MANAGEMENT CONSULTING SERVICES FOR REVIEW OF FEASIBILITY STUDY, PROCUREMENT OF EPC CONTRACTOR AND CONTRACT MANAGEMENT & ADMINISTRATION OF ATTABAD LAKE HYDROPOWER PROJECT (54 MW)

FINAL FEASIBILITY REVIEW / VALIDATION REPORT

MAY 2023

TABLE OF CONTENTS

LIST OF TABLES VII
LIST OF FIGURES IX

1 INTRODUCTION 1-1

1.1 GENERAL 1-1
1.2 LOCATION 1-1
1.3 ACCESSIBILITY 1-4
1.4 CLIMATE 1-4
1.5 PROJECT OBJECTIVES 1-4
1.6 PREVIOUS STUDIES 1-6
1.7 PROJECT COMPONENTS FROM FEASIBILITY STUDY BY WAPDA 1-6
1.8 SALIENT FEATURES 1-8
1.9 PROJECT MANAGEMENT CONSULTANTS 1-9
1.10 SCOPE OF MANAGEMENT CONSULTANCY SERVICES 1-9
1.11 CURRENT REVIEW REPORT 1-10

2 REVIEW OF POWER MARKET AND DEMAND FORECAST STUDIES 2-1

2.1 GENERAL 2-1
2.2 POWER GENERATION AND DEMAND COMPARISON OF GILGIT BALTISTAN 2-1
2.3 POWER DISTRIBUTION, TRANSMISSION AND NATIONAL GRID CONNECTIVITY OF GILGIT BALTISTAN 2-1
2.4 REVIEW FINDINGS AND RECOMMENDATIONS 2-6

3 REVIEW OF TOPOGRAPHIC AND HYDROGRAPHIC SURVEY 3-1

3.1 GENERAL 3-1
3.2 REVIEW FINDINGS 3-1
3.2.1 Establishment of the Permanent Control Benchmarks 3-1
3.2.2 Observed Spot Levels 3-2
3.2.3 Survey of Locations of Geotechnical Investigations 3-2
3.2.4 Satellite Based Survey of the Project Area 3-2
3.2.5 Results of Hydrographic Survey 3-2
3.3 REVIEW RECOMMENDATIONS 3-2

4 REVIEW OF HYDROLOGY AND SEDIMENTATION STUDIES 4-1

4.1 GENERAL 4-1
4.2 WATERSHED BOUNDARY OF WEIR 4-1
4.3 CLIMATOLOGY 4-3
4.3.1 Climatological Data - Skardu 4-3
4.3.2 Climatological Data - Gilgit 4-4
4.4 HYDROLOGICAL STATIONS 4-5
4.5 FLOW STUDY 4-6

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

4.5.1 Estimation of Flows – Feasibility Study 2021 4-6
4.5.2 Estimation of Flows - Review Study 4-8
4.5.3 Water Availability and Reservoir Operational Study – Review Study 4-13
4.5.4 Comparison of Flows Study (Feasibility Study vs. Review Study) 4-15
4.6 FLOOD STUDY 4-16
4.6.1 Flood Estimation - Feasibility Study 2021 4-16
4.6.2 Flood Estimation - Review Study 4-17
4.7 HYDROLOGICAL FLOOD ROUTING 4-19
4.7.1 Flood Routing - Feasibility Study 2021 4-20
4.7.2 Flood Routing - Review Study 4-21
4.8 SEDIMENTATION STUDY 4-25
4.8.1 Sedimentation Study - Feasibility Study 2021 4-25
4.8.2 Sedimentation Study – Review Study 4-25
4.9 SUMMARY OF REVIEW STUDY 4-28
4.10 ANALYSIS ON ADDITIONAL AVAILABLE DATA 4-29
4.11 RECOMMENDATIONS 4-30

5 REVIEW OF GEOLOGY AND GEOTECHNICAL STUDIES 5-1

5.1 GENERAL 5-1
5.2 REVIEW OF GEOLOGICAL STUDIES 5-1
5.2.1 Review Scope of Geological Studies 5-1
5.2.2 Regional Geology and Regional Faults 5-2
5.2.3 Site Geology 5-2
5.2.4 Geological Structures 5-3
5.2.5 Geomorphology 5-4
5.2.6 Review of Surface Geological Investigations 5-6
5.3 REVIEW OF GEOTECHNICAL STUDIES AND SUBSURFACE INVESTIGATIONS 5-7
5.3.1 Review of Field Testing Data 5-13
5.3.2 Review of Laboratory Testing Data 5-14
5.4 ADDITIONALLY PROPOSED FIELD AND LABORATORY INVESTIGATIONS 5-17
5.5 REVIEW OF FOUNDATION EVALUATION 5-21
5.5.1 Review Findings 5-21
5.5.2 Technical Considerations for Foundations 5-22
5.5.3 Recommendations for Foundation Evaluations 5-24
5.6 REVIEW OF CONSTRUCTION MATERIAL STUDIES 5-26
5.6.1 General Review 5-26
5.6.2 Material Specific Review 5-26
5.6.3 Recommendation for Construction Material Studies 5-27

6 REVIEW OF NEOTECTONICS STUDY AND SEISMIC HAZARD ANALYSIS 6-1

6.1 GENERAL 6-1
6.2 REVIEW FINDINGS 6-1
6.3 RECOMMENDATIONS 6-1

7 REVIEW OF PROJECT LAYOUT STUDIES 7-1

7.1 GENERAL 7-1
7.2 ALTERNATIVE-I: PROJECT LAYOUT ON THE LEFT BANK 7-1
7.3 ALTERNATIVE-II: PROJECT LAYOUT ON THE RIGHT BANK 7-1
7.4 SELECTED LAYOUT AT FEASIBILITY STAGE 2021 7-1
7.5 PROJECT LAYOUT STUDIES AT REVIEW STAGE 7-3
7.5.1 Site Visit Observations and Feasibility Review Findings for Project Layout 7-3
7.5.2 Proposal for Detail Design Regarding Project Layout 7-13

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

7.5.3 Future Prospects of Modified Layout 7-16

8 REVIEW OF POWER POTENTIAL STUDIES 8-1

8.1 GENERAL 8-1
8.2 WATER AVAILABILITY AT RESERVOIR 8-1
8.2.1 Flow Duration Curve (FDC) 8-3
8.2.2 Tail Water Rating Curve 8-4
8.3 POWER AND ENERGY STUDIES 8-4
8.3.1 Net Head 8-4
8.3.2 Power and Energy Potential 8-4
8.3.3 Optimization of Power and Energy 8-5
8.4 REVIEW STAGE CONFIRMATORY ENERGY CALCULATIONS 8-6
8.4.1 Power and Energy Calculations based on Flow Duration Curve (FDC) method with Two (02) No. of Generating Units. 8-7
8.4.2 Power and Energy Calculations based on Flow Duration Curve (FDC) method with Three (03) No. of Generating Units 8-18
8.4.3 Power and Energy Calculations based on Flow Duration Curve (FDC) method with Three (03) No. of Generating Units 8-28
8.5 REVIEW FINDINGS 8-37

9 REVIEW OF STRUCTURE DESIGN STUDIES 9-1

9.1 GENERAL 9-1
9.2 HYDRAULIC MODELLING OF RESERVOIR 9-1
9.3 NATURAL DAMMING ON HUNZA RIVER 9-3
9.4 HYDRAULIC DESIGN 9-3
9.4.1 Hydraulic Design of Weir/Spillway and Stilling Basin 9-3
9.4.2 Flushing Outlets 9-4
9.4.3 Freeboard Calculations 9-5
9.5 DESIGN OF RIVER DIVERSION WORKS 9-5
9.5.1 Discharge Capacity of River Diversion Works 9-5
9.6 POWER INTAKE STRUCTURE 9-6
9.6.1 Hydraulic Design of Intake 9-6
9.7 LOW PRESSURE TUNNEL 9-8
9.8 SURGE TANK 9-9
9.8.1 Hydraulic Design of Surge Tank 9-9
9.8.2 Load Case Maximum Upsurge 9-10
9.8.3 Results of Surge Tank Simulation 9-12
9.9 WATER HAMMER ANALYSIS IN PENSTOCKS 9-12
9.9.1 Water Hammer Calculations for Single Penstock 9-14
9.9.2 Pressure Wave Velocity 9-14
9.9.3 Water Hammer Pressure (Allievi Chart) 9-14
9.10 POWERHOUSE 9-15
9.11 TAILRACE CHANNEL 9-16

10 REVIEW OF GEOTECHNICAL AND STRUCTURAL STABILITY ANALYSIS 10-1

10.1 REVIEW OF SLOPE STABILITY ANALYSIS 10-1
10.2 REVIEW OF SEEPAGE ANALYSIS 10-1

11 REVIEW OF HYDROMECHANICAL EQUIPMENT STUDIES 11-1

11.1 TURBINE 11-1
11.1.1 Turbine Selection Criteria 11-1
11.1.2 Type, Rated Speed & Setting 11-1

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

11.1.3 Turbine Shaft....11-1
11.1.4 Air Admission System for Aeration against Pressure Pulsation and Vortexes....11-1
11.1.5 Power and Energy Potential....11-1
11.2 GOVERNOR SYSTEM....11-13
11.3 INLET VALVE....11-13
11.4 MECHANICAL AUXILIARY SYSTEMS....11-14
11.4.1 Cooling Water System....11-14
11.4.2 Oil Handling System....11-14
11.4.3 Fire Protection System....11-14
11.5 POWERHOUSE (PH) LAYOUT....11-15
11.6 PENSTOCK....11-15
11.7 HYDRAULIC STEEL STRUCTURES....11-16
11.7.1 General....11-16
11.7.2 Power Intake Structure....11-16
11.7.4 Tail race Structure....11-18
11.8 SUMMARY OF REVIEW FINDINGS....11-18

12 REVIEW OF ELECTRICAL EQUIPMENT STUDIES....12-1

12.1 GENERAL....12-1
12.2 REVIEW OF POWERHOUSE ELECTRICAL WORKS STUDIES....12-1
12.2.1 Generator & Excitation System....12-1
12.2.2 Generator Circuit Breaker....12-2
12.2.3 Power Transformer....12-2
12.2.4 Station Service Transformer....12-2
12.2.5 Unit Auxiliary Transformers....12-2
12.2.6 Medium & Low Voltage System....12-3
12.2.7 Control & Instrumentation System....12-3
12.2.8 Protection Equipment....12-4
12.2.9 DC & UPS System....12-4
12.2.10 Cables....12-4
12.2.11 Illumination & Small Power System....12-5
12.2.12 Emergency Diesel Generator....12-5
12.2.13 Electrical Workshop....12-5
12.2.14 Earthing & Lightning System....12-5
12.2.15 Fire Detection & Alarm System....12-5
12.2.16 Drawings....12-5
12.3 REVIEW OF SWITCHYARD STUDIES....12-5
12.3.1 Review Findings....12-5
12.3.2 Main Single Line Diagram and Protection Single Line Diagram....12-7
12.3.3 11/132kV Unit Transformer....12-7
12.4 REVIEW OF DISTRIBUTION STUDIES....12-8
12.5 REVIEW OF SCADA AND TELECOM STUDIES....12-9
12.5.1 Functional Overview / Scope of Work....12-9
12.5.2 Station Instrumentation and Control (I&C) System....12-10
12.5.3 Recommendations....12-10

13 REVIEW OF TRANSMISSION LINE STUDY....13-1

13.1 TRANSMISSION LINES FROM ATTABAD LAKE HPP....13-1
13.2 TYPE OF TOWERS AND BASIC DATA....13-1
13.3 INSULATORS....13-1
13.4 LOAD FLOW STUDIES....13-2

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

14 REVIEW OF PROJECT QUANTITIES AND COST ESTIMATES 14-1

14.1 GENERAL 14-1
14.1.1 Rate Assumption 14-1
14.1.2 Price Index 14-1
14.1.3 Development of Unit Rates 14-1
14.1.4 Rate Analysis 14-1
14.2 QUANTITY AND COST ESTIMATE OF MAIN WEIR AND FLUSHING SECTION 14-1
14.3 QUANTITY AND COST ESTIMATE OF GEOTECHNICAL WORKS 14-2
14.4 QUANTITY AND COST ESTIMATE OF HYDROMECHANICAL WORKS 14-2
14.5 QUANTITY AND COST ESTIMATE OF TRANSMISSION LINE WORKS 14-3
14.6 QUANTITY AND COST ESTIMATE OF PENSTOCK 14-3
14.7 QUANTITY AND COST ESTIMATE OF POWERHOUSE AND TAILRACE CHANNEL 14-3
14.8 REVIEW OF ANNEXURE A EQUIPMENT, MATERIAL AND LABOUR RATES 14-3
14.9 COMPARISON OF QUANTITIES FOR FEASIBILITY STUDY AND REVIEW STAGE STUDY 14-3

15 REVIEW OF CONSTRUCTION PLANNING AND COST ESTIMATES 15-1

15.1 FACTORS AFFECTING PROGRESS OF CONSTRUCTION WORKS 15-1
15.2 PROCUREMENT AND STORAGE OF MATERIALS 15-1
15.2.1 Cement 15-1
15.2.2 Coarse Aggregate 15-1
15.2.3 Fine Aggregate (Sand) 15-1
15.2.4 Reinforcing Steel 15-1
15.2.5 Explosive Materials 15-1
15.2.6 Steel Plates and Steel Formwork 15-1
15.2.7 Water and Stone for Riprap and Fill Material 15-1
15.3 REVIEW OF CONSTRUCTION PLANNING AND METHODOLOGY 15-2
15.3.1 Care and Handling of Water 15-2
15.3.2 Sediment Flushing Tunnel / Channel (Under sluice) 15-2
15.3.3 Power Intake 15-2
15.3.4 Overflow Weir / Ungated Spillway 15-2
15.3.5 Access Tunnels / Adits for Headrace Tunnel 15-3
15.3.6 Low Pressure Headrace Tunnel 15-3
15.3.7 Surge Tank 15-3
15.3.8 Penstock 15-3
15.3.9 Powerhouse Civil Works 15-3
15.3.10 Unit Erection 15-3
15.3.11 Mechanical & Electrical Installations 15-3
15.3.12 Tailrace Channel 15-3
15.3.13 Switchyard 15-3
15.3.14 Transmission Lines 15-4
15.3.15 Assembly of Electro-Mechanical Equipment 15-4
15.3.16 Testing and Commissioning 15-4
15.4 REVIEW OF PROJECT IMPLEMENTATION SCHEDULE 15-4
15.5 CONSTRUCTION MANAGEMENT 15-4
15.5.1 Project Executing Agency 15-4
15.5.2 Consultants 15-4

16 REVIEW OF ENVIRONMENTAL IMPACT STUDY 16-1

16.1 GENERAL 16-1
16.2 CHAPTER 1: INTRODUCTION 16-1

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

16.3 CHAPTER 2: PROJECT DESCRIPTION 16-1
16.4 CHAPTER 3: REGULATORY LAWS AND THE INSTITUTIONAL FRAMEWORK 16-2
16.5 CHAPTER 4: BASELINE CONDITIONS 16-2
16.6 CHAPTER 5: ESIA AND MITIGATION MEASURES 16-3
16.7 CHAPTER 6: ENVIRONMENTAL MANAGEMENT AND MONITORING PLAN 16-3
16.8 CONCLUSIONS AND RECOMMENDATIONS 16-4

1 INTRODUCTION

1.1 GENERAL

Gilgit-Baltistan of Pakistan is blessed with abundant renewable hydropower resources. More than 95% of Pakistan hydel potential is located in mountainous areas of Gilgit-Baltistan (GB), Khyber Pakhtunkhwa (KP) and Azad Jammu and Kashmir (AJK). The reconnaissance study of hydel potential for whole Gilgit-Baltistan is almost complete, and identified potential sites are still to be optimized in terms of capacity, cost and need of power for growing load centers.

Attabad Lake was created due to a massive land slide in January, 2010. In November, 2015, Prime Minister of Pakistan announced the construction of Attabad Lake Hydropower Project (ALHPP) and accordingly, Govt. of Gilgit-Baltistan undertook its Feasibility Study with proposed capacity of 32.5 MW.

Later, In August 2017, Ministry of Water and Power sought expert opinion from Chairman WAPDA on construction of ALHPP. WAPDA conducted Topographic surveys and Geotechnical Investigations for an updated study and proposed installed capacity to 54 MW with a 2320 m long headrace low pressure tunnel on the left side of Hunza River.

54 MW power generation was planned to meet the winter power demand of Hunza Valley by utilizing the peaking storage facility at existing Attabad Lake. As a result of the assessment of field investigations and engineering studies, it was concluded that the Project of 54 MW is technically, economically feasible and environmentally safe. The Project can further enhance due to available potential at the location of Hunza River once the regional and national grids are established.

The project is proposed to be implemented through Engineering, Procurement and Construction (EPC) mode for which services of Management Consultants (MC) have been acquired for the review of Feasibility Study, Procurement of EPC Contractor and Contract Management & Administration.

1.2 LOCATION

The most promising project layout, as assessed at Feasibility stage, was located at the Attabad Lake on the left bank of Hunza River at a distance of about 20 km from Karimabad, 120 km from Gilgit and 735 km from Islamabad.

The coordinates of the Weir and Power House site are given in the Table 1.1.

Table 1.1 Coordinates of Weir and Power House site (From Feasibility Report)

Overflow Weir/Ungated Spillway	484036.834 m E	4018143.837 m N	2414 m.a.s.l
Powerhouse	481645.920 m E	4017963.719 m N	2300 m.a.s.l

The Project is to be constructed on marginal lands owned by the community of Ahmadabad village, where minimum environmental and social issues have been anticipated.

The project location map and vicinity map are shown in Figure 1.1 & Figure 1.2 respectively.

1.3 ACCESSIBILITY

The Project site is accessible from Federal Capital (Islamabad) connected to Gilgit along the existing N-35 Karakoram Highway (KKH), which leads to Project Area at Attabad Lake near Hunza. The route through KKH can be accessed via Motorways from Islamabad to Burhan Interchange near Hassanabdal (M-1 Islamabad-Peshawar Motorway-44 km) and from Burhan Interchange to Thakot (M-15 Hazara Motorway – 186 km). The access onward to Gilgit and Hunza continues as a part of KKH (Thakot to Gilgit– 390 km; Gilgit to Attabad Lake/ Hunza along Hunza River – 120 km). There is another route from Islamabad to Gilgit and Hunza via Babusar Pass, through National Highway (N-15). The route, although shorter than KKH through Besham, to reach up to Chilas, usually remains closed for six months in a year due to heavy snowfall during the winter season.

Gilgit Airport is the nearest air travel facility to the Project Area which is about 120 km from the Project Site. Domestic flights are regularly scheduled from Islamabad airport to Gilgit. However, flight operations largely depend upon the weather conditions. Project accessibility map is shown in Figure 1.3.

1.4 CLIMATE

The Gilgit Meteorological Station is the nearest weather station to Hunza Valley that has a sound historical record covering more than five decades. Monthly temperature variations at Gilgit indicate parabolic trend, with peak in the month of July. Summer prevails in months from June to August. In July and August, mean maximum and minimum temperatures are normally above 35˚C and 15˚C respectively. The winter is cold and chilly, starting from November and continuing till end of March. The lowest temperatures are in the month of January with mean maximum and minimum temperatures reaching below 10˚C and (-) 2˚C respectively.

1.5 PROJECT OBJECTIVES

The major objectives of the Project are following.

a. Meet the winter power demand of Hunza valley.
b. Ensure the socio-economic uplift of the locals.
c. Boost tourism in the area by uplifting power availability in the area.
d. Address the issue of pollution by increasing power capacity of the region and reduce the usage of industrial backup diesel generators.

1.6 PREVIOUS STUDIES

Following studies have been previously carried out on Attabad Lake Hydropower Project:

a. Feasibility Study (conducted by local consultants, 2017)

Water and Power Department of Govt. of Gilgit Baltistan (GoGB) intended to utilize the storage of Attabad Lake as an opportunity to develop Hydropower Project of appropriate capacity to meet the ever increasing demand of Hunza City and its suburbs. In this regards, GoGB conducted a Feasibility study through local consultant of GB, Designmen Consulting Engineers (Pvt.) Ltd, Islamabad in association with Mountain Infrastructure & Engineering Services Gilgit for the power capacity of 32.5 MW.

The left bank of the Attabad Lake was used for the layout of the project where it comprised of intake with normal head pond level 2416 m.a.s.l., 2015.62 m long power tunnel, 340m long steel penstock, surface powerhouse and 255 m long tailrace with outlet into Hunza River.

b. Updated Feasibility Study (conducted by WAPDA, 2021)

WAPDA prepared a Feasibility Report by utilizing in-house technical expertise. The project was sized as per flows availability, size of conveyance system and suitability of surface powerhouse according to prevailing topographic and geological features. The plant size of 54 MW was planned to provide the installed power during peak hours throughout the years. A Weir was proposed to divert the flow of Hunza River into Head Race tunnel, 2300 m long nearby Karakoram Highway, then 450m long penstock bifurcating into three high pressure pipes through a manifold will lead to Power House. A deep flushing channel/ diversion/ under sluices structure was proposed to evacuate the water from lake on the left side of existing outlet and act as flushing channel for sediments from the lake once project comes into operation.

1.7 PROJECT COMPONENTS FROM FEASIBILITY STUDY BY WAPDA

Attabad Lake Hydropower Project comprises of the following components and Feasibility stage project layout is shown in Figure 1.4.

1. Natural dam of 45 m height from river bed to act as diversion structure with low level outlet for flushing and an overflow ungated spillway.
2. Power Intake structure, proposed on the left bank of river to take the design discharge of 60 m^3/s.
3. Low pressure headrace tunnel having diameter of 5.5 m with total length of 2320 m.
4. Vertical surge shaft of 10 m diameter with height of 49 m
5. Concrete lined pressure shaft of 3.6 m diameter having a length of 80 m.
6. Steel penstock having a length of 470 m and diameter of 3.5 m.
7. Surface powerhouse with three (03) Francis units with an installed capacity of 54 MW and open switchyard.
8. Tailrace channel of 18 m length.

1.9 PROJECT MANAGEMENT CONSULTANTS

Request for Proposal (RFP) for Management Consulting Services for Review of Feasibility Study, Procurement of EPC Contractor and Contract Management and Administration of Attabad Lake Hydropower Project (54 MW) was issued by Pakistan Water and Power Development Authority (WAPDA). The Contract for Consultancy Services, through competitive bidding, was awarded to the Joint Venture of National Engineering Services Pakistan (Pvt.) Ltd. (NESPAK) the lead firm, Associated Consulting Engineers (ACE.) Ltd, Pakistan Engineering Services (Pvt.) Ltd. (PES), BARQAAB Consulting Services (Pvt.) Ltd. and DOLSAR Engineering Inc. Co., as JV Partners.

The Consultancy Services Agreement was signed after pre-contract negotiations between the Pakistan Water and Power Development Authority (WAPDA). i.e. the Client, and Joint Venture Members i.e. the Consultant, on June 08, 2022, at the office of GM Projects (Northern Areas) WAPDA, Sunny view, Lahore. The effective date of the commencement of services is July 07, 2022.

1.10 SCOPE OF MANAGEMENT CONSULTANCY SERVICES

The detailed scope of consultancy services is listed below:

a. Phase I (Procurement)

1. Review of Feasibility Study Report
2. Visit the site and submit recommendations.
3. Prepare Generation Capacity Expansion Plan (GCEP)
4. Prepare EPC Tender Documents for International Competitive Bidding.
5. Prepare pre/post qualification criteria for finalization and approval from the Client. Assist the Client in pre/post qualification of bidders, replies to bidders' queries, evaluation of technical and financial bids, negotiations with successful bidder, award and finalization of the Contract Agreement.

b. Phase II (Mobilization, Detail Engineering Design, Construction)

1. Review the EPC Contractor's major design documents and data and verify his basis of design.
2. Monitor submission of documents against the Engineering Review Documents Schedule, review in a timely manner, the EPC Contractor's drawings, specifications, O&M manuals etc., to ensure compliance with the EPC specification.
3. Provide timely notice of events or trends to Client, which could have potential negative impacts to project and propose resolutions.
4. Be cognizant of and pro-active in reviewing the overall design of the Project for design improvements, which may result in long term benefits including cost reductions, schedule improvements and/or better operability, maintainability etc.
5. Review and comment on major purchase orders and sub-contracts.
6. Respond to any major design or equipment change requests submitted by the EPC Contractor.
7. Attend any model tests or final workshop inspections for the plant to be installed in the Project.
8. Monitor procurement and expediting activities performed by the EPC Contractor.
9. Witness In-works Performance, Commissioning and reliability tests for major items of equipment.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

10. Review the construction methods of the contractor prior to application, to avoid the use of unfair or improper methods, which could result in delays, defective works or intolerable exposure to hazards of persons or property.
11. Review the procurement, implementation, delivery and disbursement schedule.
12. Coordinate the post construction services to be carried out by the EPC Contractor during the Defect Liability Period.
13. Maintain the necessary presence until the site is cleared by the EPC Contractor.
14. Develop an effective working relationship with EPC Contractor ensuring clear and appropriate forms of communication are established and maintained through-out onsite construction, commissioning and testing phase of project.
15. Review, comment and monitor the EPC Contractor's compliance with its own procedures, for example: Construction Management Plan and Environmental Management Plan.
16. Certify the EPC contractor's requests for payment against the contract requirement.
17. Prepare an MC Project Close-Out Report containing a historical record of the project.
18. Review and comment on the EPC Contractor's Project Completion Final Report, including the As Built Documentation and O & M manuals before final acceptance.
19. Certify to client that the project works have been completed in accordance with the Contract in view of the monitoring of the construction and evaluation of the performance tests including defect liability period.
20. Review and approve Contractor's "Quality Assurance Plans" and monitor the work of the Quality Assurance units established by the Contractor.
21. Monitor / coordinate field and laboratory tests being carried out during construction.
22. Monitor the collection of samples through drilling and tests pits and testing of fill materials, rip rap, concrete aggregate, etc.
23. Coordinate and monitor the selection of prospective borrow areas and identification of processing requirements.

1.11 CURRENT REVIEW REPORT

After the site visit, a detailed technical review was carried out to confirm that the design study is consistent with Feasibility level engineering requirements. Consultants reviewed all the sections of the Feasibility Report of 54 MW Attabad Lake Hydropower Project. The Review Report includes some specific data, geologic maps, plans, and sections, taken from previous reports, for quick reference. Review findings are presented in each chapter with further recommendations for Detail Design by EPC Contractor.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

2 REVIEW OF POWER MARKET AND DEMAND FORECAST STUDIES

2.1 GENERAL

Electrification of the remote areas remains a critical issue for the Gilgit-Baltistan (GB) region of Pakistan, where most of the population lives without access to the national grid and mostly relies on traditional energy resources, which ignores the huge potential of renewable energy in the region. This section addresses the energy access issue of 1.8 million people of Gilgit-Baltistan (GB), of which 86% reside in the rural areas.

Gilgit-Baltistan in the North, faces severe electricity shortfalls despite having a good potential of untapped photovoltaic (PV), wind and hydro resources due to lack of proper energy policy, infrastructural development issues, and investment barriers for private sector. Sustainable access to energy is a major issue of the region, with 15 to 18 hours of daily power outages that have critically hampered the commercial activities. Across Gilgit-Baltistan, energy sources used in households and commercial enterprises are still firewood, kerosene oil, candles, dung cakes, diesel oil, batteries, liquefied petroleum gas (LPG), and coal. The current energy mix of the GB region is 45% firewood, 30% LPG, 6% kerosene oil and only 19% from (distributed hydro plants).

