Panels and equipment inside the buildings

6.23.3.10 AC and DC Auxiliary Supplies

6.23.3.10.1 DC Distribution Boards

Following tests shall be performed on MCBs in the DC distribution boards:

a) Verification of breakers'/MCBs' operation at settings of thermal/magnetic releases
b) On-load tests: Measurement of loading of each circuit.

6.23.3.10.2 AC Distribution Boards

Following tests shall be performed on MCBs in the AC distribution boards:

a) Verification of voltage and phasing up to each outgoing breaker/mcb
b) Verification of breakers'/MCBs' operation at settings of thermal/magnetic releases
c) On-load tests: Measurement of loading of each circuit

6.23.3.11 Temperature inside Panels, Cubicles and Marshalling Kiosks

Recording of temperatures inside the panels, cubicles and marshalling kiosks:

- Temperature to be measured after panels, cubicles, marshalling kiosks have been energized with ac and dc supplies and all devices mounted therein have been in service for sufficient time.
- Ambient temperatures i.e., room temperature for indoor equipment, yard temperature for outdoor equipment to be recorded.

6.23.3.12 Coordinated Functional Tests of Control, Protection, Metering and Monitoring Systems

Functional tests shall be carried out to verify coordinated functioning of the control, protection, metering and monitoring systems.

6.23.3.13 Miscellaneous

a) Performance of additional tests to verify characteristic(s) and functions peculiar to the design of an equipment or system device installed at the switchyard/utilized in the protection, control, metering and monitoring systems shall be assessed at the detailed engineering and implementation stages.
b) Visual inspections of equipment and devices shall be carried out in respect of damage, labelling, alignment, dust proofing, sealing against vermin etc.
c) Humidity and vibration recording devices are fitted to the equipment and systems for monitoring during transportation. Recordings of these devices shall be inspected upon arrival/installation at the site. Copies of the recordings shall be made part of the site test books.
d) High voltage tests shall be performed on the equipment in accordance with the standards.
e) Applicable tests and verifications mentioned in the above sections and sub-sections shall be applicable to all the equipment and systems not specifically mentioned herein above but may be installed at the switchyards.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

ANNEXURE-I: TECHNICAL SCHEDULES (E&M WORKS)

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

1. HYDRO-MECHANICAL EQUIPMENT

1.1 TURBINE AND AUXILIARIES

Item	Designation	Unit	Value	Remarks
1	Manufacturer name and Country of Origin			
2	Place of manufacture			
3	Number & type of turbine		3 x Vertical Francis	
4	Rated speed	rpm	375 rpm	
5	Direction of rotation viewed from generator side		Clockwise	
6	Shaft alignment		Vertical	
7	Guaranteed efficiency of turbine at:			
	1. 100% rated output	%		**Min 93%**
	2. 90% rated output	%		
	3. 80% rated output	%		
	4. 70% rated output	%		
	5. 60% rated output	%		
	6. 50% rated output	%		
	7. 40% rated output	%		
8	Guaranteed Weighted Average Efficiency (Refer to clause 1.1.15 for weighting factors of this volume)	`%		**>92.8%**
9	Model Hill Diagram. Attachment no.:			
10	Prototype Performance diagram / Hill Diagram. Attachment no.:			
11	Prototype and/or Model test data for demonstrating the Efficiency guarantees. Attachment Nos:			
12	Graph showing the stable operating rage of turbine for continuous operation. Attachment no:			
13	Prototype and/or Model test data for demonstration of the cavitation guarantees given. Attachment Nos:			
14	If the sediment content will influence the cavitation guarantees, this shall be shown at attachment no:

	Speed at reduced mode	m/min	
7	Crane travelling speeds:		
	Fast	m/min	
	Slow	m/min	

2.3 TRASH RACK CLEANING MACHINE

Item	Designation	Unit	Value
1	Manufacturer		
2	Country of Origin		
3	Type		
4	Capacity	Ton	
5	Travelling speeds:		
	Fast	m/min	
	Slow	m/min	

3. ELECTRICAL PLANT EQUIPMENT

3.1 GENERATORS

Description	Unit	Value
Manufacturer		
Origin of manufacturing		
Type		

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Description	Unit	Value
Applicable Design Standard		
Maximum Continuous Rating at rated pf, rated voltage, rated frequency and Class B temperature rise Guarantee value	MVA	
Rated Output, SN	MVA	
Rated Power Factor, PF (lagging & leading)		
Rated Voltage, UN	kV	
Voltage Limits	± %	
Rated Current, IN	A	
Rated Frequency, fN	Hz	
Rated Speed, nN	rpm	
Design Runaway Speed	rpm	
Rotor, Moment of Inertia, J	tm^2	
Direction of Rotation	Clockwise, Anti-clockwise	
Losses at Maximum Continuous Rating, Rated Voltage, Temperature 75°C and 50 Hz		
Iron losses	kW	
Mechanical losses	kW	
I2 R-losses	kW	
Excitation and field circuit losses	kW	
Total Losses **Guarantee value**	kW	
Efficiencies: At rated output and 75 °C winding temperature. Bearing losses caused by turbine runner weight and hydraulic load shall not be included.		
At PF= 0.8 - 23.20 MVA (100% load)	%	
- 17.40 MVA (75% load)	%	
- 11.60 MVA (50% load)	%	
At PF= 1.0 - 23.20 MVA (100% load)	%	
- 17.40 MVA (75% load)	%	
- 11.60 MVA (50% load)	%	
Temperature Rise provided that air temperature entering into the generator through the air coolers does not exceed 40 °C at rated load and power factor:		
Stator winding, average value measured with ETD	K	

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Description	Unit	Value
Rotor winding, the entire winding measured by the resistance method	K	
Stator core, average value measured with ETD	K	
Maximum temperature rises above ambient air:		
Excitation transformer windings, average measured with ETD	K	
Absolute temperatures		
Drive End Sliding bearing temperature, measured with ETD in the Babbitt metal	°C	
Non-drive End Sliding bearing temperatures, measured with ETD in the Babbitt metal	°C	
Outlet cooling water, the inlet temperature not exceeding 25oC	°C	
Reactances:		
Unsaturated direct axis synchronous reactance, xd	p.u.	
Unsaturated direct axis transient reactance, x'd	p.u.	
Saturated direct axis sub transient reactances, x''_d	p.u.	
Saturated quadrature axis sub transient reactance, x''_q	p.u.	
Short-Circuit Ratio		
The ratio of excitation currents at no load and rated voltage and at short circuit and rated current, i.e. i_{fo}/i_{fk}	p.u.	
Generator designed mechanically to withstand continuously a turbine output of not less than	MW	
Continuous output, overexcited, at rated speed and voltage when operated as a synchronous condenser, not less than	MVAr	
Continuous output, under-excited, at rated speed and voltage when charging a transmission line, without becoming completely self-excited or unstable, not less than,	MVAr	
Stator winding withstand voltage (rms) at rated frequency, not less than	kV	
Stator winding impulse withstand voltage (BIL, crest), not less than	kV	
Excitation System Response Ratio, not less than		
Generator Monitoring System		

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Description	Unit	Value
Generator Air Gap Monitoring System	Manufacturer / type	
Generator Vibration detection system	Manufacturer /type	
Short Circuit Currents		
Stationary 3-phase short circuit current from no load and rated voltage	A	
Stationary 3-phase short circuit current from rated load and constant excitation	A	
Maximum peak phase current by 3-phase short circuit from no load	A	
Air Coolers		
Nos. of cooling radiators		
Braking System		
Rot. speed when applying brakes	rpm	
Run-out time	min	
Max. temperature of brake ring	°C	
Air pressure for braking	bar	
Weights and Foundation Forces		
Total weight of generator	ton	
Erection		
Heaviest piece for lifting during erection	ton	
Required lifting height for erection	mm	

3.2 EXCITATION SYSTEM

Description	Units	Value
Manufacturer		
Origin of Manufacturing		
Type		
Excitation at generator rated load and the field winding at steady operating temperature:		
- excitation current	A	
- excitation voltage	V	
Ceiling voltage	%	

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Voltage rises above nominal voltage at the generator terminals by throw-off of rated load and constant excitation.		
- at rated power factor	%	
- at PF = 1.0	%	
De-excitation time after tripping from rated load and 1.05 x U_N	sec	
Excitation transformer:		
Manufacturer		
Type		
- rated output	kVA	
- rated primary voltage	V	
- rated secondary voltage	V	
- vector group		
- impedance voltage	%	
Field flashing:		
- field flashing current (from battery)	A	
- estimated time for voltage build-up	S	
- required cooling time before repeated starting	S	

3.3 SEGREGATED PHASE BUS

Description	Units	Value
Manufacturer		
Origin of manufacturing		
Rating (50 Hz)		
Current	A	
Voltage	V	
3 Phase Short circuit withstand current rating (3sec)	kA	
Peak Short circuit withstand current rating	kA	
Protection Degree (IP Class)		
Total Weight (for 01 Unit)	Kg/m	
Conductor	%	
Material		
Shape	mm	
Cross Section	mm^2	

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Painting External		
Enclosure		
Material		
Dimensions	mm	
Thickness	mm^2	
Painting		
Insulators		
Power frequency withstand voltage rating	kV	
Lightening Impulse withstand voltage rating	kV	
Clearance min. Phase/Earth	mm	
Clearance min. Phase/Phase	mm	
Temperatures		
Ambient	°C	
Conductor	°C	
Enclosure	°C	

3.4 GENERATOR STEP-UP TRANSFORMERS (20/26 MVA)

Description	Unit	Value
Manufacturer's name		
Origin of manufacturing		
Type of transformer		
Applicable IEC standard		
Rated frequency		
Method of Neutral Grounding		
Type of cooling		
Cooling capacity		
Rated Continuous Output **Guarantee Value**	MVA	
Temperature rises at continuous rated power: - Top oil temperature rise - Average winding temperature rise - Temperature rise hot spot	 K K K	
Noise level	dB	
Rated voltage:		

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Description	Unit	Value
- Primary (HV) winding - Secondary (LV) winding	kV kV	
Tapping on windings - Number of taps - Tapping range - Type of tap changer	 No. %	
Highest voltage for equipment: - Primary (HV) winding - Secondary (LV) winding	 kV kV	
Lightning impulse withstand voltage: - Primary (HV) winding - Primary (HV) winding neutral point - Secondary (LV) winding	 kV kV kV	
Power frequency withstand voltage (1 min.) - Primary (HV) winding - Primary (HV) winding neutral point - Secondary (LV) winding	 kV kV kV	
Vector group		
Auxiliary Supply: - AC - DC		
Short circuit impedance at 100% of the rated power at principal tapping	%	
No load losses **Guarantee Value**	kW	
Load losses at principle tapping **Guarantee Value**	kW	
Insulation oil type		
Material of ratings and name plates		
Material of control/terminal box		
Protection class of control/terminal box	IP	
Flux density in iron at rated voltage and frequency and at rated voltage ratio tap (no load): - Cores - Yokes		
Transformer bushing		
Manufacturer		
Type		
Current rating of the bushings: - HV bushings - LV bushings - Neutral bushings	 A A A	
Voltage class: - HV bushings	 kV	

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Description	Unit	Value
- LV bushings - Neutral bushings	kV kV	
Creepage distance in air: - HV bushings - Neutral bushings	 mm mm	
Total weight of complete transformer	kg	

3.5 SWITCHYARD POWER TRANSFORMER (10/13 MVA, 132/33 kV and 6.3 MVA, 33/11 kV)

Description	Unit	Value
Manufacturer's name		
Origin of manufacturing		
Type of transformer		
Applicable IEC standard		
Rated frequency		
Method of Neutral Grounding		
Type of cooling		
Cooling capacity		
Rated Continuous Output **Guarantee Value**	MVA

Append the following information: Append catalogues of the Vendors Proposer intended to use. Moreover, Proposer to ensure that the supplied cables will be equals or better than the type specified in technical specifications		
Ampacity at rated air temperature	A	
Considering cable configuration		
Distance between two phases		
Distance between two system		
Rated short time withstand current (1 sec)	kA	
Max. Permissible fault duration at 90 °C conductor temperature and at max. fault current	kA/sec	
Conductor material		
Number of strands		
Max. continuous conductor temperature	°C	
Max. conductor temperature under short circuit condition	°C	
Material of insulation		
Material of semi conducting layer		
Material of screen		
Cross section of screen	mm^2	
Material of outer jacket/sheath		
Material of filling sheath		
Material of armoring		
Outer diameter of the cable	mm^2	
Min. bending radius	mm	
Cable length in drum	Meter	
Dimension of drum	mm x mm x mm	
Weight of drum	Kg

6. 132kV SWITCHYARD and Remote End Line Bays

	Description	Units	Value
6.1	**SUBSTATION AUTOMATION SYSTEM EQUIPMENT (Control, Indications & Monitoring)**		
	a) Manufacturer		
	b) Country of Manufacture.		
	c) Type.		
	d) Manufacturing ordering code		
6.1.1	**Bay Control Unit (BCU) Cabinet**		
	1. Manufacturer		
	2. Model number		
	3. Cubicle is swing rack type (Yes/No)		
	4. Cubicle is dust & vermin-proof (Yes)		
	5. Protection class is IP54 (Yes)		
	6. Cubicle is floor mounted (Yes)		
	7. Accessible from both front/rear (Yes)		
	8. Material of sheet		

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

	Description	Units	Value
	9. Thickness of sheet:		
	a. Front door (2 mm)		
	b. Rear and side doors (1.5 mm)		
	10. Dimensions:		
	a) Height (2200 mm)		
	b) Width (800 mm)		
	c) Depth (600 mm)		
	11. Weight (kg)		
6.1.2	**Bay Control Unit (BCU)**		
(A)	**General**		
	1. Manufacturer		
	2. Country of manufacture		
	3. Model number		
	4. Applicable standards		
	5. Type test:		
	a) Carried out (Yes/No)		
	b) Date		
	c) Testing laboratory:		
	i. name		
	ii. country		
	6. Date of first commercial operation of BCU		
(B)	**Equipment Design and Performance:**		
	1. Word length of BCU processor (bits)		
	2. Time of power interruption which will not cause break in normal operation (ms)		
	3. Are telemetered values checked for alarm limits in RTU? (Yes/No)		
	4. Is time stamping of indications / alarms provided? (Yes/No)		
	5. Resolution of time stamping (ms)		
	6. List of internal indications and alarms related to the system operation provided (Yes/No)		
	7. MTBF		
(C)	**Working Principle:**		
	1. Request/response principle		
	2. Time-division multiplex code		

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

	Description	Units	Value
	3. Series transmission with PCM		
(D)	**BCU Capacity:**		
	1. Capacity of one digital input (DI) module		
	2. Capacity of one digital output (DO) module		
	3. Capacity of one analogue input (AI) module		
	4. Equipped capacity for SCADA signals (Specify reference of Proposal)		
	5. Number of input and output modules in BCU (Specify reference of Proposal)		
(E)	**Status Indications:**		
	1. Signal level to activate input device (mA)		
	2. Signal duration to assure recognition (ms)		
	3. Input filtering time (10-20 ms)		
	4. Delay mechanism incorporated to eliminate spurious indications. (Yes)		
	5. Limits of adjustment of above delay (50ms…20s)		
	6. Surge and insulation limits (kV)		
	7. Galvanic isolation provided (Yes)		
(F)	**Alarm Indications:**		
	1. Signal level to activate input device (mA)		
	2. Signal duration to assure recognition (ms)		
	3. Surge and insulation limits (kV)		
	4. Galvanic isolation provided (Yes)		
(G)	**Analog Inputs:**		
	1. Input signal (mA)		
	2. A/D converter resolution (12+sig. bits)		
	3. Accuracy (0.03 %)		
	4. Common mode voltage (V)		
	5. Common mode rejection (dB)		
	6. Serial mode rejection at 60 Hz (dB)		
	7. Galvanic isolation provided (Yes)		
(H)	**Control Outputs:**		
	1. Control board output (make / break contact or other)		
	2. Signal duration		
	3. Contact rating (V, A, W)		