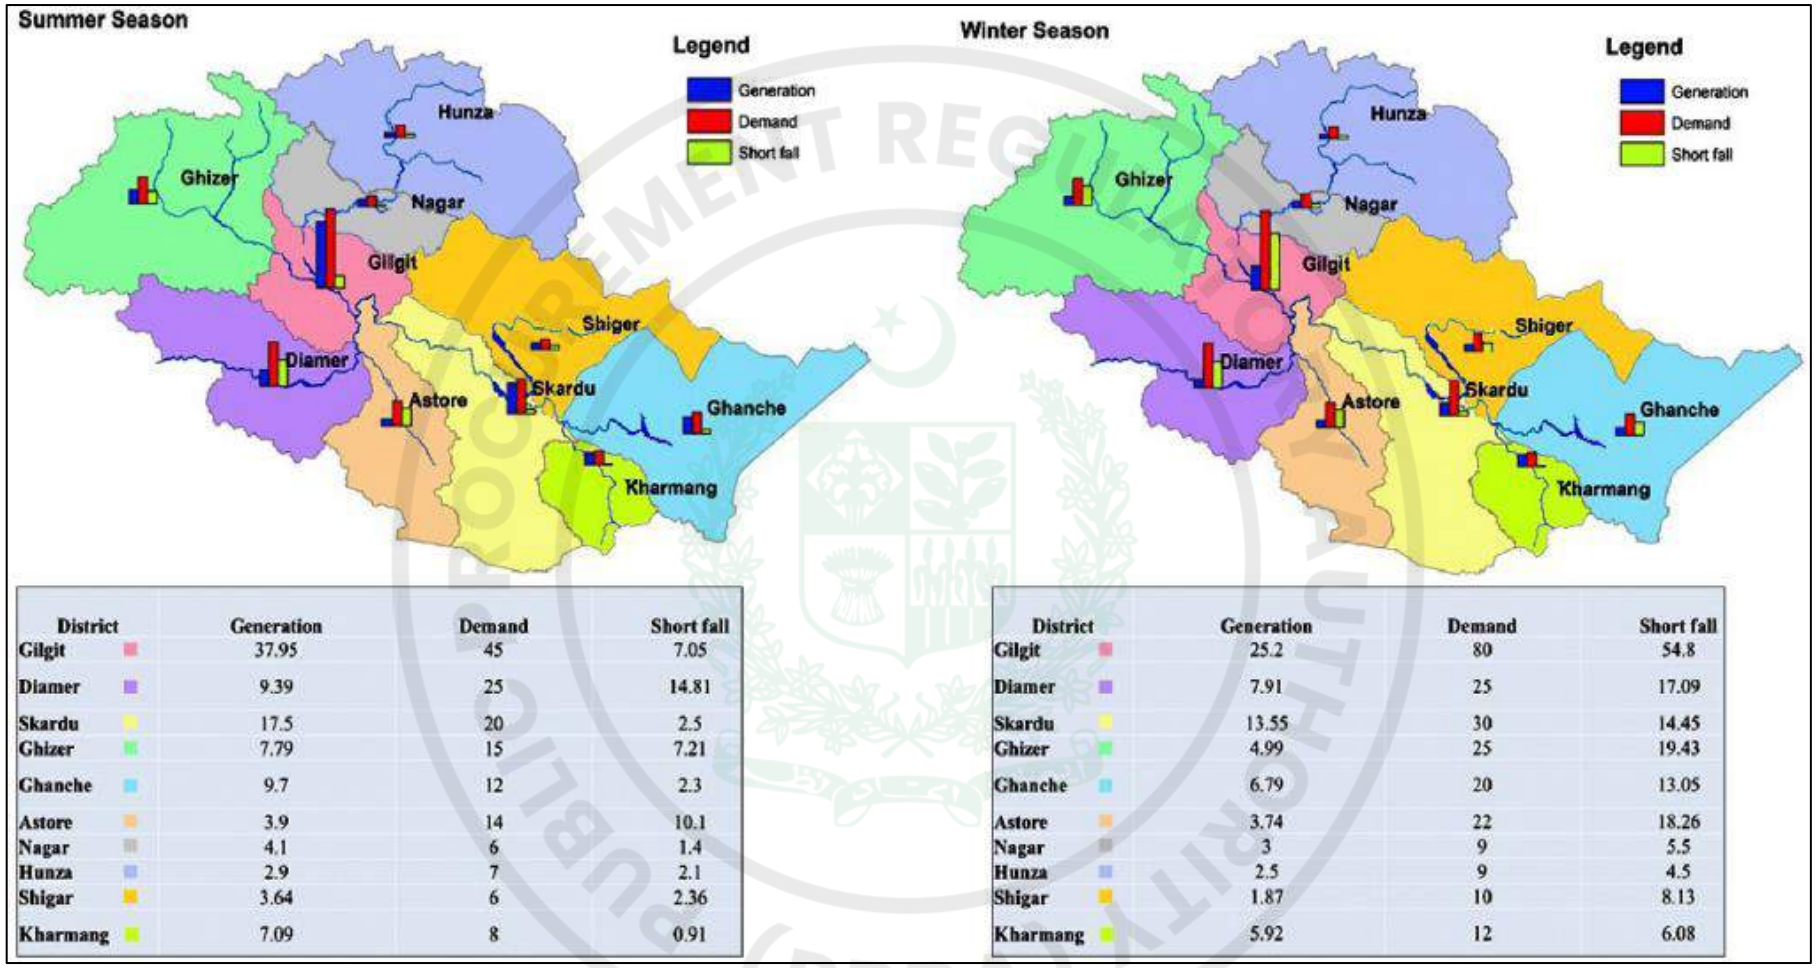
2.2 POWER GENERATION AND DEMAND COMPARISON OF GILGIT BALTISTAN

Electricity being generated by small hydropower stations with capacities ranging from 50 kW to 4000 kW. Currently, 119 hydropower stations are in operation with a total installed capacity of 148.69 MW. During winter, the supply of electricity reduces due to low water flows in rivers; however, demand remains high because of harsh weather. The seasonal shifting of the population from higher altitudes to lower valleys also affects the overall demand for energy in winter. During summer, a substantial influx of tourists is another factor in the increased energy demand across GB. However, the region is significantly affected in winter, as river flows decrease to drastic low levels. Seasonal variation in electricity generation, demand, and shortfall of the ten districts of GB are illustrated in Fig. 2.1. Gilgit region has six (06) districts namely Gilgit, Nagar, Hunza, Ghizer, Diamer (Chilas) and Astore, while Baltistan Region has four (04) Districts namely Skardu, Ghanche, Kharmang and Shiger. Gilgit is the capital of the GB region and due to trade activities, it has highest gap of 54.8MW in winter, while the total shortfall of the whole GB is about 242MW.

2.3 POWER DISTRIBUTION, TRANSMISSION AND NATIONAL GRID CONNECTIVITY OF GILGIT BALTISTAN

Gilgit-Baltistan has a rugged terrain that makes an extension of the national grid very costly. Therefore, GB remains electrically isolated from the country and consequently faces severe shortfalls. In near future, a mega hydro project like Diamer-Basha will enable the construction of a 765kV double-circuit transmission line to connect the region with the national grid (National Transmission & Dispatch Company, NTDCL). Though a small region of GB in south-east will be connected to national grid, interconnection of all the dispersedly populated areas through the mountainous terrain is a daunting task for provincial government. SG technologies made it favorable to share energy among distributed region with a robust centralized and distributed energy management system coupled with smart energy hubs and storages, which provide reliable, secure and resilient clean energy with minimum transmission congestions. Therefore, micro grid technologies will remain most suitable for provision of electricity to these off-grid areas. Moreover, micro grids are crucial building blocks of future national grids with in-built resilience.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026



Across GB, power is generally distributed over short distances through 11kV distribution lines for domestic, commercial, and industrial usage. In only a few areas of Gilgit and Skardu, the power supply network has been augmented with 66kV transmission lines, while a majority of the GB region relies on 11kV feeders, where each feeder is independently supplied by a group of hydel and thermal power plants. This transmission and distribution system experiences tremendous operational difficulties in terms of selective tripping and load management. Faults are cleared by tripping an entire feeder because of limited switchgear deployment along the length of the feeder. Moreover, load shedding by intentional simultaneous tripping of multiple feeders is practiced throughout GB to manage severe power shortages.

District Map of Gilgit Baltistan is shown in Figure 2.1 and District wise generation and demand comparison (from a research paper) for both summer and winter season is shown in Figure 2.2.

Figure 2.1: District Map of Gilgit-Baltistan

Total	**120.76**	**1.60**	**122.36**	**75.43**	**15.84**	**91.27**	**254.82**	**452.19**	**132.46**	**360.92**

Power scenario is sketched out in Figure 2.3 and Figure 2.4 for the summer and winter 2020, for Gilgit Baltistan, which show that due to bulk supply of water in summer deficit between demand and generation is less than from winter power scenario.

In Figure 2.5, comparison for the power demand in Gilgit-Baltistan for the both season of summer and winter is presented.

2.4 REVIEW FINDINGS AND RECOMMENDATIONS

Energy is a critical input for economic development and correspondingly power sector comprises an indispensable infrastructure in any economy. Providing adequate and affordable electric power is essential for economic development, human welfare and better living standards. The growth of the economy along with its global competitiveness hinges on the availability of reliable and quality power at competitive rates to all consumers throughout the country. Electricity is central to achieving economic, social and environmental objective.

Attabad Lake Hydropower Project is located in the Hunza District, it is worthy to discuss the current Power scenario of Hunza district in detail for understanding the imperial impact of project in the region and forecast the demand for the future. The power supply area of the proposed site covers mainly the Upper, Middle and Lower Hunza District.

Based on review of chapter presented in the Feasibility report MC validate the data and importance to construct the Attabad Lake Project as early as possible.

3 REVIEW OF TOPOGRAPHIC AND HYDROGRAPHIC SURVEY

3.1 GENERAL

The Feasibility stage topographic survey of ALHPP was executed using terrestrial survey and mapping technique. An area of approx. 04 km^2 was covered with an average extent of 1 km x 4.5 km. Following instruments were used to perform the activity.

- Topcon Total Station W0303
- DGPS Trimble R8s GNSS
- Raytheon echo sounder

As part of the Topographic survey the scope was as follows:

1. Setup a Project trigonometric network with a system of Benchmarks.
2. Terrestrial survey of the area of Project components about 400 hectares at scale 1:1000 with contour interval of 2 m, covering 4 km downstream of weir site along Hunza River.
3. Longitudinal profile of Hunza River, 4 km downstream from weir site.
4. Terrestrial survey of valley cross sections along Hunza River, 4 km downstream of weir site at an interval of 200 m, covering the main river course and valley slopes upto 200 m on either side.
5. Terrestrial survey of borehole locations.
6. Satellite based survey of the Project Area.

As part of the Hydrographic survey the scope was as follows:

1. Cross-sections of the lake along range lines from left to right bank, at 250 m interval for first 3 km & 500 m interval for rest of the lake.
2. Computation of existing storage capacity of the lake.
3. Development of area-capacity curve.
4. Development of contour maps of the Lake.
5. Discharge Measurement at Ganish Bridge.

3.2 REVIEW FINDINGS

3.2.1 Establishment of the Permanent Control Benchmarks

The project's permanent reference benchmarks, BM-1 and BM-2 were established using DGPS with an achieved accuracy of 50 cm and these benchmarks are 600 m apart, as discussed in section 3.7.3. The established two (02) permanent benchmarks do not conform with the survey standards and requirements discussed in its section 3.6.3, wherein it mentions the accuracy standard of

- Horizontal 3 mm + 0.1 ppm RMS
- Vertical 3.5 mm + 0.4 ppm RMS

The established permanent benchmarks and levels observed near the structure areas require field verification.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

3.2.2 Observed Spot Levels

Considering the treacherous terrain and difficult access conditions, due to steep slopes, as the limiting factors, the spot levels collected during the field survey are very sparse, hence due to rigorous interpolation, the modeled topography does not depict the ground condition.

Moreover, near the Intake area, the developed contours do not match with the nearby spot levels and the difference ranges from 5 m to 10 m.

3.2.3 Survey of Locations of Geotechnical Investigations

In Feasibility report, refer section 3.8.6, the boreholes and test pits locations were marked at major project components prior to start of drilling work and considering the safe installation of the drilling rig the recorded ground levels were reported to be deviating up to 5 m from the NSL. The change of ground levels (Z) implies variation in the horizontal coordinates (X, Y) as well, hence requires clarity.

3.2.4 Satellite Based Survey of the Project Area

Satellite based various remote sensing dataset as discussed in the report, refer section 3.10, but the outputs and its application require clarity. Moreover, the calibration of remotely sensed datasets with respect to established geodetic control network is not known.

3.2.5 Results of Hydrographic Survey

In Feasibility report, refer section 3.12.2, describes that all the cross-sections observed during hydrographic survey are connected to the geodetic control, established for the topographic survey. Furthermore, a comparison of observed cross-sections with previous data of 2011, was made and deduced an average deposition of 30 to 40 m over 09 years. This comparison can be made if same geodetic reference is used during both survey campaigns.

3.3 REVIEW RECOMMENDATIONS

Considering difficult site accessibility and stated data limitations, the topographic survey data is required to be enriched by deploying modern survey and mapping techniques.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

4 REVIEW OF HYDROLOGY AND SEDIMENTATION STUDIES

4.1 GENERAL

Northern Areas of Pakistan is unique in its geographical configuration and layout which houses confluence of three major mountain ranges i.e. Hindukush, Karakorum and Himalayans and 5 out of 14 peaks above 8000 m.a.s.l. The Hindukush-Karakoram-Himalaya (HKKH) Region, often called “Water Towers of Asia,” provides natural reserves of fresh water in the form of snow and glaciers that sustain water availability in mountainous or Himalayan Areas, as well as in adjacent areas.

Hydrology and its applications are inevitable for planning and building hydraulic structures. The hydrological series that represents variations in river flow throughout the year is utilized to estimate the water availability and sediment inflow at weir/dam site for assessment of water storage, reservoir operational study, flows diversion, power and energy production from the available stream flow.

Hydrological and sediment transport studies play a pivotal role in the planning, design and execution of the hydropower projects. The important hydrological parameters required to be evaluated are the availability of flows; extreme flow events along various project components. Flood studies are needed for sizing as well as safe design of structures. Moreover, the design flows for the hydropower machinery are also decided on the basis of available flows at dam site. Sediment study defines the life of reservoir.

In Feasibility study, Daily flow data of Dainyor Bridge station at Hunza River for the period of 1966 to 2015 was used for the estimation of flows at Attabad Lake. Mean Annual Flows Varies from 127m³/s to 310m³/s. Mean annual flows estimated as 208.36m³/s. Mean Monthly flows vary from 28.34 cumecs in March to 696.45 cumecs in July. Average mean monthly flows estimated as 206.13 cumecs. Rated design discharge of 60m³/s was available for almost 50% of the time for the installed capacity of 54 MW power generations. Design flood of 3,250m³/s at weir site had been selected for the calculations of design of structures. Average annual suspended sediment estimated as 20.06MMT and bed load had been considered as 20% of the total suspended load. Total Sediment load at weir site worked out to be 24.06 M Tons. Without flushing, reservoir would be filled with sediments in 10 years.

4.2 WATERSHED BOUNDARY OF WEIR

The catchment area upto proposed weir site has been meausred by using GIS software. It has been estimated as 8922.9Km². Maximum Elevation of catchment area is 5237m amsl. The watershed boundary for the proposed Weir site is shown in Figure 4.1.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

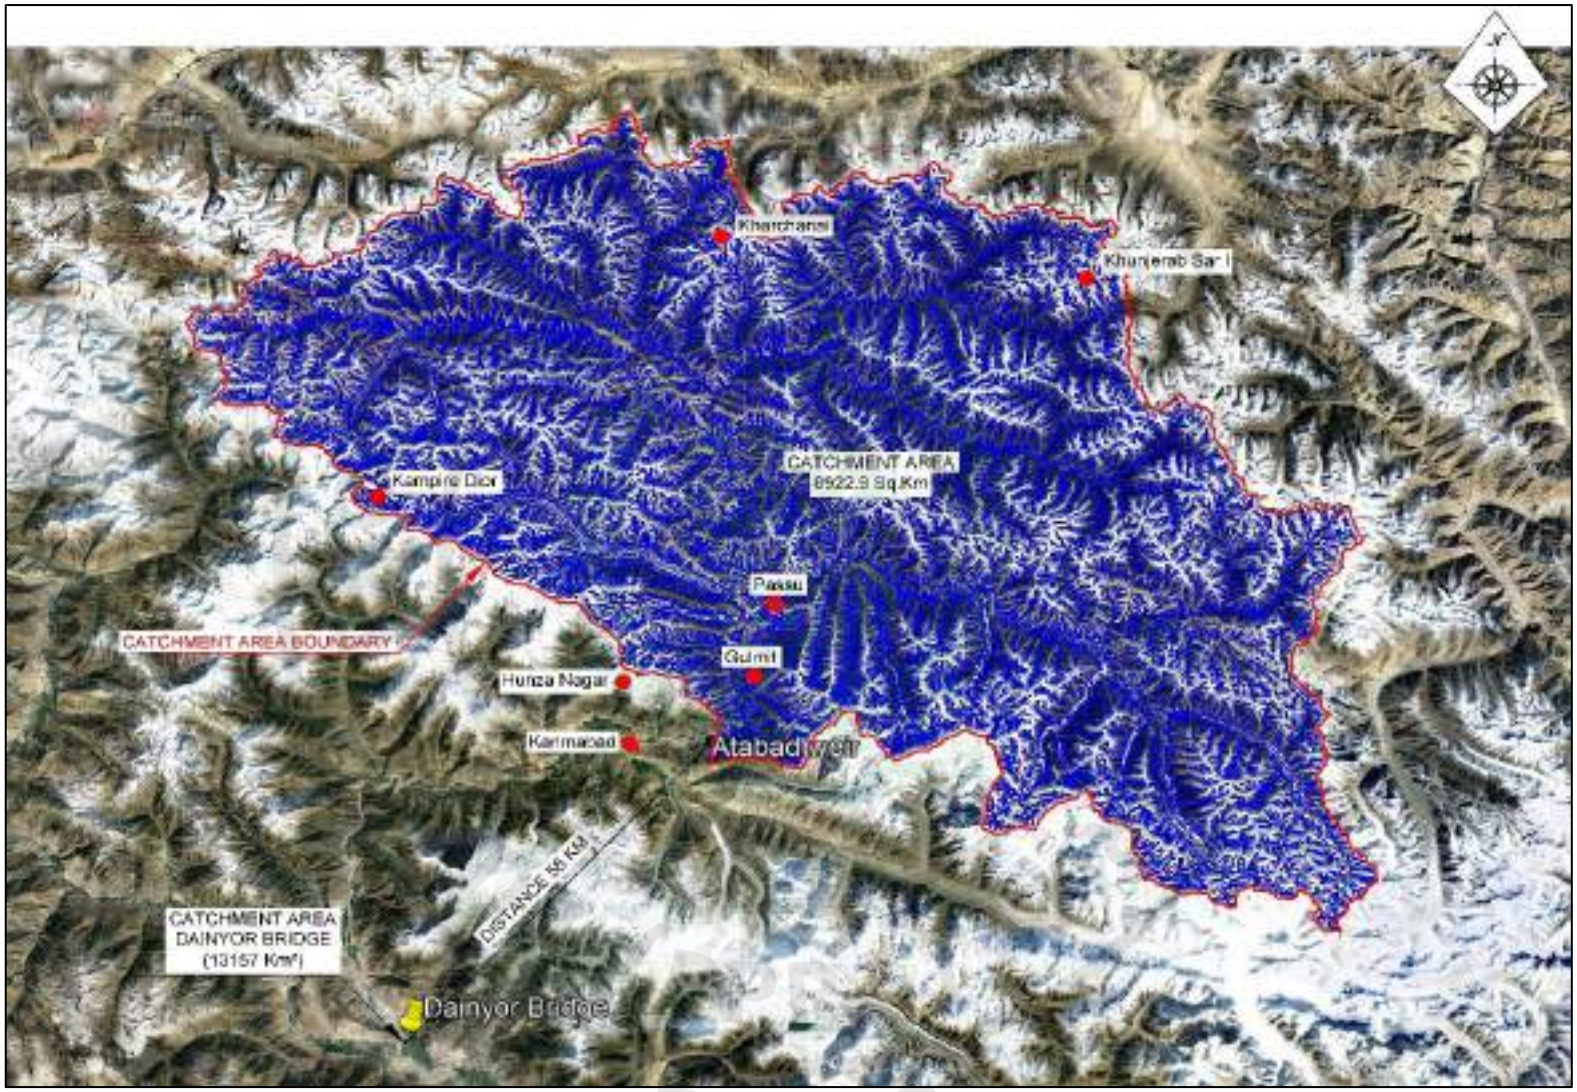

Figure 4.1: Watershed Boundary for Weir Site

4.3 CLIMATOLOGY

Precipitation, air temperature, relative humidity and evaporation are the important climatological parameters required for understanding the climate of the region. There are number of climatic stations in the vicinity of project area, which are operated by Pakistan Meteorological Department (PMD) and Surface Water Hydrology Project (SWHP) of WAPDA. In the review of feasibility study, the climatic data of Skardu and Gilgit station is collected.

4.3.1 Climatological Data - Skardu

Precipitation and tempreture data at Skardu are collected from Pakistan Meteorological Department (PMD), which are summarised in Table 4.1 and presented in Figure 4.2 & Figure 4.3.

Table 4.1 Mean Monthly Temperature & Precipitation - Skardu

Months	Air Temperature °C (1952-2004)			Precipitation (2007-2015)
	Mean Min Temp	Mean Max Temp	Mean Temp	(mm)

4.4 HYDROLOGICAL STATIONS

There are a number of hydrological stations installed on main Indus River and its tributaries around project area for which flow data is available. Flow measurements have been carried out by the Surface Water Hydrology Project (SWHP) of WAPDA.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

The list of few important gauging stations surrounding the Project area is given in Table 4.3.

4.5 FLOW STUDY

Estimation of flows is an important component for design of hydraulic structures, reservoir parameters, and hydropower projects as well as for other water sector projects. Flow study is essential requirement for the estimation of water availability at Attabad Lake HPP. For this purpose, a long-term flow series are required at a site being considered for diversion of flows. Proposed project location is situated at Hunza river at upstream of Dainyor gauging station. Flows generated at Attabad Lake by using daily flows data of Dainyor Bridge at Hunza River for period of 1966-2015. The methodology adopted for developing these correlations are as follows.

4.5.1 Estimation of Flows - Feasibility Study 2021

Flows were estimated at proposed weir by using observed daily flows data of Dainyor Bridge at Hunza River for period of 1966-2015. That gauge was operative by SWHP, WAPDA. The catchment area of Attabad Lake estimated as 8901 km^2. The flows generated at weir site by using catchment ratio method. The mean monthly available flows at weir site are shown in Table 4.4.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

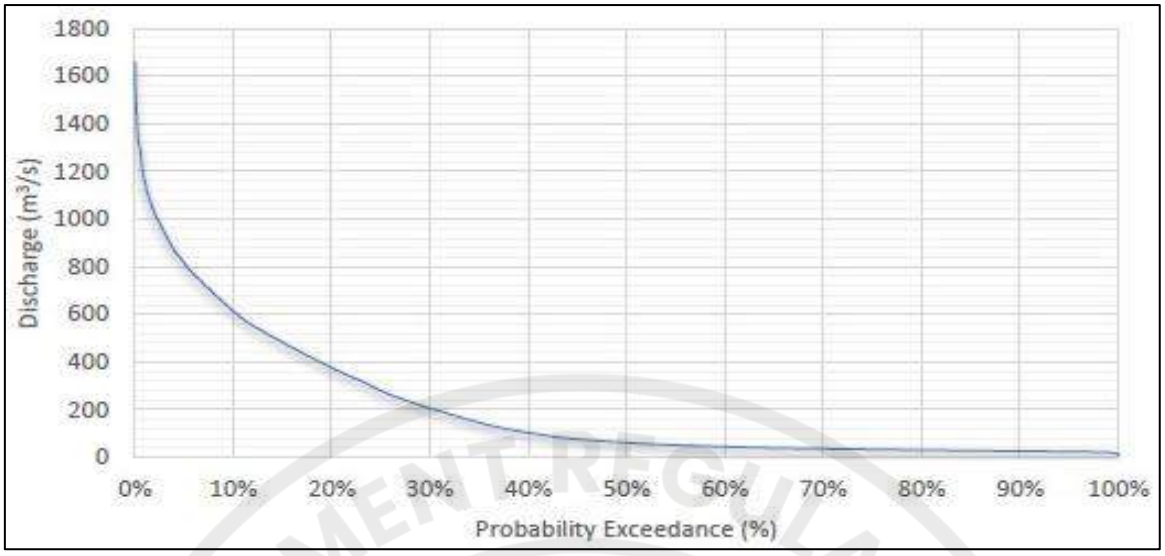

Figure 4.5: Flow Duration Curve - Feasibility Study 2021

4.5.2 Estimation of Flows - Review Study

In Present study, flows are estimated at Attabad Lake, proposed weir location by using daily flows data of Dainyor Bridge at Hunza River for period of 1966-2015. Catchment area of Dainyor Bridge at Hunza River is 13,157 km^2 and Attabad Lake having 8922.9 km^2. Flows are generated at Attabad Lake-Weir for period of 1966-2015, by using catchment area ratio (0.678) method at observed flows data of Dainyor Bridge station. Mean Monthly flows of Dainyor Station at Hunza River for period of 1966-2015 are represented in Figure 4.6 and are tabulated in Table 4.6

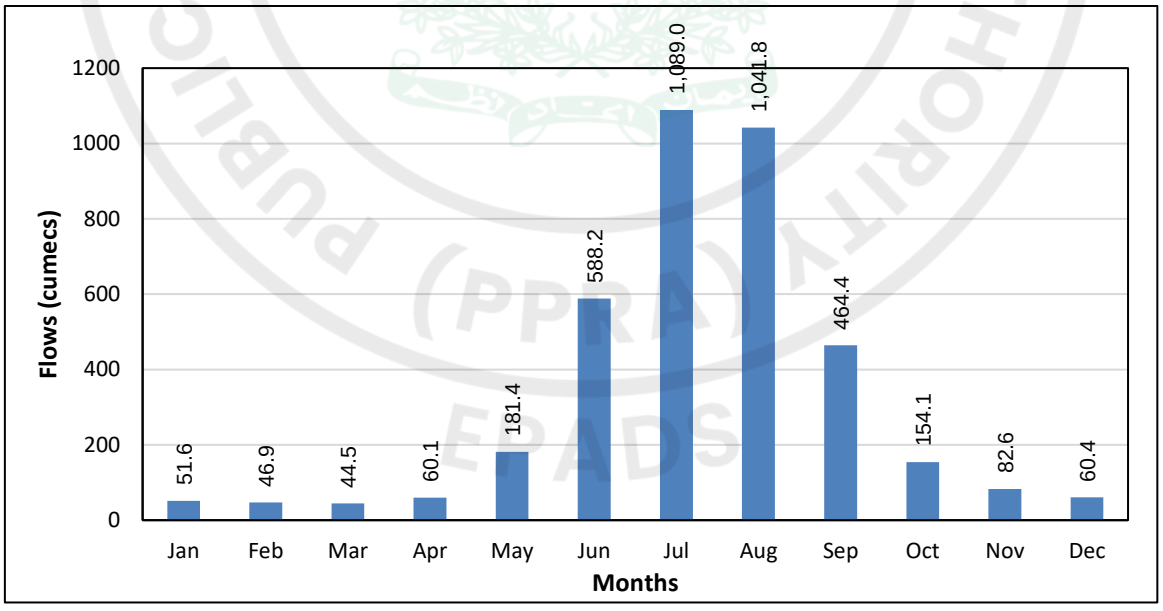

Figure 4.6: Mean Monthly Flows Dainyor Bridge at Hunza River (1966-2015)

Mean monthly flows for Dainyor bridge are minimum during March and maximum during July with values of (44.5 m^3/s and 1089 m^3/s) respectively. Mean annual flows are 322.1 cumecs.

- **Extended Flow Series at Weir Site**

Flows have been estimated during review studies at Attabad Lake Weir for period of 1966-2015 by using Dainyor Bridge data at Hunza River with the application of catchment area ratio method. Mean monthly maximum and minimum flows available at proposed weir site are 739.2 cumecs in July and 29.95 cumecs in March, respectively. Average mean monthly flows estimated at weir site with value of 218.48 cumecs. The mean annual flows and mean daily flows estimated as 220.07 cumecs and 219.69 cumecs, respectively. The mean monthly and mean annual flows are shown in graphically form in Figure 4.7 and Figure 4.8, respectively and in Table 4.7.

- **Daily Flow Duration Curve at Weir Site**

Daily flow duration curve for the period of 1966-2015 is developed by using daily estimated flows at proposed weir site are tabulated below in Table 4.8 and shown graphically in Figure 4.9. The flow duration curve represented the required discharge of 60 cumecs is available at 52 % of time availability.

Table 4.8 Daily Flow Duration Curve at Weir Site

% of Time	Flow (m^3/s)	% of Time	Flow (m^3/s)
1%	1244.43	55%	54.13
5%	877.51	60%	47.02
10%	660.62	65%	41.75
15%	522.35	70%	38.22
20%	408.61	75%	35.08

4.5.3 Water Availability and Reservoir Operational Study - Review Study

Mean annual water availability at weir site is 220.08 cumecs and in volume 6940 MCM. Desired design discharge is 60 cumecs for the installed capacity of 54MW. Three turbines are suggested each of 20 cumecs design discharge capacity. Weir crest elevation as suggested in feasibility study is 2414 a.m.s.l and having gross storage capacity of 147 MCM against 2414 a.m.s.l according to elevation area capacity curve (EAC). But in feasibility study, gross storage capacity of Attabad Lake is taken as 125 MCM. So, in present study consider same gross storage capacity as reported in feasibility study.

Turbines run with full desired discharge capacity of 60 cumecs from May to October. There is a shortage from November to April and these shortages will be reducing by the utilization of stored water in reservoir. It means reservoir start ponding in May and store water of 125 MCM up to gross storage level in the same month.

From May to October reservoir storage remain constant. Reservoir storage of 125 MCM will be utilize for six months from November to April according to month wise water demand for power generation. Three turbines of each 20 cumecs design discharge capacity to be suggested to fulfill the required design discharge capacity of 60 cumecs. Turbine run with full design discharge capacity at 20 cumecs availability of flow for that turbine, otherwise turbine will be functional at certain limit of low flows availability depend upon turbine design requirement. It may be 40% to 50% of Turbine design discharge as per design parameters and below this flows limit, turbine will not be functional. So, also need for consideration of minimum flow requirement to keep turbines in functional and operative position.

Invert level of Power Intake is at 2404m with storage capacity of 101.87MCM and weir crest level 2414m with storage capacity of 147MCM as per EAC. Live storage (147MCM-101.87MCM=45.13MCM) would be utilized during lean period to reduce shortages. The detail Water availability and Reservoir Operational System for power potential is tabulated below in Table 4.9.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

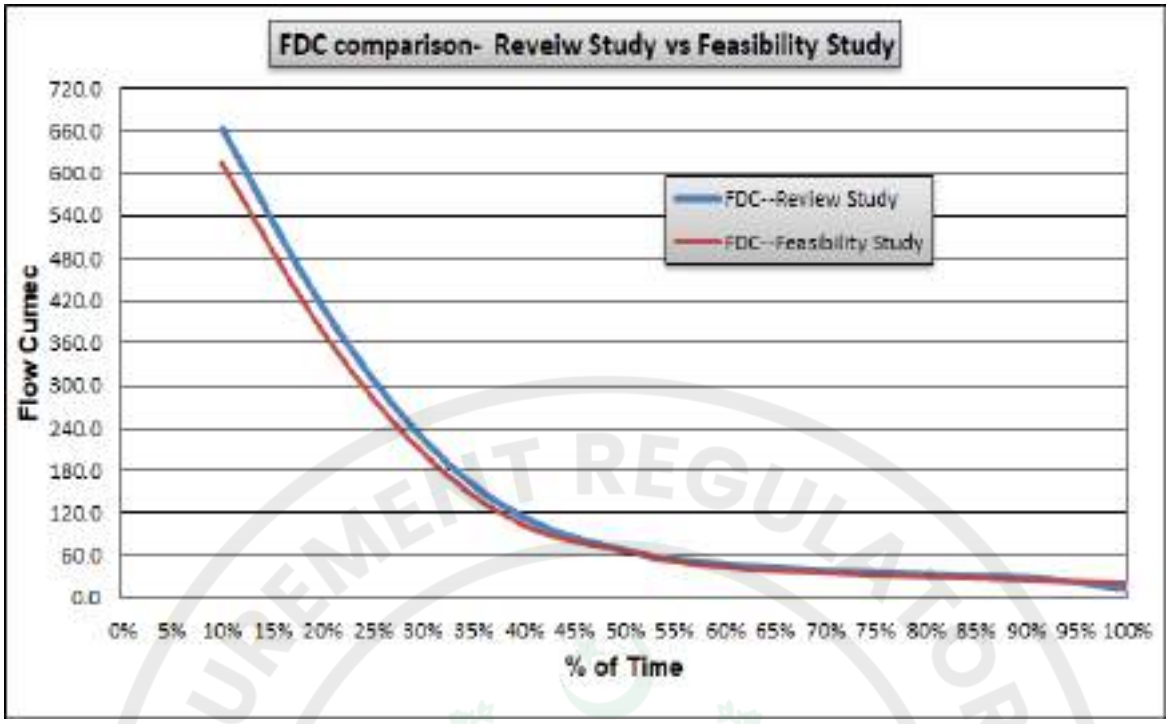

Figure 4.12: Comparison of FDC (Review Study vs. Feasibility Study)

4.6 Flood Study

Flood Frequency Analysis can be performed where maximum annual instantaneous flow values are available to estimate flood magnitudes for various return periods.

4.6.1 Flood Estimation - Feasibility Study 2021

In Study 2021, flood estimated by using two approaches as mentioned below.

- Flood Estimation by Flood Frequency Analysis
- Flood Estimation by USACE HEC-SSP Model

Flood Frequency Analysis (FFA) had been carried out to estimate the flood at different return periods. Three types of distribution series namely Gumble, Normal and Log Pearson Type-III Distribution series have been used to estimate the flood. Flood has also been estimated using the statistical model. The US Army Corps of Engineers (US-ACE) HEC SSP Model is used for this purpose. The results of flood estimated against different return periods at Attabad Lake by using two approaches are tabulated below in Table 4.10. It was recommended to adopt design flood of 10,000 years return period at weir site. Design flood of (3,250 m³/s) at weir site had been assumed for the calculations of design of structures.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Table 4.10 Flood Estimation Results - Attabad Lake

Flood Estimation	Flood Frequency Analysis -Results			HEC-SSP Model Result	
Return Period (years)	Gumble Distribution (m^3/s)	Normal Distribution (m^3/s)	Log Pearson Type-III (m^3/s)	Computed Flood from Curve (m^3/s)	Expected Probable Flood (m^3/s)
2	1,142	1,232	1,155	1,154	1,154
5	1,411	1,426	1,428	1,431	1,436

1,000	2,691	2,520	2,518	2,559	2,698
10,000	**3,237**	**2,984**	**2,915**	3,016	**3,292**

4.6.2 Flood Estimation - Review Study

Flood has been estimated from the available record. The maximum peak daily discharges of Dainyor Bridge station at Hunza Rivers for every year recorded. The instantaneous peaks will definitely be higher than the measured daily flows. Instantaneous peak flows of Dainyor Bridge station for the period 1966 to 2015 have been calculated and generated one day maximum peak Instantaneous flow for every year at proposed weir site. The estimated instantaneous peak flow for the period of 1966-2015 at Attabad Lake is graphically represented in Figure 4.13.

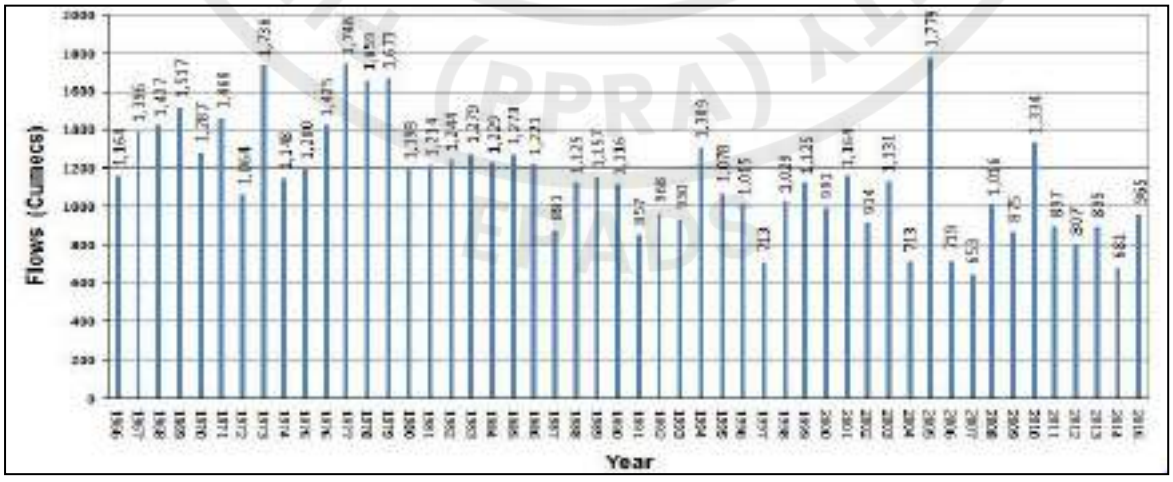

Figure 4.13: Instantaneous Peak Flows at Attabad Lake (1966-2015)

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- **Flood Estimation at Attabad Lake - Weir**

Flood has been estimated at propose weir site by using Peak Instantaneous flows of Attabad Lake for period of 1966-2015. Flood Frequency Analysis (FFA) has been carried out by using different distribution (Gumble, Lognormal & Pearson type 3). Flood frequency results against different return periods are tabulated and represented below in Table 4.11 and Figure 4.14 through Figure 4.16.

Table 4.11 Floods against Different Return Period - Attabad Lake Weir

Flood Estimation at Weir by Flood Frequency Analysis			
Return Period (years)	**Gumbel (cumecs)**	**Lognormal (cumecs)**	**Log-Pearson type 3 (cumecs)**
10000	**3320**	**2840**	**2580**
2000	2910	2550	2370
1000	2740	2420	2270
500	2570	2300	2170
200	2340	2130	2040
100	2160	2000	1930
50	1990	1870	1820
20	1750	1680	1660
10	1570	1540	1520

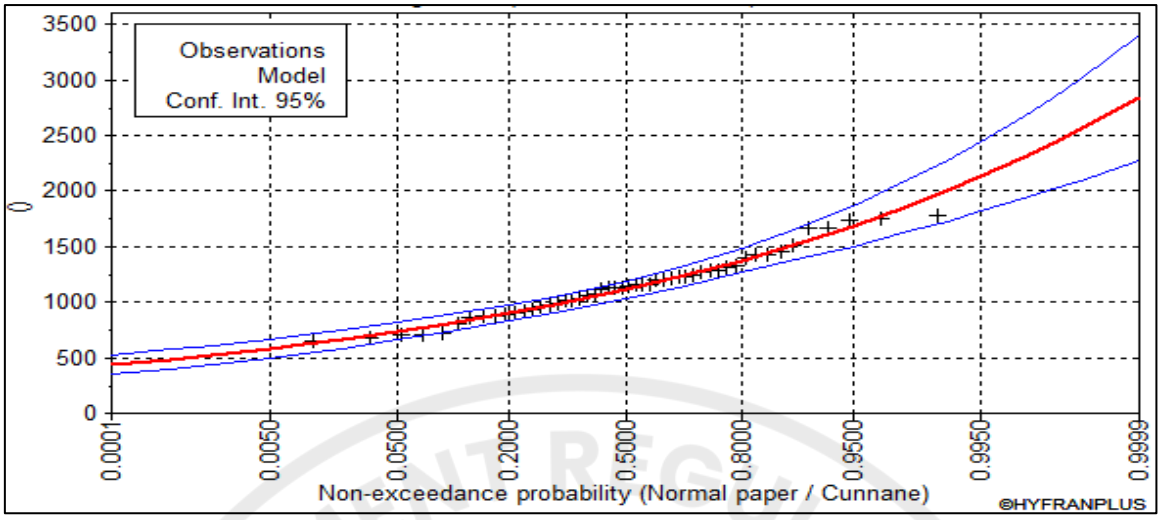

Figure 4.15: Flood Frequency at Weir - Lognormal Distribution

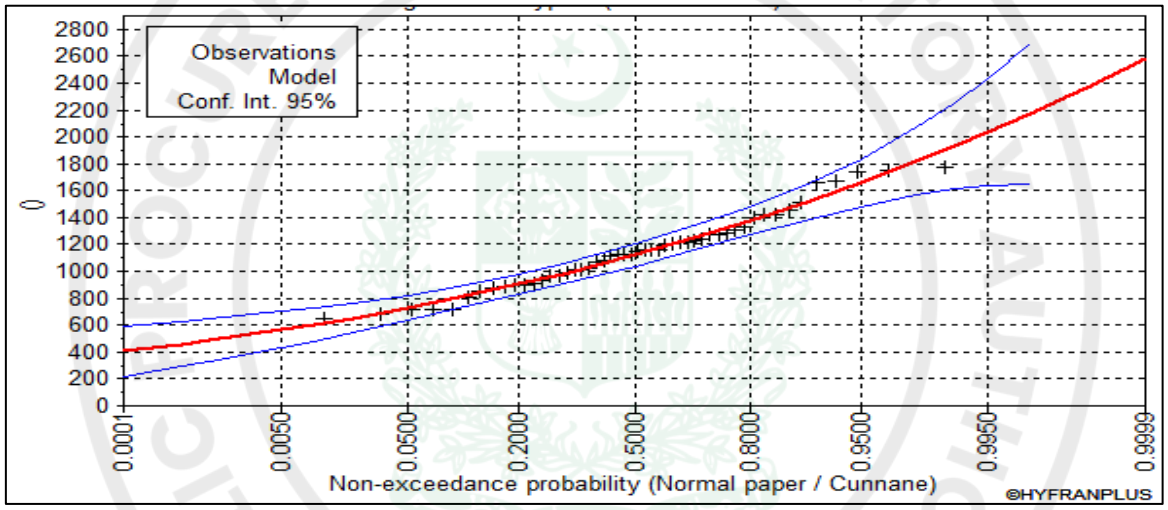

Figure 4.16: Flood Frequency at Weir - Pearson Type 3 Distribution

- **Recommended Design Flood**

Keeping in view the flood estimation against returns periods by using different distributions, it is recommended to adopt Gumble Distribution against 10,000 years of return period for the selection of design flood at proposed weir site.

Finally, Design Flood of 3320 m³/s at weir site has been selected for the design of hydraulic structures.

4.7 HYDROLOGICAL FLOOD ROUTING

Flood routing is a mathematical procedure for predicting the changing magnitude, speed, and shape of a flood wave as a function of time (i.e., the flow hydrograph) at one or more points along a waterway. Although, the lake has not much storage capacity but still it can lag and attenuate the peak generated by floods to minimize the adverse impacts on the downstream structures and areas. The temporarily stored water is then released through an outlet or spillway after the peak has passed.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

4.7.1 Flood Routing - Feasibility Study 2021

To setup the HEC-HMS model, Storage-Discharge relationship had been developed for the reservoir. The hydrograph with the peak of 3,250 m³/s had entered in the lake as inflow and attenuated peak of 3,085 m³/s was attained after 4 hours of the inflow peak. The attenuated peak was attained at an elevation of 2421.3 masl. The inflow hydrograph of 3,250 m³/s , the rating curve of overflow spillway and flood routing of Attabad Lake are presented in Figure 4.17, Figure 4.18 and Figure 4.19.

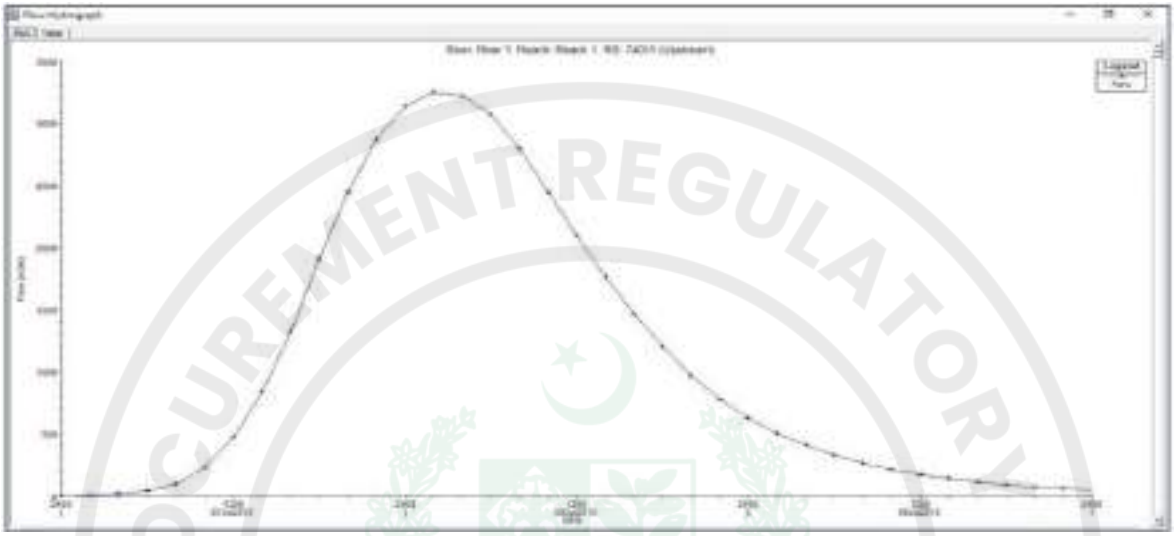

Figure 4.17: Flow Hydrograph of 3250 Cumecs

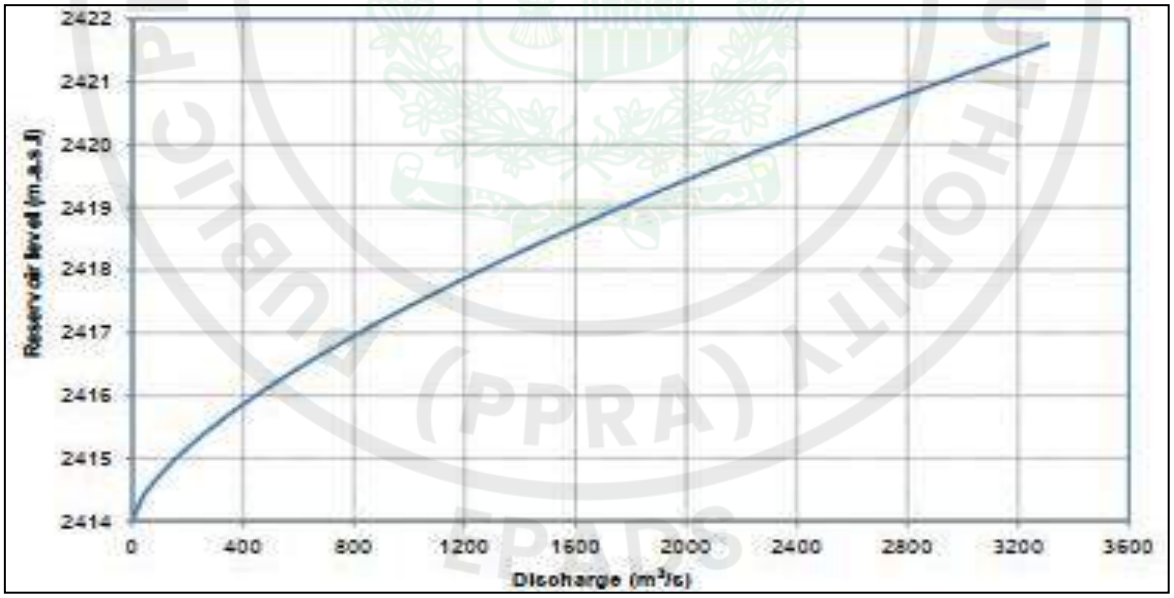

Figure 4.18: Rating Curve of Spillway

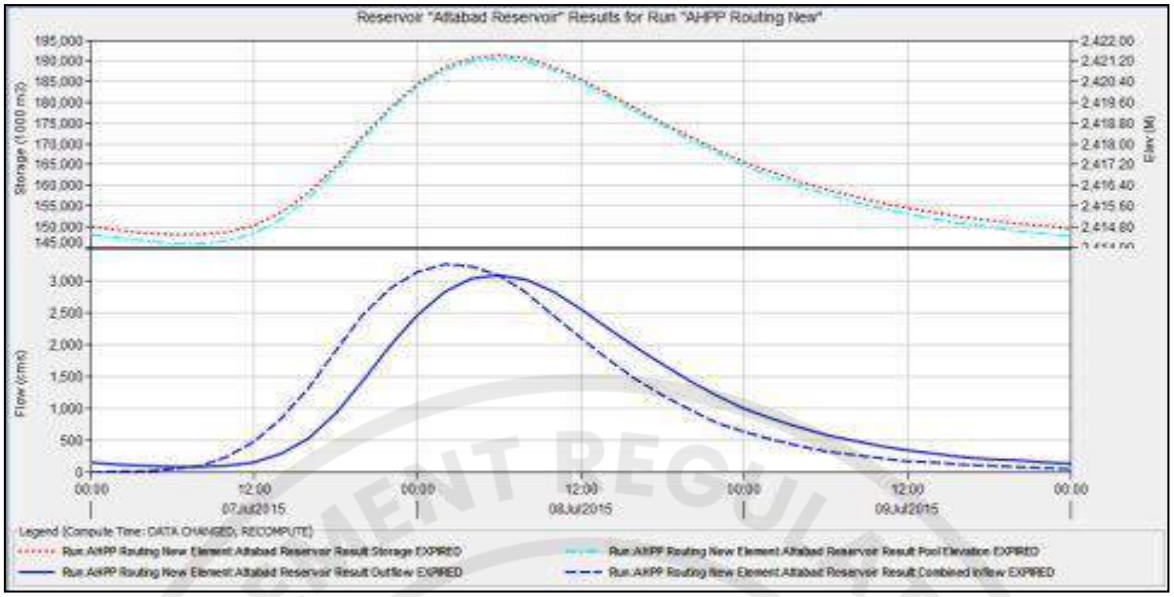

Figure 4.19: Attabad Lake Flood Routing Feasibility Study

4.7.2 Flood Routing - Review Study

In present study, for developing HEC-HMS Model, the model input parameters (Capacity Storage relationship and Elevation Area Capacity Curve) keeping same as in feasibility study. Taking catchment area 8922.9 sq.km and peak inflow 3320 m³/s. Assuming spillway crest level as 2414 m a.m.s.l. The inflow hydrograph of (3250 m³/s as in Feasibility Study) is converted into Unit Hydrograph by unity method and generated Inflow Hydrograph of 3320 m³/s on the basis of Unit Hydrograph. Unit hydrograph and Inflow Hydrograph of 3320 cumecs are as given in Figure 4.20 and Figure 4.21.

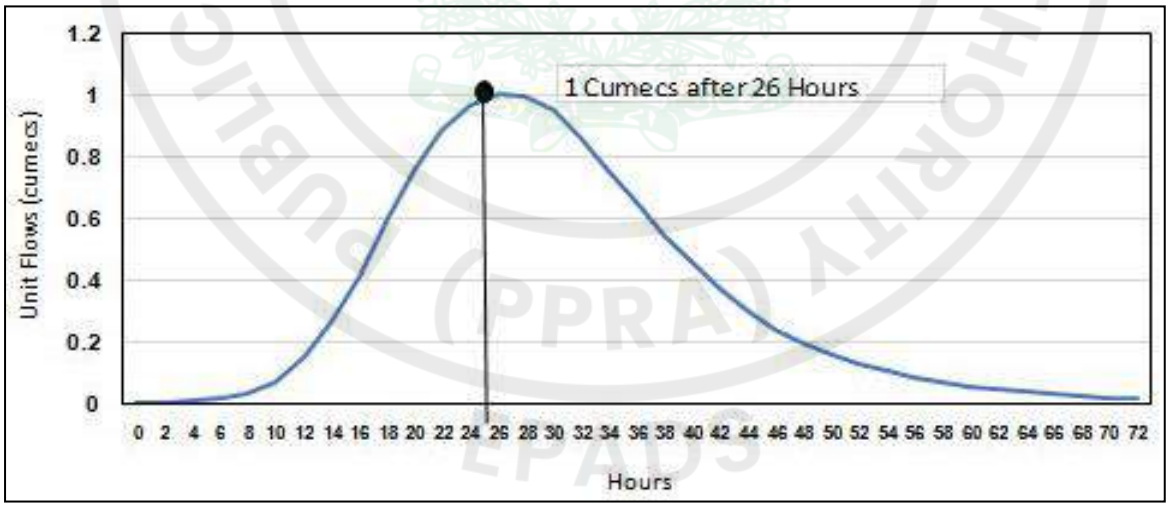

Figure 4.20: Unit Hydrograph

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

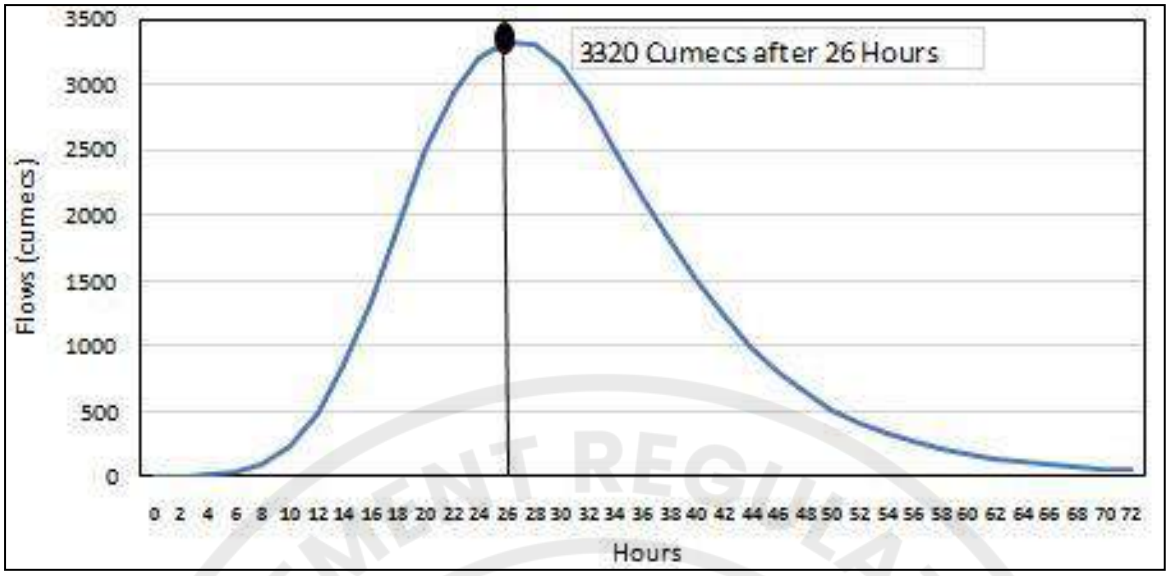

Figure 4.21: Flow Hydrograph of 3320 Cumecs

HEC-HMS, model run by considering inflow hydrograph with the peak of 3,320 m³/s has been entered in the lake as inflow and attenuated peak of 3,152.8 m³/s is attained after 4 hours of the inflow peak. The attenuated peak is attained at an elevation of 2421.4 m a s l. HEC-HMS results are shown below in Figure 4.22.

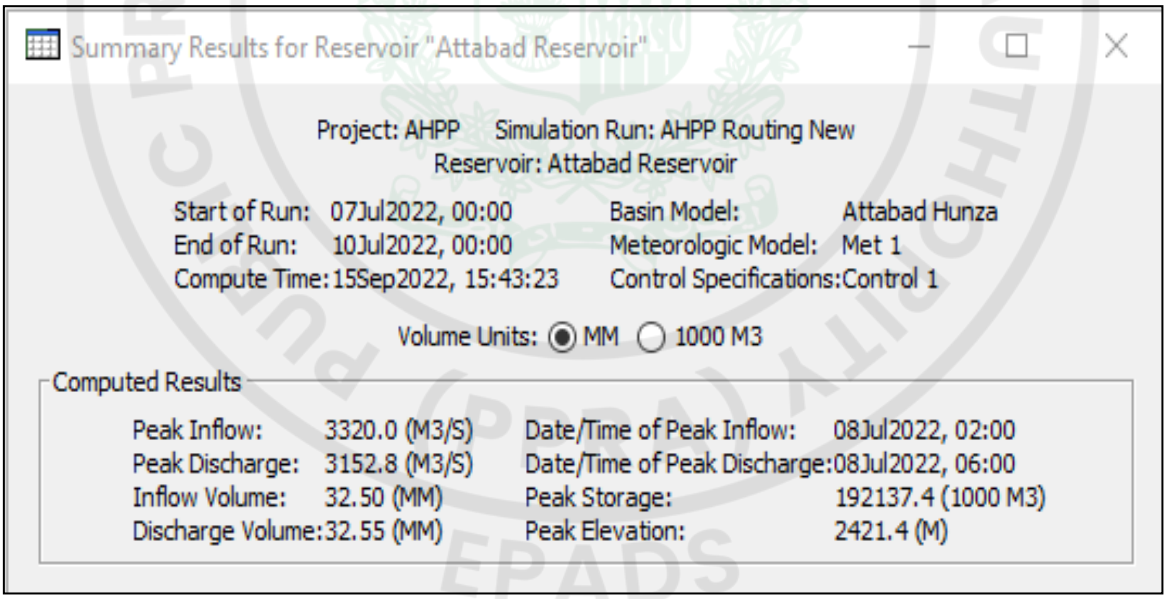

Figure 4.22: HEC HMS Model - Simulation Results

Attabad Lake Flood Routing results are given in Figure 4.23 and tabulated in Table 4.12.

4.8 SEDIMENTATION STUDY

Sedimentation study is prerequisite for the design of any hydropower project. Sediment transport studies are essential to estimate total sediment inflow at the weir site, sediment load and the life of the reservoir with and without flushing or sluicing options and all other aspects related to sedimentation.

4.8.1 Sedimentation Study - Feasibility Study 2021

Suspended sediments at Attabad Lake were estimated by using sediment data of Dainyor Bridge station. Relationship developed between suspended sediment and discharge data of Dainyor Bridge. Sediment rating curve developed with that correlation and generated suspended sediment yield at proposed weir site with the application of developed sediment rating curve. Average annual suspended sediment estimated as 20.06MMT.

Average Volume of fresh sediment deposits for Attabad Lake HPP is estimated as: (20.06 MMT x 1000 kg/MT) / (1122.4 kg/m^3 x 1234 m^3/acre-feet x 106) ~ 14,483 Acre-Feet/year. Bed load had been considered as 20% of the total suspended load. Total Sediment load at weir site worked out to be 24.06 M Tons. Without flushing, reservoir would be filled with sediments in 10 years.

4.8.2 Sedimentation Study - Review Study

- **Estimation of Suspended Sediment at Weir**

Estimation of suspended sediment at weir site by using two approaches

- Observed Dainyor Bridge Sediment Data
- Development of Sediment Rating Curve

1st Approch: Observed Sediment Data of Dainyor Bridge

Observed annual suspended sediment data of Dainyor Bridge at Hunza river is collected from SWHP-WAPDA, for the year of 1966-2005 is tabulated below in Table 4.13.

Table 4.13 Observed Suspended Sediment at Dainyor Bridge

Suspended Sediment Yield at Hunza River (Dainyor Bridge) - SWHP WAPDA			
Year	**Sediments (m.s.t)**	**Year**	**Sediments (m.s.t)**
1966	74.1	1986	34.2
1967	76.2	1987	23.3
1968	81.2	1988	39.6
1969	78.2	1989	5.59
1970	85.3	1990	12.9
1971	86.9	1991	7.73
1972	32.2	1992	11.2
1973	111	1993	10.2
1974	40.6	1994	14.1
1975	31.2	1995	15.5
1976	31.3	1996	20.5

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Suspended Sediment Yield at Hunza River (Dainyor Bridge) - SWHP WAPDA			
Year	**Sediments (m.s.t)**	**Year**	**Sediments (m.s.t)**
1977	56.1	1997	10.8
1978	59	1998	19.7
1979	47.7	1999	18.3
1980	33.3	2000	19.2
1981	31.4	2001	20.4
1982	29.2	2002	12.8
1983	33.7	2003	17.5
1984	46.4	2004	11.04
1985	39.3	**Avg**	**36.64**

The average annual suspended sediment at Dainyor Bridge estimated from the above table is 36.64 MTons. As Attabad Lake is located at upstream of Dainyor Bridge on Hunza river, average annual suspended sediment estimated at Attabad Lake by using catchment area ratio method. Thus, average annual suspended sediment at proposed weir site is worked out to be **24.85 MTons.**

2nd Approch: Development of Sediment Rating Curve

Observed daily suspended sediment data w.r.t discharges of Dainyor Bridge gauging station have been collected from SWHP-WAPDA, for the period of 1966-2015. Best correlation developed between suspended sediments with discharges for the period of 1967-1988 as represented in Figure 4.24.

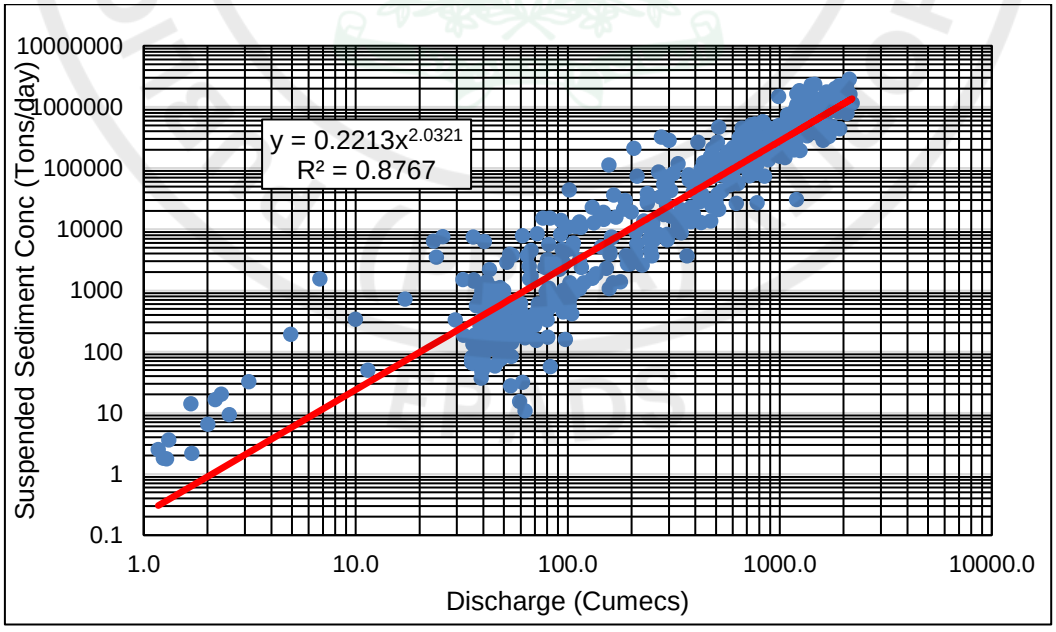

Figure 4.24: Correlation between Suspended Sediment and Discharge - Dainyor Bridge

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

The best fit relationship thus obtained was:

$$y = 0.221x^{2.032}$$

For the safety and life of project, appropriate estimation of sediment yield at weir site is needed. Therefore, keeping on safer side, select the years having above average estimated inflows at Attabad Lake. Putting the value of estimated available flows at weir site (x) in the above equation will give the suspended sediment (y) at weir. The mean monthly and mean annual suspended sediment at Attabad Lake are represented below in Figure 4.25 & Figure 4.26.