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

	Description	Units	Value
	4. Contact operating time (100ms…30s)		
	5. Control outputs options		
	6. Surge insulation limits (kN)		
	7. Galvanic isolation provided (Yes)		
(I)	**General Digital Outputs:**		
	1. With relay outputs:		
	a) Contact type (make/break)		
	b) Contact rating (V, A, W)		
	c) Contact operating time (ms)		
(J)	**Set Point Outputs:**		
	1. Output type (make/break contacts or others)		
	2. Output code		
(K)	**Analog Outputs:**		
	1. Output (mA)		
	2. Output impedance (ohm)		
	3. Resolution binary bits (12+sig.)		
	4. Accuracy (± %)		
(L)	**Maintenance and Administration:**		
	1. Maintenance laptop PC available, software functions shall be detailed.		
	2. Laptop PC operating system		
	3. Downloading process available for database and RTU software release. (Yes)		
	4. Documents and manual (YES)		
(M)	**Communication Interfaces:**		
	1. Redundant communication ports provided? (Yes)		
	a) List all types of communication interfaces		
	b) List all types of protocols supported (IEC60870)		
	2. Transmission times:		
	a) Collection of 8 analog values at 4800bps (ms)		
	b) Collection of a change of state or 1 digital value at 4800bps (ms)		
	c) Transfer of 1 check-back-before-execute command at 4800bps operator check time (ms)		
	3. Line output:		

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

	Description	Units	Value
	a) Adjustable output level range (dBm)		
	b) Continuous adjustment (Yes/No)		
	4. Input from line:		
	a) Range of acceptable input signal level (dB)		
	b) Line impedance matching facilities provided (Yes/No)		
	c) Surge and insulation limits (kV)		
	d) List of all LED indications provided (Specify reference of Proposal)		
(N)	**Climatic Conditions:**		
	1. Temperature range for guaranteed operation (0-55°C)		
	2. Maximum relative humidity at 35°C (%)		
(O)	**Power Supply Requirements:**		
	1. Power consumption (W)		
	2. Power supply voltage range (V)		
(P)	**Electrical and Electromagnetic Environment:**		
	1. Electrostatic discharge immunity test: IEC 61000-4-2 (8 kV peak)		
	2. Radiated, radio-frequency, electromagnetic field immunity test: IEC 61000-4-3 (10 V/m)		
	3. Electrical fast transient/burst immunity test: IEC 61000-4-4 (2 kV peak)		
	4. Surge immunity test: IEC 61000-4-5		
	5. Insulation tests for electrical relays: IEC 60255-5 (5 kV, 1.2/50)		
6.1.3	**SCADA Interface Cabinet (SIC)**		
	1. Manufacturer		
	2. Country of manufacture		
	3. Model number		
	4. Cubicle is swing rack type (Yes)		
	5. Cubicle is dust and vermin-proof (Yes)		
	6. Protection class is IP54 (Yes)		
	7. Cubicle is floor mounted (Yes)		
	8. Accessible from both front/rear		
	9. Material of sheet

	6. Date of first commercial operation of PLC terminal		
	7. Type of modulation is SSB-SC (Yes)		
	8. Full duplex operation (Yes)		
	9. HF transmitter power (40W)		
	10. Nominal HF bandwidth (kHz)		
	11. HF carrier range (40-500 kHz)		
	12. Transmit and receive frequencies programmable		
	13. Frequency separation:		
	a) Tx to own Rx (kHz)		
	b) Tx to adjacent Rx (kHz)		
	c) Tx to adjacent Tx (kHz)		
	d) Rx to adjacent Rx (kHz)		
	14. Loss due to parallel operation of two PLC (dB)		
	15. Return loss:		
	a) transmit direction (dB)		
	b) receive direction (dB)		
	16. Signal to noise ratio (without compandor):		
	a) fair weather (dB)		
	b) adverse weather (dB)		
	17. HF output impedance (ohm)		
	18. Receiver sensitivity (≤ 30dBm)		
	19. AGC range (± dB)		
	20 AF interface:		
	a) module name		
	b) AF bandwidth (Hz)		
	c) speech possible on both 2/4-wire (Yes)		

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Item	Description	Units	Value
	d) nominal impedance of AF signals (ohm)		
	21. Teleoperation interface:		
	a) module name		
	b) max. teleoperation inputs/outputs		
	22. Frequency of pilot signal (Hz)		
	Is frequency programmable? (Yes/No)		
	23. VF channel allocation for each PLC link will be provided during detailed design (Yes)		
	24. Service telephone equipment provided with each PLC terminal (Yes)		
	25. Frequency response of speech channel (±1 dB referred to 800 Hz) (kHz)		
	26. Frequency response of VF signaling channel referred to 3.0 kHz (kHz)		
	27. Facility for transmission of Tele protection signals with boosted power available		
	28. Compandors required on PLC links (Yes/No)		
	29. Idle noise (dBm0p)		
	30. Crosstalk attenuation (dB)		
	31. Line side equipment withstand voltage (kV)		
	32. Alarms:		
	a) transmitter alarm		
	b) receiver alarm		
	33. Alarm outputs in form of potential free contacts available (Yes)		
	34. Power supply voltage range (V DC)		
	35. Power consumption of fully equipped terminal (W)		
	36. Operation temperature		
	a) maximum (55°C)		
	b) minimum (-5°C)		
	37. Relative humidity		
	a) maximum (95%)		
	b) minimum (5%)		
	38. Type test reports enclosed (Yes/No)		
	39. Reference list enclosed (Yes)		
	40. Technical literature enclosed (Yes)		
6.2.1.3	**Digital Protection Signaling Equipment**		
	1. Manufacturer		

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Item	Description	Units	Value
	2. Country of manufacture		
	3. Model number		
	4. Applicable standard is IEC 60834-1 (Yes)		
	5. Type test:		
	a) Carried out (Yes/No)		
	b) Date		
	c) Testing laboratory:		
	i. name		
	ii. country		
	6. Date of first commercial operation of DPSE		
	7. Integrated with DPLC (Yes)		
	8. Number of independent commands (≥ 4 No.)		
	9. Transmitter output level, adjustable on Z = 600 Ohms (balanced) (dBm)		
	10. Power boosting (6 dB)		
	11. Receiver input level on Z = 600 Ohms (balanced) (dBm)		
	12. Permissible input level variation (dB)		
	13. Trip signal blocking in case of event		
	of excessive line noise (Yes)		
	14. Permissible white noise input level within the transmission band (dB)		
	15. Return loss in 0.3-3.6 KHz band (≥ 14dB)		
	16. SNR for blocking (< 6dB)		
	17. Signal level fluctuation from the nominal that causes receiver output blocking (± 6dB)		
	18. External trip counters provided (Yes)		
	19. Signal delay time including transmission channel time mode, including input/output relays:		
	a) directional comparison relays (< 20ms)		
	b) distance/BFP relays (< 30ms)		
	20. Command duration (min. 60ms)		
	21. Command prolongation up to (ms)		
	22. Self-supervising in case of equipment failure (Yes/No)		
	23. LED indication for normal operation (Yes)		
	24. LED indication for failure of equipment (Yes)		
	25. Switching capacity of contacts (AC) (100/0.5 V/A)		

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Item	Description	Units	Value
	26. Loop test facility (Yes/No)		
	27. Maximum requirements for transmitter input contacts (24-250V dc)		
	28. False trip probability:		
	a) permissive trip (10E-2)		
	b) direct trip (10E-5)		
	29. Receiver output relay contacts:		
	a) continuous (2 potential free A/V dc)		
	b) for 1 minute (changeover A/V dc)		
	30. Signaling transmission during test (Yes/No)		
	31. Power supply voltage range (-40 to -58V DC)		
	32. Power consumption (W)		
	33. Power ON/OFF switch with protection (Yes/No)		
	34. Operation temperature:		
	a) maximum (55°C)		
	b) minimum (-5°C)		
	35. Relative humidity:		
	a) maximum (95%)		
	b) minimum (5%)		
	36. Type test reports enclosed (Yes/No)		
	37. Reference list enclosed (Yes)		
	38. Technical literature enclosed (Yes)		
6.2.1.4	**Line Matching Units**		
	1. Manufacturer		
	2. Country of manufacture		
	3. Model number		
	4. Applicable standards IEC60481 (Yes)		
	5. Type test:		
	a) Carried out (Yes/No)		
	b) Date		
	c) Testing laboratory (name/country)		
	6 Date of first commercial operation of LMU		
	7. Units are broad-band type (Yes)		
	8. Tuning frequency range is field programmable (Yes)		

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Item	Description	Units	Value
	9. Composite loss over tuning range (dB)		
	10. Return loss:		
	a) equipment side (dB)		
	b) line side (dB)		
	11. Line side impedance (ohm)		
	12. Equipment side impedance (75/150 ohm)		
	13. Peak envelope power rating (W)		
	14. Main arrester nominal discharge current (kA)		
	15. Drain Coil:		
	a) impedance at 50 Hz (ohm)		
	b) for nominal temperature rise (A,rms)		
	c) current carrying capacity at 50 Hz for 0.2 sec. (A,rms)		
	16. Unit withstand voltage for shock-wave 1.2/50 µsec applied on power line side (kV)		
	17 Insulation level for 1 minute applied between:		
	a) coil and earth (kV,rms)		
	b) coil and screen (kV,rms)		
	18. Cubicle is dust and vermin-proof (Yes)		
	19. Protection class is IP55 or better (Yes)		
	20. Cable input and door seals provided (Yes)		
	21. Rating plate provided (Yes)		
	22. Arrangement diagram pasted on door (Yes)		
	23. Operation temperature:		
	a) maximum (55°C)		
	b) minimum (-5°C)		
	24. Relative humidity:		
	a) maximum (95%)		
	b) minimum (5%)		
	25. Type test reports enclosed (Yes/No)		
	26. Reference list enclosed (Yes)		
	27. Technical literature enclosed (Yes)		
6.2.1.5	**Coaxial Cable**		
	1. Manufacturer		
	2. Country of manufacture		

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Item	Description	Units	Value
	3. Model number		
	4. Applicable standards		
	5. Date of first commercial operation of HF cable		
	6. Inner conductor:		
	a) material (bare copper)		
	b) type of conductor (solid)		
	c) diameter (1-2mm)		
	7. Insulation between inner and outer conductor:		
	a) material (solid PE)		
	b) diameter (mm)		
	8. Outer conductor:		
	a) material (bare copper braid)		
	b) diameter (mm)		
	9 Inner sheath:		
	a) material (PE black)		
	b) thickness (mm)		
	10. Armor:		
	a) material (galvanized steel tape)		
	b) Number of layers (2 No.)		
	c) tape thickness (mm)		
	11. Outer sheath:		
	a) material (HDPE black)		
	b) thickness (mm)		
	12. Structural layout of cable enclosed (Yes)		
	13. Minimum bending radius (mm)		
	14. Delivery length per drum (m)		
	15. Cable weight (kg/km)		
	16. Maximum permissible pulling force (kN)		
	17. Nominal impedance (75/150 ohm)		
	18. Resistance of inner conductor at 20°C (ohm/km)		
	19. Resistance of outer conductor at 20°C (ohm/km)		
	20. Insulation resistance between inner and outer conductors (min.), measured at 500V DC (Mohm.km)		
	21. Capacitance between inner and outer conductors at 800 Hz (≤66 nF/km)		

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Item	Description	Units	Value
	22. Attenuation at:		
	a) 100 kHz (≤ 1.8 dB/km)		
	b) 300 kHz (≤ 2.8 dB/km)		
	c) 500 kHz (≤ 4.1 dB/km)		
	23. Operation temperature:		
	a) maximum (70°C)		
	b) minimum (-10°C)		
	24. Relative humidity:		
	a) Maximum (95%)		
	b) Minimum (5%)		
	25. Reference list enclosed (Yes)		
	26. Technical literature enclosed (Yes)		
6.2.1.6	**Line Traps**		
	1. Manufacturer		
	2. Country of manufacture		
	3. Model number		
	4. Applicable standards IEC60353 (Yes)		
	5. Type test:		
	a) Carried out (Yes/No)		
	b) Date		
	c) Testing laboratory (name/country)		
	6. Date of first commercial operation of Line Trap		
	7. Coil inductance		
	8. Blocking impedance		
	9. Rated continuous current (A)		
	10. Temperature rise at rated continuous current (°C)		
	11. Short-time current rating:		
	a) Thermal (kA)		
	b) Dynamic (kA)		
	12. Temperature rise at rated short-time current (°C)		
	13. Over-load for 20 minutes (%)		
	14. Overall radius (mm)		
	15. Overall length (mm)

Item	Description	Units	Value
	9. Material of sheet		
	10. Thickness of sheet:		
	a. Front door (2 mm)		
	b. Rear and side doors (1.5 mm)		
	11. Dimensions:		
	a) Height (2200 mm)		
	b) Width (600/800 mm)		
	c) Depth (600 mm)		
	12. Weight (kg)		
6.2.2.2	**SDH Optical Line Terminal Equipment**		
	1. Manufacturer		
	2. Country of manufacture		
	3. Model number		
	4. Applicable standards		
	5. Type test:		
	a) Carried out (Yes/No)		
	b) Date		
	c) Testing laboratory:		
	i. name		
	ii. country		
	6. Date of first commercial operation of the offered SDH OLTE		
	7. System configuration is point to point with MSP 1+1 protection scheme (Yes)		
	8. Duplicated control/cross-connect modules provided (Yes)		
	9. Duplicated power supply modules provided (Yes)		
	10. Electrical interface:		
	a) Input/output interface as per ITU-T G703 and G957 (Yes)		
	b) Line code		
	c) Number of ports		
	d) Line impedance		
	11. Optical interface:		
	a) Operation technique (SDH)		
	b) Transmission rate (STM-1)		
	c) Transmission mode (single mode)		

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Item	Description	Units	Value
	d) Expandable to higher order STM levels (Yes)		
	e) Number of optical STM-1 input/output (≥ 4)		
	f) Optical transmitter element (laser diode)		
	g) Mean transmitted optical power		
	h) Optical connector type		
	i) Wavelength (nm)		
	j) Optical code format		
	k) Optical receiver element		
	l) Optical receiver sensitivity at BER=10 -10 (dBm)		
	m) Dynamic range (dB)		
	12. EOW service channel provided (Yes)		
	13. Jitter and wander of equipment as per G.783 (Yes)		
	14. Protection switching characteristics:		
	a) Automatic switching criteria (BER, AIS, LIS)		
	b) Maximum switching time (<5 ms)		
	c) Manual and auto switching mode (Yes)		
	15. Maintenance tools:		
	a) AIS (Yes)		
	b) LIS alarm (Yes)		
	c) Order channel (Yes)		
	d) Service data channel (Yes)		
	e) Craft channel (Yes)		
	16. Alarm conditions:		
	a) Loss of transmitted signal (Yes)		
	b) Loss of received signal (Yes)		
	c) BER > 10 -6 (Yes)		
	d) BER > 10 -3 (Yes)		
	e) Loss of STM-1 signal (Yes)		
	f) Laser failure (Yes)		
	g) Power supply failure (Yes)		
	17. LEDs on front of the panel for normal operation (Yes)		
	18. LEDs on front of the panel for major alarms (Yes)		
	19. EMC compatibility (Yes)		