Average monthly suspended sediments at weir site are varying from 7721 Tons in March to 8,256,082 Tons in July. Average annual suspended sediment estimated at weir site is **20.30 MTons**.

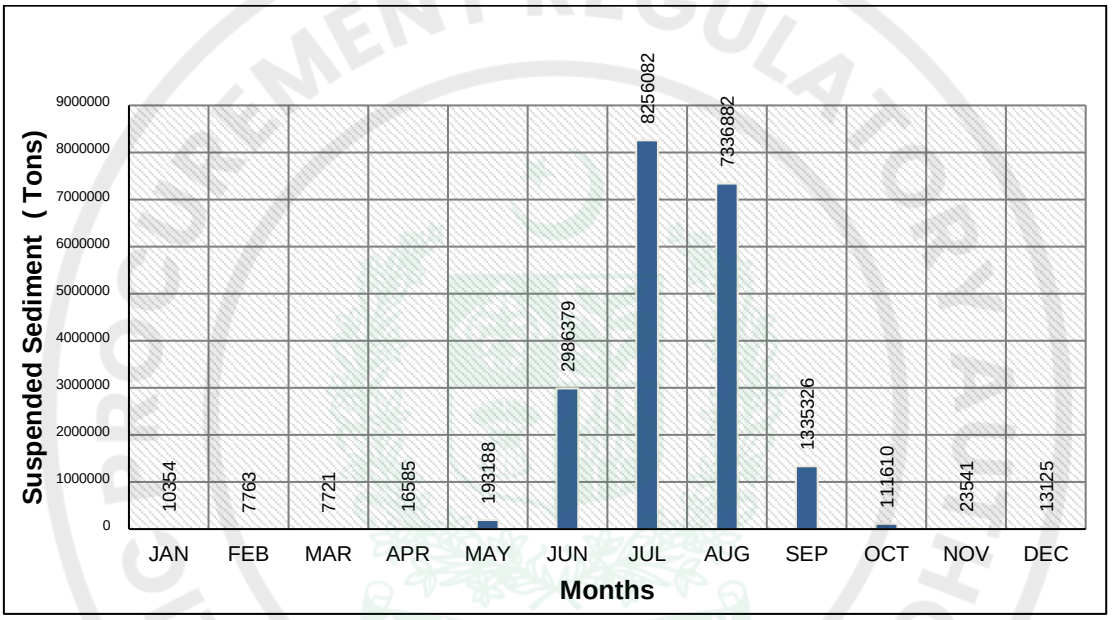

Figure 4.25: Monthly Suspended Sediment at Attabad Lake

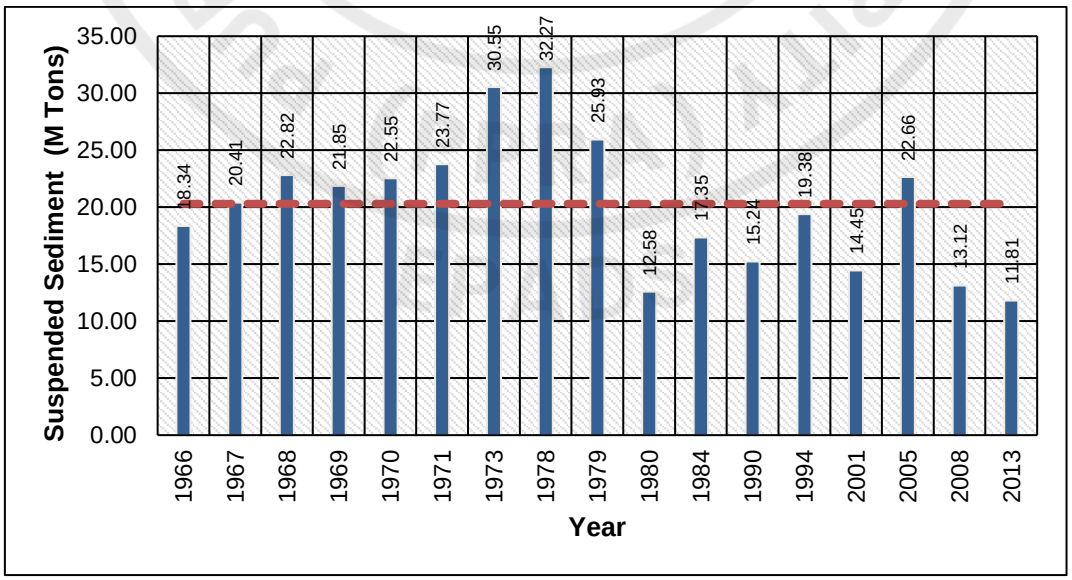

Figure 4.26: Annual Suspended Sediment at Attabad Lake

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Average annual suspended sediment yield at weir site estimated with values of 24.85 MTons and 20.30 MTons against 1st and 2nd approach respectively. Keeping in view the above two approaches, finally estimated annual suspended sediment yield at Attabad Lake is taking average of above two values (24.85 MTons and 20.30 MTons). The resulted average annual suspended sediment at weir site is 22.5 MTons.

- **Estimation of Total Sediment Load**

Total annual sediment load at Attabad Lake is addition of suspended sediment load and Bed load at weir site. Bed load is considered as 20% of suspended sediment load. Annual suspended sediment load at weir site is 22.5 MTons. Bed load is 20% of Suspended load and Bed load worked out to be 4.51 MTons. **Total annual sediment load in Attabad Lake is estimated with value of 27.08 MTons.** Density of sediment is 62 lb/ft³. Total annual sediment load in volume is **27.71 MCM** or **22,466 Ac FT**.

4.9 SUMMARY OF REVIEW STUDY

Comparative summary of Review w.r.t Feasibility Study is as shown below in Table 4.14.

Table 4.14 Comparative Summary of Feasibility vs. Review Study

Sr. No.	Description	Feasibility study 2021	Review Study 2022
1	Catchment area	8901 km²	8922.9 km²
2	Climatic Data	Gilgit	Gilgit & Skardu

4.10 ANALYSIS ON ADDITIONAL AVAILABLE DATA

Flow study review for the same period (1966-2015) of observe daily flows data of Hunza River at Dainyor Bridge station as used in Feasibility study. The analysis and comparative (Hydrology & Sedimentation study) as discussed above in detail.

The additional daily flows data of Hunza river at Dainyor Bridge for period of three (03) years (2016, 2019 & 2020) along with suspended sediment data of two years (2019-2020) had been acquired from SWHP-WAPDA. The data was studied and its findings are as follow.

- Missing daily flows data for the period of 2016.
- Discontinuous years of data availability.

For the analysis of flows pattern and water availability, continuous years of data required. In the current scenario, flows study done for the period of 1966-2015. The additional data was available for the period of 2019-2020, and reflected three years missing data (2016-2018). In the light of above observations, hydrological study could not be updated.

The comparative analysis of two years daily flows data of Dainyor Bridge for period of (2019-2020) w.r.t (1966-2015) is represented in Figure 4.27 and avgerage mean monthly flows are 275 cumecs in 2019-2020 & 322 cumecs in 1966-2015, respectively.

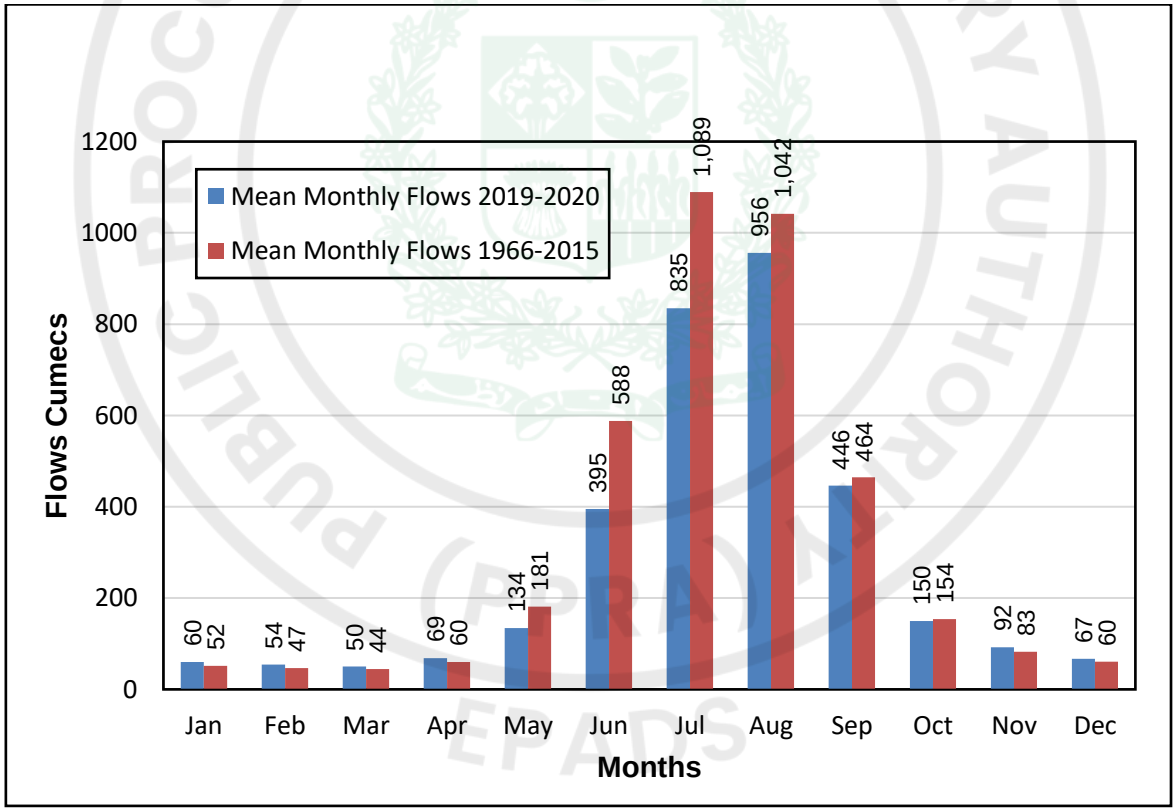

Figure 4.27: Comparison of Mean Monthly Flows - Hunza River at Dainyor Bridge

The flows generated at proposed weir location for the period of (2019-2020) by using Dainyor Bridge data with the application catchment area ratio method. The flows comparison study of Attabad lake for two (02) periods of durations (1966-2015) and (2019-2020) are represented below in Figure 4.28.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

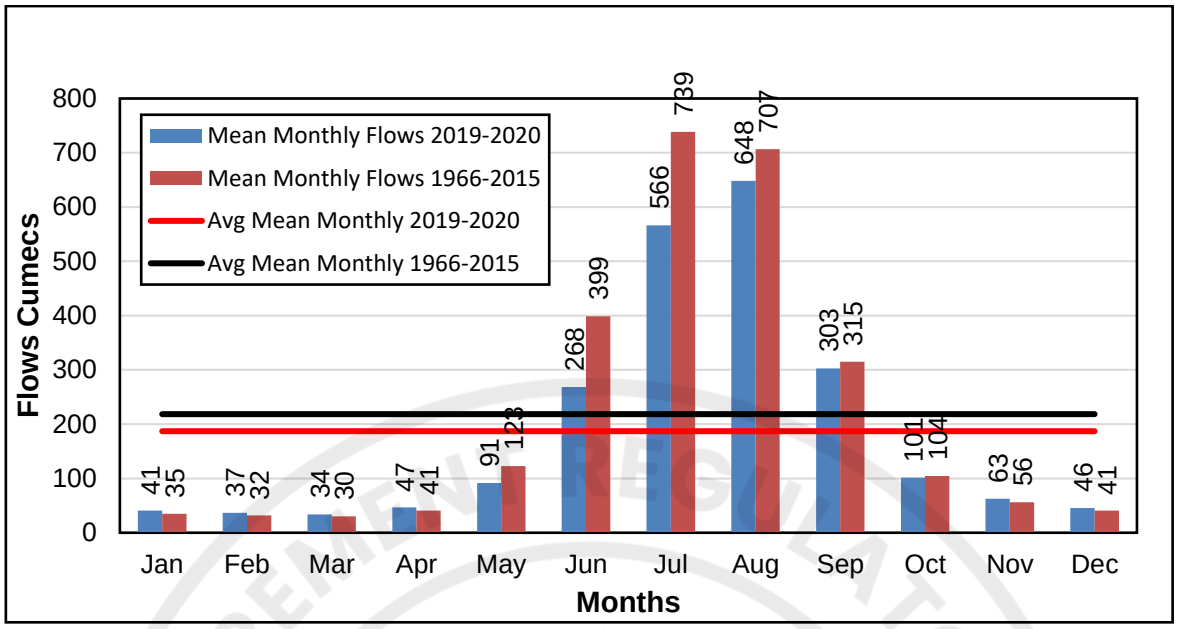

Figure 4.28: Comparison of Mean Monthly Flows - ATTABAD LAKE

The average mean monthly flows at proposed weir for period of (2019-2020) are 187.7 cumecs and for period of (1966-2015) are 218.4 cumecs, respectively. Above figure highlighted flows patter for both duration periods are similar but on other hand, flows availability reduce in period of 2019-2020.

Flows study need to be updated in detail design stage to get the effective estimated values of flows and all other hydrological parameters.

4.11 RECOMMENDATIONS

As part of the TORs, Detail Design of Attabad Lake shall be carried out by EPC Contractor. Following recommendations for EPC Contractor regarding Hydrology and Sedimentation Study are as under.

- Stream gauging station should be installed at project site for ascertaining the authenticity of water availability at project site (especially low flows during winter months).
- Flow study need to be revised/updated during detail design stage by EPC contractor. In present study, flows were estimated for the period of 1966-2015 with mean annual flows available at weir site as 6940 MCM.
- GLOFS study will be under taken during detail design stage by EPC Contractor.
- Detailed studies for design flood estimation need to be carried out by the EPC Contractor. In the Detailed Design, the Contractor shall select appropriate return periods for estimating the design floods for weir and power house site. However, the check flood not to be less than 10,000 years return period or GLOF value.
- It is suggested that GLOF value and recently flood occurrence in 2022 also be considered for estimation of flood at weir site. Design floods to be selected to ensure safety of structures and based on analysis of flood risks and consequences.
- Detailed studies for the estimation of sediment load should also be undertaken during the detail design study by EPC Contractor.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

5 REVIEW OF GEOLOGY AND GEOTECHNICAL STUDIES

5.1 GENERAL

Geology and Geotechnical Studies of Attabad Lake Hydropower Project have been reviwed to ascertain the quantum and dependency of available data for further Detail design studies to be carried out by EPC Contractor. The field investigations, in-situ testing, samples collected and laboratory testing data has been reviewed to cover the available inventory of documented geotechnical investigations.

The review findings are given in forthcoming sections of this chapter along with further recommendations.

5.2 REVIEW OF GEOLOGICAL STUDIES

Attabad Lake Hydro Power Project (ALHPP) is proposed on Hunza River, a left tributary of Gilgit River. A large landslide occurred on January 4, 2010. Valley slope comprising a very steep side mountain suddenly collapsed. The slope failure was so massive and instantaneous that blocked the water flows. Vertical face of the landslide scarp as estimated by GSP (Geological Survey of Pakistan) was about 100 m high and the blocked segment of the valley was about 2 km (ISSMGE Bulletin: Volume 4, Issue 3 Page 21) that formed a natural dam and ceased the flow of Hunza river resulting in an upstream reservoir. WAPDA Authority planned to utilize the potential of hydropower due to this lake. Initially, Govt. of GB carried out Feasibility Study by engaging Local consultants in March, 2017. The study was deficient in many aspects including geotechnical investigations, laboratory testing, layout planning, impacts of right bank sliding, Neo-tectonic study and environmental issues. Therefore, Govt. of GB requested WAPDA to carryout detailed Feasibility Study and Hydro Planning Organization (HPO), WAPDA updated the Feasibility Study in June, 2021.

The geological and geotechnical investigations include Surface Geological Mapping, drilling of boreholes and Test pits at the proposed sites of weir, sediment flushing channel/under sluice, headrace tunnel, powerhouse area, and identification of borrow area for construction material. Samples collected during geotechnical investigations have been tested to ascertain geotechnical properties at Central Material Testing Laboratory (CMTL), Lahore. This chapter includes review of all geological and geotechnical investigations and studies which were carried out at Feasibility stage.

5.2.1 Review Scope of Geological Studies

The purpose of the review is to evaluate the available project information as documented in the feasibility report, (Volume I, Main report chapters) about site geology, geotechnical and foundation characteristics with respect to standard practice for a typical medium sized hydropower project located in valley largely incised by the fluvio-glacial geomorphic agents. The project site comprises the valley section located near the massive landslide which is a tectonically highly disturbed area marked by a pronounced seismic activity.

The review process activities involved the following:

- Review of Project Feasibility Report and accompanied Drawings (March, 2017).
- Review of Project Feasibility Report and accompanied Drawings (June, 2021).
- Review of geological and geotechnical investigations in terms of their adequacy for the interpreted geological model of the project.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- Review of subsurface geology particularly of the proposed weir site, power tunnel and powerhouse area.
- Registering the geological and geotechnical hazards and involved risks
- Review of suitability of recommended construction materials for various uses particularly recommendation of using the local available construction materials for the sake of improving the project economics and getting other desired benefits.
- Based on the integrity of the technical evidence, investigations and the syntheses of the analyses, the gravity and soundness of the conclusions and recommendations provided in feasibility report are adequate and/or sound enough to proceed further for the execution of the project.

The review has been completed in perspective of the following:

- Critical review of feasibility report, regional and project geological maps, relevant project documents and Google Earth satellite image.
- Critical review of the geological interpretation of the geotechnical investigations along with project layout in perspective of the terrain characterization and geohazards.
- Preparation of Feasibility Study (June, 2021) Review Report.

5.2.2 Regional Geology and Regional Faults

Regional geologic and tectonic conditions were evaluated using available geologic maps and relevant technical literature. The regional geological and tectonic Map of Pakistan published by Geological Survey of Pakistan (GSP). Geological map has been modified by Pecher et al.2008 after collecting data of different resources and the Regional Tectonic Map is compiled by Ali H.Kazmi & Riaz A. Rana under the supervision of Asrarullah Director General, Geological Survey of Pakistan in 1982.The modification of this Map has done by Chaudry and Ghazanfer in1986 and Ahsan et al, 2008. was used at Feasibility stage for the purpose of regional geological and tectonic assessment. In detail design studies, latest and elaborated regional geological maps/data/information should be used by the EPC contractor for extracting more regional geological information for the project area.

5.2.3 Site Geology

The recent deposits are the most widely spread soil units that overlies the bedrock. The slopes are covered with surficial deposits having variable thickness. Terrace deposits comprise mixtures of clay, sandy silt, boulders and gravel in varying proportions.

Soil units present in the Project Area are described below.

- **Angular Boulder Gravels with Sand and Appreciable Amount of Fines (ABGM)**
  Most of the slopes are covered by material comprising of ABGM. This is colluvial material broken from the rock units, rolled down slope and settled at the foothill or along the slopes. These deposits are mainly associated with crushed/brecciated rock units, originated/caused by brittle deformation due to tectonic compression resulting in faulting/shearing. ABGM material is present in the sediment flushing channel, surficial deposits in power tunnel alignment and in part of tailrace channel.
- **Rounded Boulder Gravels with Sand and Appreciable Amount of Fines (RBGM)**
  River bed is mainly occupied by RBGM material. Some exposures are also present at power house site Due to the formation of lake, the bed of the river is mostly covered with

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

silt and sand. RBGM is present in the main weir area, part of sediment flushing channel and part of power tunnel.

- **Terrace Deposits**
  Terrace Deposits consist mainly of unconsolidated mixtures of clay, silt, sand and gravels with occasional boulders and own re-worked origin being mostly derived from loose material of (RBGM, ABGM, Morainic and Brecciated deposits). Terrace deposits are present at a relatively higher elevations in the project area.

- **Morainic Deposits**
  It consists mainly of material ranging in size from large boulders to clay size particles, angular to sub-angular, poorly sorted, elongated and have flat surface, powerhouse area is covered by moraine deposits with clayey silt to silty clay.

Rock units present in the Project Area are described below.

- **Granitic Gneiss**
  It is light grey to grey in color on fresh surface and weathers to light brown, coarse to very coarse grained, moderately to highly jointed, highly sheared up to higher elevation due to geological faults, sparse to moderately weathered, moderately hard to hard. Part of power tunnel and tunnel outlet is in Granitic Gneiss.

- **Granodiorite**
  It is dark grey to blackish grey, weathers to brownish grey, medium to coarse grained, moderately weathered, moderately hard to hard, moderately jointed and is intruded by pegmatites and granitic gneiss. It is crushed, mylonised, and sheared at places. It is well exposed at the banks of Hunza River where it is intruded by many pegmatite dykes. Some shear zones are also present in this unit. Part of power tunnel and intake area are in Granodiorite.

5.2.4 Geological Structures

The whole project area bears the drastic imprints of two regional, seismically active and capable fault systems i.e., MKT and Karakorum Strike Slip Fault (KSSF). As the project area has undergone multiple episodes of tectonic events, many regional as well as local faults and their branch faults and off-shoot splays have formed. There are many faults present in the vicinity of proposed ALHPP. These faults owe their origin to the tectonic regimes associated with MKT and KSSF and transverse in between these two fault systems. Some of these faults have been observed during Surface Geological mapping and reported as following:

- **Attabad-Hispar Valley Fault**
  This fault crosses the Hunza River and forming a junction point with Hunza River and Attabad Fault in Attabad village. It is a thrust fault striking N30°E and dipping 40°SE and is well exposed at the left side slope near the project area. Granitic gneiss along its alignment is sheared / brecciated, forming fault breccia at many places. Due to high degree of shearing, many active landslides and rockfalls have been originated along its trace.
- **Attabad Fault**
  This Thrust Fault is striking N60°W and dipping 52°NE, exposed in area rear of Attabad village. It is relatively a small fault and terminates along junction point of three faults. A large brecciated and sheared rock is present along this Thrust Fault. Sheared and brecciated rock can be seen on outcrops at right bank slope.

- **Attabad River Fault**

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

The exposure of this fault is present at right bank slope of Hunza River. The breccia is well exposed at right side, just downstream of Sarat Suspension Bridge. The intensity of brecciation increases towards Salamanabad village. In fact, Salamanabad village is developed on brecciated rockmass.

5.2.5 Geomorphology

Geomorphologic studies were not conducted during the Feasibility stage.

The reviewer has made the geomorphologic assessment of the project area and its closed vicinity using satellite images and remote sensing techniques as shown in Figure 1. The segment of Hunza valley wherein the various components of the project are situated reflects very high relief conditions marked by relatively steeply inclined extensive mountain slopes along right side of the valley as compared to the left bank mountain slopes.

The mountain slopes are mostly marked by erratic slopes instabilities along with relatively less extensive segments of casuistic slopes. The mass wasting regimes active in the project area are drastically influenced by a broad spectra of variables such as geomechanical conditions, moisture distribution and dynamic loading. Most abundant slope hazards include but not limited to Rockfall/Debris flows, rolling slopes in unconsolidated loose overburden and mud/debris flows in sub-parallel rectilinear secondary drainage.

In perspective of the aforementioned volatile slope conditions, it is recommended that during detail design, prior to the initiation of specific and specialized investigations, a comprehensive and overall baseline terrain characterization based on geologic, geotectonic, geomorphologic, seismic geohazard and prevailing climatic conditions should have been conducted. Simplified Geomorphological Map of project area is shown in Figure 5.1.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

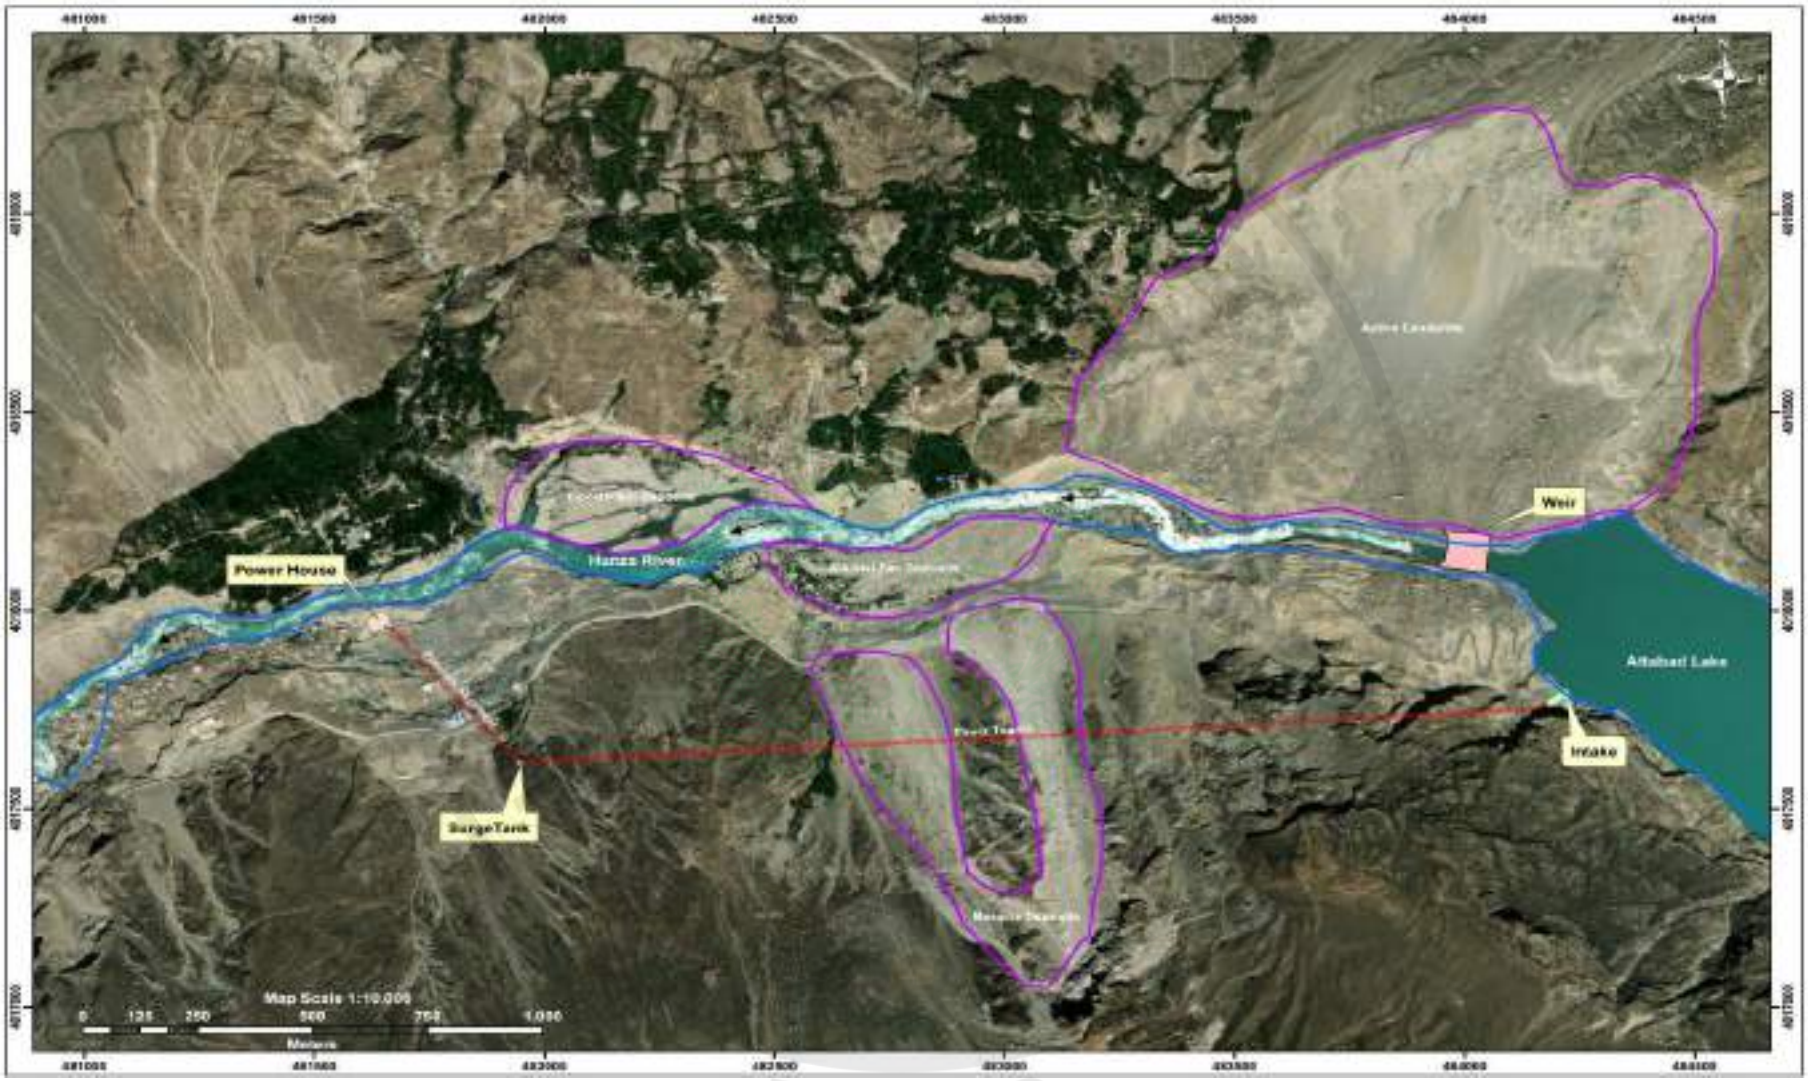

Figure 5.1: Simplified Geomorphological Map of Project Area

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

5.2.6 Review of Surface Geological Investigations

- **Geological Mapping**

The Surface geological mapping of the project area has been carried out on 16 topographic sheets prepared by Survey Division Peshawar, HPO, WAPDA on scale 1:1 000 with contour interval of 2 m, with the help of Total Station, Plane Table and Brunton compass and presented at scale of 1:2000.

The EPC contractor will verify the geological mapping conducted during the Feasibility Study and necessary amendments in the geological map will be made, where required. Moreover, additional geological studies will also be carried out focusing geomechanical properties and rockmass characterization.

The EPC Contractor shall perform the geologic mapping during detail design stage with an appropriate scale to capture the ground information for safely hosting the proposed structures. For engineering purpose, the mapping will define geologic conditions potentially affecting the project appurtenant structures. Emphasis, therefore, will be given on the physical properties of soil and rock masses as they may affect proposed foundations excavation, slope stability at abutment slope excavation and construction methods. The physical properties or geologic factors include the occurrence and properties of soil units, rock outcrop patterns, rock strength, weathering, permeability and condition of structural discontinuities (jointing, bedding, foliation, schistosity, faults, shear zones, etc.). The geologic materials (soils, rocks) will be described and classified following the accepted guidelines as used in other activities for soil or rock descriptions, classification and logging. Execution of the detailed geological mapping during the detail design stage will be done using Satellite Images/ Drone images.

The EPC Contractor shall perform the geologic mapping of the soil cover area/ quaternary deposits, using Unified Soil Classification System (USCS) will be conducted as required particularly focusing on (i) factors affecting water-tightness, (ii) occurrence of major faults and lineaments, and (iii) identification and characterization of significant geological hazards that might pose threat to the safety of safe operation of the project.

- **Scanline Survey**

To determine the geomechanical properties of the rockmass, scanline surveys at the critical locations plays a vital role for the assessment of the mode of failures present in the project area. However, no such studies have been conducted during the Feasibility study.

The EPC contractor should perform scanline surveys in accordance to the ISRM standards 2007and compile scanline data in tabulated form which should include joint type, dip/strike, interval, aperture, roughness, infilling and Uniaxial Compressive Strength (UCS). The collected dip/strike discontinuity data should also be plotted on software like DIPS or other structural geology software to define characteristics of major sets of discontinuity and mode of failures (planner, wedge and toppling) at the slopes as shown in a typical Kinematic Analysis in Figure 5.2.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

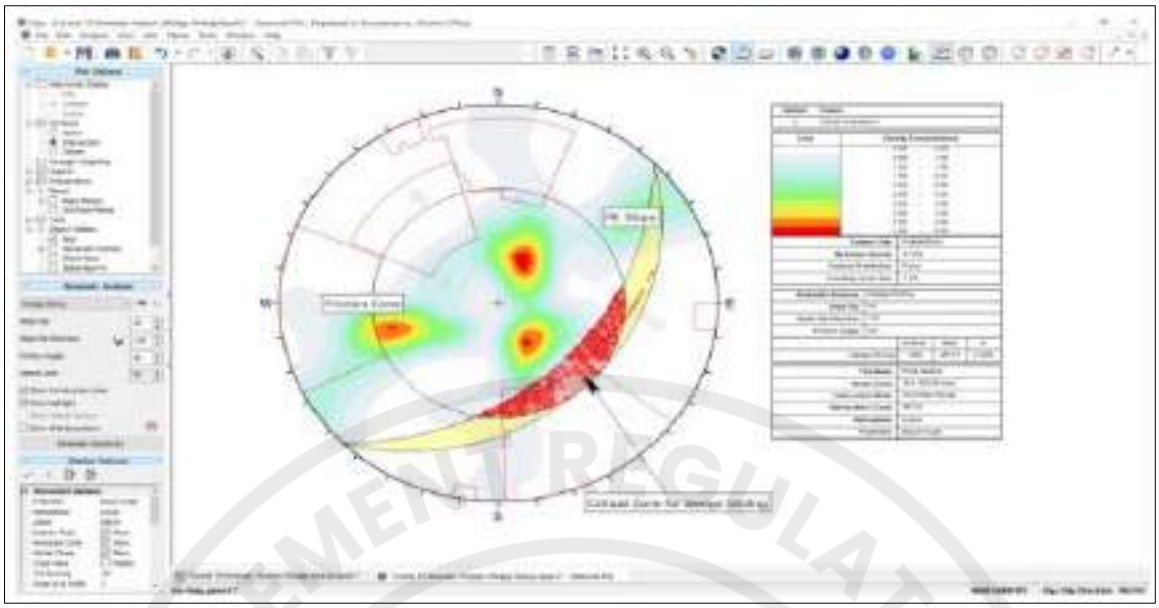

Figure 5.2: Interface of RocScience DIPS Software Showing Kinematic Analysis

- **Neotectonincs**

During the Feasibility stage, neotectonic study has been carried out in sufficient details. The area under study has been covered 40km upstream and 50km downstream of slided mass. However, during the detail design stage EPC contractor shall verify and confirm the local faults, shears, lineaments, scars and tectonic distortion trends specific to the project area and its 50 km radial vicinity.

5.3 REVIEW OF GEOTECHNICAL STUDIES AND SUBSURFACE INVESTIGATIONS

Field investigations for Feasibility study 2021 included drilling of six (06) boreholes, excavation of ten (10) test pits, field testing in boreholes and sampling for laboratory testing. Comprehensive field investigations plan of Feasibility study 2021 marked on satellite image is shown in Figure 5.3.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Figure 5.3: Field Investigation Plan of Feasibility Study 2021

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Summary of drilled boreholes with locations, drilled depths and conducted water pressure tests is given in Table 5.1. Total drilling of 401 m have been executed for foundation evaluation of different structures, bore holes of varying depths have been drilled accordingly to estimated geological conditions prevailing in subsurface. Permeability tests have been performed using constant head method in overburden material at 3 m interval whereas water pressure tests (Lugeon tests) in bed rock have been performed at interval of 5 m or at change of strata. Rock cores and soil samples have been collected from all the bore holes at various depths for lab testing.

Summary of excavated test pits with depths is given in Table 5.2. A total ten (10) number of test pits having cumulative depth of 30m were excavated to study the surficial material present at different locations.

The review of subsurface investigation data revealed following:

- Low core recovery and RQD values recovered at shallow depths.
- Core recovery and RQD values increases with depth.
- Lack of discontinuity data recording in the core logs as only one (01) borehole i.e., BH-04 was drilled 74m into the bedrock.
- Lack of bedrock information.
- Lack of details of preserved rock samples in the borehole logs.
- Non availability of core box photographs.
- Details of permeability test have not been provided.
- Description of material encountered is lacking and confusing, like information about sand/fines, roundness or angularity of gravels etc.
- Sufficient Investigations at many important structures like pressure tunnel intake, surge tank, penstock, and right abutment of main weir were not done.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Table 5.1 Boreholes and Summary of Analysis

Area	BH No.	Depth (m)	Inclination	Material Encountered	Permeability Range (cm/sec)	Water Pressure Test
Weir L/S	BH-01	90	90°	Angular Boulder Gravels of slided mass, light grey to grey in color, mostly of Granodiorite and Granitic gneiss.	0-4m depth, K=0.04618, 13-16m depth, K=0.002858, 16-19m Depth, K=0.012294

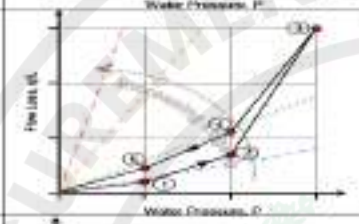
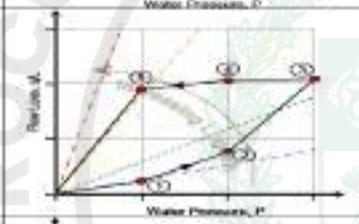
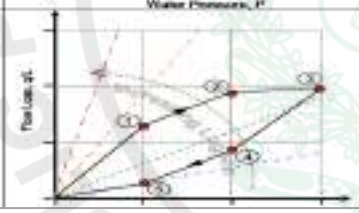
5.3.1 Review of Field Testing Data

- **Permeability and Water Pressure Testing**

Summary of permeability and water pressure tests is given in table 5.1. Permeability and water pressure tests performed in feasibility study are limited and insufficient to use in the detail design.







During the detail design stage, the EPC Contractor has to drill appropriate number of additional boreholes at the project appurtenant structures and have to perform Lugeon at regular interval to assess Lugeon values under the weir, powerhouse and other structures of the project. These additional geotechnical investigations will be supervised by an experienced Engineering Geologist.

- **Determination of Lugeon Pattern**

The EPC contractor has to plot the values of 'Flow' verses 'Pressure' to assess the Lugeon pattern that will help in evaluating the discontinuities pattern in the test section as shown in Table 5.3 represents the proposed Lugeon interpretation procedure using the flow loss vs. pressure.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Table 5.3 Proposed Lugeon interpretation procedure using the flow loss vs. pressure

BEHAVIOR	WATER LOSS VS PRESSURE PATTERN	DESCRIPTION	REPRESENTATIVE LUGEON VALUE
LAMINAR		All Lugeon values about equal regardless of the water pressure	Average of Lugeon values for all stages
TURBULENT		Lugeon values decrease as the water pressures increase. The minimum Lugeon value is observed at the stage with the maximum water pressure	Range of Lugeon values observed at water pressures expected during operation. If water pressure expected during operation is unknown use the value corresponding to the medium water pressure (2nd or 4th stage)
DILATION		Lugeon values vary proportionally to the water pressures. The maximum Lugeon value is observed at the stage with the maximum water pressure	Range of Lugeon values observed at water pressures expected during operation. If water pressure expected during operation is unknown use the value corresponding to either low or medium water pressures (1st, 2nd, 4th, or 5th stage)
WASH-OUT		Lugeon values increase as the test proceeds. Discontinuities' infillings are progressively washed-out by the water	Highest Lugeon value recorded (5th stage)
VOID FILLING		Lugeon values decrease as the test proceeds. Either non-persistent discontinuities are progressively being filled or swelling is taking place	Use final Lugeon value (5th stage), provided that presence of non-persistent discontinuities and/or occurrence of swelling is confirmed by observation of rock core.

- **Processing of Lugeon Test Result**

Graphs of depth and Lugeon values for all the existing and new Lugeon tests have to be prepared as shown in Figure 4 for clarification of the relation between depth and permeability, as well as detecting abnormally high permeable zones in deep portions. This will help in evaluating the requirements of any grouting measures required in the foundations of the appurtenant structures.

The occurrence of unconsolidated and loose quaternary deposits such as ABGM, RBGM, Terrace and Morainic deposits at various project structures indicates that such materials may need to be treated for stability of the works and slopes.

5.3.2 Review of Laboratory Testing Data

A total of 10 rock core samples from BH-04 (Power tunnel alignment) have been selected for evaluation of geotechnical parameters for design purpose. A total of 15 samples, i.e., 3 block sample, 3 samples from borrow area, and 9 test pit samples have been selected for investigations. Samples from all Test Pits have been selected by cone and quarter method and different type of tests have been performed to check their engineering properties and confirm their suitability as aggregate material.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- **Petrographic Analysis**

Petrographic Analysis was performed on a total of 05 samples to confirm the mineral assemblage in the particular rock unit. For this purpose, 2 samples were collected through excavation of test pits, 2 samples from different locations were collected during surface geological mapping, and 01 drilling core sample was collected from power tunnel alignment.

Table 5.4 Results of Petrographic Analysis

Sr. No.	Borehole No.	Rock Name	Major Minerals					Minor Minerals					Remarks / Description
			Quartz	K-Feldspar	Oligoclase	Biotite	Amphibole	Magnetite	Chlorite	Epidote	Muscovite	Carbonate	
1	Rock Samples	Foliated Granite	24	18	17	21	1	2	2	6	7	1	ASR Potential exists
2		Granite	32	26	14	6	3	2	4	1	3	3	ASR Potential exists
3		Granodiorite	24	11	20	15	16	2	3	5	2	2	ASR Potential exists
4		Granodiorite	26	12	25	14	11	2	3	3	2	2	ASR Potential exists
5	BH-04	Granitic Gneiss	30	13	28	17	4	1	3	1	2	1	ASR Potential exists

However, as revealed from test results reproduced herein Table 5.4, it is suggested that more petrographic analyses are required on samples collected from various locations of additional investigations. For the assessment of ASR, the limited number of tests are not enough to describe the rock conditions existing in the project area.

- **Direct shear test**

Direct Shear Test is performed on Granitic Gneiss Sample. One sample from BH-04 was selected for Direct Shear Test from depth of 56 to 56.35m. The result shows that cohesion “c” has 0.595 MPa with angle of shear resistance “ϕ” is 21.8 deg. Only one test is insufficient for detail design of a hydropower project. Therefore, it is recommended that more direct shear tests should be performed by EPC Contractor during the detail Design stage at various project structures.

- **Rock Core Modulus**

Rock Core Modulus was determined for 2 core samples and 3 bulk samples. The core samples were of Granitic gneiss rock. The results are reproduced in Table 5.5.

Table 5.5 Results of Rock Core Modulus Determination

Sr. No.	Bore Hole	Location	Depth (m)		Test Results (MPa)		
			From	To	Young's Modulus	Modulus of Deformation	Mode of Failure
1	BH-04	Power Tunnel Alignment	48.0	48.25	$2.29*10^4$	$1.15*10^4$	Axial
2			61.0	61.30	$1.83*10^4$	$9.16*10^3$	Axial
3	Bulk Samples	Passu Area	-	-	$7.52*10^4$	$3.76*10^4$	Diagonal & Axial
4		Powerhouse Area	-	-	$4.16*10^4$	$2.08*10^4$	Diagonal & Axial
5		Slided Mass	-	-	$4.96*10^4$	$1.88*10^4$	Diagonal

It is recommended that more tests are required during detail design stage. EPC Contractor should conduct more tests on samples collected from additional investigations.

- **Point Load Strength Index Test**

Point Load Strength Index test is performed on 3 core samples, one sample of Mylonised Granitic Gneiss and 2 samples of Granitic Gneiss, and 4 bulk samples. The results are reproduced in Table 5.6.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Table 5.6 Results of Point Load Strength Index Test

Sr. No.	Bore Hole No.	Location	Depth (m)		Test Results		
			From	To	Is (Mpa)	Is 50 (Mpa)	Failure
1	BH-04	Power Tunnel Alignment	21.00	21.15	4.04	3.93	Diametrically
2			31.21	31.52	5.39	5.23	Diametrically
3			43.25	43.55	3.14	3.05	Diametrically
4	Bulk Samples	TP-08	-	-	1.81	1.66	Diametrically
5		Passu Area	-	-	4.11	4.30	Diametrically
6		Powerhouse Area	-	-	3.97	4.15	Diametrically
7		Slided Mass	-	-	5.68	5.94	Diametrically

As required, any additional tests may be conducted on the core samples.

- **Uniaxial Compressive Strength Test**

Uniaxial Compressive Strength test is performed on 3 rock core samples of Granitic Gneiss, 3 samples from Test Pits and 3 Bulk samples from borrow areas. The results are reproduced in Table 5.7.

Table 5.7 Results of Uniaxial Compressive Strength Test

Sr. No.	Bore Hole / Test Pits	Location	Depth (m)		Test Results	
			From	To	UCS (MPa)	Failure Mode
1	BH-04	Power Tunnel Alignment	38.14	38.43	49.2	Diagonal
2			56.00	56.39	45.2	Diagonal
3			68.00	68.23	38.5	Diagonal
4	TP-7	Slided Mass (Left side)	-	-	52.40	Diagonal
5	TP-8	Slided Mass (Right side)	-	-	71.91	Diagonal
6	TP-9	Slided Mass (Right side)	-	-	34.63	Diagonal
7	-	Passu Area	-	-	47	Diagonal
8	-	P/H Area	-	-	88	Diagonal & Axial
9	-	Slided Mass	-	-	59	Diagonal & Axial

Core samples are from only one borehole and all samples are of same lithology. More sampling and testing is required for the better assessment of results and prediction of actual rockmass conditions prevailing in the project area during the detail design stage.

- **Indirect Tensile Strength Test**

Indirect Tensile Strength test is performed on Granitic Gneiss rock. (ITS) Test has been carried out on core samples collected from BH-04, at depth from 43.25 to 43.55m. The (ITS) Test is mostly estimated as 10 to 15% of Uniaxial Compressive Strength (UCS). The labortory test value is 6.46 MPa which indicates that rock is moderately hard.

- **Hoek Triaxial Compressive Strength Test**

Hoek Triaxial Compressive Strength test is performed on 2 rock core samples of Granitic Gneiss. The values of cohesion “C” and angle of internal friction “Ø” calculated by (HTCS) Test, indicates that the shear strength of the rock core samples is low to moderate. The results are reproduced in Table 5.8.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Table 5.8 Results of Hoek Triaxial Compressive Strength Test

Sr. No.	Borehole No.	Depth		Cohesion "C" MPa	Angle (Ø) deg.
		From	To		
1	BH-04	52.60	53.00	2.18	27.749
2		63.00	63.35	0.60	15.543

The review of laboratory testing data revealed following.

- The number of test performed on rock samples are not adequate
- Rock samples collected from only 01 borehole i.e., BH-04 is not truly representing the sub surface engineering properties of rocks for whole of the project area
- Test results obtained from rock and soil samples are limited and presenting unexpected variations.
- In case of direct shear test only one sample is not enough to describe the Cohesion and Shear resistance values of a rock type furthermore this test should be performed on all types of rock units existing is the project area.
- The number of test performed are not enough to describe Young Modulus and Modulus of Deformation. The testing should be performed on samples of all rock types.
- For UCS test core samples are from only one borehole and all samples are of same rock type i.e., Granitic Gneiss. Adequate number of tests/ samples and testing is required for the better assessment of results and prediction of actual rockmass conditions prevailing in project area.
- Direct shear test and Uniaxial compressive strength test is performed on the sample taken from the same depth of same borehole (56-56.35m)
- Property Index tests (NMC, Specific Gravity, Porosity, Dry Density, Water absorption) are performed on the samples on which rockmass testing is already performed.

Considering the previously available data, and the project requirement, the subsurface deep investigation and refining/ conforming the information plenty of standardized laboratory testing of site specific rock samples is essentially required by the EPC Contractor for the assessment of rockmass parameters for detailed design.

5.4 ADDITIONALLY PROPOSED FIELD AND LABORATORY INVESTIGATIONS

Apart from this limitation of previous stage, for detail design by the EPC Contractor shall require drill holes at the sites of missing structures as well as to drill additional holes at already investigated sites for refining/ conforming the information for use in EPC design. Considering the previously available data, and the project nature, the deep subsurface investigations vertical and inclined both are essentially required by the EPC Contractor for the detailed design. It is recommended to perform the additional geotechnical investigations following the terrain characterization of the project area and prior to the finalization of the project layout plan.

In order to complete the set of data obtained from the ground surveys drilling of some additional boreholes to evaluate the geotechnical and geological conditions at the project components are recommended for Detail design studies by EPC Contractor. These boreholes should be located on the right bank of the weir where no previous borehole present, water intake, surge tank and penstock alignment, in the present powerhouse location (can be used for tailrace structure) and new proposed location of powerhouse.

The locations of the proposed boreholes is given in Table 5.9 and shown in Figure 5.4 and Figure 5.5. This proposal is subject to finalization of project layout during detail design studies.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Table 5.9 Coordinates and Locations of Proposed Boreholes for Detail Design

Sr. No	Borehole	Northing	Easting	Depth (m)	Location
1	BH-7	4018180	484021	60	Weir Site (Right abutment)
2	BH-8	4017758	484168	90	Power Intake
3	BH-9	4017615	481944	70	Surge Tank
4	BH-10	4017720	481859	80	Penstock
5	BH-11	4017836	481762	60	Proposed Power House Area
6	BH-12	4017961	481648	60	Power House Area

It is proposed to perform laboratory tests in order to define the grain size, permeability and grain size of the slopewash material during the opening of the borehole on the right bank of the weir location.

Lugeon tets should be done during the drilling of boreholes in the intake and surge tank. Also UCS with elastic moduli, unit weight, porosity, point load, UCS and triaxial tests should be perfomed on samples taken from these boreholes.

Menard pressuremeter test is proposed in the location of the penstock and powerhouse.

5.5 REVIEW OF FOUNDATION EVALUATION

The available documentation reviewed in this regard includes in-situ foundation evaluation as reported under Sub-Section 5.11and further foundation treatments and specific considerations under Sub-Section 10.11, both from Volume-I: Main Report of the Feasibility Study 2021. The FEM models and concept have also been presented in figures as included in Volume-VII: Appendices to the Feasibility Study. Additionally, the project drawings from Volume-II studied for the review include the surface geological cross section of weir and under sluice area as shown in drawing AFS-GE-313 along with the arrangement, plan, cross-section and longitudinal section of these structures as presented in Feasibility study 2021 drawings AFS-GE-408 to AFS-GE-411.

5.5.1 Review Findings

The following aspects have been noted from the available documentation:

- **Weir and Under sluice Area**

- BH-1, BH-2 and BH-3 drilled in the slided mass at the location of these structures show that the underlying strata consists of loose, highly pervious ABGM (slided mass), having large size boulders and cavities with no rock till the depth of 90m.
- The foundation of weir is proposed to be laid on this slided mass after foundation treatment.
- It is recommended in Feasibility study to replace a maximum of 14m deep slided mass material with stabilized soil layer as weir foundation treatment.
- Silty clay hauled from the powerhouse area mixed with 2% cement will be placed as foundation material under 60m wide weir.
- Moreover, 2 cutoff walls were also proposed beneath the main structure of the weir and under sluices.
- Permeability of weir area is very high as BH-01 drilling is showing 100% water loss and water head was not maintained/built during the permeability test.
- Geological rock units with which weir has to be abut, includes granodiorite, intruded by pegmatite veins at right side. On left side, weir has to be abut with ABGM formed by slided mass (DWG No: AFS-GE-297 & 298). This statement given in section 5.12 of Attabad Lake HPP Main Feasibility Report is contradictory to the geological maps and geological cross sections.

- **Intake**

- Surface geological section of intake is presented in drawing AFS-GE-314. It is proposed to be excavated in the granodiorite rock which is strong to moderately strong. Granodiorite rock is exposed at steep angle where it is hard, massive, strong to moderately strong, and sparsely to moderately jointed. But at higher elevation, the rock is highly jointed and sheared, having vertical open joints which must be treated for stability and safety.(DWG No: AFS-GE-295 & 298). Intake area slopes alongwith Tunnel Portal slopes stability analysis was not conducted during the Feasibility study.

- **Power tunnel**

- Geological cross-section of power tunnel is missing from the Volume: II Drawings.
- It is proposed to be excavated through grandiorite with subordinate Granitic gneiss.
- BH-4 shows that the rock has high RQD values with low permeability which seems good for tunnel excavation.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- Data obtained during the feasibility study for tunnel design is not upto the mark for the safe design of the Power Tunnel.

- **Surge Tank**

- It is proposed in moderately hard, highly jointed and sheared granitic gneiss rock.
- Borehole location map AFS-GE-316 shows that no borehole has been drilled at the proposed location.

- **Penstock**

- The Penstock will be supported by piers according to Section 5 “Geology and Geotechnical Studies” whereas according to Section 15 “Construction Planning” the penstock will be laid over concrete in the excavated trench. Moreover, in the “Penstock Plan and Longitudinal Profile” DWG NO. AFS-ST-430, piers and its foundations cannot be observed instead anchor blocks can be observed at the joints.
- The foundation of piers is proposed to be laid on overburden material (sandy gravel and boulder) after removal of clayey silt.

- **Powerhouse**

- The powerhouse layout, plan, cross-section and longitudinal section are presented in Dwg. No. AFS-PH-(431, 432, 435 and 436) respectively.
- BH-05 and BH-06 had been drilled in the proposed power house area. According to the field log BH-05 detects boulders and gravel material at a depth of 30 m whereas BH-06 detects similar material at a depth of 15 m.
- It is proposed to remove the whole thickness of clayey silt layer due to high swelling potential and then lay the foundation of powerhouse on gravels and boulders.

- **Cofferdam**

- The layout and cross-section of coffer dam are provided in drawing AFS-WE-412 and AFS-WE-413.
- The staged construction sequence of cofferdam will comprise the construction of upstream coffer dam along with under sluice channel in stage-I, afterwards, Stage-II cofferdam will be constructed on the upstream of weir site till the completion of weir construction. Diversion flood is selected as 1750 cumecs corresponding to 20-year return period.
- Coffer dam is proposed to be made of silty sand, sandy silt and gravelly sand available at river bed and slided mass. The large boulders present in the slided mass are proposed as riprap material. The foundation of coffer dam will consist of impervious cutoff off provided by intersecting columns of jet grouting.

5.5.2 Technical Considerations for Foundations

The following aspects necessitate specific technical considerations regarding foundations of the project structures as described above:

- **Weir and Under sluice Area**

- The longitudinal sections shown in drawing AFS-GE-410 are not clearly consistent with the cross-sections shown in drawing AFS-GE-411, in depicting the proposed treatment of stabilized clay blanket and the depth of cutoff walls. The concept proposed and indicated through the Figures 2.11 and 2.17 along with the respective FEM Models for analysis as shown in Figures 2.12 and 2.18 are also in contrast with the drawings.
- The specific properties of silty clay material from the powerhouse area in-situ and treated have not been lab tested for comparative assessment of utility. Tests like dispersion,

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

swelling, shrinkage shear test parameters etc. must be evaluated prior to a recommendation of such a proposal.

- The strata at the weir location seems very critical due to presence of loose ABGM, therefore any excavation through large boulders seems impractical and likely to slide at or during the time of execution.
- Secondly, the clayey blanket is proposed to be placed on the highly pervious and loose slided mass. As clay is always placed in the form of thin compacted layers. The placing and compaction of clay on the slided mass material also seems hazardous and impractical as finer material particles of the clay have the potential to migrate or erode in absence of adequate filters over its foundation. The presence of large cavities further complicates this issue.
- Structural stability of the weir has not been addressed to evaluate its safety in bearing, sliding and overturning scenarios.
- The type of cutoff wall is not finalized rather both options of cement slurry and plastic piles have been indicated. The equipment requirements, execution methodologies and material specifications for each of these options are different and necessitate specific deliberations in context.
- The slide slopes are proposed to be stabilized through benching which seems impractical in such loose material having boulders as large as 25m. The estimated volume and extents of the excavation has the potential to increase considerably out-of-proportion. Due to the critical nature of strata, the excavation is hazardous and attempts to excavate may possibly trigger further land sliding. Moreover, the care and handling of excavation equipment in such area is not feasible.

- **Intake**

- Since, no borehole is drilled at this site so it needs further subsurface investigations.
- It is also reported that the rocks at higher elevation are highly jointed and sheared having vertical open joints which needs to be analyzed and treated for safety and stability.

- **Power Tunnel**

- It is mentioned in Volume-I, the rocks at end of the tunnel are highly sheared and the rock units are crushed which needs to be analyzed and evaluated for the stability of the proposed power tunnel.

- **Surge Tank**

- Surge Tank Plan and Section DWG No. AFS-ST-428 Section A-A shows that Surge Tank is almost 61 meters embedded below the NSL. Due to absence of investigative boreholes the subsurface strata are unknown at this location. Subsurface investigations shall be conducted before evaluating the stability of Surge Tank structure.

- **Penstock**

- Section 5 “Geology and Geotechnical Studies” contradicts with DWG NO. AFS-ST-430 “Penstock Plan and Longitudinal Profile” as piers are proposed to support the Penstock alignment in prior whereas anchor blocks can be observed in later.
- Subsurface investigations along he proposed Penstock length are important for analysis.

- **Powerhouse**

- The underlying strata of powerhouse consists of clayey silt material followed by sandy gravels and boulders. The layers of deposited material may vary as the field logs show different depth of clayey silt material.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- Cross Section for Powerhouse DWG. AFS-PH-435 shows the depth of the base of the Powerhouse 16 m below the natural surface level. Removal of the whole thickness of clayey silt layer thereby also implies depths greater than the powerhouse base.
- No further details related to powerhouse foundation have been specified in the feasibility report. As such the complete removal of the cover layer (clayey silt) and the proposed foundations for the powerhouse require re-consideration in terms of further clarity.

- **Cofferdam**

- It is reported in the feasibility study that the coffer dam will be constructed for 2-year period but the stability and protection of cofferdam in such slide prone area is not considered in feasibility study. Further, the provision of grouting columns in the slided mass material seems impractical due to presence of large cavities. Also, the quantification of material available at the indicated sites for the construction of dam body is not specified.

5.5.3 Recommendations for Foundation Evaluations

- **Weir**

- The EPC Contractor shall perform the detailed engineering geological mapping during detail design stage with a scale of 1:500 to capture the ground information for safely hosting the weir. Moreover, additional geological and geohazard studies shall also be carried out focusing geomechanical properties, terrain characterization and rockmass categorization.
- Additional design stage geotechnical investigations should be performed by EPC Contractor on both left and right abutments and also into the middle part of the Weir foundation/gabion mattress.
- Permeability tests in soil and rock, collection of samples from overburden strata and rock coring for appropriate laboratory testing, must be done for these boreholes.
- A comprehensive cut slope stability analysis should be performed by the EPC Contractor for detailed design of cut slopes in both soil and rock conditions. Suitable slope stability measures shall be then adopted according to the results of analyses including shotcrete, wiremesh, and rock bolts etc.
- Permeability parameters for seepage analysis must be evaluated for near to actual depiction of site conditions in numerical model so that seepage control measures can be adopted. This shall be done by means of appropriate geotechnical investigations and permeability testing in river bed by EPC Contractor.

- **Intake**

- Accurate location of the Intake shall be finalized after terrain characterization and geohazard studies
- Scanline survey and geomechanical properties of the rockmass shall be evaluated by the EPC Contractor during the detailed design stage.
- For stability assessment and detailed design of cut slopes, appropriate geotechnical investigations shall be performed by EPC Contractor at the location of Intake.
- Specialized laboratory testing for evaluating relevant shear strength constitutive model for stability analysis and Uniaxial Compressive Strength (UCS) tests
- Detailed design of bedrock slopes, cut slopes and tunnel portals/ intake area shall be prepared by the EPC Contractor. Selection of type/ layout of protection/ stabilization Measures shall also be prepared by the EPC Contractor.

- **Power Tunnel**

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- The EPC contractor should perform the geologic mapping during detail design stage with a scale of 1:500 along the power tunnel alignment corridor to capture the ground information. Moreover, additional geological and geohazard studies shall also be carried out focusing geomechanical properties, terrain characterization and rockmass categorization.
- Accurate alignment of the tunnel should be finalized after terrain characterization, geological and geohazard studies
- Scanline survey and geomechanical properties of the rockmass shall be evaluated by the EPC Contractor during the tunnel alignment mapping in detailed design stage
- Appropriate geotechnical investigations with vertical and inclined boreholes shall be conducted during the tunnel design.
- Laboratory testing of selected samples should be conducted for evaluating the relevant geotechnical parameters.
- Detailed discontinuity survey/Scanline survey is required across the tunnel alignment for the assessment of rock quality.
- Assessment of rock quality is required by the empirical methods like Rock Mass Rating and Q-Method and evaluate the support across the power tunnel alignment.
- Support of power tunnel alignment is required to check through numerical modeling in computer programs.