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Item	Description	Units	Value
	20. Operating voltage range (-40 to - 58 Vdc)		
	21. Power consumption of full rack (W)		
	22. Operation temperature range (0 to 50°C)		
	23. Relative humidity range (to 95%)		
	24. MTBF of complete shelf (hours)		
	25. Type test reports enclosed (Yes/No)		
	26. Reference list enclosed (Yes)		
	27. Technical literature enclosed (Yes)		
	28. Relevant drawings enclosed		
	29. Other documents required under Specifications		
6.2.2.3	**Optical Distribution Frame**		
	1. Manufacturer		
	2. Country of manufacture		
	3. Model number		
	4. Applicable standards		
	5. Maximum number of optical fibers that can be terminated (24/48)		
	6. Number of optical connectors including the auxiliary connectors		
	7. Patch cords provided between the ODF and the OLTE (Yes)		
	8. Maximum loss of connector (<0.3 dB)		
	9. EMC compatibility as per IEC (Yes)		
	10. Installed in separate cabinet/OLTE cabinet		
	11. Dimension of ODF:		
	a) Height (mm)		
	b) Width (mm)		
	c) Depth (mm)		
	12. Reference list enclosed (Yes)		
	13. Technical literature enclosed (Yes)		
6.2.2.4	**Digital Multiplexer**		
	1. Manufacturer		
	2. Country of manufacture		
	3. Model number		
	4. Applicable standards		
	5. Type test:		

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Item	Description	Units	Value
	a) Carried out (Yes/No)		
	b) Date		
	c) Testing laboratory:		
	i. name		
	ii. country		
	6. Date of first commercial operation of the offered Digital Multiplexer (dd-mm-yy)		
	7. Type of modulation is PCM (Yes)		
	8. Duplicated control/cross-connect modules provided (Yes)		
	9. Duplicated power supply modules provided		
	10. Transmission characteristics:		
	a) Number of channels, voice or data		
	b) Sampling rate (8 kHz)		
	c) Binary digits/sample (8 bits/sample)		
	d) Encoding law (A-law)		
	e) Number of time slots per frame (32)		
	f) Number of bits per time slot (8)		
	g) Frame length (256)		
	h) Crosstalk attenuation (min) (65 dB)		
	11. Equipment performance as per ITU-T G712 (Yes)		
	12. EMC compatibility according to IEC (Yes)		
	13. 2 Mbits/s input/output interfaces:		
	a) Bit rate (2048 kb/s)		
	b) Code format (HDB3)		
	c) Signal waveform acc. to ITU-T G.703, G.708 (Yes)		
	d) Frame structure acc. to ITU-T G.732, G.704 (Yes)		
	e) Jitter acc. To ITU-T G.780, G.825 (Yes)		
	f) Input attenuation range at 1024kHz (0-6 dB)		
	g) Impedance (75Ω coax. /120Ω symm.)		
	14. Audio frequency interface:		
	a) Frequency bandwidth (300-3400 Hz)		
	b) Audio frequency termination (4-W & 2-W)		
	c) Signaling interface (E&M)		
	d) Input & output impedance (600Ω balanced)		

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Item	Description	Units	Value
	e) Return loss (dB)		
	f) Input level range (dBm)		
	g) Output level range (dBm)		
	h) Attenuation/frequency distortion as per ITU-T G.712 (Yes)		
	i) Group delay distortion as per ITU-T G.712 (Yes)		
	j) Send receive crosstalk as per ITU-T (Yes)		
	k) Inter channel crosstalk as per ITU-T (Yes)		
	l) Variation of gain with input level in compliance with ITU-T G.712 (Yes)		
	m) Signal to total distortion in compliance with ITU-T G.712 (Yes)		
	n) Spurious in-band signals in compliance with ITU-T G.712 (Yes)		
	o) Intermodulation in compliance with ITU-T G.712 (Yes)		
	15. Digital interface:		
	a) Bit rate (synchronous operation) (64 kbit/s)		
	b) Bit rate tolerance (± 5 x 10-5)		
	c) Encoding format as per ITU-T G.703, G.704 (Yes)		
	d) Pulse shape as per ITU-T G.703, G.705 (Yes)		
	e) Impedance (120Ω balanced)		
	f) Return loss (16 dB)		
	16. Signaling multiplex:		
	a) Allocation of time slot#16 in acc. with ITU-T G.704 (Yes)		
	b) Multi frame structure		
	17. Compandor A-law with A=87.6:		
	a) Frame structure as per ITU-T G.712 (Yes)		
	18. Maintenance tools:		
	a) AIS (Yes)		
	b) LIS alarm (Yes)		
	c) Service data channel (Yes)		
	19. Alarm conditions:		
	a) BER > 10 -3 (Yes)		
	b) Loss of 2Mbps signal (Yes)		
	c) Loss of VF frequency (Yes)		
	d) Power supply failure (Yes)		
	20. LEDs on front panel for normal operation (Yes)		

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Item	Description	Units	Value
	21. LEDs on front panel for each alarm (Yes)		
	22. Operating voltage range (-40 to - 58 V)		
	23. Power consumption of fully equipped shelf (W)		
	24. Operation temperature range (0 to 50°C)		
	25. Relative humidity range (5 to 95%)		
	26. MTBF of complete shelf (hours)		
	27. Type test reports enclosed (Yes/No)

Item	Description	Units	Value
	h) Material of coating above cladding (UV cured acrylate)		
	i) Coating diameter (250±5)		
	8. Central strength member:		
	a) Material		
	b) Material is dielectric (Yes)		
	c) Diameter (minimum) (mm)		
	9. Buffer tube:		
	a) Loose tubes with loose fiber protection (Yes)		
	b) Number of tubes (≥3)		
	c) Number of fibers per tube (≤8)		
	d) Material of tube		
	e) Inner diameter (mm)		
	f) Thickness (0.4 mm)		
	g) Tube filling compound (moisture-proof gel)		
	10. Interstices between tubes filled with jelly compound (Yes)		
	11. Moisture-resistant wrapping around tubes (Yes)		
	12. Inner sheath:		
	a) Material (Thermoplastic)		
	b) Nominal thickness (1.5 mm)		
	13. Strength member reinforcing layer:		
	a) Material (Aramid or glass yarn)		
	b) Nominal thickness (mm)		
	14. Anti-rodent protection:		
	a) Material (Glass tape)		
	b) Thickness (mm)		
	15. Outer jacket:		
	a) Material (HDPE)		
	b) Thickness (1.5 mm)		
	16. Anti-termite coating over outer jacket (Yes)		
	17. Overall diameter of cable (mm)		
	18. Transmission mode (Single mode)		
	19. Wavelength (1310 & 1550 nm)		
	20. Cable cut-off wavelength<1270)		

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Item	Description	Units	Value
	21. Max. attenuation at 1310 nm (0.35 dB)		
	22. Max. attenuation at 1550 nm (0.22 dB)		
	23. Chromatic dispersion at 1310 nm (< 4 ps/nm.km)		
	24. Chromatic dispersion at 1550 nm (< 20 ps/nm.km)		
	25. Zero dispersion wavelength (1300-1330 nm)		
	26. Zero dispersion slope (≤0.1 ps/nm².km)		
	27. Operation temperature range (-10 to 70°C)		
	28. Relative humidity range (5 to 95%)		
	29. Minimum permissible bending radius (12 x cable dia.)		
	30. Maximum permissible pulling force (> 3 kN)		
	31. Ultimate breaking force (kN)		
	32. Delivery length per drum (2000m)		
	33. Cable installed in 50mm PVC duct from tower base to grid station control building (Yes)		
	34. Cable installed in flexible ducts on cable trays within grid station control building (Yes)		
	35. Material of cable drum (wooden/steel with screwed lagging)		
	36. Overall dimensions:		
	a) Flange diameter (mm)		
	b) Core diameter (mm)		
	c) Width (mm)		
	37. Reel spindle hole diameter (mm)		
	38. Weights:		
	a) Maximum gross weight of a full drum (kg)		
	b) Empty drum (kg)		
	39. Type test reports of same type of FOC enclosed (Yes/No)		
	40. Technical literature for FOC enclosed (Yes)		
	41. Reference list for FOC enclosed (Yes)		
6.2.3	**TELEPHONE (PAX) EQUIPMENT**		
6.2.3.1	**PAX Equipment Cubicle**		
	1. Manufacturer		
	2. Country of manufacture		
	3. Model number		
	4. Cubicle is swing rack type (Yes)		

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Item	Description	Units	Value
	5. Cubicle is dust & vermin-proof (Yes)		
	6. Protection class is IP54 (Yes)		
	7. Cubicle is floor mounted (Yes)		
	8. Accessible from both front/rear (Yes/No)		
	9. Material of sheet		
	10. Thickness of sheet:		
	a. Front door (2 mm)		
	b. Rear and side doors (1.5 mm)		
	11. Dimensions:		
	a) Height (2200 mm)		
	b) Width (600/800 mm)		
	c) Depth (600 mm)		
	12. Weight (kg)		
6.2.3.2	**Digital Exchange**		
	1. Manufacturer		
	2. Country of manufacture		
	3. Model number		
	4. Exchange is SPC type (Yes)		
	5. Type of modulation		
	6. Type of multiplexing		
	7. Back-up memory provided (Yes) If yes, specify time taken to reload the software and customer files on restoration of AC mains (s)		
	8. Interface circuit for extension is according to ITU-T Q23 (Yes)		
	9. Interface circuit for trunk line is according to:		
	a) DTMF/ITU-TR2 signaling for 4-wire E&M		
	b) Q-signaling for 2 Mb/s digital trunk (Yes)		
	10. Equipped number of subscribers:		
	a) Analog		
	b) Digital		
	11. Equipped number of trunk lines		
	a) Analog		
	b) Digital		
	12. Maximum capacity of subscribers		

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Item	Description	Units	Value
	13. Maximum capacity of trunk lines		
	14. Subscriber lines 2-wire/4-wire:		
	a) Input speech level (4-wire) (dBm)		
	b) Output speech level (4-wire) (dBm)		
	c) Input speech level (2-wire) (dBm)		
	d) Output speech level (2-wire) (dBm)		
	15. Ringing voltage (V,rms)		
	16. Numbering scheme is software programmable in field (Yes)		
	17. Software features, as specified, provided (Yes)		
	18. Priority intrusion, forced release, section dialing facilities available over the network analog and digital trunk lines (Yes)		
	19. Power supply voltage range (-40 to -58 V)		
	20. Power consumption of full rack (W)		
	21. MTBF of full rack (hours)		
	22. Details of maintenance facilities given (Yes) (Specify volume/section of Tender)		
	23. Exchange has been in operation for five years operation in power utilities (Yes)		
	24. Type test reports attached (Yes/No)		
	25. Reference list attached (Yes)		
	26. Technical literature enclosed (Yes)		
6.2.3.3	**Normal Telephone Sets**		
	1. Manufacturer		
	2. Country of manufacture		
	3. Model number		
	4. Instruments are push-button type (Yes)		
	5. Type of signaling (decadic/DTMF)		
	6. If DTMF, receivers operate at frequencies acc. to ITU-T Q23 (Yes)		
6.2.3.4	**Executive Telephone Sets**		
	1. Manufacturer		
	2. Country of manufacture		
	3. Model number		
	4. Units are desk mounted type (Yes)		
	5. Type of dial		

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Item	Description	Units	Value
	6. If DTMF, receivers operate at frequencies acc. to ITU-T Q23 (Yes)		
	7. Features, as specified, provided (Yes)		
6.2.4	**MAIN DISTRIBUTION FRAME (MDF)**		
6.2.4.1	**Equipment Cabinet**		
	1. Manufacturer		
	2. Country of manufacture		
	3. Model number		
	4. Protection class is IP54 (Yes)		
	5. Color		
	6. Cabinet is self-standing type (Yes)		
	7. Dimensions:		
	a) Height (2200 mm)		
	b) Width (600/800 mm)		
	c) Depth (600 mm)		
	8. Number of cable entries:		
	a) From bottom		
	b) From top		
	9. Gland plate:		
	a) Stainless steel material (Yes/No)		
	b) Grade		
	c) Length (mm)		
	d) Width (mm)		
	e) Thickness (mm)		
	10. Gland:		
	a) Brass material (Yes/No)		
	b) Grade		
	11. Weight of cabinet (kg)		
6.2.4.2	**MDF equipment**		
	1. Manufacturer		
	2. Country of manufacture		
	3. Model number of frame		
	4. Terminating blocks are quick connect type (Yes)		
	5. Type number of disconnecting block		

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Item	Description	Units	Value
	6. Type number of connecting block		
	7. Type number of block with surge protection		
	8. Insulation voltage of surge arrester (V)		
	9. Number of pairs that can be terminated per frame		
	10. Number of pairs in each block		
	11. Cabinet equipped for 600 pairs termination (Yes)		
	12. Number of blocks:		
	a) Disconnection		
	b) Connection		
	c) Surge protection		
	13. Maximum capacity of cabinet (1200 pairs)		
6.2.5	**SCADA SYSTEM**		
6.2.5.1	**Transducers**		
(A)	**General:**		
	1. State standards for design and tests		
	IEC, EN, IEEE)		
	2. Power supply voltage range (V)		
	3. Temperature range for guaranteed operation (°C)		
	4. Maximum relative humidity at 35°C (%)		
(B)	**Active power transducer:**		
	1. Manufacturer		
	2. Type number		
	3. Type of load (balanced/unbalanced) (3 phase 3 wire/3 phase 4 wire)		
	4. Output signal (±10 mA, 4-20 mA)		
	5. Accuracy class (0.5 %)		
	6. External resistance load (ohm)		
	7. Input voltage (V)		
	8. Input current (mA)		
	9. Input consumption (burden) (VA)		
	10. Input frequency (50 Hz)		
	11. Input overload capacity (current circuits):		
	a) continuous		
	b) for 10 sec.		