- **Surge tank and Penstock**

- The EPC Contractor should perform the geologic mapping during the detail design stage with a scale of 1:500 along the Surge Tank and Penstock alignment to capture the ground information. Moreover, additional geological and geohazard studies shall also be carried out focusing geomechanical properties, terrain characterization and rockmass categorization.
- Any alternations/ adjustments in the locations of Surge Tank and Penstock alignment shall be finalized after terrain characterization and geohazard studies
- Piers will support the penstock alignment, as proposed. In this section, the piers are laid down on overburden material and the presence of clayey silt may create problem and might be excavated prior to establish the foundation for piers.
- Appropriate confirmatory geotechnical investigations shall be performed by EPC Contractor for Surge Tank and Penstock location to assess the strength and other geotechnical parameters of soil and rock.
- For Surge tank Structure, detailed foundation design analysis is required for checking the stability.
- Slope stability analysis is required for the slopes of Surge tank proposed area.

- **Powerhouse and Tailrace Channel**

- The EPC Contractor shall perform the geologic mapping during the detail design stage with a scale of 1:500 in power house area to capture the ground information. Moreover, additional geological and geohazard studies shall also be carried out focusing terrain characterization.
- More refinements, in the proposed and optional locations of Power house should be considered after detailed terrain characterization, geohazard studies and on the basis of the Design stage Investigations if required.
- Appropriate geotechnical investigations and laboratory testing is required for the determination of geotechnical parameters.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- Detail foundation design analysis are required during the detailed design stage by the EPC Contractor.

5.6 REVIEW OF CONSTRUCTION MATERIAL STUDIES

Appropriate selection of the material sources for construction of a project put major impacts on its durability, performance, cost and quality. In the context, a systematic investigation will be required to identify suitable sources for various construction materials. Sources of construction materials will be identified and confirmed for its suitability as per project requirements in the closest vicinity of the project to save time and cost.

Feasibility studies of the proposed hydro power project was carried out in June 2021. Construction materials study conducted during the Feasibility stage including test pit logs and laboratory test results etc. are reviewed and found generic and lacking in many aspects.

5.6.1 General Review

- Quantification of construction material suitable sources is not done. It is very important to quantify the suitable sources with respect to the material requirement in the project.
- For qualitative analysis, few mandatory tests for finalization of the suitability of construction materials are missing which are mentioned below in material specific review comments.
- To conclude whether any source has ASR potential, accelerated mortar bar test (ASTM C1260) along with Petrographic examination (ASTM C295) should be done.
- No established rock quarries in the vicinity are studied in this report. Neither any information regarding available established rock quarries is documented. Previous studies of the materials utilized in the construction of three tunnels (left bank of Attabad Lake) can also be useful for the current project.
- For cement, steel, bitumen, concrete admixtures and others manufactured materials, general information is given in the report. Specific studies related to the availability of production of cement types, steel grades-wise and others, are missing in the report and is recommended to be carried out before the preparation of BOQs.
- Attabad Lake itself is the biggest possible source of mixing water used in concrete, which is also not investigated through detailed testing in accordance with ASTM C1602, in this report.
- Fill material requires more investigation and testing to check and finalize the sources. Selection of fill material keeping in view the permeability requirement with respect to each component, is of significant importance. To prevent from seepage, different soil types are required and should be studied separately and sources should be located accordingly in the closest vicinity.
- At least one location map should be prepared showing all the construction material sources discussed in the relevant section.

5.6.2 Material Specific Review

- **Fine Aggregate**

Refer section 7.2.1 of the Feasibility report. One sand quarry with only one test pit (TP-1) is studied at Feasibility stage. This is a river bed quarry located in the tail of Attabad Lake. Quantification was not done. Petrography was also not done. Without doing petrographic test, Alkali Silica Reaction potential cannot be concluded. Sieve analysis was done showing percentage of Sand, Silt and Gravel (USCS classification). No fineness modulus was mentioned which is a mandatory requirement for sand size confirmation. Gradation analysis was given in the form of graph and sieve analysis

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

details was not given. Soundness test and other deleterious tests (guidelines of ASTM C33) are also missing in the Feasibility Report.

- **Silt and Clay Quarry**

Refer section 7.2.2 of the feasibility report, 3 test pits were done to analyze the fill materials availability in the project area. TP-2 & TP-3 were done in helipad/powerhouse area and TP-10 near Kiln area, near Ganesh Bridge. These natural soils were not classified as per fill material type requirement. Quantification was also not done.

- **Coarse Aggregate**

Refer section 7.3 of the feasibility report, three sources (Slided mass, power house area/river bed and Passu areas) were selected and sampling and testing were carried out accordingly during Feasibility stage for coarse aggregate. Quantification is not done for above three sources.

Passu area quarry is located 35 km upstream of Attabad Lake near Passu village. Rock is marble and have economic importance and generally not permitted to be used as coarse aggregate for concrete (need to check the laws of mineral department, Govt. of Gilgit Baltistan). Petrographic result shows no ASR potential. Remaining two exhibit ASR and cannot be used with ordinary Portland cement. Both sources have significant quantity of fine materials which are not noted. More than 20% deleterious quartz as indicate in their respective petrographic examination make it highly susceptible to ASR potential. Slided Mass (TP-7) shows higher Loss Angeles Abrasion and cannot be used as coarse aggregate in concrete.

5.6.3 Recommendation for Construction Material Studies

- Missing testing is recommended for Fine Aggregate to be done with more samples collection from the source to finalize the suitability of the said source. New sand quarries are also recommended to be located for fine aggregate utilization in the project.
- It is recommended to classify silt and clay soils as per ASTM soil classification system.
- As already discussed, that established rock quarries should be studied and documented accordingly. More rock quarries in the vicinity are recommended to be investigated to finalize the suitability of the coarse aggregate.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

6 REVIEW OF NEOTECTONICS STUDY AND SEISMIC HAZARD ANALYSIS

6.1 GENERAL

A review of the available report/data related to seismological studies was carried out, the following report/data have been reviewed in this regard;

- "Feasibility Report-2021, Volume-IV, Neotectonic and Seismic Hazard Analysis, Attabad Lake Hydropower Project, WAPDA".
- Additional data via email dated September 22, 2022 titled "Attabad HPP: Data requirement for Review of Neotectonics & Seismic Hazard Study".
- Letter with additional data titled "Attabad LHPP-clarification regarding review of Seismic Hazard Study dated October 11, 2022".

6.2 REVIEW FINDINGS

On the basis of review of the above mentioned reports/additional data, the findings are as under;

- As a part of Feasibility Study (2021), the seismic hazard evaluation was carried out for selecting the seismic design parameters. The following seismic design parameters were recommended;
  i. Safety Evaluation Earthquake (SEE) = 0.44g for Dam/Weir & 0.38g for Spillway
  ii. Operating Basis Earthquake (OBE)= 0.24g

Overall the work done (seismic design parameters) during feasibility stage needs to update/finalize before or during Detail Design stage due to the following reasons;

- No Ground Motion Prediction Equation (GMPE) for the deep seismic source zone (Hindukush) is used in calculation of seismic design parameters.
- Above mentioned selected seismic design parameters should be comparable with the findings of PSHA (Total Hazard Curves, Response Spectra) and/or DSHA (Table 6.2-1 & 6.2-2 of Feasibility Study).

6.3 RECOMMENDATIONS

It is recommended to carry out following surveys/studies before or during Detail Design stage;

- Detailed site specific seismic hazard assessment should have been conducted to authenticate & finalized the seismic design parameters.
- Geologic mapping of faults is also recommended, specifically to confirm the local faults as mentioned in the report.
- Necessary geophysical surveys in support of seismic hazard assessment, where required.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

7 REVIEW OF PROJECT LAYOUT STUDIES

7.1 GENERAL

Two alternate layouts were studied at Feasibility stage 2021. One was with project components on left bank and one on right bank. A comparative study was done at Feasibility stage for these alternates. Both studies alternates are described in following sections.

7.2 ALTERNATIVE-I: PROJECT LAYOUT ON THE LEFT BANK

In the Feasibility study, it is stated that the left bank alternative with Weir and Under sluices, 2.3 km headrace tunnel, surge tank, embedded penstock and a surface power house is favorable alternate and considered suitable to propose a Project. Review of Feasibility study implies that selecting the left bank option is a legitimate decision in terms of topographic conditions and ease of access.

7.3 ALTERNATIVE-II: PROJECT LAYOUT ON THE RIGHT BANK

Alternative-II, which is the right bank option, is a less favorable option for Attabad Lake HPP in terms of access, stability of slopes, and ease of construction and same assessment was done during Feasibility study.

The water intake structure planned in alternative-II is far away from the Weir body. For this reason, it is not possible to flush the sediment that will be deposited in front of the intake.

7.4 SELECTED LAYOUT AT FEASIBILITY STAGE 2021

The project layout studies were refined during Feasibility study after selection of left bank alternate and further following two alternates were studied on left bank option in detail.

a. Alternate-1A, Headrace Tunnel Option.
b. Alternate-1B, Headrace with Embedded Pressure Pipe.

The selection of the Project Layout (Alternative-I A) on the left bank with identified weir site, 2.3 km long headrace tunnel, 550 m embedded penstock and surface powerhouse in the Feasibility study was more beneficial layout plan for this project in terms of geology, cost/kWh for design discharge, ease of construction and technical reasons.

The selected Project Layout (Alternative-I A) from Feasibility study is reproduced in Figure 7.1.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

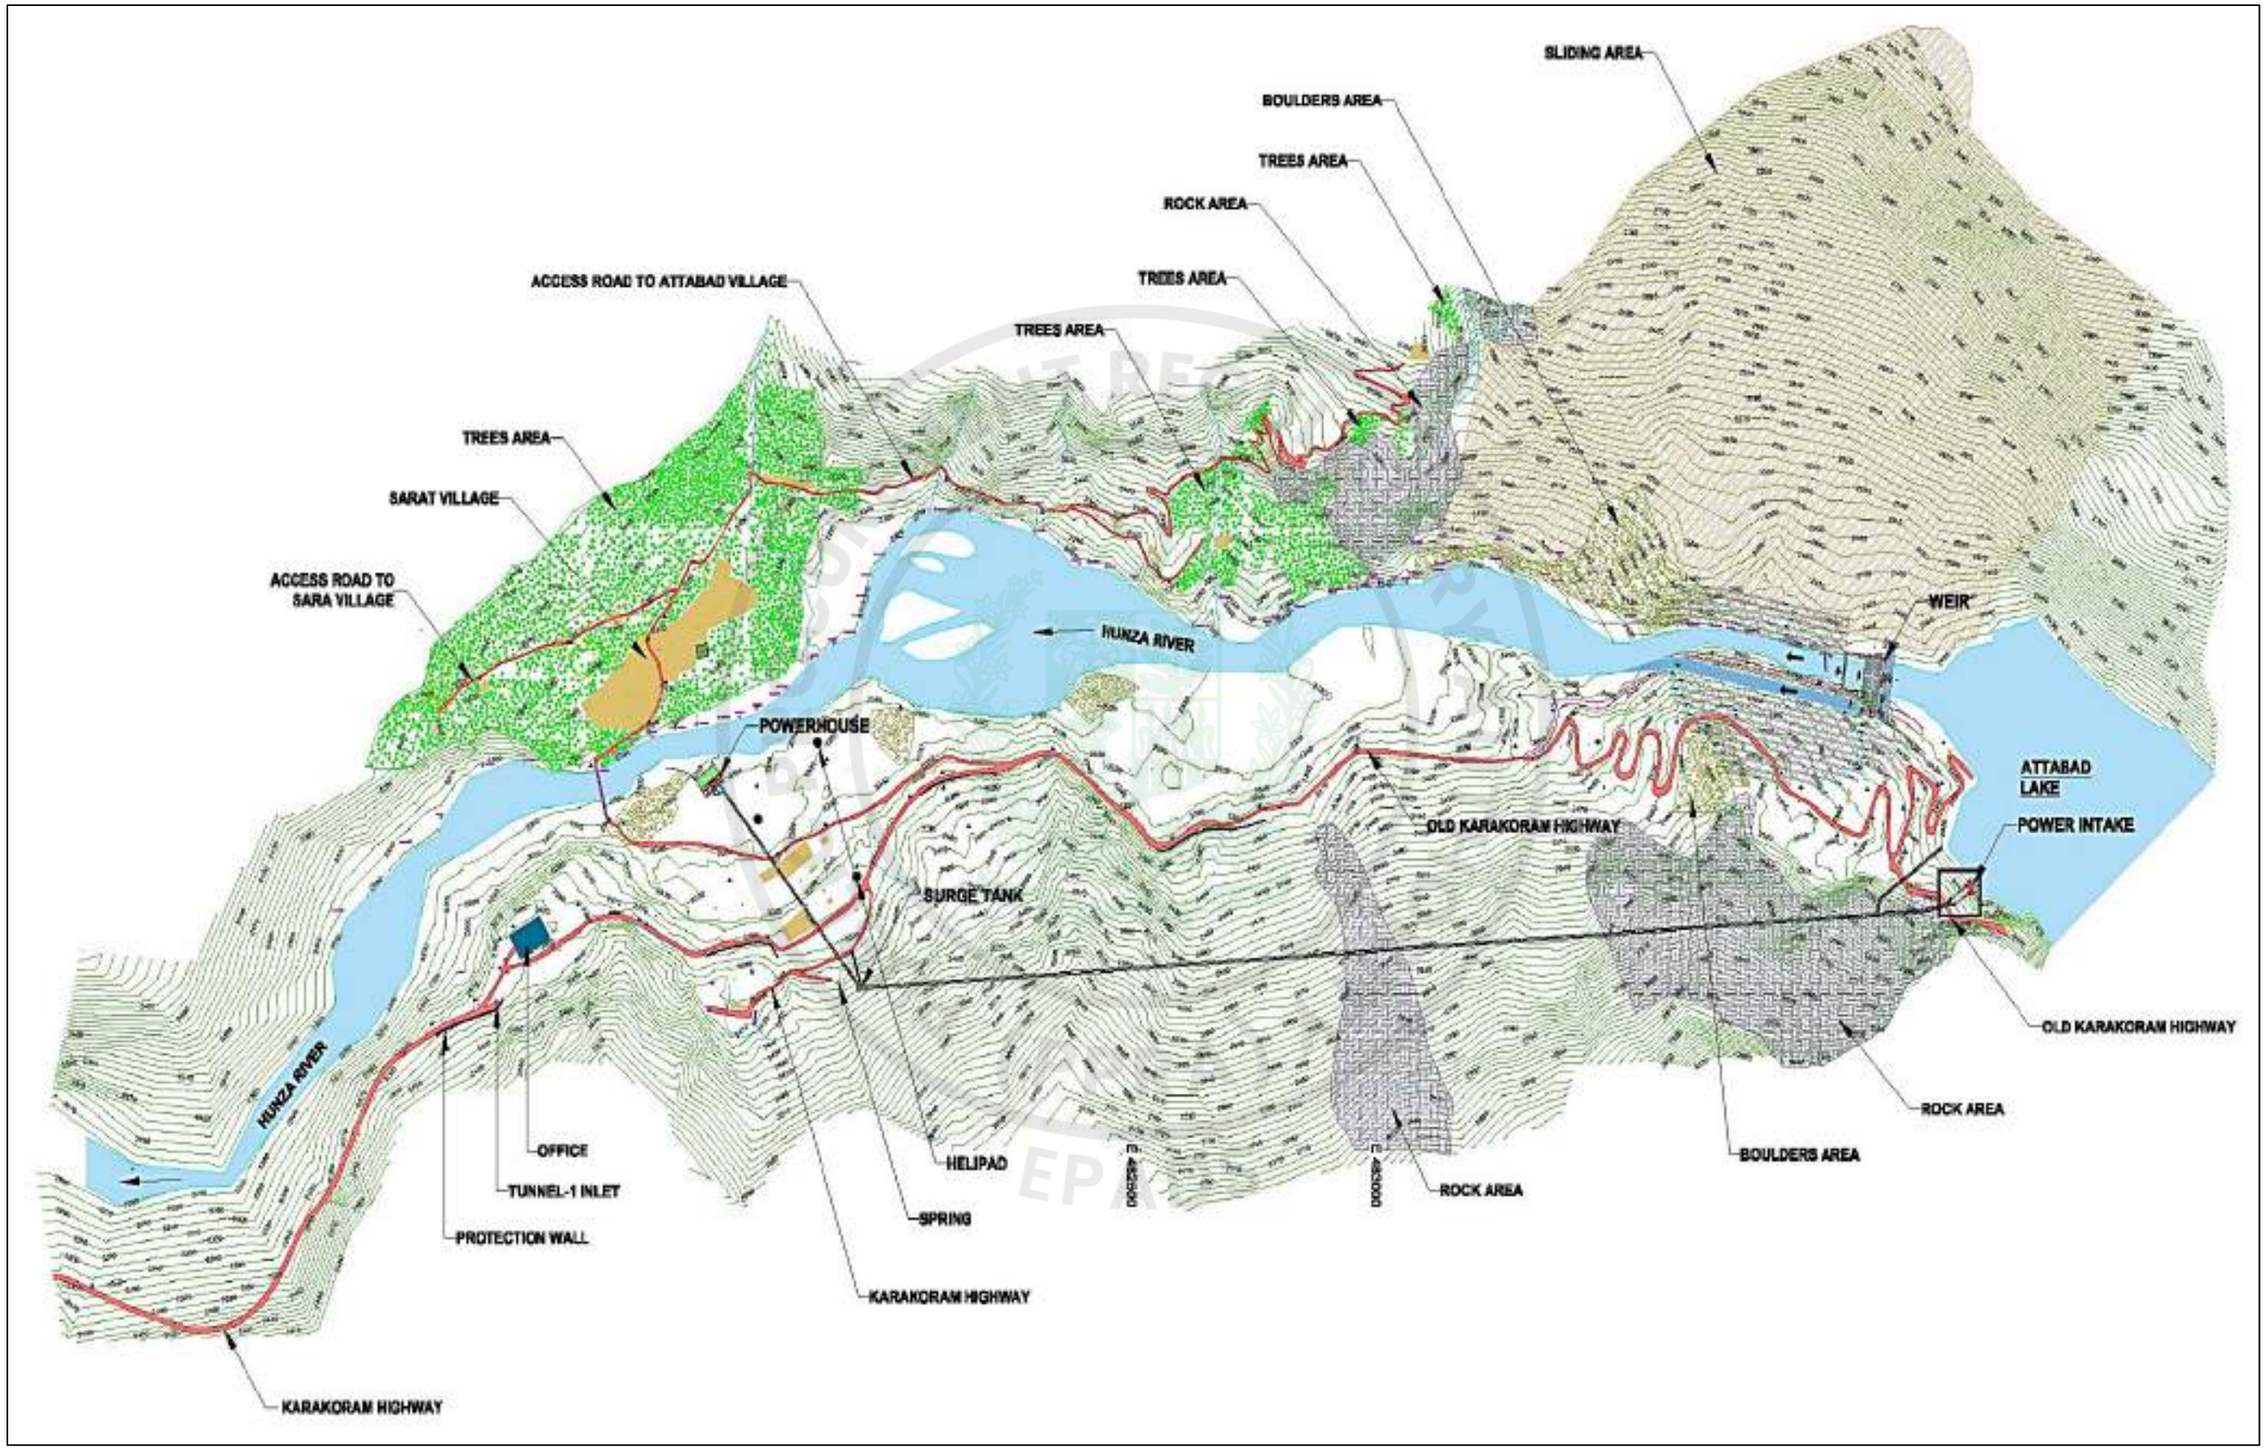

Figure 7.1: Feasibility stage Project Layout Alternative-1A

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

7.5 PROJECT LAYOUT STUDIES AT REVIEW STAGE

The natural Dam created due to landslide resulted in formation of a Lake behind it at Attabad. It not only possess a threat but at the same time an opportunity for making use of the head due to this Earthen Dam. Due to lake formation, there is potential drop of more than 100 m in 2.5 km river reach. The mean annual flow of Hunza River at Attabad Lake is 204 m^3/s. The Project Layout is to be configured considering the power demand and demand pattern of regional grid. Attabad Lake storage can be used for daily peaking. A design discharge with peaking storage facility is to be selected to generate the installed capacity 95% time of the year in peak hours. From the available flow data and estimated flow series at Project Area, a discharge of 60 m^3/s has been taken as design discharge.

The Management Consultants have carried out comprehensive review of Project layout and have thoroughly reviewed the technical aspects of all Project components proposed for the Feasibility study 2021 Alternate-I A. Reconnaissance site visit was also conducted to get acquainted with the proposed sites and to give recommendations for EPC Contractor detail design.

7.5.1 Site Visit Observations and Feasibility Review Findings for Project Layout

Following sections describe the site visit observations of proposed sites of project components. These site observations are supported by Review findings of Feasibility study 2021.

- **Weir / Spillway and Under Sluice Area**

The slided mound area proposed for the main Weir / Spillway and Under Sluice structures was visited. Landslide material was observed on both banks. Feasibility stage Geotechnical Investigations in this area did not report the bedrock even as deep as 90 m. The overburden was reported to comprise of ABGM of slide mass (in BH-01 and BH-02) or sandy gravels (in BH-03). Although the description may also vary as gravels, cobbles and boulders embedded in silty sandy matrix of mix origin, the physical presence and extent of this strata especially the boulders was realized with this site visit. Excavation for abutments and foundations is risky under such conditions and might be in higher volumes than proposed in Feasibility.

Feasibility stage Weir and Under Sluices layout and longitudinal section is reproduced in Figure 7.2 and Figure 7.3.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Although, the location of the crest of the proposed Weir and the approach channel were visible, the spillway chute area was inaccessible due to collapse of a portion of the track that runs along the edge of the spillway excavated by FWO. This only reinforces the need for stabilizing the embankment, particularly, in the region of proposed weir.

Weir and Under sluices area needs special care on foundation treatment and seepage under the structures as well as through the banks / abutments. Specific considerations in this regard include the requirement and effectiveness of measures to be adopted for seepage control, practicality of the methods to be utilized for required excavations in slopes and foundations, measures required for stabilizing and / or reinforcing the required excavations, along with the equipment mobilization and installation constraints. Construction of piles / seepage cutoff proposed in Feasibility might be difficult due to presence of boulders. Bentonite mixtures for excavation stability might also be ineffective. Concrete diaphragm or sheet piles will also be difficult. For these reasons, MC initial proposal for ensuring the stability and the seepage of the Weir site is the consolidation grouting using sand mixed grouting with hardening accelerating admixtures. The depth and pattern of the consolidation grouting to be defined in the next design stage (by EPC Contactor).

River bed also needs stabilization to avoid differential settlements of the proposed gated structures. The variability of slide material along with large size boulders present in the slide mass also necessitate a sensitivity / back analysis for justification of the geotechnical parameters to be considered.

The slow erosion of fines from the slide mass from both sides, in contact with the flowing waters of the river was another point of concern. The muddy water was observed due to migration of fines on edges reflected inherent instability of the loose mass to an extent which was alarming while considering this stratum for founding the sensitive structures with hydro-mechanical fixtures like gates, slots etc.

Some of the photographs of Feasibility stage proposed Weir and Under sluices site as taken during reconnaissance site visit are shown in Figure 7.4 through Figure 7.10.

Figure 7.10: Left Abutment, Fresh Slide area and completely damaged walkway / path towards chute area

- **Intake Area**

The intake area is inaccessible except by boat. The intake appears to be located in relatively sound rock (as good as any seen in the area) and the location is geologically appropriate. However, its construction should pose significant challenge. It is anticipated that there are likely to be structural issues regarding the design of coffer dam and the access chamber for intake gate, trash racks and stop logs. Further, the Hydrology, Sedimentation and Hydraulic

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

model data is being reviewed to assess these structural issues. Photograph of Feasibility stage proposed Intake site as taken during reconnaissance site visit is shown in Figure 7.11.

Figure 7.11: Intake Area view from Upstream of Weir, Sound Rock Exposed

- **Power Tunnel and Surge Shaft Area**

Geology of Power Tunnel and Surge Shaft area seems appropriate with Granitic Gneiss as also presented in the surface geological maps from Feasibility. The location of surge shaft was flagged to assist in visualizing the alignment of the Penstock to the Powerhouse. The access to surge shaft and headrace tunnel can approached through old KKH.

Four (04) highway tunnels exist in the general area in which the Power Tunnel is to be constructed, so its construction might not pose any problem. The details for the existing highway tunnels of KKH, i.e. the actual alignments marked on plan and profile, the geological mapping information during their construction phase, etc were requested by MC to Client to support and validate geological conditions along the proposed Tunnel. Client arranged construction and as-built drawings of these existing KKH tunnels with alignment, profile and geological data. These support documents were studied by MC to validate the alignment and geological conditions.

The closest part of the headrace scheme to the KKH Tunnel is at surge tank. At this point, the surge tank bottom elevation is 2385 m, whereas the KKH tunnel invert elevation is 2376 m. The perpendicular distance between the outer walls of the structures is 65 m. Since the geological formation is defined as moderately weathered gneiss in the as-built drawings of the KKH tunnel, the interaction between the structures is regarded as safe.

The measures to be taken at the fault zone that is assumed to be present at the middle section of tunnel during site visit which the low pressure tunnel is passing through shall be clarified and incorporated in the tender design. On the other hand, the as-built drawing of KKH tunnel no 2 states that the section that is parallel to the low pressure headrace tunnel is completely in moderately weathered gneiss and a fault zone is not mentioned.

Photograph of Feasibility stage proposed Surge shaft site as taken during reconnaissance site visit is shown in Figure 7.12.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Figure 7.12: Flagged Surge shaft Area, Sheared and Jointed Rock Exposed

- **Penstock**

A single Penstock leads from the surge shaft to the Powerhouse in the feasibility study proposed by WAPDA. Except for the upper reach, the proposed Penstock alignment traverses through relatively easy terrain

In the upper reach, there may be some slope stability issues, although, it appears that the rock line is near the ground surface. Further towards lower elevations, the rock line appears to recede away from the natural ground with fine material on surface with sand and gravel lenses.

It is proposed to drill two boreholes under the anchor blocks in order to have information to be used for the design of anchor blocks. These boreholes can be used also for the powerhouse.

- **Powerhouse Area**

The Powerhouse, as proposed in the Feasibility report, is located on flat terrace along left bank of Hunza River. The site was flagged and marked so it could be identified clearly quite adjacent to the left bank of the river Hunza.

It looks as if rock may not be available under the Powerhouse footprint. However, the area looks satisfactory for construction of the Powerhouse and other appurtenant structures. There also appears to be no slope stability issues at the proposed site.

Photographs of Feasibility stage proposed Powerhouse site as taken during reconnaissance site visit are shown in Figure 7.13 and Figure 7.14.

7.5.2 Proposal for Detail Design Regarding Project Layout

A modification in Feasibility stage Alternative-I A layout is proposed by MC based on described review findings and site visit observations. The layout modified by MC is “Modified Alternate-I A” and is presented in figure 7.15. The modifications are to be checked for technical and economic viability during Detail design stage by EPC Contractor. Following are components of this proposal and recommendations for Detail Design are also given.

- **Weir Body**

The naturally formed Attabad Lake dam body due to the landslide has been surviving since 2010. The prevailing scenario of overflow indicates that existing conditions are naturally stabilized. Attempts to excavate side slopes for enlarging the area and/or deepening to place structural foundations has the potential to destabilize the present in-situ conditions. Keeping this fact in mind, MC is proposing to utilize the naturally formed dam body in order to minimize the total cost of the project and to avoid aggravating any further potential geotechnical problems. The naturally formed embankment is proposed to be covered with “flexible gabion mattress” in order to take extra precaution to defend against any further surface erosions due to floods. The gabion mattress offers a prime advantage that the structure can be changed in height and size simply by building up or removing courses of gabions on the existing formation. After a period of operation, the shape of the structure can be adjusted according to requirements, and progressive adjustments can be made thereafter. This way of design will eliminate the necessity of any concrete structure on the Dam axis reducing the cost significantly.

Generally, gabions offer the most convenient solution than most other materials in such situations when substrata problems of permeability, erodibility, and bearing capabilities are faced. Moreover, in addition to their flexibility, which allows them to deform while remaining structurally sound, other advantages which gabions offer are relatively low cost and simplicity of construction. This is specifically significant for this site, where stone is locally available, sophisticated plant and equipment are unnecessary, Skilled craftsmen are not needed, and labour can be fully trained within a matter of days to carry out assembly and erection of the units in the required manner.

However, design of the gabion mattress should involve required hydraulic and structural stability considerations for detailing the geometry, size and fillings. Moreover, numerical and physical model should be undertaken.

The originally proposed 19 m wide under sluice is to be excavated on the left side of an overflow weir / ungated spillway, which is 60 m wide. This under sluice section is proposed primarily for drawdown of the lake level below El. 2400 masl to allow commencement of construction works on the power intake structure. Canceling the previously proposed flushing part of the Weir in the Feasibility Study would make dewatering of the construction site of the power intake and newly proposed flushing tunnel difficult. This is an important disadvantage of the newly proposed layout that should be kept in mind. Conversely, the rock face at the power intake location can also be used to advantage of this alternate proposal. A downstream rearrangement of the intakes (both power and flushing) would allow commencement of construction works on these locations behind a retained natural mound of the rock face acting as a natural plug for the upstream lake levels. The interim construction access can be managed from the downstream around and over the slided mass area to allow uninterrupted construction activities, independent of the lake water levels. The natural upstream plug can later-on be removed near completion of all works by pre-splitting and controlled blasting techniques.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Construction stages should be considered and discussed thoroughly in the next design phase with **tentative Construction Methodology** as follows.

During low flow season i.e. December, January, February, March and April, the Contractor can work on Weir site by diverting water in two stages. In first stage, local diversion Contractor shall laydown gabion mattress on one side and then remaining portion can be laid down during second stage diversion.

- **Flushing Tunnel**

Since the Under sluices that will be utilized for sediment flushing are being avoided in the proposed alternative layout due to geotechnical issues, a tunnel at a lower level than the power intake structure is proposed to flush out the sediment that is likely to be deposited in front of the intake structure.

The flushing tunnel underneath the intake area is proposed at distance of 7m away in the plan view and flushing tunnel outlet will be after the most disturbed area. In this case the life of Powerhouse can be increased by many years. Only risk involve in this proposal will be outlet portion of the flushing tunnel which will lie in overburden area. Cut and cover conduit or even open channel can be given in this area after a transition. In worst conditions if some damage happens to outlet structure, it can easily repair any time because flushing will not be done throughout the year. One more advantage will be available to us that power house will be running continuously during repair time of this outlet structure.

It is foreseen by MC that a flushing tunnel with a diameter of 5.50 m and a length of approximately 1100 m might be constructed beneath the power intake structure. This flushing tunnel will be capable of flushing about 250 m^3/s discharge with a velocity of approximately 10 m/s which will be enough to convey the sediment downstream without any deposition. The velocity during the operation should not be less than 4 m/s in order not to have sedimentation inside the flushing tunnel. It is recommended to control the flushing tunnel with a gate located at the entrance, as the approach of the access tunnel to the valve chamber remains within the landslide and poses difficulties. Hydromechanical equipment, gate and gate slots must be designed with the corrosive effects of sedimentary water in mind.

The proposed flushing tunnel inlet base elevation is recommended to be 2380 m leaving a distance of approximately 2 x D between the headrace tunnel and flushing tunnel which is thought to be enough for this type of rock formation. The rock formation at the inlet area is classified as Granodiorite and is suitable for tunnel construction. The slope of the flushing tunnel might be selected approximately as 0.5%. The exit elevation of the flushing tunnel will be approximately at 2375 m.

The water velocity is limited (nearly 10 m/s) in the proposed flushing tunnel. Therefore, there is no need for an extraordinary energy dissipater structure at first glance. But riprap or gabion mattress should be placed at the outlet of the flushing tunnel for surface protection. It is also recommended to study a suitable energy dissipater structure in the next design stage. But the detail designer has to consider the possible deposit of sediment at the outlet of the flushing tunnel (inside the proposed energy dissipater structure).

The downstream part of the tunnel will pass through the landslide (about 250 m long from the outlet), and it is difficult to do tunnel excavation in this region. Therefore, the excavation in this region can alternately be open-cut and the system in this region might be an open channel system. However, if there is a probability of a landslide forming in the open cut slopes of this channel, then a closed conduit might be constructed to avoid the probability of blocking the tunnel outlet and the channel by landslide.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Regarding the **tentative Construction Methodology,** Contractor will approach the intake area of power and flushing tunnels trough an adit from the existing road leaving 3 to 5m plug area of existing rock. Once construction of power intake and flushing tunnel is completed then contractor can remove this rock plug.

Since the sedimentation and flushing of the reservoir depend on lots of variables, the flushing tunnel diameter, discharge capacity, effectiveness of the system and intake level must be determined with a hydraulic numerical model study / physical model study by EPC contractor. The EPC Contractor should carry out the detail design of the tunnel in such a manner that any damage (abrasion, cavitation, etc.) to the concrete cover or rock mass in the flushing tunnel can be prevented during flushing operation.

Following are the recommendations regarding hydrological and sedimentation aspects for proposed flushing tunnel.

- Flushing tunnel should run periodically to remove silts deposited in front of power intake or nearby power intake vicinity.
- Flushing tunnel is purposed to be adopted for removal of certain estimated capacity of sediments, not for flushing maximum sediment volume.
- Flushing tunnel should be operational by considering reservoir storage capacity in balance position.
- Water availability, Reservoir operation for power generation and Flushing tunnel action to be linked in such a manner to keep project parameters and objectives functional.
- Flows study indicated that after utilization of 60 cumecs design discharge, water releases / spill periods are (May to October) with maximum releases in July (679 cumecs) and August (649 cumecs), respectively. Lean period from (Nov to April), where shortages are reduces by utilization of reservoir live storage water.
- Selection period for flushing is to be in July and August. The water release volume would be used for flushing purpose, which keep the reservoir storage capacity in balance. Sediment study also reflected, maximum sediment deposition in July and August. So, July and August are ideal periods for flushing tunnel operational, which would enhance project life and meet the objectives in a successful manner.

- **Power Tunnel Design Aspects**

Power Tunnel alignment seems appropriate. However, surface overburden is present along the Power Tunnel alignment as presented in the surface geological maps from Feasibility study which might be an indication of less rock cover. This aspect is to be studied during Detail Design studies by EPC Contractor. Moreover, the surge shaft / end portal of the Power Tunnel appears to end in sheared and jointed rock in terrain susceptible to external slope stability failure. This has to be given due consideration in Detail Design studies, particularly in view of the fact that the area is prone to earthquakes of large magnitudes.

- **Powerhouse**

Surface Powerhouse as proposed in Feasibility study is located adjacent to main river on an alluvium terrace. To minimize cost of protection works from maximum flood and for its increased safety, the Powerhouse may be moved to a slightly higher ground. It would reduce the Penstock length, at the cost of some extra excavation being proposed on an elevated surface profile for Powerhouse. The excavation may also additionally safeguard against structural stability issues. However, the primary measures of foundation design might remain similar to the pervious conceptual location, due to similarity in the strata. At the proposed site, surface powerhouse can be constructed. Surface powerhouse, tailrace channel and bifurcated penstock can be placed at required elevation by excavating the alluvium.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Another possibility, which can be explored, is underground powerhouse. In case of underground length of steel liner will become minimum length while length of tailrace channel will become longest. In this case head losses will become minimum. The project area is located in zone-4 regarding seismic activities. It is evident from past experiences that underground power houses behave much better as compared to surface Powerhouses during any seismic hazard activity. If economics allow, technically this option will be more stable safe with minimum O & M requirements.

7.5.3 Future Prospects of Modified Layout

A schematic drawing showing the proposed modifications in Feasibility study Alternative-I A layout is presented in Figure 7.15 as “Modified Alternate-1A layout”.

If in case all slide material is washed away at Weir site then a temporary coffer dam can be added in front of intake area in a shorter duration which will restore power house and then a new / fresh Weir/ Dam in this area can be constructed.

If intake structure is moved to Weir location and in case all slide material washes away then in this scenario considerable time will be required for restoration of Weir/Dam for generation of power.

8 REVIEW OF POWER POTENTIAL STUDIES

8.1 GENERAL

The demand for electricity varies seasonally. In lower areas of the country demand reaches to its maximum in summer season and remains lower in winter. But in northern area of the country especially in Gilgit-Baltistan (GB) demand for power and energy is maximum in winter season and remains within lower ranges in summer. Electricity demands also vary during the same day, people use more power in the morning and in the evening. Therefore, many powerhouses are managed to tackle such peak times. For this purpose, temporary storage is done in the lake/pond/forebay and releases during peak hours. Such projects have small storage as compared to large dam's storage.

As the lake had already been developed so reservoir capacity has not been enhanced than present to avoid inundation of upstream areas due to increase of water levels, however, flushing will be carried out to retain the present capacity of the lake. Area Capacity Curve from Feasibility study is shown in Figure 8.1.

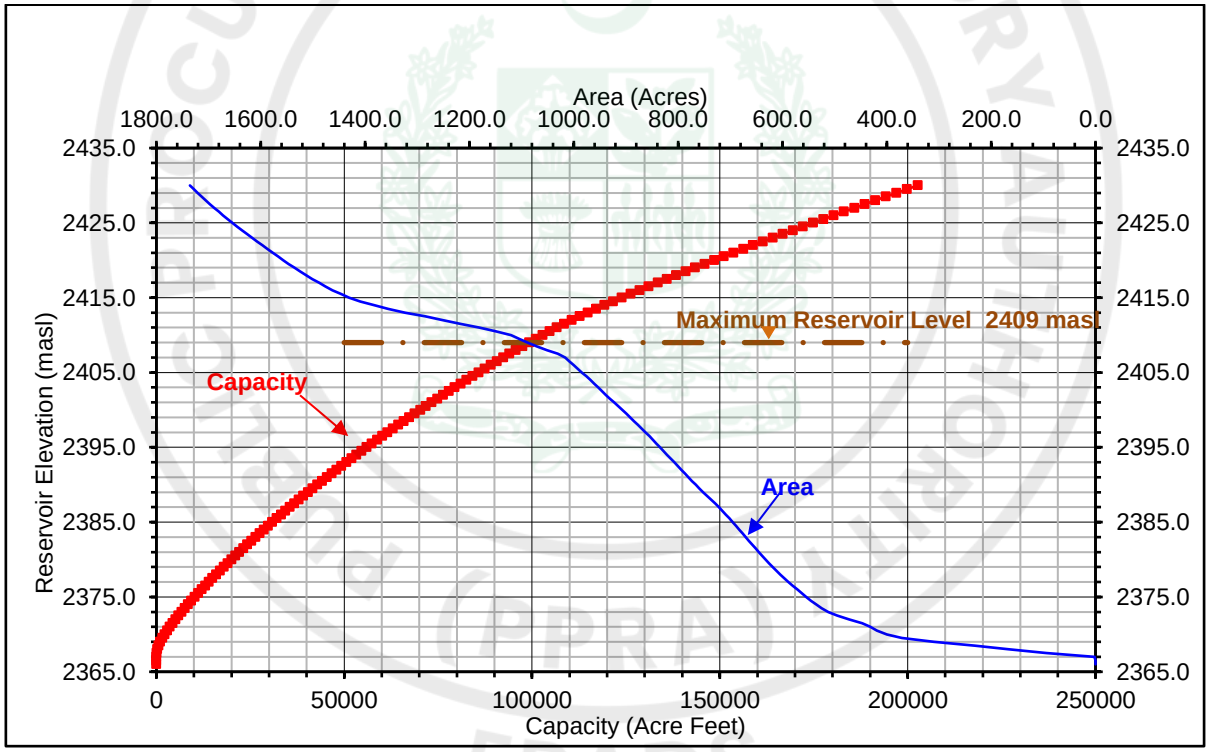

Figure 8.1: Area Capacity Curve

8.2 WATER AVAILABILITY AT RESERVOIR

Mean annual flows are calculated for the period 1966-2015. Average value for mean annual flow has been calculated as 208.36 m^3/s. Flows are generally maximum in July and August almost touching 700 m^3/s. Whereas, flows are low from December to April each year when snow falls in the catchment. The graph shows that design discharge of 60 m^3/s is available for about half year (almost 6 months). Graph also shows that flows are exceeding the design discharge from June to mid-December which shows the potential of hydropower generation. Graphical presentation of Mean Annual Flows is shown in Figure 8.2 and graphical presentation of Mean Monthly Flows is shown in Figure 8.3.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

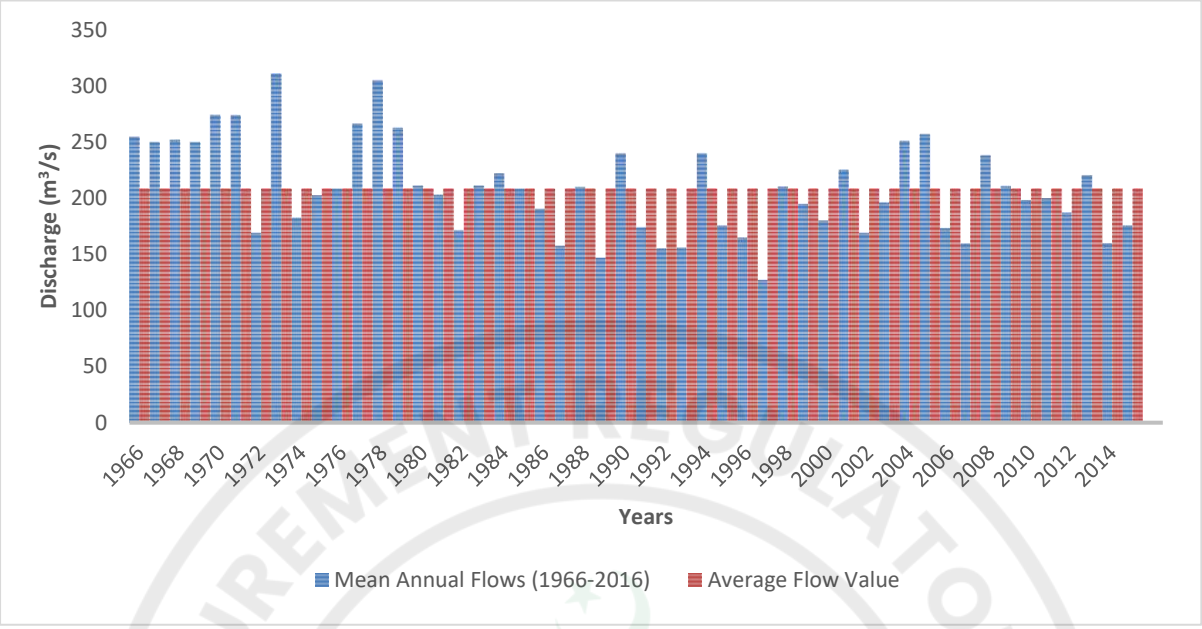

Figure 8.2: Mean Annual Flows

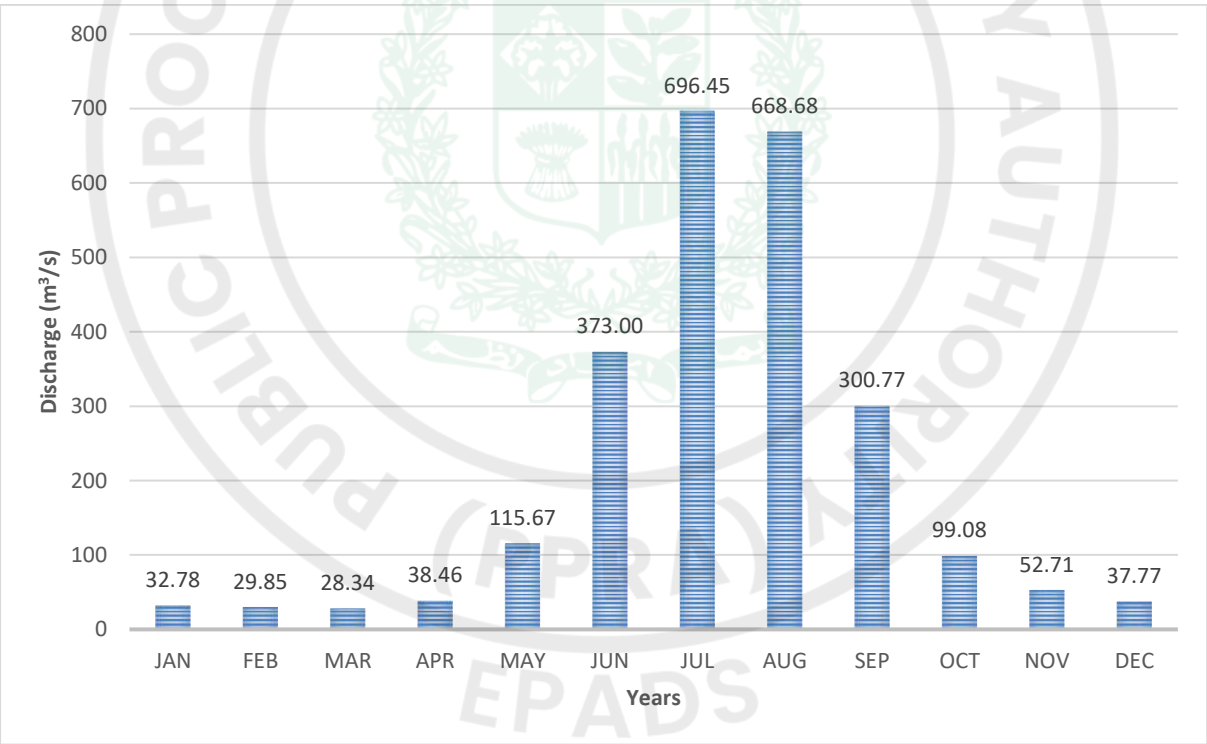

Figure 8.3: Mean Monthly Flows

Maximum, Mean and Minimum daily flows for the period 1966-2015 are also plotted in the Figure 8.4 to depict the flow pattern at Attabad Lake site.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

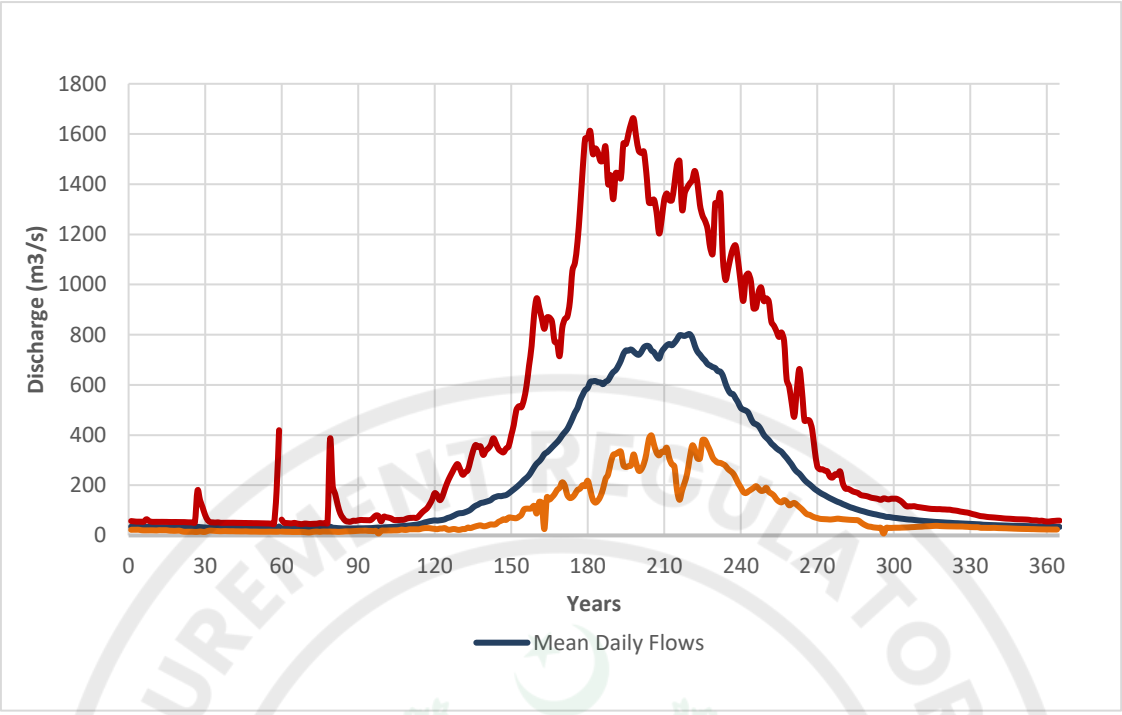

Figure 8.4: Mean, Maximum & Minimum Daily Flows

8.2.1 Flow Duration Curve (FDC)

Flow Duration Curve (FDC) for Attabad Lake HPP as plotted on the basis of almost 51 years (1966-2016) is shown here in Figure 8.5. Flow duration curve results are shown in Table 8.1. From FDC it is evident that design discharge of 60 m^3/s is available for almost 50% of the time. Therefore, design discharge of 60 m^3/s is justified for the generation of 54 MW power.

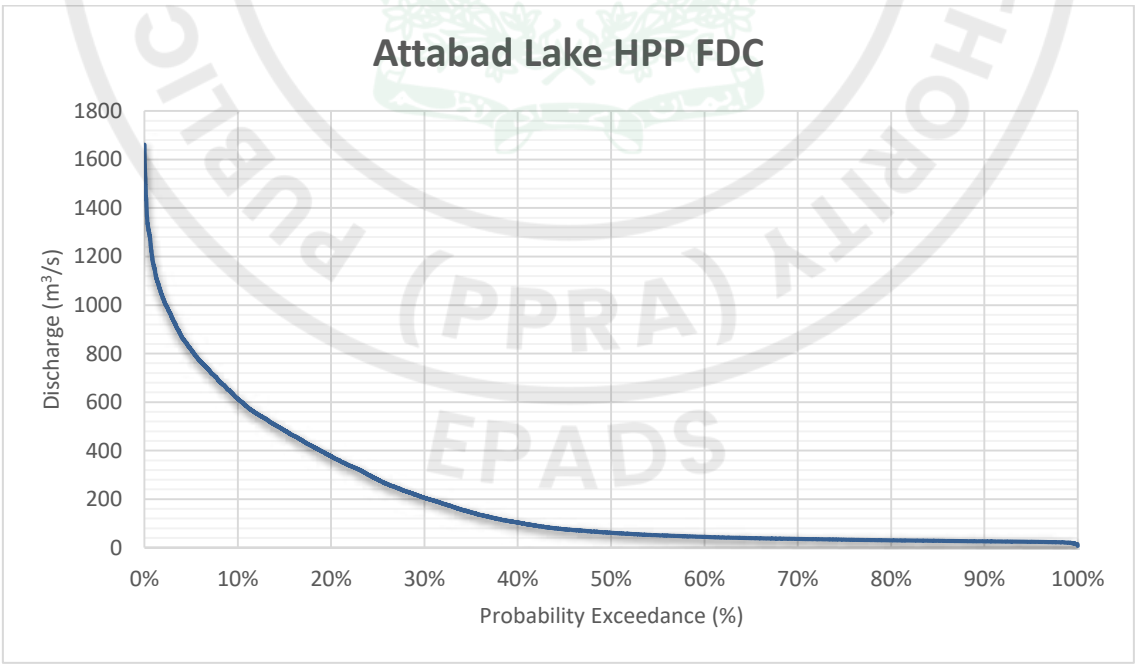

Figure 8.5 Attabad Lake Flow Duration Curve (FDC)

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Table 8.1: Flow Duration Curve Results

Probability Exceedance (%)	Flow (m^3/s)	Probability Exceedance (%)	Flow (m^3/s)
10	613.4	60	44.3
20	376.6	70	36
30	205	80	30.3
40	103.3	90	26.2
50	61.3	99	20.5

8.2.2 Tail Water Rating Curve

In the Feasibility Study, tail-water rating curve for the downstream of Powerhouse was presented. However, the details of the calculations were not stated in the report such as manning coefficient assumed, which cross-section the calculations have been made on etc. The tailwater rating curve has been calculated during Review studies using HecRAS with cross sections from Feasibility study drawings and 2-3 m of difference has been obtained for all discharges. This might be due to the reason that the cross sectional information and other inputs are not know. Therefore, the difference in the results seems acceptable.

8.3 POWER AND ENERGY STUDIES

8.3.1 Net Head

Net design head in the Feasibility Report has been reported to vary between 105 m to 107 m. Review study revealed that the net head varies from 104.5 m to 106.5 m, therefore the results are significantly close to each other and acceptable at the feasibility stage.

The river discharge given in the 2nd period of July 1998 in Table 8-7 of the Feasibility Report is 832.02 m^3/s. 60 m^3/s part of this discharge is used for energy production in the power plant and the remaining 772.02 m^3/s is discharged through spillway. In this case, the water level elevation in the reservoir becomes approximately 2417.28 m according to our calculations. The water level for the same period in Figure 8-7 is 2416.80 m, which is close enough for the feasibility phase.

Tailwater water levels at various discharges given in Feasibility report Figure 8-8 coincide with the information given in Table 8.3. It has been determined that the information given in Section 8.5.2 (Table 8.3) of Feasibility report is sufficiently accurate and acceptable.

The tailwater channel width appears to be 45 m in the Powerhouse drawings. When the water height is calculated for 60 m^3/sec discharge in accordance with this width, the water depth above the crest is 0.85 m and the water level is 2298.85 m. In this case, it is understood that the water level of the stream bed (Feasibility Report Figure 8-8) dictates the tail water elevation and the net head calculations should be made accordingly.

8.3.2 Power and Energy Potential

Power and energy potential at the site have been estimated on average 10-daily basis using time series data from 1966 to 2015. Available head across the hydropower facility has been computed keeping in view the minimum and maximum operation water levels i.e. 2,012 to 2,014 m.a.s.l. Tailwater rating curve has been used for estimating the tailwater levels on the downstream side for determining the head available for power generation.

The power estimates have been computed by using the following formula and efficiency coefficients are given in Table 8.2.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

$$P = \frac{\gamma \times n \times g \times H \times Q}{1000}$$

where,

P	=	Power output, 54 MW
ρ	=	Density of water, 1,000 kg /m^3
g	=	Gravity acceleration, 9.81 m/s^2
η	=	Overall efficiency of the hydroelectric plant 88.32%
Q	=	Design discharge, 60m3/s
H	=	Net Head varies between 105 m to 107.5 m depending head Water levels

Table 8.2: Efficiency Coefficients of Various Power Plant Components

Component	Efficiency
Turbine & Speed Increaser	91.5%
Generator	97.5%
Transformer	99%
Overall	88.32%

The average daily energy has been calculated as follows:

$$E = \frac{P \times h \times d}{1000}$$

where,

E	=	Energy output (GWh)
P	=	Power output (MW)
h	=	Hours in a day
d	=	Number of days in each time step

8.3.3 Optimization of Power and Energy

In previous studies (year 2017), 32.5 MW capacity plant had been proposed for this project, however, keeping in view the potential of the lake and availability of head, the power and energy optimization have been carried out to size the plant. Upstream water levels and tail water rating along with the average flow data for the period 1966 to 2015 have been used for calculating the power, energy and plant factor.

Comparison of power and energy potential of this study with the previous study has been tabulated in Table 8.3.

8.5 REVIEW FINDINGS

Based on verifying study and calculations MC are of the opinion that solution finalized in the Feasibility study with installed capacity of 54MW with 79% plant factor is most optimized solution.

However, as per recommendations from Mechanical expert, efficiency of turbine can be taken as 93%. MC endorse the selection of turbine with 93% efficiency which may result in little higher installed capacity of about 57 MW.

9 REVIEW OF STRUCTURE DESIGN STUDIES

9.1 GENERAL

In general, there are differences between values in the Feasibility Report and respective drawings. There are also differences for the same variable in the Feasibility Report in different sections. This issue should be corrected in the next design stages.

The inflow after the January 2010 land slide filled upstream valley created a 22 km long reservoir till the end of May 2010. The estimated lake initial storage was about 310 million m^3.

The deposited mass as a result of land slide is mainly composed of non-cohesive rock flour (fine dust, silt, silt gravels and cobbles) at the toe of the failed slope. Large boulders of granodioritic rocks with intrusions of granite, pegmatite and apatite were deposited close to the left bank of Hunza River. The deposit on the downstream side is composed of black clay with high plasticity and organic content. The upstream shoulder of the natural dam has mild slope and downstream slope is quite steep. With 2 km long dam, there is rare chance of piping failure. A view from Weir Site is shown in photograph given in Figure 9.1.

Figure 9.1: View from Attabad Lake HPP Reservoir

9.2 HYDRAULIC MODELLING OF RESERVOIR

The Hydrologic Engineering Center's River Analysis System (HEC-RAS 5.0.7) program has been used in the Feasibility Study of Attabad Lake HPP in order to analyze and assess the impact of design flood (3250 m^3/s) on the proposed system. A 1D-Unsteady numerical modeling has been used in the analysis. As a result of this analysis, it is found that there would be no major impact on the upstream settlements due to the overflow weir at 2414 m.a.s.l. and flood would remain within the river system. Weir site upstream and downstream views are given in photographs in Figure 9.2 and Figure 9.3.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

In the feasibility dated 2021 prepared by WAPDA, hydrological data between 1966 to 2015 have been used. The latest information should be accessed and hydrology should be updated. It will be good for the health of the projects to observe the increases in the flood discharge due to global climate change in Pakistan in recent years and, if possible, to apply them to the projects.

The hydraulic model that has been prepared during the Feasibility Study is a suitable approach.

Figure 9.2: Weir Site Location Downstream View

Figure 9.3: Weir Site Location upstream view

9.3 NATURAL DAMMING ON HUNZA RIVER

It is possible that the lower elevations of the reservoir will be filled with sediment due to the construction of the body on the slide mass. The bottom spillway system in a classical dam is not within the scope of the project.

9.4 HYDRAULIC DESIGN

9.4.1 Hydraulic Design of Weir/Spillway and Stilling Basin

- **Weir/Spillway Discharge Capacity Overflow Ungated Structure**

In the feasibility report, it is mentioned that “The spillway discharge capacity at elevation 2421.4 masl is 3250 m³/s. along with overflow spillway, two low level flushing outlets would be in operation to discharge 600 m³/2. The total discharge through overflow weir/ungated spillway is 3250 m³/s, which is 10000 year return period. The spillway can therefore safely pass the PMF discharge with sufficient free board.”

According to the drawings, the maximum flood water elevation is calculated as 2421.00 m and therefore the water head at the uncontrolled ogee shaped spillway is 7 m. However, the spillway discharge elevation is given as 2421.4 m in the section of the feasibility report 9.4.1.1, this incompatibility should be eliminated in the next design phase. It is not possible to pass Q_{10000}, that is, 3250 m³/sec, from the uncontrolled spillway with 60 m spillway width and 7 m water head.

Quick calculations show that the uncontrolled ogee shaped spillway has a discharge capacity of approximately 2400 m³/sec. The discharge capacity of the undersluice section, with a dimension of 5x5 m, having a hydraulic head of 16.5 m from the center of the opening is approximately 270 m³/sec. The total discharge capacity for 3 gates is approximately 810 m³/sec. The total discharge capaity of the uncontrolled and gated undersluice parts is 3210 m³/sec and it is very close to the design flood discharge. Therefore, the calculations can be considered accurate. Since the gated undersluice section of the spillway will work together with the uncontrolled ogee shaped spillway to evacuate the flood to the downstream, it is of great importance that the gates are always working. Therefore, reliable energy must be guaranteed for the weir location.

Weir sluice gate operation is vital for sediment flushing and full utilization of energy potential in accordance with the considerations expressed in the reservoir operating system given in Chapter 8.2 of Feasibility Report.

- **Design of Spillway Stilling Basin**

In this section of Feasibility Report, stilling basin design of the uncontrolled ogee shaped spillway has been done with the following dimensions:

Invert of stilling basin	2397.0 masl
Width of stilling basin	60.0 m
Elevation of river bed d/s	2400.00 masl
Length of stilling basin	55.0 m

There are inconsistencies between the elevations used in drawings and calculations. According to the control calculations, the calculations are generally confirmed, but the stilling basin wall top elevation in the drawings is insufficient compared to the calculations. In this framework, calculations and design compatibility should be ensured in the next stage.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

9.4.2 Flushing Outlets

Three low level sediment flushing cum diversion outlets have been provided on the left bank upstream of the embankment dam to enable flushing of sediment in front of the power intakes in the Feasibility Study. Design of under sluice from Feasibility study is given below.