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Item	Description	Units	Value
	c) for 1 sec.		
	12 Galvanic separations between input and output (Yes)		
	13. Test voltage (≥4 kV/50Hz/1 min.)		
	14. Measuring range (± MW)		
	15. Type of mounting (surface/rack)		
(C)	**Reactive power transducer:**		
	1. Manufacturer		
	2. Type number		
	3. Type of load (balanced/unbalanced)		
	(3 phase 3 wire/3 phase 4 wire)		
	4. Output signal (±10 mA, 4-20 mA)		
	5. Accuracy class (0.5 %)		
	6. External resistance load (ohm)		
	7. Input voltage (V)		
	8. Input current (mA)		
	9. Input consumption (burden) (VA per phase)		
	10. Input frequency (50 Hz)		
	11. Input overload capacity (current circuits):		
	a) continuous		
	b) for 10 sec.		
	c) for 1 sec.		
	12. Galvanic separation between input and output (Yes)		
	13. Test voltage (≥4 kV/50Hz/1 min.)		
	14. Measuring range (± MVAr)		
	15. Type of mounting (surface/rack)		
(D)	**Voltage transducer:**		
	1. Manufacturer		
	2. Type number		
	3. Output signal (0-10 mA, 4-20 mA)		
	4. Accuracy class (0.5 %)		
	5. External resistance load (ohm)		
	6. Input voltage measuring range (V)		
	7. Input current (mA)		

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Item	Description	Units	Value
	8. Input consumption (burden) (VA)		
	9. Input frequency (45-55 Hz)		
	10. Input overload capacity (current circuits):		
	a) continuous		
	b) for 10 sec.		
	11. Galvanic separation between input and output (Yes)		
	12. Test voltage (≥4 kV/50Hz/1 min.)		
	13. Measuring range (V)		
	14. Type of mounting (surface/rack)		
(E)	**Frequency transducer:**		
	1. Manufacturer		
	2. Type number		
	3. Output signal (0-10 mA, 4-20 mA)		
	4. Accuracy class:		
	a) of nominal frequency (<0.05%)		
	b) of measured span (<0.5%)		
	5. External resistance load (ohm)		
	6. Input voltage (V)		
	7. Tolerance on input voltage (%)		
	8. Input consumption (burden) (VA)		
	9. Input frequency (45-55 Hz)		
	10. Input overload capacity (current circuits):		
	a) continuous		
	b) for 10 sec.		
	11. Galvanic separation between input and output (Yes)		
	12. Test voltage (≥4 kV/50Hz/1 min.)		
	13. Measuring range (Hz)		
	14. Type of mounting (surface/rack)		
6.2.6	**Supporting Documents**		
	1. Supporting documents, as specified, provided (Yes)		
	2. Give reference of each document in the Proposal (Volume #, Page # of Proposal)		
	3. Type test reports enclosed (Yes)		
	4. Relevant drawings enclosed (Yes)		

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Item	Description	Units	Value
	5. Reference lists attached (Yes)		
6.2.7	**48V DC POWER SUPPLY SYSTEM**		
6.2.7.1	**General**		
	1. Nominal system voltage (V)		
6.2.7.2	**Battery Chargers**		
	1. Manufacturer		
	2. Country of manufacture		
	3. Model number		
	4. Duplicated configuration (Yes/No)		
	5. Rated current of each charger, A.		
	6. Type of rectifier bridge		
	7. Operation mode		
	8. Duty class		
	9. AC mains voltage/tolerance (V±%)		
	10. Input frequency/tolerance (Hz±%)		
	11. Rated output DC voltage (V)		
	12. Output voltage variation for specified fluctuation in AC mains and ± 5% frequency change (± %)		
	13. Audible noise (dB)		
	14. Insulation resistance (Mohm)		
	15. Time to 100% charge a fully discharged battery (hours)		
	16. Input power factor at:		
	a) lightly loaded condition		
	b) full load		
	17. Charger efficiency at 100% load (%)		
	18. Operating temperature range for guaranteed operation (deg. C)		
	19. Relative humidity at maximum ambient temperature (%)		
	20. Controls and alarms, as specified, provided (Yes/No)		
6.2.7.3	**Charger Cabinet**		
	1. Manufacturer		
	2. Country of manufacture		
	3. Model number		
	4. Material of cabinet		
	5. Cabinet is dust & vermin-proof (Yes/No)		

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Item	Description	Units	Value
	6. Protection class is IP54 (Yes/No)		
	7. Cabinet is floor mounted (Yes/No)		
	8. ON/OFF main switches with green LEDs provided (Yes/No)		
	9. Red LED to indicate manual boost operation provided (Yes/No)		
	10. Specified DC and AC ammeters and voltmeters provided (Yes/No)		
	11. Protection equipment, as specified, provided (Yes/No)		
	12. Weight (kg)		
6.2.7.4	**Instrumentation and DC Distribution Cabinet**		
	1. Instrumentation:		
	a) Instruments, as specified, provided (Yes/No)		
	b) Manufacturer		
	c) Country of manufacture		
	d) Tolerance of meters (± %)		
	2. DC distribution cabinet:		
	a) Manufacturer		
	b) Model number		
	c) Design according to IEC 60439, 60146, 60478 and 60896 (Yes/No)		
	d) Material of cubicle		
	e) Cubicle is vermin-proof (Yes/No)		
	f) Type of arrangement within cabinet for connection to common grounding system		
	g) Weight (kg)		
	h) Installation mode		
	i) Number of outgoing circuits		
	j) Battery DC voltmeter installed (Yes/No)		
	k) Battery DC contactor installed (Yes/No)		
	l) Battery DC contactor disconnect voltage (V)		
	m) Battery DC contactor reconnect voltage (V)		
	n) Manufacturer of MCBs		
	o) Type number of MCBs		
	p) Ratings of breakers provided (A)		
	q) Alarms, as specified, provided (Yes/No)		
6.2.7.5	**Batteries**		

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Item	Description	Units	Value
	1. Manufacturer		
	2. Country of manufacture		
	3. Model number		
	4. Duplicated configuration (Yes/No)		
	5. Rated capacity of each battery, AH.		
	6. Battery is single cell type (Yes/No)		
	7. Number of cells in each battery		
	8. Positive plate is planet type (Yes/No)		
	9. Float voltage per cell (V)		
	10. Boost voltage per cell (V)		
	11. End voltage per cell (V)		
	12. Minimum aging factor		
	13. Self-discharge at 25°C (%)		
	14. Name of electrolyte		
	15. Material of cell terminals		
	16. Material of intercell connectors		
	17. Material of battery racks		
	18. Racks are treated with acid-resistant paint (Yes/No)		
	19. Mode of installation of cells		
	20. List of accessories provided (Yes/No)		
	21. List of similar installations provided with Proposal (Yes/No)		
	22. Operating temperature range for guaranteed operation (°C)		
	23. Relative humidity at maximum ambient temperature (%)		
	24. Guaranteed life (years)		

6.3 132 KV SWITCHYARD EQUIPMENT

Item	Description	Units	Value
6.3.1	**CIRCUIT BREAKERS: 132kV**		
6.3.1.1	Reference Data		
	1. Nominal voltage class, kV, rms		
	2. Type designation		
	3. Manufacturer's name and country		
	4. Catalog No.		

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Item	Description	Units	Value
	5. Is Proposal in accordance with the Specifications? (If not, list deviations in an attachment to this Schedule.)		
6.3.1.2	Voltage Data:		
	1. Nominal system voltage, kV, rms.		
	2. (a) Rated voltage kV, rms.		
	2. (b) Steady state max. sustained voltage.		
	3. Visible or audible corona at steady state, maximum sustained voltage.		
	4. Rated insulation level:		
	(a) Rated one minute power frequency		
	-withstand voltage, kV, rms.		
	-Phase to earth and between phases.		
	-Across open breaker.		
	(b) Rated switching impulse		
	-withstand voltage, kV, peak.		
	-Phase to earth.		
	-Between phases.		
	-Across open breaker.		
	(c) Rated lightning impulse		
	-withstand voltage, kV, peak.		
	-Phase to earth and between phases.		
	-Across open breaker.		
	5. Rated frequency.		
	6. Max. rate of rise of recovery voltage the breaker is designed to handle at rated interrupting MVA, kV/usec.		
	7. Maximum RIV at 1.1xUr//3 line to ground when tested as per IEC 694, micro volt.		
6.3.1.3	Current Ratings:		
	1. Rated current at 50 Hz and 50 deg. C not less than, A, rms:		
	a) Bay circuit breaker.		
	b) Shunt reactor circuit breaker.		
	2. Rated short time withstand current, kA, rms.		
	3. Rated peak withstand current, kA, peak.		
	4. Rated duration of short circuit, sec.		
6.3.1.4	**Breaking/Making:**		

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Item	Description	Units	Value
	1. Rated short circuit breaking current at rated voltage and 50 deg. C, not less than kA, rms.		
	2. Percentage of DC component		
	3. Rated short-circuit making current, kA, peak.		
	4. Rated out of phase breaking current, kA, rms.		
	5. Rated line charging breaking current at rated voltage.		
	6. Rated cable charging breaking current, A at rated voltage.		
	7. Transient recovery overvoltage for terminal faults according to IEC standards:		
	u1= first reference voltage, kV.		
	t1 = time to reach u1, usec.		
	uc =second reference voltage (TRV peak value), kV.		
	t2 = time to reach uc, usec.		
	td = time delay, usec.		
	u' = reference voltage, kV		
	t' = time to reach u', u sec.		
	u1/t1 = rate of rise of voltage, kV/usec.		
	8. First pole to clear factor.		
	9. Are short line fault rated characteristics according to IEC (Yes/No).		
6.3.1.5	**Time Characteristics at Rated Control Voltage and Operating Pressure:**		
	1. Rated operating sequence.		
	2. Maximum time interval between the complete closing of the first and the last pole, msec.		
	3. Maximum closing time (from energization of closing coil to the completion of closing stroke), msec.		
	4. Maximum operating time from energization of tripcoiltocontact parting, msec.		
	5. Minimum time from arc extinguishing to contact remake for auto reclosing, msec.		
	6. Maximum arc duration, msec.		
	7. Dead time adjustment for three phase auto reclosing, msec.		
	8. Additional time for interrupting the resistor currents.		
	9. Time from contact touch to contact part on Close Open operation, upon which interrupting rating is based, msec.		
	10. Rate of rise of recovery voltage at:		

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Item	Description	Units	Value
	a) 100% fault duty, V/usec.		
	b) 60% fault duty, V/usec.		
	c) 30% fault duty, V/usec.		
	d) 10% fault duty, V/usec.		
	11. Rate of rise of recovery voltage (line side) at rated interrupting current with fault at critical distance, V/usec.		
	12. Critical impedance to fault,km.		
	13. Rated break time, msec.		
	14. Breaking time (with rated control voltage based on 50 Hz) at:		
	a) 100% fault duty, msec.		
	b) 25% fault duty, mesc.		
	c) Less than 25% duty, msec.		
	15. Maximum time variation between:		
	a) The opening of series contacts on, any one `phase, msec.		
	b) The closing of contact on any two phases, msec.		
	c) The opening of contacts on any two phases, msec.		
	16. Closing resistors:		
	Resistance, ohms.		
	insertion time, msec.		
	17. Opening resistors:		
	resistance, ohms.		
	insertion time, msec.		
	18. Time interval between two maintenances (for infrequent operation).		
	19. Number of operations after which a maintenance is necessary (for frequent operations).		
	20. Total number of possible operations (the lifetime of the operating mechanisms if stipulated maintenance is performed).		
6.3.1.6	**Design:**		
	1. Resistive drop across main contacts at rated current, mili volts.		
	2. Type of main arcing contacts.		
	3. Contact material, how adjusted and method of extinguishing arc.		

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Item	Description	Units	Value
	4. Type of auxiliary arcing contacts, contact material, how adjusted, and method of extinguishing arc.		
	5. Number of series breaks in main contacts.		
	6. Voltage distribution between breaks.		
	7. Does magnetic effect of local current increase contact pressure.		
	8. Minimum electrical clearance between stationary and moving conducting parts when breaker is open, mm.		
	9. Type of terminals and connectors.		
	10. Is breaker suited for independent pole operation.		
	11. Is breaker suited for high speed, 3phase and single-phase auto reclosing.		
	12. Maximum noise level at distance of 1 meter horizontal distance at the perimeter of circuit breaker during opening and closing operations, dB(A).		
	13. Permissible loading of breaker terminals:		
	a) Horizontal, kg.		
	b) Vertical ,kg.		
	c) Longitudinal, kg.		
6.3.1.7	**Insulating Porcelains:**		
	(a) Insulator Columns:		
	1. Type		
	2. Manufacturer		
	3. Number of units per column		
	4. Maximum diameter of insulators		
	5. Clearance, phase to phase, mm.		
	6. External creepage distance, phase to ground, mm.		
	7. Protected creepage distance (90 deg. shadow) mm.		
	8. External striking distance:		
	phase to ground, mm.		
	phase to phase, mm.		
	9. Ultimate strength of columns:		
	. cantilever, N.		
	. tension, N.		
	. torsion, Nm.		
	. compression, N.		

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Item	Description	Units	Value
	10. Rated Voltage, kV.		
	11. 1 minute power frequency wet withstand voltage, kV. rms.		
	12. 1 minute power frequency dry withstand voltage, kV, rms.		
	13. Lightning impulse withstand voltage, kV, peak.		
	14. Wet switching impulse withstand, kV, peak.		
	15. Creepage distance, mm.		
6.3.1.8	**Operating Mechanism:**		
	1. Type of mechanism		
	. Method of closing.		
	. Method of tripping.		
	2. Operating pressure of interrupting medium, bars		
	3. Number of phases and voltage of:		
	. motors, V, DC/AC		
	. heaters, V, rms.		
	4. Power demand of:		
	. motors, W.		
	. heaters, W.		
	5. Number of trip coils per phase.		
	6. Closing control current (total for three phase):		
	a) initial, A.		
	b) holding, A.		
	7. Closing control voltage, V.		
	8. Tripping control current per trip coil, A.		
	9. Opening control voltage, V.		
	10. Locked rotor and maximum running current required by motor operated mechanism at rated voltage, A.		
6.3.1.9	**Auxiliary Switches:**		
	1. Number of normally open contacts.		
	a) Total		
	b) Spare		
	2. Number of normally closed contacts.		
	a) Total		
	b) Spare		

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Item	Description	Units	Value
	3. Number of reversible contacts.		
	a) Total		
	b) Spare		
	4. Number of adjustable contacts.		
	a) Total		
	b) Spare		
	5. Voltage rating, V dc.		
	6. Current rating of auxiliary contacts:		
	a) Make and hold, Amps.		
	b) Interrupting, resistive, Amps.		
6.3.1.10	**Other Data:**		
	1. Nominal operating pressure of circuit breaker, bars.		
	2. Normal operating pressure range of circuit breaker:		
	a) Minimum, bars		
	b) Maximum, bars.		
	3. Total volume of SF6 gas per pole, m3.		
	4. Total weight of SF6 gas per pole, kg.		
	5. No. of operations from SF6 stored at circuit breaker without recycling.		
	6. No. of operations after which circuit breaker is to be overhauled:		
	a) Short-circuit operations.		
	b) Operations in normal service.		
	7. Maximum leakage of SF6 gas per year per circuit breaker.		
	8. SF6 pressure at which:		
	(a) closing is blocked, bars		
	(b) tripping is blocked, bars.		
	9. No. and description of safety alarms provided for:		
	a) _____		
	b) _____		
	c) _____		
6.3.1.11	**Hydraulically Operated Circuit Breaker:(N.A)**		
	1. Number of Close Open operations which can be performed by the stored energy in each circuit breaker		

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Item	Description	Units	Value
	operating device starting at the normal working pressure and without replenishing.		
	2. Normal value of pressure and range of pressure within which the circuit breaker will operate satisfactorily, bars.		
	3. Append description of stored energy system to be furnished with circuit breaker. (Yes/No)		
	4. Time required to pump from lockout pressure to normal pressure, minutes.		
6.3.1.12	**Spring Charge Mechanism:**		
	1. No. of operating mechanisms for 3pole circuit breaker.		
	2. Time required for the motor to recharge the closing spring at min. dc supply voltage, sec.		
6.3.1.13	**Weights, Dimensions and Miscellaneous:**		
	1. Overall length, mm		
	2. Overall width, mm		
	3. Overall height, mm		
	4. Phase spacing, mm		
	5. Terminal height above foundation, mm.		
	6. Maximum shipping dimension (largest item), m x m x m.		
	7. Total weight of single pole breaker unit, kg.		
	8. Total weight of complete circuit breaker, kg.		
	9. Total weight of support structure, kg.		
	10. Maximum shipping weight (heaviest item),kg.		
	11. Withstand to earthquake shocks. Horizontal and vertical ground acceleration, g.		
	12. Append drawing of support structure (Yes/No)		
	13. Append drawing of mechanism details (Yes/No)		
	14. Append list of type and routine tests to be performed by the Manufacturer and details of test procedure that will be used to prove breaker performance in accordance with the proposed IEC standards (Yes/No)		
	15. Append list of attached drawings, design briefs and documentation (Yes/No)		
	16. Additional clear space required for removal of bushings and/or interrupters, m x m x m.		
	17. Additional height or width required for use of manual closing mechanism, mm.		
	18. Append description of facilities for handling and lifting:		

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Item	Description	Units	Value
	interrupter. (Yes/No)		
	interrupter assembly. (Yes/No)		
	insulator supporting columns. (Yes/No)		
	19. Append a description of measures incorporated for tropicalization and dust proofing of breaker components including control relays and contacts. (Yes/No)		
	20. Append copy of type tests required by the documents and performed on the breaker. (Yes/No)		
	21. Submit diagram showing how main contacts of the breaker are shunted with resistors and capacitors (Yes/No)		
	22. Where are resistors and capacitors located? Supply drawing showing this information (Yes/No)		
	23. Submit a travel diagram plotted in msec with the following points shown thereon for one opening operation: (Yes/No)		
	a) Trip coil energized.		
	b) Resistor switch closes.		
	c) Main contact's part.		
	d) Arc extinguished (maximum interruption time).		
	e) Main contacts fully open.		
	f) Resistor switch starts opening.		
	g) Resistor switch fully open.		
	24. Submit a similar diagram for a closing operation with the following points shown thereon: (Yes/No)		
	a) Closing relay energized.		
	b) Preinsertion resistor switch closes.		
	c) Main contact's touch.		
	d) Main contacts fully closed.		
	e) Preinserted resistor switch opens.		
	25. Submit a similar diagram for an opening operation and unsuccessful instantaneous reclosing operation into a fault. This too consist of an open zero time close open (Yes/No)		
6.3.2	**DISCONNECTORS AND EARTHING SWITCHES**	**132kV**	
6.3.2.1	**Reference Data:**		
	1. Nominal voltage class, kV		
	2. Type designation		
	3. Break type (Vertical/Horizontal)		

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Item	Description	Units	Value
	4. Manufacturer's name and country		
	5. Catalog No.		
	6. Is Proposal in accordance with the Specifications? (If not, list deviations in an attachment to this Schedule)		
6.3.2.2	**Voltage Data:**		
	1. Nominal system voltage, kV, rms.		
	2. Rated voltage, kV, rms.		
	3. Rated insulation level:		
	(a) Rated 1 min. power frequency withstand voltage:		
	Phase to earth and between phases, kV, rms.		
	Across the isolating distance, kV, rms.		
	(b) Rated switching impulse withstand voltage:		
	Phase to earth kV, peak.		
	Between phases, kV, peak		
	Across the isolating distance, kV, peak.		
	(c) Rated lightning impulse withstand voltage:		
	Phase to earth and between		
	phases, kV, peak.		
	Across the isolating distance, kV, peak.		
	4. Frequency, Hz.		
	5. Max. RIV at 1.1xUr//3 rms line to ground voltage when tested as per IEC 694, microvolts		
6.3.2.3	**Current Data:**		
	1. Rated current at 50 deg. C, not less than, A, rms:		
	a) Bay disconnectors.		
	b) Shunt reactor disconnectors.		
	c) Transformer disconnectors.		
	2. Rated short time withstand current for disconnectors and earthing switches, kA, rms.		
	3. Rated duration of short circuit for disconnectors and earthing switches, sec.		
	4. Rated peak withstand current for disconnectors and earthing switches, kA, peak.		
6.3.2.4	**Operating Mechanism:**		
6.3.2.4 .1	**Motor Operated Mechanism for Disconnectors and Earthing Switches:**		
	1. Manufacturer's name and country		

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Item	Description	Units	Value
	2. Type and catalog No.		
	3. Max. opening time, sec.		
	4. Max. closing time, sec.		
	5. Number of phases and voltage of:		
	(a) motor, V, dc.		
	(b) heater, V, rms.		
	6. Power demand of :		
	(a) motor, W.		
	(b) heater, W.		
	7. Maximum current during: At 220V DC		
	(a) start, A, rms.		
	(b) running, A, rms.		
	(c) stall, A, rms.		
	Maximum time required to open or close the disconnector, sec.		
	Number of operations (Close Open) disconnector is capable to perform.		
6.3.2.4.2	**Manually Operated Mechanism:**		
I.	**For Disconnectors:**		
	1. Maximum Torque required to open (operation effort and point of application shall be indicated on an outline drawing) Kgm.		
	2. Method of manual operation.		
	3. Number of revolutions of crank required for full stroke of disconnector.		
II.	**For Earthing Switches**		
	1. Maximum Torque required to open (operation effort and point of application shall be indicated on an outline drawing) Kgm.		
	2. Method of manual operation.		
	3. Number of revolutions of crank required for full stroke of disconnector.		
6.3.2.5	**Contact Data:**		
	1. Normal contact pressure (disconnector in fully closed position), kg.		
	2. Maximum wiping contact pressure, kg		
	3. Material of contact surfaces		

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Item	Description	Units	Value
6.3.2.6	**Switch Materials:**		
	1. Disconnector		
	2. Earthing switch		
	3. Other live parts		
6.3.2.7	**Dimensions:**		
	1. Maximum opening from closed position.		
	2. Height from base to center line of terminal connectors, mm.		
	3. Length of disconnector base, mm		
	4. Length from jaw end terminal pad to hinge end terminal pad, mm		
	5. Length of open gap, metal to metal, mm		
	6. Live part, phase clearance disconnector (centerline to centerline spacing) based on (5) above, mm.		
	7. Overall length, mm		
	8. Overall width, mm		
	9. Overall height, mm		
6.3.2.8	**Insulator Stacks:**		
	1. Type		
	2. Manufacturer's name and country		
	3. IEC Designation		
	4. No. of units per stack		
	5. Lighting impulse withstand voltage, kV, peak.		
	6. Switching impulse withstand voltage, wet, kV, peak.		
	7. Power frequency 1 min. wet withstand, voltage, kV. rms.		
	8. Radio interference voltage:		
	(a) Test voltage, kV rms to ground.		
	(b) Max. RIV, at 1.1xUr//3kV line to ground when tested as per IEC 694, micro volts.		
	9. Minimum creepage distance, mm.		
	10. Ultimate strength at top of insulator stack:		
	(a) Cantilever, N		
	(b) Tension, N		
	(c) Torsion, Nm		
	(d) Compression, N		

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Item	Description	Units	Value
	11. Maximum cantilever load on any insulator at points of contact resulting from disconnectors operation, N		
	12 a) Top metal fitting pitch circle diameter		
	b) Bottom metal fitting pitch circle diameter		
	13 Material and color		
6.3.2.9	**Auxiliary Switches:**		
	1. Number of normally open contacts.		
	a) Total		
	b) Spare		
	2. Number of normally closed contacts.		
	a) Total		
	b) Spare		
	3. Number of reversible contacts:		
	a) Total		
	b) Spare		
	4. Number of adjustable contacts.		
	a) Total		
	b) Spare		
	5. Voltage rating, V, dc.		
	6. Continuous current rating, A, dc		
	7. Contact material.		
6.3.2.10	**Terminals and Connectors:**		
	1. Rated Mechanical Terminal Load:		
	a) Static mechanical terminal loads:		
	i) Straight load, N		
	ii) Cross load, N		
	b) External dynamic mechanical load, N		
	c) Do the offered loads meet the specified requirements of Clause 6.3.3 of the Technical Specifications (Yes/No).		
	2. Manufacturer and type of terminal connectors.		
	3. Terminal connectors current rating, A.		
	4. Material of conducting parts.		
	5. Standard or streamlined connectors.		
6.3.2.11	**Support Structures:**		

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Item	Description	Units	Value
	Lattice type or Tubular		
6.3.2.12	**Weights:**		
	1. Switch, single pole weights:		
	(a) Live parts, kg.		
	(b) Switch base with operating linkage, kg.		
	(c) Net weight of power operated mechanism, kg:		
	i) For disconnectors		
	ii) For earthing switches		
	(d) Net weight of manual operated mechanism, kg:		
	i) For disconnectors		
	ii) For earthing switches		
	(e) Net weight of earthing switch, kg		
	2. Maximum shipping weight (heaviest item), kg		
6.3.2.13	**Foundation Loading:**		
	1. Load that foundation should be designed for: (this figure is the sum of disconnector and earthing switch (where applicable) weight, plus impact, expressed in terms of static force).		
	2. Uplift that foundation should be designed for, kg. foundation, including those		
6.3.2.14	**Miscellaneous:**		
	1. Append drawing of supports. (Yes/No)		
	2. Append construction detail drawing (Yes/No)		
	3. Append mechanism detailed drawing. (Yes/No)		
	4. Append list of type and routine tests to be performed at the factory. (Yes/No)		
	5. Append list of attached drawings, and documentation. (Yes/No)		
6.3.3	**STEEL STRUCTURES:**		
6.3.3.1	Structural Steel:		
	1. Type and standard specification number.		
	2. Manufacturer's name and country		
	3. Minimum yield strength, kg/mm2.		
	4. Ultimate tensile strength, kg/mm2.		
6.3.3.2	**Bolts and Nuts:**		

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Item	Description	Units	Value
	1. Type and standard specification number.		
	2. Manufacturer's name and country		
	3. Minimum tensile strength of bolt and proof load on nuts of 16 mm diameter, kg.		
	4. Hardness of bolt material.		
	a) Minimum		
	b) Maximum.		
6.3.4	**HIGH VOLTAGE BUS WORK:**	**132kV**	
6.3.4.1	**Switchyard Conductor:**		
6.3.4.1 .1	**Tubular Conductors:**		
	1. Manufacturer's name and country		
	2. Type designation.		
	3. Inner dia, mm.		
	4. Outer dia, mm.		
	5. Rated continuous current, at 30 degree C temperature rise above an ambient temperature of 50 deg.C, A, rms.		
	6. Rated short time (1 sec.) current, A, rms.		
	7. Weight kg/m.		
	8. Moment of inertia, kgm2.		
6.3.4.1 .2	**All Aluminum Conductor:**		
	1. Manufacturer's name and country		
	2. Conductor Type.		
	3. Conductor size, kilo circular mils (KCM).		
	4. Stranding:		
	(a) Number of AL. wires.		
	(b) Dia. of each wire, mm.		
	5. Overall conductor dia, mm.		
	6. Cross-sectional area, sq.mm.		
	7. Rated continuous current, A, rms.		
	8. Rated short time (1 sec.) current, A, rms.		
	9. Rated ultimate tensile strength, kN.		
	10. Mass, nominal, kg/m.		
	11. No. of conductors per bundle.		

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Item	Description	Units	Value
	12. Bundle configuration.		
	13. Bundle spacing.		
6.3.4.1 .3	**Shield Wire:**		
	1. Manufacturer's name and country		
	2. Diameter of galvanized steel wire, mm.		
	3. Stranding:		
	(a) Number of strands of wire.		
	(b) Diameter of each strand, mm.		
	4. Grade of wire.		
	5. Weight of wire, kg/km.		
	6. Minimum breaking strength of wire, kN.		
	7. Weight of zinc coating, kg/sq.m of uncoated strand surface.		
6.3.4.2	**Insulators:**		
6.3.4.2 .1	**Station Post Type:**		
	1. Type		
	2. (a) Manufacturer’s name and country		
	(b) IEC Designation.		
	3. Insulator unit, length/height, mm.		
	4. No. of units in each insulator		
	5. Power frequency flashover, voltage, kV:		
	(a) Dry.		
	(b) Wet.		
	6. Impulse flashover, kV.		
	(a) Positive.		
	(b) Negative.		
	7. Power frequency withstand voltage, kV.		
	(a) One minute dry.		
	(b) 10 sec. wet.		
	8. Power frequency puncture voltage, kV.		
	9. Switching impulse withstand voltage, wet, kV, peak		
	10. Lightning impulse withstand voltage, kV, peak.		
	11. Radio interference voltage.		

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Item	Description	Units	Value
	(a) Test, kV, rms. to ground.		
	(b) Max. RIV at 1.1 x Ur//3 line to ground voltage, when tested as per IEC 694, micro volts		
	12. Leakage distance, mm		
	13. Mechanical values, Failing Load (minimum):		
	(a) Cantilever strength, N		
	(b) Tensile strength, N		
	(c) Torsional strength Nm		
	(d) Compressional strength, N		
	(e) Impact strength Nm		
6.3.4.2.2	**Suspension Type:**		
	1. Type.		
	2. Manufacturer's name and country		
	3. ANSI Class		
	4. Insulator unit, length, mm		
	5. No. of units in each string.		
	6. No. of insulator strings per conductor (at each end).		
	7. Dia of disc, mm.		
	8. Disc spacing, mm.		
	9. Power frequency flashover voltage, kV.		
	(a) Dry.		
	(b) Wet.		
	10. Critical impulse flashover 1.2x50 micro sec wave:		
	(a) Positive, kV peak.		
	(b) Negative, kV peak.		
	11. Power frequency withstand voltage, kV.		
	(a) One minute dry.		
	(b) 10 sec. wet.		
	12. Power frequency puncture voltage, kV.		
	13. Lightning impulse withstand voltage, kV.		
	14. Dry arcing distance, mm		
	15. Radio interference voltage:		
	(a) Test, kV rms, to ground.		

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Item	Description	Units	Value
	(b) Max. RIV at 1000 kHz, micro volts		
	16. Leakage distance, mm.		
	17. Mechanical values: 132kV		
	(a) Tensile strength, N		
	(b) Torsional strength, Nm		
	(c) Compressional strength, N		
	(d) Combined electrical and mechanical strength, N.		
	(e) Impact strength, Nm		
6.3.4.3	**Switchyard Connectors and Hardware:**		
	1. Manufacturer's name and country		
	2. Cast aluminum connectors:		
	(a) Type/Grade of Alloy.		
	(b) Specification No.		
	3. Bolts, nuts and washers' item (2) above:		
	(a) Type/Grade of Alloy.		
	(b) Specification No.		
	4. Cast aluminum bus clamps:		
	(a) Type/Grade of Alloy.		
	(b) Specification No.		
	5. Bolts, nuts and washers for item (3) above:		
	(a) Type/Grade of Alloy.		
	(b) Specification No.		
	6. Nonferrous (other than aluminum) connectors and bus clamps:		
	(a) Type/Grade of Alloy.		
	(b) Specification No.		
	7. Bolts, nuts and washers for item (5) above:		
	(a) Type/Grade of Alloy.		
	(b) Specification No.		
	8. AAC compression type dead end terminals:		
	(a) Type/Grade of Alloy.		
	(b) Specification No.		
	9. AAC conductor hardware, high strength cast aluminum:		
	(a) Type/Grade of Alloy.

Item	Description	Units	Value
	(b) Specification No.		
	10. Bolts, nuts and washers for AAC conductor hardware, high strength cast aluminum:		
	(a) Type/Grade of Alloy.		
	(b) Specification No.		
	11. AAC conductor hardware galvanized steel and malleable iron:		
	(a) Type/Grade of Alloy.		
	(b) Specification No.		
	12. Strain clamp for overhead shield wire:		
	a) Type/material		
	b) Ultimate strength, kg.		

PUBLIC PROCUREMENT REGULATORY AUTHORITY (PPRA) EPADS

Item	Description	132kV	
6.3.5	**CURRENT TRANSFORMERS**	**CT**	**SMS CT**
	1. Type designation.		
	2. Manufacturer's name and country		
	3. Nominal system voltage, kV, rms.		
	4. Rated voltage for the equipment kV, rms.		
	5. Rated continuous overvoltage, kV, rms.		
	6. Rated frequency, Hz.		
	7. Rated primary current, A, rms.		
	8. Rated secondary current, A, rms.		
	9. Rated transformation ratios.		
	10. Rated output, VA of each secondary winding at the lowest taps.		
	11. Number of secondary cores and windings.		
	12. Protective Cores:		
	(a) Rated equivalent limiting secondary e.m.f.(Ea1) [IEC, 446)		
	(b) Accuracy class.		
	(c) Accuracy limit factor		
	13. Measuring Core:		
	(a) Accuracy class.		
	(b) Instrument security factor		
	14. Short time (1 second) current rating:		
	(a) Thermal, kA.		
	(b) Dynamic, kA.		
	15. Rated lightning impulse withstand voltage, kV peak.		
	16. Rated switching impulse withstand voltage, kV peak.		
	17. Rated primary power frequency short time withstand voltage kV, rms.		
	18. Maximum temperature rise 132kV under specified service conditions above ambient of 50-degree C.		
	19. Design test certificate:		
	(a) Issuing institute.		
	(b) Number and date.		
	20. Earthquake withstand, g.		
	21. Creepage distance, mm.		

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Item	Description	132kV	
	22. Max. RIV. at 1.1x Ur//3 line to ground, micro volts.		
	23. Weight per pole, kg.		
6.3.6	**CAPACITOR VOLTAGE TRANSFORMERS:**	**CVT**	**SMS CVT**
	1. Manufacturer's name and country		
	2. Type designation.		
	3. Nominal system voltage, kV, rms.		
	4. Rated voltage for the equipment kV, rms.		
	5. Rated continuous overvoltage, kV, rms.		
	6. Rated frequency, Hz.		
	7. Rated secondary voltage, V.		
	8. Rated transformation ratios.		
	9. Rated output at a power factor of 0.8 lagging, VA:		
	a) Ist winding.		
	b) 2nd winding.		
	c) Total simultaneous burden.		
	10. Rated voltage factor		
	11. IEC accuracy class:		
	a) Ist winding.		
	b) 2nd winding.		
	12. Rated coupling capacitance, pf.		
	13. Rated lightning impulse withstand voltage, kV peak.		
	14. One minute, power frequency withstands voltage kV, rms.		
	15. Rated switching impulse withstand voltage, kV peak.		
	16. Variation of capacitance, + %.		
	17. Low terminal:		
	a) Stray capacitance at any frequency in the carrier frequency range 30 kHz 500 kHz, pF.		
	b) Stray conductance at any frequency in the carrier frequency range 30 kHz 500 132 kV 132 kV kHz, micromhos.		
	18. Insertion loss of the carrier drain coil over the carrier frequency range 30 kHz 500 kHz with Z = 300 ohms, dB.		
	19. Voltage drop across the carrier drain coil at 50 Hz and 550 kV, rms.		

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Item	Description	132kV	
	20. Minimum rated lightning impulse insulation level of the carrier drain coil, kV, peak.		
	21. Carrier protective gap sparkover, kV peak.		
	22. Drain coil:		
	a) Inductance, mH.		
	b) D.C. resistance, ohms.		
	c) Impedance in the range 30 kHz 500 kHz, kohms.		
	d) Maximum continuous current at 50 Hz, Amps, rms.		
	23. Design test certificate:		
	a) Issuing institute.		
	b) Number and date.		
	24. Creepage distance, mm.		
	25. Maximum temperature rise under specified service conditions above an ambient of 50, deg. C.		
	26. Maximum RIV, at 1.1 x Ur//3 line to ground voltage and 1 MHz, micro volts.		
	27. Weight per pole, Kg.

	8. Thermal short time (1 sec.) current rating, A.	
	9. Burden of current circuit, VA	
	10. Burden of voltage circuit, VA	
	11. Auxiliary voltage, (D.C), V	
	12. Tolerance in auxiliary, voltage %, (+).	
	13. Consumption of D.C. auxiliary circuits:	
	(a) During normal conditions, watts.	
	(b) During short circuit, watts.	
	14. Settings, range available for starting unit:	
	(a) Ground faults, ohms/phase	
	(b) Phase faults ohms/phase	
	15. Setting range available for measuring unit:	
	(a) Ground fault, ohms/phase	
	(b) Phase fault, ohms/phase	
	16. Directional Sensitivity:	
	(a) For two phase and earth faults, mV	
	(b) For three phase faults when memory has expired, mV	
	17. Time Steps:	
	(a) Number	
	(b) Setting ranges.	
	Basic step (minimum time), msec.	
	2nd step, msec.	
	3rd step, msec.	
	4th step, msec.	
	18. Contact data, append complete contact data for signaling and tripping.	
	19. Are the following modules included in the scheme offered: (a) Power swing blocking module, (Yes/No) (b) Carrier interface module, (Yes/No)	

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Item	Description	132kV
	(c) Any additional module for starting or measuring systems.	
	20. List any module additional to the main scheme offered by the tenderer to provide the characteristics as specified.	
	21. Operating temperature range, deg. C.	
	22. Insulation test voltage and duration	
	23. Available modes of operation: (a) Directional comparison blocking, (Yes/No) (b) Permissive underreach transfer tripping, (Yes/No) (c) Permissive overreach transfer tripping, (Yes/No) (d) Stage acceleration (Yes/No)	
6.3.8.1.5	**Line Overcurrent Protection:**	
	1. Manufacturer's name and country	
	2. Type designation	
	3. DC infeed.	
	. Independent DC/DC converter	
	included. (Yes/No)	
	. Tolerances Idc%.	
	. Rated voltage. V.	
	. Overload protection (Yes/No)	
	. Short circuit Protection (Yes/No)	
	. Power consumption at:	
	(a) Normal operation VA	
	(b) Fault VA	
	4. Relay burden at 3 times minimum operating current, VA	
	5. Operating characteristics	
	. Definite time (Yes/No)	
	. IDMT (Yes/No)	
	6. Instantaneous element (Yes/No)	
	included.	
	7. Current setting range:	

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Item	Description	132kV
	. Phase elements.	
	. Earth element.	
	. Instantaneous element.	
	8. Operating time:	
	. Minimum operating time sec.	
	. Time setting range.	
	9. Pickup to drop-off ratio.	
6.3.8.1.6	**Voltage Relays:(if used)**	
	(a) Definite time over voltage relays:	
	Manufacturer's name and country	
	Type	
	Setting range, volts	
	Minimum pick up, time, ms	
	Maximum reset, time, ms.	
	pickup to drop-off ratio %	
	(b) Inverse time over voltage relays:	
	Manufacturer's name and country	
	Type	
	Setting range, volts.	
	Voltage/time Setting range %	
	Pickup drop of ratio %	
6.3.8.2	**Power Transformer Protection**	
6.3.8.2.1	**Numerical Differential Relay Main- I:**	
	a) Manufacturer's name and country	
	b) Type designation	
	c) Setting range, A.	
	d) Bias setting range, % or time setting range, sec.	
6.3.8.2.2	**Restricted Earth Fault**	
	a) Manufacturer's name and country	
	b) Type designation	
	c) Setting range	
6.3.8.2.3	**IDMT Over Current Protection**	
	a) For phase faults complete, HV and LV sides.	

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Item	Description	132kV
	1. Manufacturer's name and country	
	2. Type designation	
	b) For ground faults complete, HV and LV sides.	
	1. Manufacturer's name and country	
	2. Type designation	
	c) For ground faults complete, neutral:	
	1. Manufacturer's name and country	
	2. Type designation	
6.3.8.3	**Busbar Protection as Specified Protection Complete:**	
	1. Manufacturer's name and country	
	2. Type designation	
6.3.8.4	**Breaker Failure Protection Complete:**	
	1. Manufacturer's name and country	
	2. Type designation	
6.3.8.5	**Synchronizing Check Scheme Complete:**	
	1. Manufacturer's name and country	
	2. Type designation	
6.3.8.6	**Lockout Relays:**	
	1. Manufacturer's name and country	
	2. Type designation	
6.3.8.7	**Tripping Relays:**	
	1. Manufacturer's name and country	
	2. Type designation	
	3. Pickup time, m sec	
6.3.8.8	**Panel Wiring:**	
	1. Voltage rating	
	2. Size	
	3. Type of insulation	
6.3.8.9	**Auxiliary Relays & Contactors:**	
	1. Self-reset	
	(a) Manufacturer's name and country	
	(b) Type designation	
	2. Manual reset

Item	Description		
	1. Type designation		
	2. Manufacturer's name and country		
	3. Standard to which manufactured		
	4. Test certificates:		
	(a) Issuing Institute.		
	(b) Number and date.		
	5. Maximum allowable conductor temperature.		
	(a) At continuous operation.		
	(b) Under short circuit conditions.		
	6. Conductor material (No of strands/diameter of each strands)		
	7. Insulation material.		
	8. Sheath material		
	9. Screening material		
	10. Armoring material and thickness		
	11. A.C. test withstand voltage level for 5 minutes, kV.		
	12. D.C. test withstand voltage level for 4 minutes, kV.		
	13. Cable identification tag material.		
	14. Wire identification tag type/material.		
	15. D.C resistance at 20 deg C		
	16. A.C resistance at 80 deg C		
6.3.10	**Grounding System:**		
6.3.10.1	1. Earthing Conductor/Cable:		
	(a) Type and specification number.		
	(b) Manufacturer's name and country		
	(c) Size, sq.mm.		
	(d) Dia of conductor, mm.		
	(e) Total length of the conductor used.		
	3. Connectors:		
	(a) Type and specification number.		
	(b) Manufacturer's name and country		
	(c) Alloy.		
	(d) Material of bolts.

Item	Description	
6.3.11	**A.C/D.C AUXILIARY SUPPLIES:**	**132kV**
6.3.11.1	**220 Volts D.C. System: 220V DC**	**220V DC**
6.3.11.1.1	**General:**	
	1. Nominal system voltage.	
	2. System voltage under float charge conditions.	
	3. System voltage under boost charge conditions.	
6.3.11.1.2	**Batteries:**	
	1. Type.	
	2. Manufacturer's name and country	
	3. Cells.	
	a) Type	
	b) Number	
	4. Rated capacity at 10 hour rate and 25 deg. C. ambient temperature, AH.	
	5. Percentage of rated capacity available, AH.	
	a) at 0 deg. C ambient temp.	
	b) at 50 deg. C. ambient temp.	
	6. Cell voltage, V.	
	a) Nominal.	
	b) On floating charge.	
	c) On boost charge.	
	7. Short circuit current, amp. dc.	
	8. Recommended range of temperature for normal operation, deg. C.	
	9. Type of anode.	
	10. Type of cathode.	
	11. Type of container.	
	12. Weight of cell with electrolyte, Kg.	
	13. Expected life for specified service, years.	
	14. Material of racks.	
	15. Overall dimensions of rack with the cells in place, cm.	
	16. Weight of rack, Kg.	
	17. Total weight of battery, Kg.	
6.3.11.1.3	**Battery Chargers:**	

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Item	Description	
	1. Manufacturer's name and country	
	2. Type designation.	
	3. AC input voltage, V, rms.	
	4. Tolerance for variation in input voltage, +%.	
	5. Rated frequency of input voltage, Hz.	
	6. Tolerance in frequency, %.	
	7. Input current at max. DC output, Amps. rms.	
	8. Output voltage, V, DC.	
	9. Output voltage setting range, volts, DC.	
	10. Variation in output voltage for output current variation from 0 to maximum.	
	11. Rated continuous output current at 50 deg. C., Amps. DC.	
	12. Rated short time current (3 sec.), Amps., DC.	
	13. Time to charge a fully discharged battery, Hr.	
	14. Type of bridge rectifier.	
	15. Circuit breaker for AC input provided (Yes/No).	
	16. Circuit breaker for DC output provided (Yes/No).	
	17. AC voltmeter:	
	a) Manufacturer's name and country	
	b) Type designation.	
	c) Indication range, V, rms.	
	18. AC ammeter:	
	a) Manufacturer's name and country	
	b) Type designation.	
	c) Indication range, Amps., rms.	
	19. DC voltmeter:	
	a) Manufacturer's name and country	
	b) Type designation.	
	c) Indication range, volts.	
	20. DC ammeter:	
	a) Manufacturer's name and country	
	b) Type designation.	
	c) Indication range, Amps.

DISCLAIMER:

THIS IS CONCEPT LEVEL DRAWING WITH NO GUARANTEE OF COMPLETENESS OR PRECISION. EPC CONTRACTOR WILL BE FULLY RESPONSIBLE FOR THE ACTUAL DESIGN AND DRAWINGS TO ENSURE THE APPROPRIATE CONSTRUCTION, FUNCTIONALITY & EFFECTIVE OPERATION OF THE PROJECT (AS PER CONTRACT).

NOTES:

1. ALL DIMENSIONS/ELEVATIONS ARE IN METERS.
2. ELEVATIONS AND LEVELS ARE BASED ON THE TOPOGRAPHIC SURVEY ATTACHED IN PACKAGE III, VOLUME III OF THE BIDDING DOCUMENT. VERIFICATION OF THESE ELEVATIONS IS RESPONSIBILITY OF THE EPC CONTRACTOR.
3. THE EXCAVATION SLOPE/LIMITS ARE TENTATIVE. SURFACE EXCAVATIONS SHOWN ON THIS DRAWING MAY CHANGE DURING DETAILED DESIGN/EXECUTION DESIGN AFTER HAVING MORE INFORMATION ABOUT GEOLOGY AND TOPOGRAPHY OF PROJECT SITE.
4. THE EXCAVATION SLOPES SHOULD BE DEFINED AS A RESULT OF STABILITY ANALYSES.
5. GABION PROTECTION MAY BE APPLIED INSTEAD OF SIDE EXCAVATION. IF THIS IS PREFERRED BY THE CONTRACTOR THE NECESSARY CONTROL FOR THE FREEBOARD SHOULD BE DONE.
6. ACCESS ROADS ARE NOT SHOWN. THE CONTRACTOR WILL DESIGN THE ROADS ACCORDING TO HIS OWN REQUIREMENT.
7. THE CONTRACTOR WILL BE ABLE TO MAKE NECESSARY CHANGES IN THE DIMENSIONS OF THE STRUCTURES, DIVERSION AND DEWATERING SYSTEM, EXCAVATION AND THE CONSTRUCTION METHODOLOGY IN ACCORDANCE WITH THE PROPOSED SCHEME.

	MARSHALLING KIOSK (M.K)
	DISCONNECTOR SWITCH (DS)
	CIRCUIT BREAKER (CB)
	CURRENT TRANSFORMER (CT)

NOTES:

1. SPANS BETWEEN SUBSTATION GANTRIES AND THE RELEVANT TRANSMISSION LINE TOWERS SHALL BE FURNISHED BY OTHERS. HOWEVER, THE CONTRACTOR SHALL SUPPLY AND INSTALL ALL NECESSARY JUMPERS/DROPPERS AND HARDWARE FOR CONNECTIONS BETWEEN TRANSMISSION LINES AND THE SUBSTATION EQUIPMENT.
2. INSTALL ALUMINIUM ALLOY CONDUCTOR INSIDE THE ALLUMINIUM TUBULAR CONDUCTOR TO PREVENT VIBRATION AND TACK-WELDING TO PREVENT ARCING OF THIS PARALLEL CONDUCTOR AT THE ENDS.
3. CORROSION INHIBITING COMPOUNDS SHALL BE USED FOR ALL ELECTRICAL CONNECTIONS AND SHALL BE APPLIED TO CONTACT GROOVES AND ON CONDUCTORS PRIOR TO ASSEMBLY.
4. BUS SUPPORT CLAMPS SHALL BE DESIGNED TO ALLOW FOR THERMAL EXPANSION.
5. SPECIAL CARE SHALL BE EXERCISED IN HANDLING ALL TUBING, CABLE AND FITTINGS TO PREVENT SCRATCHES ON THEIR SURFACES. TO PREVENT CORONA, ALL WELDS MADE ON CONDUCTORS OR FITTINGS SHALL BE MADE WITH A SMOOTH BEAD WHICH SHALL BE FILED AND SANDED.
6. LAYOUT SHALL BE ADJUSTED DURING DETAIL DESIGN STAGE
7. ALL DIMENSIONS SHALL BE MEASURED FROM TOP OF FOUNDATIONS.
8. INTERCONNECTION BETWEEN POWER HOUSE AND 132kV SWITCHYARD WILL BE THROUGH SEGREGATED BUS BAR AS SPECIFIED IN POWER PLANT SPECIFICATION.

DISCLAIMER:

THIS IS CONCEPT LEVEL DRAWING WITH NO GUARANTEE OF COMPLETENESS OR PRECISION. EPC CONTRACTOR WILL BE FULLY RESPONSIBLE FOR THE DETAIL DESIGN AND PREPARATION OF REQUIRED DRAWINGS TO ENSURE THE APPROPRIATE CONSTRUCTION, FUNCTIONALITY & EFFECTIVE OPERATION OF THE PROJECT (AS PER CONTRACT).

NOTES:

1. THIS DRAWING SHOWS ONLY TYPICAL AC OUTGOING CIRCUITS.
2. EMERGENCY DIESEL GENERATING SET SHALL BE SUPPLIED COMPLETE WITH CONTROL, PROTECTION, METERING, INDICATION AND ANNUNCIATION SYSTEMS AS SPECIFIED.
3. FOLLOWING REMOTE CONTROLS OF THE DIESEL GENERATOR/DIESEL ENGINE SHALL BE PROVIDED ON THE DIESEL GENERATOR PANEL IN CONTROL ROOM:
   A) DIESEL GENERATOR START.
   B) GENERATOR STOP.
   C) VOLTAGE AND CURRENT INDICATION.
   D) FREQUENCY INDICATION.
4. DETAILS FOR CONTROL, METERING, INDICATIONS AND OTHER INSTRUMENTS RELEVANT TO AC SYSTEM SHALL BE FINALIZED AT THE DETAIL DESIGN STAGE.
5. THE SIZES OF THE CABLES ON THIS DRAWING ARE APPROXIMATE SIZES. THE CONTRACTOR SHALL SUBMIT CALCULATIONS FOR APPROVAL OF THE EMPLOYER'S REPRSENTATIVE FOR THE SELECTION OF CABLES STAGE.
6. THE CONTRACTOR SHALL PROVIDE SUB-DISTRIBUTION BOARDS AS SPECIFIED / REQUIRED BY THE EMPLOYER'S REPRESENTATIVE.
7. THE SIZE OF BUSBAR AND MCBs SHALL BE DETERMINED BY THE CONTRACTOR AND SHALL BE SUBJECT TO APPROVAL BY THE EMPLOYER'S REPRESENTATIVE. FRAME SIZES OF MCBs SHALL BE 250A MINIMUM.
8. BCU SHALL BE PROVIDED TO COVER ALL 11kV SWGR SIGNALS TO SAS.
9. ENERGY METERS FOR 400V SHALL BE HOUSED IN EACH PAD MOUNTED TRANSFORMER.

DISCLAIMER:

THIS IS CONCEPT LEVEL DRAWING WITH NO GUARANTEE OF COMPLETENESS OR PRECISION. EPC CONTRACTOR WILL BE FULLY RESPONSIBLE FOR THE DETAIL DESIGN AND PREPARATION OF REQUIRED DRAWINGS TO ENSURE THE APPROPRIATE CONSTRUCTION, FUNCTIONALITY & EFFECTIVE OPERATION OF THE PROJECT (AS PER CONTRACT).

EXECUTIVE SUMMARY

S.1 INTRODUCTION

Attabad Lake Hydropower Project (ALHPP) has been identified on Hunza River downstream of Attabad Lake due to creation of dam due to land slide from right bank of Hunza River in January, 2010 20 km upstream of Aliabad, Hunza Valley, Gilgit-Baltistan. ALHPP is proposed on Attabad Lake which has live storage capacity of about 11 million m^3. Project Location is shown in Dwg. No: AFS-GN-101.

On Nov, 2015 Prime Minister announced the construction of ALHPP, Accordingly Ministry of Water and Power, Gilgit-Baltistan undertook its Feasibility Study through Annual Development Program (ADP) for Financial Year 2016-17. In the beginning Feasibility Study of ALHPP was carried out by local consultants, Design man Consulting Engineers (Pvt) Ltd, Islamabad in association with Mountain Infrastructure & Engineering Services, Gilgit, in March, 2017. The Project was finalised with an installed capacity of 32.5 MW and mean annual energy of 255 GWH. On August, 2017, Ministry of Water and Power, Gilgit-Baltistan wrote letter to the Chairman WAPDA to give expert opinion on the Feasibility Study of ALHPP. On July 2019, a meeting was held between Chairman, WAPDA and Chief Secretary, Gilgit-Baltistan. It was agreed that Feasibility Study would be reviewed by Hydro Planning Organization (HPO), WAPDA because of its expertise in the field of Hydropower. Water and Power Development, Gilgit-Baltistan shared the already carried out Feasibility Study with HPO, WAPDA in January, 2020. Feasibility Study has been examined by HPO, WAPDA and found that proposed layout is designed without diversion works and sediment flushing facility which are imperative for Project execution. Therefore, Feasibility Study has been again undertaken by HPO, WAPDA with additional investigation. The Terms of Reference (TOR) set for HPO, WAPDA by Govt. of Gilgit-Baltistan is to review Feasibility Study and preparation and submission of PC-I of ALHPP.

HPO, WAPDA prepared a new Feasibility Study with additional field investigations including topographic and hydrographic survey of Lake, 400 m onshore drilling, neotectonic studies and geological mapping with new layout. It enhanced its capacity to 54 MW with mean annual energy of 374 GWh with an estimated cost of Rs.21,246 million in order to meet the beside requirements of entire Hunza River valley but also fulfil the demand of Gilgit and Ghizar districts with peaking storage facility at Attabad Lake, the installed power of 54 MW can be generated throughout the year during peak hours..

ALHPP has been designed for an installed capacity of 54.0 MW with the design discharge and rated head of 60 m^3/s and 106 m respectively. Project will provide mean annual electricity/energy of 374 GWh by using 3 vertical Francis turbines with a plant factor of 79%.

S.2 PROJECT ACCESS

The Project is accessible from Federal Capital Islamabad connected to Gilgit along the existing N-35 Karakorum Highway (KKH) which leads to Project Area at Attabad Lake near Hunza. The route through KKH can be accessed via Motorways from Islamabad to Burhan Interchange near Hassanabdal (M-1 Islamabad-Peshawar Motorway – 44 km) and from Burhan Interchange to Thakot (M-15 Hazara Motorway – 186 km). From there, the access onward to Gilgit and

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Hunza continues as a part of KKH (Thakot to Gilgit– 390 km; Gilgit to Attabad Lake/ Hunza along Hunza River – 120 km). There is another route from Islamabad to Gilgit and Hunza via Babusar Pass, through National Highway (N-15). This route is although shortest than KKH through Besham, to reach upto Chilas but it usually remains closed for six months in a year due to heavy snowfall during the winter season.

Gilgit Airport is the nearest facility to the Project Area which is about 120 km from the Project Site. Domestic flights from Islamabad airport are schedule for Gilgit on daily basis but flight operation depends upon the weather conditions. Recently flights from Lahore and Karachi are also operational to Gilgit Airport.

S.3 TOPOGRAPHIC & HYDROGRAPHIC SURVEYS

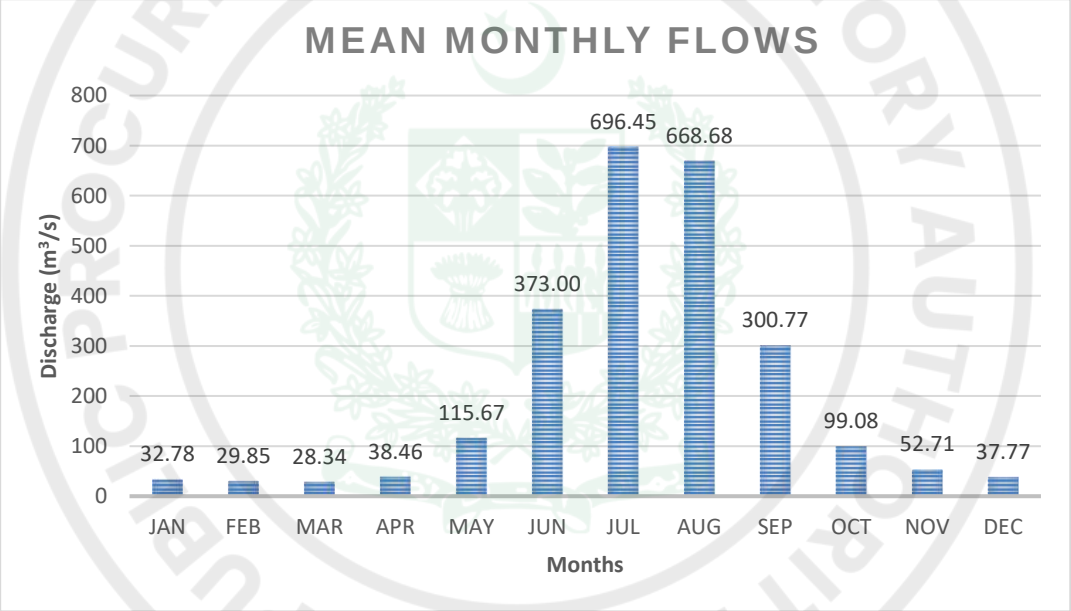
To determine the geographical conditions of the Project Area, the topographic survey has been performed by Survey Division, HPO, WAPDA, Peshawar during August & September, 2020. The satellite based survey with two fold approach i.e. Google Earth and Geographical Information System (GIS) has been adopted in addition to the conventional topographic survey. A comprehensive topographic survey of the Project Area has been carried out at a scale of 1:1000 to cover topographic features of ALHPP comprehensively. The topographic survey of the Project Area includes:

- Topographic survey of the Project Area of about 400 hectares, covering 4 km downstream of Weir Site along Hunza River.
- Longitudinal profile along Hunza River, 4 km downstream from Weir Site.
- Topographic survey of 21 valley cross sections along Hunza River, 4 km downstream of Weir Site at an interval of 200 m, covering the main river course and valley slopes (ranging from 175 to 250 m) on either side.

The hydrographic survey of the Attabad Lake has been carried out by International Sedimentation Research Institute (ISRIP), WAPDA, Pakistan during September & October, 2020 using echo sounding equipment. 40 Nos. cross-sections and longitudinal bed profile covering a total lake length of 12,450 m.

The present water surface area of lake at El. 2412 m.a.s.l is 1088.7 Acres (4.41 km^2).The storage capacity at an El. 2412 m.a.s.l comes to be 99,249 Acre Feet (122.42 Mm^3). The comparison of current Hydrographic survey data with previous survey data of year 2011 shows that on an average there is about 30 to 40 m deposition during last 9 years.

S.4 CLIMATE OF THE PROJECT AREA



The Gilgit Meteorological Station is the nearest station to Hunza Valley that has a sound historical record covering more than five decades. Monthly temperature variations (maximum, minimum and mean) at Gilgit indicate parabolic trend with peak in the month of July. Summer prevails in months from June to August. In July and August, mean maximum and minimum temperatures are normally above 35˚C and 15˚C respectively. The winter is cold and chilly that starts from November and remain still end of March. The lowest temperatures are in the month of January when mean maximum and minimum temperatures reaches below 10˚C and (-) 2˚C respectively.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Precipitation data has not been available to depict the precipitation pattern of the Hunza Basin, therefore isohyetal map used to have a picture of precipitation distribution in the basin. That shows mean annual rainfall of the basin for the last 20 years (2000 – 2019) and the precipitation values vary from 88 to 485 mm.

S.5 HYDROLOGY

The main tributaries of Hunza River are; Chapursan, Kilik, Bola Das joining the Hunza River from the west and Khunjerab along with Ghujerab, Simshal and Hispar Rivers joining river from the east of the valley. There is only one hydrological gauging station on Hunza River at Danyor Bridge being operated by SWHP-WAPDA. This station is located at about 107 km downstream of Attabad Landslide Dam. Therefore, river flows are transposed and estimated from documented discharge data from hydrological station at Danyor. Daily discharge data from 1966 to 2015 is available and processed for the calculations. Average value for mean annual flow has been calculated as 208.36 m^3/s.

Mean Monthly Flows (1966-2015)

Keeping in view the different types flood estimations and generation of high peaks due to GLOFs, it is recommended to adopt design flood of 10,000 years return period at weir site. Therefore, design flood of 3,250 m^3/s at weir site has been assumed for the calculations of design of hydraulic structures.

S.6 SEDIMENTATION

Average value of suspended sediment at Danyor comes out 33.43 MMT with data range 1966-2015 which falls on higher side and also differs from present scenario. To remain on realistic side, we choose the period of 2011-2015 for the calculation of suspended sediment and the average of suspended sediment comes out 20.06 MMT. Bed load has been considered as 20% of the total suspended load. Keeping the trap efficiency in view, reservoir life of the Attabad Lake is about 11 years without flushing.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

S. 7 POWER AND ENERGY

Power and energy potential at the site have been estimated on average 10-daily basis using time series data from 1966 to 2015. Keeping in view historic data, optimized design discharge of 60 m^3/s has been selected. Available head across the hydropower facility has been computed keeping in view the minimum and maximum operation water levels i.e. 2,012 to 2,014 m.a.s.l.

In the present study 10-Daily Power Curves, the optimum installed capacity would be 54.0 MW having mean annual energy of 374 GWh. The plant factor has been calculated as 79%. In previous studies, 32.5 MW capacity plant had been proposed for this Project, however, keeping in view the potential of the lake and availability of head, the power and energy optimization have been carried out to size the plant.

S.8 GEOLOGY

Geologically site is located in Karakorum consists mostly of sedimentary, meta sedimentary, igneous and metamorphic rock, bounded by Karakorum Fault in the East, Chaman and Herat Fault in West (Zanchi 1993) ranging in age from Precambrian to Cretaceous. It is glacial originated valley modified later on by river system. Morphologically the valley is lithological as well as structurally controlled.

The site geology unit consists of slided mass and rock. Granitic gneiss and granodiorite rock are exposed which at higher elevations. Geological mapping and 400m drilling have been carried out to evaluate the surface and subsurface foundation conditions of main weir, under sluice/sediment flushing channel, power house and tailrace. 10 test pits have been excavated to analyze the slope and barrow area material to be used for construction material. Samples from bore holes, test pits and barrow area have been tested from CMTL, Lahore to find out the engineering properties along with their suitability to be used as construction material.

Being disastrous slided area due to active tectonics, neo-tectonics studies have been conducted to assess the operational active forces and distortion/deformation in recent sediments (0.1 Ma). Attabad slide commenced as a result of active deformational force, therefore, 30 km upstream and 30 km downstream along both banks of Hunza River have been traversed to gather the recent tectonic/deformational feature. Features found in recent deposits include folds, micro faults, jointing, horst and graben etc.

Both Probalistic Seismic Hazard Analysis (PSHA) and Deterministic Seismic Hazard Analysis (DSHA) approaches have been used to analyze the Seismic Hazard Analysis, keeping in view the on-site and regional tectonic scenario to recommend a suitable earthquake resistant design. This study has focused on the earthquake potential hazard and related ground motions and estimate the value of “g”. Peak Ground Acceleration (PGA) values for

Operating Basis Earthquake (OBE) at return period of 145 years are recomended as horizontal = 0.24 g & vertical = 0.17 g

while Safety Evaluation Eartquake (SEE) at return period of 10,000 years are recommended as horizontal = 0.44g and Vertical = 0.29 g.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Ample quantity construction materials are available in the economic haulage of the Project Area. Sand from Shishkat village area and marble from Passu and RBGM from power house area may be crushed down for coarse aggregate. The boulders in slided mass, may be use as rip rap material while silt/clay is also available for impervious blanket.

S.9 ALTERNATIVE PROJECT LAYOUT

The Project layout has been considered on either bank with powerhouse near Attabad. Options for structures location are limited due to land slided area, steep slope in reservoir area, and weak geological formation in the Project Area. Considering the aforementioned limitations Alternative Project Layout on the Left and the Right Bank have been studied.

Alternative-I: Project Layout on the Left Bank

Alternative-II: Project Layout on the Right Bank

After detail study Alternative-I Project Layout on the left bank came out to be a favourable option and further 2 options have been studied

a. Alternative -I A Headrace Tunnel Option

b. Alternative -I B Headrace with Embedded Pressure Pipe

Finally, Alternative -I A Headrace Tunnel Option has been selected for further studies. (Selected Project Layout is shown in Dwg.No.AFS-LAY-404 & Project Longitudinal X-Section in Dwg.No.AFS-LAY-407).

S.10 PROJECT LAYOUT

An overflow weir/ungated spillway along sediment flushing channel has been proposed at existing site used as spillway of Attabad Lake. Water will be diverted to power house through power intake, low pressure headrace tunnel, surge tank and penstock on the left bank. The coordinates of weir & powerhouse sites are listed below:

Site	Easting (m)	Northing (m)
Overflow Weir	484036.834	4018143.837
Powerhouse	481645.920	4017963.719

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

The proposed overflow weir/ ungated spillway is 60 m wide and a sediment flushing channel 19 m wide on its left side shown in Dwg.No: AFS-WR-409 & 410. The powerhouse site is about 2.5 km downstream of the proposed overflow weir along the left bank of Hunza River.

A design discharge of 60 m^3/s will be diverted towards the powerhouse through intake left bank waterway located upstream side of overflow weir / ungated spillway. A 2.32 km long low pressure headrace tunnel having a diameter of 5.5 m would run along the left bank leading to a 10 m diameter and 49 m high surge tank. From there, a 470 m long embedded steel penstock with 3.5 m diameter shown in Dwg.No: AFS-ST-430 would be laid over the left bank slopes leading down to the surface power house to generate 54 MW with 03 Francis Turbines. From powerhouse, a 18 m long tailrace channel leading from each generating unit would discharge water back into the Hunza River.

S.11 CIVIL AND HYDRAULIC STRUCTURE DESIGN

ALHPP is a Runoff River peaking scheme on Hunza River in Hunza Region. The Project is planned to develop the reach of river 2.5 km downstream of Attabad Lake to generate 54 MW power by proposing and Feasibility Level Design of the following Civil Engineering Structures has been carried out:

- Natural dam of 45 m height from river bed to act as diversion structure with low level outlet and an overflow ungated spillway.
- Power Intake structure is proposed on the left bank of river to take the design discharge of 60 m^3/s.
- Low pressure headrace tunnel having diameter of 5.5 m with total length of 2320 m.
- Vertical surge shaft of 10 m diameter with height of 49 m.
- Concrete lined pressure shaft of 3.6 m diameter having a length of 80 m.
- Steel penstock having a length of 470 m length and diameter of 3.5 m.
- Surface powerhouse with three (03) Francis units with an installed capacity of 54 MW and open switchyard.
- Tailrace channel of 18 m length.

S.12 MECHANICAL WORKS

The powerhouse will be equipped with Three Vertical Shaft Francis turbines (18.0 MW each) X-Section of powerhouse shown in Dwg. No: AFS-PH-435. The total plant out capacity of ALHPP is 54.0 MW. The turbine shall be capable to operate within a wide range of head and discharges at maximum attributable efficiency.

No. of Units	03 (Vertical Francis)
Plant Discharge, Q_{Total} (m^3/sec)	60
Rated Net Head, H_n (m)	106
Plant Capacity, P_{Total} (MW)	54

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

The turbine rated output is expressed by the following equation:

$P_t = 9.81 \times Q \times H_n \times \eta_t$

Where	P_t	Turbine out Power (KW)	
	Q	Discharge (m^3/sec)	20
	H_n	Rated Net Head (m)	106
	η_t	Efficiency of turbine	91.50 %
		9.81*20*106*0.915	19000 KW

Rated Turbine Output at shaft, P 19.0 MW with rated speed of 375 rpm

S.13 POWER HOUSE ELECTRICAL WORKS

The design of the generator is determined by the construction, layout and speed of the turbine. The choice of a vertical shaft Francis turbines defines a vertical generator and appropriate guide bearings. Main parameters of the generators for power house are tabulated below:

Generator Shaft Orientation	Vertically Coupled
No. of Units	3
Nominal Capacity	21.2 MVA (18 MW)
Rated Speed	375 RPM
No. of Poles	16
Efficiency	98 %
Unit Output Voltage	11 kV
Frequency	50 Hz
Power Factor	0.85
Insulation Class	F
Limit of Thermal Utilization	B
Excitation	Static
Excitation Voltage	220 V DC
Runway speed	648 rpm
Connection	Y, Neutral Grounded through transformer resistance
Cooling System	Closed circuit Air-cooling system with surface type Air/Water Coolers

S.14 POWER EVACUATION / TRANSMISSION LINE

The power generated by the ALHPP shall be mainly supplied to the load centres in the central Hunza, Aliabad and the upper Hunza (Sost) through132 kV transmission lines. A double circuit 132 kV transmission line of 27 km will be connected to the proposed Aliabad Grid station to further disperse the power in the Regional Grid Network (RGN). Along with double circuit 132 kV transmission line to Aliabad, a 132 kV single circuit of 70 km transmission line is also proposed upto the existing 33 kV grid station which will be upgraded to 132/33/11 kV grid station. Rail conductor proposed for double circuit transmission line will be in accordance with WAPDA/NTDC Specification No.P-50:88.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

S.15 ENVIRONMENTAL IMPACT ASSESSMENT (EIA)

As ALHPP is planned for generation capacity of 54 MW and 132 kV power transmission lines, the Project falls within the category 'A' which requires full scale ESIA. The primary data have been collected and assessed with reference to different project components, i.e. dam site, reservoir area, powerhouse, construction camps etc. The data regarding climate, hydrology, geology, seismology, neo-tectonics and other physical features of the Project Area has also been obtained as part of the preparation of this Feasibility Study.

The secondary data have been collected from various offices and published reports of different organizations in the Gilgit-Baltistan. These organizations included W & P Dept., Education, Forest, Agriculture, Fisheries, Sanitation, Wildlife, Environmental Protection Agency, District Administration, Tehsil Offices, Local Councils and others. The studies are carried out on the information received during field visits of Project Area, data received from some NGOs, water samples collected from Project Area at various places and tested in Environmental Protection Agency Laboratory, Gilgit, climate data received from Metrological Department, and other data taken from earlier conducted Feasibility Study and other reports of projects.

A team of experts of Hydro Planning Organization (HPO) moved to Project Area for field investigations. The team hired services of one local graduate female and one local graduate man for questioning and answering with local people in their language. Additionally, the services of a local well educated female hired for the interviews and data collection covers the subjects of gender and women empowerment. The team spent more than three weeks to visit seven villages of upstream and two villages of downstream side of the Project Area. In this exercise both genders have been covered in field visits of Project Area. The field investigators (team) with interviewing skills minimize the sampling error and wrongly asked or interpreted or recorded answers to finalize a report with the respondents.

S. 16 CONSTRUCTION PLANNING

ALHPP involves execution of considerable quantities of excavation and concreting for structures. Considering the magnitude and nature of construction activities, mechanized construction has been considered for all type of construction works to achieve specified quality at a faster rate for timely completion of the Project. The Project involves the construction of overflow weir, sediment flushing channel / under sluice, power intake, low pressure headrace tunnel, surge tank, penstock, powerhouse and tailrace channel.

Diversion works are mandatory for the commencement of the works on sediment flushing channel and overflow weir. The construction of low pressure headrace tunnel is very significant item in order to have timely completion of the Project. The construction of the access tunnels to the headrace tunnel near power intake and surge tank areas will help to make an early start on excavation of headrace tunnel which lies on the critical path.

The proposed implementation schedule takes account of the preliminary design of each structure and facilities, work quantities and site conditions. It is prepared on the basis of the construction plan, estimated construction progress, rate of each activity and work sequence. The proposed project implementation schedule spans over a period of 50 months, which includes 14 months for the pre-construction and 36 months for the construction activities construction plan is shown in Dwg.No: AFS-CP-478.

S. 17 COST ESTIMATE

The quantities of work items for ALHPP have been worked out on the basis of Layout Plan developed for the scheme on the actual topography of the area. Material quantities required have been computed using the engineering drawings consisting of plans and sections of all Project components. The unit cost is based on prevailing market rates. Considering the Exchange Rate of 1 US$ = Rs.157 (March 21, 2021). The Project Base Cost will be Rs. 20,499.565 Million (US $ 127.573 Million).

S.18 ECONOMIC AND FINANCIAL ANALYSIS

The Project will yield Internal Economic Rate of Return (IERR) of 22.36 % by applying shadow prices. The benefits cost ratio comes to 1.55:1 at 12% discount rate which also reflect the economic viability of the proposed project. The financial benefits over the project life of 30 years calculated on certain assumptions depict an Internal Financial Rate of Return (IFRR) as 19.17% which makes the project significantly viable. Unit Cost (Cost/MW) comes out to be US $ 2.506 million (Rs.393.447 million) and cost/KWh US cent 3.61 (Rs. 5.67).

The Project is technically, socially, economically and financially viable, hence recommended for implementation.

11.7 TURBINE LAYOUT AND SIZING....11-11
11.8 MAIN DATA 11-13
11.8.1 Turbine Speed 11-14
11.8.2 Runner diameter 11-14
11.8.3 Runaway speed 11-14
11.8.4 Setting 11-14
11.8.5 Components Dimensions 11-15
11.8.6 Special design criteria 11-15
11.8.7 Overpressure 11-15
11.8.8 Over-speed 11-15
11.8.9 Runaway speed 11-15
11.8.10 Critical speed 11-15
11.9 TURBINE MAJOR COMPONENTS 11-16
11.9.1 Runner 11-16
11.9.2 Turbine shaft and Coupling 11-16
11.9.3 Bearings 11-16
11.9.4 Spiral casing 11-17
11.9.5 Guide Vanes 11-17
11.9.6 Operating Mechanism 11-17
11.9.7 Guide Vane Servomotor 11-17
11.9.8 Top Cover/ Side Cover 11-17
11.9.9 Draft Tube 11-17
11.10 TURBINE MODEL TESTS 11-18
11.11 GOVERNOR SYSTEM 11-18
11.11.1 Governor Head 11-19
11.11.2 Electronic Equipment 11-19
11.11.3 Hydraulic Systems 11-20
11.11.4 Water Hammer within High Pressure Conduit 11-20
11.12 TURBINE INSTRUMENTATION, CONTROL AND SAFETY DEVICES 11-20
11.13 INLET VALVE 11-20
11.13.1 Operating Mechanism 11-21
11.13.2 Control and Safety Devices 11-21
11.14 AUXILIARY SYSTEMS 11-22

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

11.14.1 General....11-22
11.14.2 Plumbing Works....11-22
11.14.3 Water Supply System....11-22
11.14.4 Waste and Sewerage water....11-22
11.14.5 Dewatering and drainage system....11-23
11.14.6 Compressed Air System....11-23
11.14.7 Oil Handling System....11-24
11.14.8 Heating, Ventilation and Air Conditioning System....11-25
11.14.9 Fire Protection System....11-27
11.14.10 Powerhouse Crane....11-31
11.14.11 Mobile crane....11-33
11.14.12 Power House Elevator....11-33
11.14.13 Workshop Equipment and Tools....11-34
11.15 HYDRAULIC STEEL STRUCTURE....11-35
11.15.1 General....11-35
11.15.2 Power Intake Gate Equipment....11-36
11.15.3 Trashracks....11-41
11.15.4 Trashrack Cleaning Machines....11-41
11.15.5 Pressure Shaft....11-42
11.15.6 Surge Shaft....11-42
11.15.7 Draft Tube Gate Equipment....11-43
11.16 Mechanical Cost Estimation....11-44
12 ELECTRICAL EQUIPMENT....12-1
12.1 GENERAL....12-1
12.2 STANDARDS AND REGULATIONS....12-1
12.3 GENERATOR....12-1
12.3.1 Type & Description....12-2
12.3.2 Design....12-3
12.3.3 Rotor....12-4
12.3.4 Stator....12-4
12.3.5 Generator Bearings....12-5
12.3.6 Condition Monitoring System....12-7
12.3.7 Excitation System....12-7
12.3.8 Generator Circuit Breaker....12-9

12.4 OTHER ELECTRICAL EQUIPMENT 12-9
12.5 POWER TRANSFORMERS 12-9
12.6 STATION SERVICE TRANSFORMER 12-10
12.7 AUXILIARY TRANSFORMERS 12-11
12.8 SWITCHGEAR SYSTEM 12-11
12.8.1 132kV Switchgear 12-11
12.8.2 11kV Switchgear 12-12
12.8.3 400 Volt Switchgear 12-12
12.9 CONTROL, INSTRUMENTATION AND PROTECTION EQUIPMENT 12-13
12.9.1 Instrumentation & Control 12-13
12.9.2 Protection Equipment 12-14
12.10 SYNCHRONIZING 12-16
12.10.1 Automatic Synchronizer 12-16
12.10.2 Manual Synchronizing Facilities 12-16
12.11 MEASURING EQUIPMENT 12-16
12.11.1 Current Transformers (CT) 12-16
12.11.2 Voltage Transformers (VT) 12-17
12.12 SURGE ARRESTERS 12-18
12.13 DC POWER SUPPLY 12-18
12.14 CABLES 12-18
12.14.1 Power Cables 12-19
12.14.2 Control Cables 12-19
12.14.3 Telecommunication Cables 12-19
12.14.4 Fiber Optics Cables 12-20
12.15 ILLUMINATION AND SMALL POWER 12-21
12.15.1 Lighting/Illumination System 12-21
12.15.2 Emergency Lighting: 12-23
12.16 EMERGENCY DIESEL GENERATORS 12-23
12.17 ELECTRICAL WORKSHOP 12-23
12.18 GROUNDING SYSTEM 12-24
12.19 SCADA AND TELECOM SYSTEM 12-24
12.19.1 Functional Overview 12-24
12.19.2 Station Instrumentation and Control (I&C) System 12-24
12.19.3 Interface with Existing NTDC SCADA System 12-25