Maximum upstream Water Level	2421.4	m.a.s.l.
Maximum downstream Water Level	2405.0	m.a.s.l.
Upstream Bed Level	2400.0	m.a.s.l.
Downstream Bed Level	2400.0	m.a.s.l.
Design Discharge	720	m^3/s
Width of Undersluice	5.0	m
Height of Undersluice	5.0	m
Gravitational Acceleration	9.81	m/s^2
Cross sectional Area	25	
Wetted Perimeter	20	
Hydraulic Radius	1.25	
(U/S water level) - (D/S water level) = h	16.40	m
CAPACITY OF UNDER SLUICE		
$X = (1/1+f_i+f_o+f_c+f_{fr})^{\wedge}1/2$		
where		
Coefficient for intake losses (f_i)	0.06	
Coefficient for outlet losses (f_o)	1	
Coefficient for change in cross sec. (f_c)	0.04	
Coefficient for friction losses (f_{fr})		
Stickler's coefficient (k)	70	
$f_{fr} =$	0.13	
$X =$	0.67	
$V = \frac{X}{(2gh)^{\wedge}0.5}$	12.00	m/s
Q = One Under Sluice	**300.0**	m^3/s
Discharge through three Undersluices	**900.1**	m^3/s

According to the control calculations, the capacity of each of the undersluice gates is approximately 270 m^3/s. The discharge capacity calculation, which depends on many assumptions, is correct. It is recommended to conduct a model test to verify the effect of the gates on each other and the flushing ability of the undersluice system.

Since the gated under sluice section of the spillway will work together with the uncontrolled ogee shaped spillway to evacuate the flood to the downstream, it is of great importance that

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

the gates are always working. Therefore, reliable energy must be guaranteed for the weir location.

Weir sluice gate operation is vital for sediment flushing and full utilization of energy potential.

Even if geotechnical ground improvements are to be made, it is necessary to pay attention to the division of the structure into blocks in such a way that the possible minimal different settlements and the possible jamming of the gates will be prevented, that is, the caps will remain in a single block.

9.4.3 Freeboard Calculations

- **Wind Speed**

Since there is no wind data available specific to the Attabad Lake HPP region, it is assumed as 100 km/hr with all speed correction factors applied in the Feasibility Study. The calculations and assumptions made are in accordance with the general tendency.

- **Design Wave Height and Duration**

The wind height has been calculated using Molitor - Stevenson Formula as Hs = 1.21 m in the Feasibility report. The adopted crest elevation of the cofferdam is fixed at 2420.0 m.a.s.l. The channel will discharge in free flow condition.

If detailed wind and fetch information is obtained during the application design project phase, more detailed study is recommended.

9.5 DESIGN OF RIVER DIVERSION WORKS

It is suggested to do the construction with stage construction utilizing diversion channels. This method is suitable for such a construction, however, after obtaining detail inputs for mapping, floods and design of weir, river diversion works need to be checked to see if it is appropriate. It can be applied in principle, but should be re-examined with current hydrological data during the application phase.

9.5.1 Discharge Capacity of River Diversion Works

The design flood return period for Attabad Lake HPP has been selected as 20 years in the Feasibility Study. The design of the diversion system in dam-type structures is made using Q25 (with freeboard) and Q50 (without freeboard) flow rates. Q5 (with freeboard) and Q10 (without freeboard) flow rates are used in weir type structures. Attabad Hydropower Facility is in between these two facilities. Therefore, it is reasonable for the designer to use the Q20 flow rate with a freeboard. However, in the next stages, it should also be checked which frequency flow passes without freeboard.

Moreover, it is stated that the cofferdam will be strengthened in case of any possible overtopping. Diversion channel discharge rating has been calculated as given in Table 9.1.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Table 9.1 Diversion channel discharge rating calculations

Geometrical Input Data			Calculation of Downstream Rating Curve						
Length of Canal :	475.00	m	Wat. Dep	Area	Wett.Par	Hydr.Rad.	Discharge	Velocity	Froude No.
Slope Water Side : 1:	1.00	-	m	m^2	m	m	m^3/s	m/s	-

			4.40	129.36	37.45	3.45	1495.13	11.56	1.76
BL Canal Start :	2398.00	m.a.s.l.	4.80	143.04	38.58	3.71	1733.09	12.12	1.77
BL Canal End :	2392.00	m.a.s.l.	5.00	150.00	39.14	3.83	1857.79	12.39	1.77

Crest level of the cofferdam has been selected as 2421.0 masl allowing 2.0 m freeboard.

Since there is no detailed information in the drawings, the calculations could not be checked. During the detailed design phase, after the final maps are obtained, necessary design studies will be carried out, and controls will be made after the cross sections are obtained.

9.6 POWER INTAKE STRUCTURE

In the Feasibility Study twin intakes have been provided for intake of water into the power waterway system with 30.0 m³/s capacity of each. The invert of the intake is placed at elevation 2412.0 m.a.s.l. based on sediment control and submergence considerations. Deck and other operating levels have been set at 2422.0 m.a.s.l.so that the intake can perform over a range of operating water levels in the reservoir including maximum flood water levels.

The drawing contains slightly different information than report. The water intake drawing and the information about the geometry expressed in the report are inconsistent. The drawing should be harmonized with the design and calculations to be made in the next stage.

9.6.1 Hydraulic Design of Intake

- **Criteria for Design**

Intake structure dimensions and type is suitable in terms of hydraulics.

- **Intake Submergence**

There are also some inconsistencies between drawings and Feasibility Report. Power intake submergence has been calculated with Gordon's relationship for asymmetrical flow in the Feasibility Study and determined as S_{min} = 3.75 m.

The submergence has been calculated as 1.75m. The value calculated in the Feasibility Report is higher than this value. Therefore, after finalizing the intake dimensions during next stages of design, submergence calculation should be renewed.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

After the drawing of the water intake is finalized as stated in section 9.7 according to the calculations to be made, it should be ensured that the critical submergence is controlled according to the calculations to be made and the current system.

Critical submergence depth should also be verified by hydraulic model test.

- **Power Intake Settings**

Maximum Operation Level	2414.0 m.a.s.l.
Minimum Operation Level	2412.0 m.a.s.l.
Required submergence	2.0 m
Intake waterway height	4.5 m
Required Invert level	2404.0 m.a.s.l.

The intake invert has been set at 2404.0 m.a.s.l.

Since vortex formation is dependent on many factors including orientation of the intake to flow and not only on submergence, hydraulic model studies are recommended at detailed design stage to confirm that vortices do not form at the intake. Power intake site photograph is given in Figure 9.4.

Figure 9.4: Water Intake Location

- **Trashrack Cross-sectional Area**

The velocity of the water was limited to 1 m/s and a gross trashrack area of 60 square meters was selected. The trashrack grid spacing design, gross and net velocities should be reviewed with the EM equipment supplier.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

9.7 LOW PRESSURE TUNNEL

Loss types, formulas, and velocity inside reinforced concrete tunnel limitation are mentioned. 5.5 m tunnel diameter was found as a result of optimization. However, the tunnel diameter given in the drawings is 5.2 m, which is inconsistent with the 5.5 m stated in the report. The tunnel diameter is suitable as the velocity criteria given in concrete lined tunnels are met. In the report, the longitudinal slope of the tunnel is given as 0.4%. In the next design stages, the friction loss calculation together with the local losses should be renewed to ensure that the piezometry does not intersect the tunnel profile and that a safe positive pressure is formed inside the tunnel.

Low pressure tunnel from intake to surge tank would be excavated in the left bank rock formation parallel and at lower elevation to existing highway tunnel. The length of headrace tunnel is estimated about 2320 m. The closest part of the headrace scheme to the KKH Tunnel is at surge tank. At this point, the surge tank bottom elevation is 2385m, whereas the KKH tunnel invert elevation is 2376m. The perpendicular distance between the outer walls of the structures is 65m. Since the geological formation is defined as moderately weathered gneiss in the as-built drawings of the KKH tunnel, the interaction between the structures is regarded as safe.

The biggest portion of the underground works is the excavation of the headrace tunnel, which is approximately 2.3 km long. The headrace tunnel covers about 95% of the total underground works excavation volume.

Headrace tunnel was optimized by considering different diameters for design discharge of 60 m^3/s.

The optimized diameter of low pressure headrace tunnel is 5.5m and its length 2320m. The upstream level of tunnel is El. 2,402.5 masl whereas downstream level is El. 2,385 masl.

The proposed alignment for tunnel is generally fine with overburden surface cover along some locations which can be further investigated for sub surface rock cover during detail design investigations by EPC contractor.

In the Feasibility Report, the geological profile of the low pressure tunnel and proposed construction methodology and support systems are missing, hence, the quantities used in the cost estimates could not be verified. Typical support systems and their application changes shall be evaluated further to reach a more sound cost estimate.

The measures to be taken at the fault zone which the low pressure tunnel is passing through shall be clarified and incorporated in the tender design.

The data for existing KKH road tunnels alignment, elevation and geological profile is important for the design of new tunnel to arrive at a practical and safe design for its construction.

In addition to low pressure tunnel itself, the two (02) adits (access tunnels) reaching the power intake section and surge tank section that are about 450 and 202 meters long respectively shall be elaborated further. The cross sections, supports systems and geological profiles of adits need to be incorporated to the tender design of EPC documents.

In case of any other alternative layout scheme of the hydropower project that requires a tunnel arrangement, the geological longitudinal profile, cross section and provisional support systems need to be added to the tender design of EPC documents.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

9.8 SURGE TANK

Throttled cylindrical surge tank has been selected during the Feasibility Study. The cross sectional area of the cylindrical surge tank is selected with a factor of safety of 2.5 times larger than the Thoma-Criterion to ensure adequate stability of plant operation.

Choosing the throttled surge tank is appropriate in terms of minimizing the energy tunnel losses during energy production. Photograph of Surge Tank location and Penstock alignments is shown in Figure 9.5.

Figure 9.5: Penstock and Surge Tank Location

9.8.1 Hydraulic Design of Surge Tank

Main features of Surge Tank hydraulic design are summarized in Table 9.2.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Table 9.2 Minimum Cross Section for Surge Tank at Headrace Tunnel

Total headrace discharge	Q	60	m^3/s
Length of headrace tunnel	L	2320	m
Diameter of Tunnel	D	5.50	m
Cross section area	A	24.62	m^2
Head loss	h	2.6	m
Velocity in tunnel	v	2.46	m/s
Velocity head	$v^2/2g$	0.31	m
Minimum reservoir level	W_L	2412.0	m.a.s.l
Minimum tailwater level	W_L	2302.0	m.a.s.l
Head difference	H_o	110.0	m
Net head	H_n	105.2	m
	A_S	63.16	m^2
	1.5 A_S	90.08	
	$D_{Ssquared}$	10.7	m
	$D_{Sselected}$	10.0	m

Following scenarios have been assumed for the design of the surge tank:

LC-UP 1) Load acceptance from partial load, not exceeding 50 % total load increase; subsequent full load rejection;

LC-UP 2) Load acceptance of two units after synchronization; subsequent full load rejection;

LC-DN 1) Full load acceptance of two turbines followed by another turbine after a certain time interval

LC-DN 2) Load reduction by 50 per cent and subsequent complete load acceptance.

Calculations for turbine load acceptance, turbine load rejection durations and valve opening-closing durations will be repeated with the exact durations after the E/M manufacturer is determined.

Some investors/clients also want to study successive opening-closing, reopening-reclosing scenarios, therefore additional scenarios can be added to the surge tank design within the scope of this project.

9.8.2 Load Case Maximum Upsurge

This load case represents the most unfavorable moment for upsurge which is full load rejection when the headrace tunnel is at its maximum. Following assumptions and scenarios are made in the Feasibility Study for maximum upsurge:

Turbine load acceptance after synchronization		5.0 seconds (10 to100%)
Wicket gate closure at turbine load rejection :		5.0 seconds (100 to 0 %)
Maximum Reservoir Level	:	2414.0 m.a.s.l.
Minimum tunnel roughness	:	0.3 mm

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

LC-UP 1)	Load acceptance from partial load, not exceeding 50 % total load increase; subsequent full load rejection;
LC-UP 2)	Load acceptance of two units after synchronization; subsequent full load rejection;
LC-DN 1)	Full load acceptance of two turbines followed by another turbine after a certain time interval
LC-DN 2)	Load reduction by 50 per cent and subsequent complete load acceptance.

A conservative approach is taken in the present feasibility design, full load acceptance of two units connected to the headrace tunnel will be assumed as extraordinary load case for which the surge tank design shall guarantee the specified minimum freeboard margins. Following assumptions are made in the Feasibility Study for minimum down surge:

Turbine load acceptance after synchronization	50 sec (10-100%)
Wicket gate closure at turbine load rejection	5.0 sec (100-0%)
Minimum reservoir water level	2412.0 m.a.s.l.
Maximum turbine discharge	20 m^3/s
Maximum tunnel roughness	0.3 mm

Water level variation and Discharge variation is presented in Figure 9.6 and Figure 9.7 respectively.

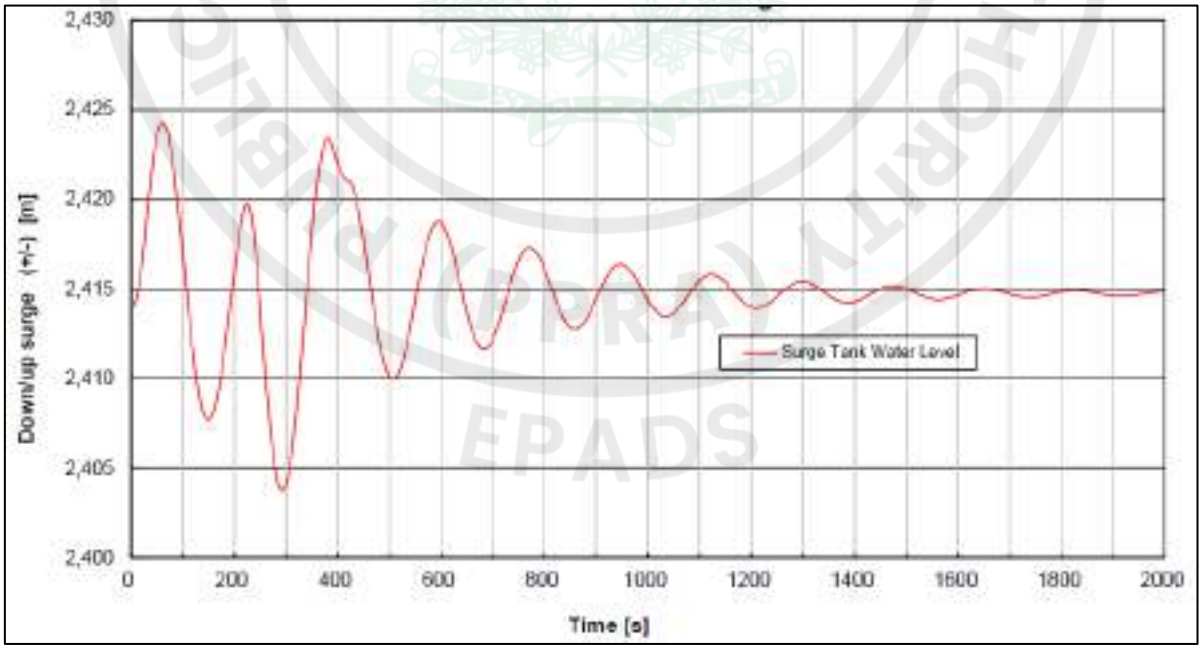

Figure 9.6: Water Level Variation in Surge Tank

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

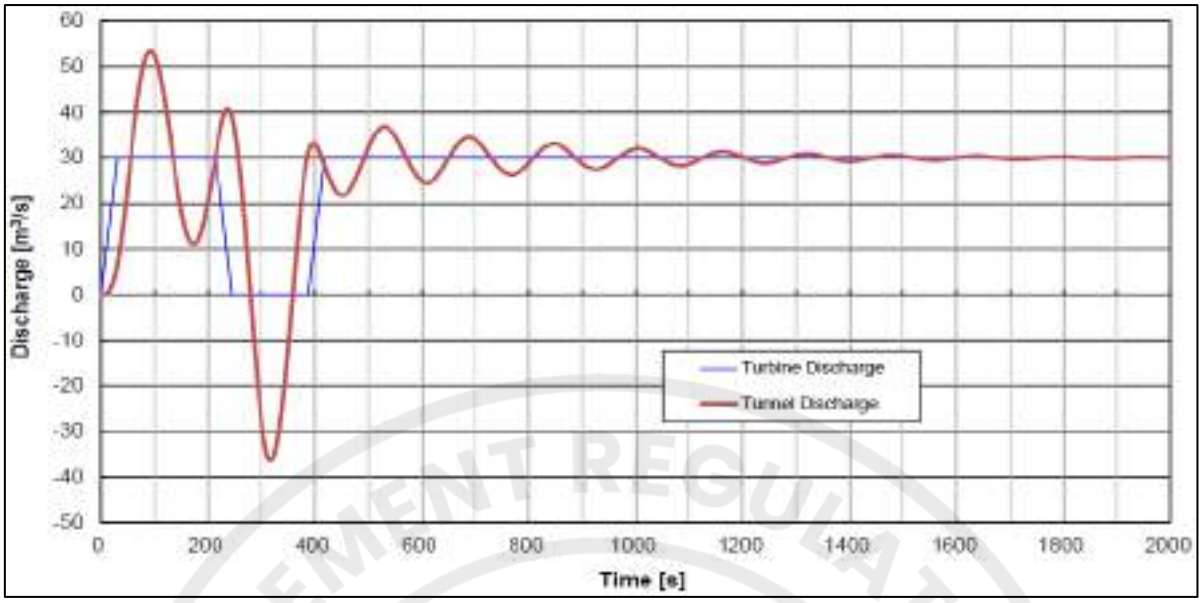

Figure 9.7: Discharge Variation in Surge Tank

During the examination of upsurge and downsurge conditions, an initial elevation should be used for T=0 sec, taking into account the losses in the conveyance system and the maximum and minimum water elevations of the reservoir. For downsurge, minimum water level and maximum system discharge (for 3 turbines) and on-off scenarios should be used while the system is stopped. For Upsurge, calculations should be made in case of sudden load rejection of 3 turbines operating at maximum flow rate at the maximum elevation of the reservoir. In this case, the losses should be taken into account when determining the initial level of the surge tank. In other words, it is not a correct approach to take the direct reservoir water level inside the surge tank. Upsurge and downsurge graphs should be determined by the EM equipment manufacturer for various operating and accident scenarios and given as separate graphs.

9.8.3 Results of Surge Tank Simulation

The results of this analysis is given in the Feasibility Study as follows:

Upsurge	2424.2 m.a.s.l
Down Surge	2403.8 m.a.s.l

In the control analyses made, it has been found that the upsurge and down surge calculations given in the report for the opening and closing of a single unit are correct. However, depending on the client's operation criteria, the opening or closing of more than one unit at the same time may occur in the system. Therefore, during the implementation project phase, the operating scenarios should be decided together with the EM supplier and the client, and the calculations should be renewed depending on the system design criteria. Cases of simultaneous opening or closing of 3 units based on past experience should also be included in the design.

9.9 WATER HAMMER ANALYSIS IN PENSTOCKS

For the water hammer analysis following conditions are used.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Reservoir Level	2414.0 m.a.s.l.
Turbines centre line level	2300.0 m.a.s.l.
Operation Mode	Full Load Rejection within 5 seconds
QT for single unit	20.0 m³/s

Due to the newly proposed location of the powerhouse, the shortening of the penstock will reduce the water hammer effect.

Since some investors do not want the water in the tunnel to flow towards the power plant and cause more damage in case of possible penstock damage, they prefer to put a butterfly valve for emergency response purposes at the first point where the penstock comes to the surface after the surge tank. In case it is decided to add such a valve, necessary precautions should be taken to prevent the penstock from buckling due to negative internal pressure. Accordingly, the drawings of a project implemented in Turkey are given in Figure 9.6 and Figure 9.7.

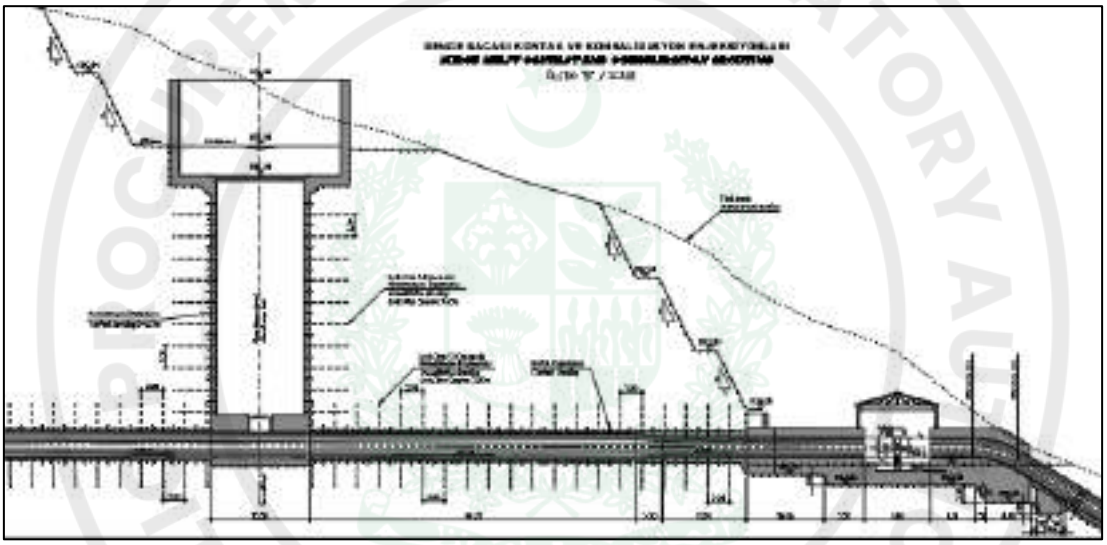

Figure 9.8: Emergency Butterfly Valve after Surge Tank 1/2

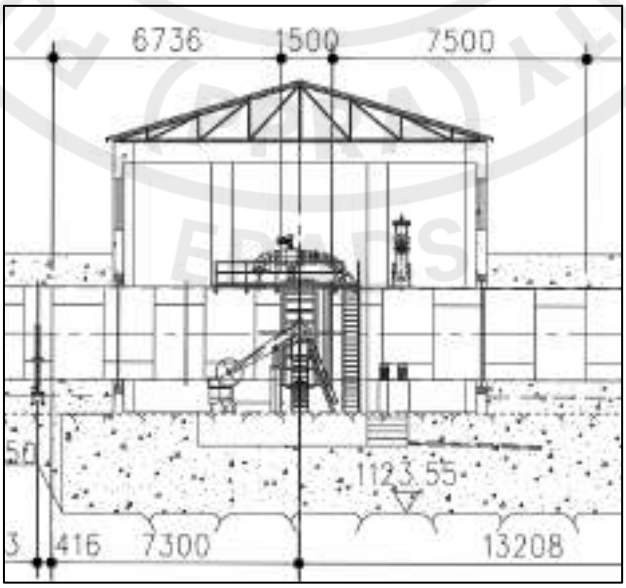

Figure 9.9: Emergency Butterfly Valve after Surge Tank 2/2

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

9.9.1 Water Hammer Calculations for Single Penstock

In Attabad Hydropower Project the power house has three turbine units. Each turbine unit is connecting with one penstock. To calculate water hammer pressure in the penstocks the longest penstock is considered because it will give the maximum rise in pressure when valve of turbine closed suddenly. The longest penstock is 35m long.

Total discharge for 3 units	Q	= 60.0 m^3/s
Discharge for single turbine	QT	= 20.0 m^3/s
Diameter of penstock	D	= 2.07 m
Velocity in the penstock	V	= 5.89 m/s
Length of penstock	L	= 35 m
Maximum Operation Level		= 2414.0 m.a.s.l.
Minimum Tail Water Level		= 2300.0 m.a.s.l.
Maximum Head		= 114 m
Steel liner Thickness	t	= 25 mm
D/t		= 82.8

9.9.2 Pressure Wave Velocity

Following Parmakian (1955) formula is used to calculate the velocity of pressure wave in the Feasibility Study:

$$a = \sqrt{\frac{1}{\rho\left(\frac{1}{K} + \frac{DC_1}{Et}\right)}}$$

Where

E = Elastic modulus for steel = $1x10^9$ N/m^2

K = Volume modulus of water = $2.1x10^{11}$ N/m^2

ρ = Mass of water = 1000 kg/m^3

$C_1 = 1-u^2$

u = Poisson's ratio for steel = 0.3

a = 140 m/s

9.9.3 Water Hammer Pressure (Allievi Chart)

Maximum pressure has been calculate as $H_0 + h_{max}$ = 107.6 m in the Feasibility study. Therefore, the pressure rise in the penstock for sudden closure of value (5 s) is 33.02 m. If the powerhouse is brought back closer to the hill, then the length of penstock will be decreased which will result in a decrease in water hammer.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

The water hammer calculations should be renewed by the mechanical engineer by using the scenarios expressed in the surge tank design according to the new location of the power plant and therefore the new penstock length.

9.10 POWERHOUSE

There are contradictions between the elevations specified in the powerhouse drawings and the elevations specified in the report. Other dimensions and elevations are given, but should be revised according to the detailed design data to be obtained from the turbine manufacturer. Possible changes in elevations according to the new location of the power plant should be considered in the next design.

Feasibility stage proposed Powerhouse location site photographs are given in Figure 9.8 and Figure 9.9.

Figure 9.10: Feasibility stage Proposed Powerhouse Location 1/2

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Figure 9.11: Feasibility stage Proposed Powerhouse Location 2/2

9.11 TAILRACE CHANNEL

From the new powerhouse location, it will be possible to connect the powerhouse to the stream bed with a tail water channel without any change in the installed power of the power plant with a channel of suitable cross-section. However, this design is also associated with the submergence required by the EM equipment

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

10 REVIEW OF GEOTECHNICAL AND STRUCTURAL STABILITY ANALYSIS

10.1 REVIEW OF SLOPE STABILITY ANALYSIS

The proposed cut slopes for the project components including the Weir have been analysed using GEOSTUDIO suite SLOPE/W.

The design parameters used in the slope stability analysis during Feasibility study are given in Table 10.1.

Table 10.1 Material parameters used for Feasibility study Slope Stability Analysis

Condition	Unit Weight (Kn/m^3)	Cohesion (KPa)	Angle of Internal Friction (Deg)
Below Water Surface	21	100	20
Above Water Surface	18	120	25

Young's Modulus of Elasticity is 1.29 e +4 and poisons ratio used is 0.15.

Slope stability analysis was performed at Feasibility stage to check the stability of right and left side slopes of weir cross-section only at RD 0+50. It must be noted that all the area along the longitudinal section of Weir is slide prone. Therefore, stability of slopes along the length of Weir area should be analyzed, or at least the deepest excavation slopes (RD 0+350) for both sides must be analyzed. This should be done even if flexible gabion mattress as discussed in section on modified project layout is to be provided with some minimal cut slopes on existing natural Spillway.

Although the Feasibility study stability analyses show that the proposed slope angle is stable for the used parameters it is proposed to carry out a sensitivity/back analysis for justification of the geotechnical parameters to be considered in the slope stability calculations especially for the right bank.

The variability of slided material along with large boulders present in the slided mass also necessitate a sensitivity/back analysis for justification of the geotechnical parameters to be considered. Both on the right and left banks, there is a risk is to disturb the sliding material during excavation which will result in higher excavation volumes.

10.2 REVIEW OF SEEPAGE ANALYSIS

Seepage analysis is performed to analyze the Weir structure against uplift and piping using permeability values of stabilized soil blanket and slided mass. For the slided mass two different permeability values are provided at same elevation. It is reported in the Feasibility report that permeability for slided mass was used from in-situ permeability of boreholes. Boreholes 1 and 2 located at the Weir site have irregular permeability values which also do not match with the input permeability values used in seepage analysis. Also, the laboratory test results for the permeability values for stabilized soil is missing from the laboratory testing report. Therefore, the input permeability values of stabilized soil and slided material are uncertain.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

11 REVIEW OF HYDROMECHANICAL EQUIPMENT STUDIES

11.1 TURBINE

11.1.1 Turbine Selection Criteria

Indian standards IS 12837 - 1989 and IS 12800 (Part 3) 1991 are mentioned under clause 11.6.1.Therefore, MC recommend to replace these with: i) United States Bureau of Reclamation (USBR) Engineering Monograph no. 20, Selecting Hydraulic Reaction Turbines. ii) ASME guide for Hydropower Mechanical Design.

11.1.2 Type, Rated Speed & Setting

Vertical shaft Francis turbines selected in the feasibility study report (FSR) are best suited for the range of heads available for Attabad lake hydropower project. Chosen synchronous speed of 375 rpm seems appropriate, however, discrepancy found with regard to setting of the turbine. Setting of -1.5m and -2m is mentioned at different places in the report. We endorse the value of -2m below minimal tail water level.

Under clause 11.6.9, the feasibility study states that the turbines will be directly coupled to the generator rotor. Also, in clause 9.11.1 it is stated that the vertical axis Francis turbine is coupled directly to a generator. These statements confuse the reader as if there will be no turbine shaft, however, under clause 11.9 it is evident that each turbine will have its shaft. We concur with the statement of clause 11.9 and clarify that there will be two shafts one for turbine and one for generator.

11.1.3 Turbine Shaft

Under clause 11.9.2, Indian Standard is specified for turbine shaft. MC recommend to replace it with ASTM A668 Class D standard, also material of both turbine and generator shafts shall be the same.

11.1.4 Air Admission System for Aeration against Pressure Pulsation and Vortexes

Generally, the turbines should operate without aeration under all operating conditions, however, turbines may have to operate continuously for long time at part-load conditions. In order to be able to aerate the turbine, if required, aeration-taps will be foreseen for a possible later admission of air to the runner and the draft tube.

11.1.5 Power and Energy Potential

- **Power**

Turbine efficiency considered in the FSR of 91.5% is on lower side. However, MC recommends for EPC Contractor to use it to the order of 93% with confirmation from the manufacturer. 93% Turbine efficiency is well achievable for similar capacity vertical Francis turbines as of Attabad HPP.

Rated head of 106m selected in the FSR for power potential is reasonable, however, it is recommended that EPC contractor should reconfirm it once all the project components are designed and approved by the MC / Employer during detail design phase.

Some of the data / parameters given in the FSR has been rationalized and mentioned hereunder:

The turbine rated output: $P_t = \rho \times g \times Q \times H_n \times \eta_t$

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Where;

P_t is turbine output in KW

P is water density at 15°C = 0.999 Kg/m³

g is acceleration due to gravity = 9.8 m/sec²

Q is design unit discharge = 20 m³/sec

H_n is rated net head = 106 m

η_t is turbine efficiency = 93%

P_t = 9.79*20*106*0.93 = 19,300 KW

- **Annual Energy**

Headwater and tailwater ratings along with average daily flow data and head losses have been used for calculating the power, energy and plant factor. Power and annual energy have been worked out using mean of daily flow data for the years 1966 to 2015 and is presented hereunder in Table 11.1.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Table 11.2: Comparison of FSR (2021) and Review Report Parameters

Description	Feasibility Study Report, 2021, Conducted by WAPDA	Review Report (AHMC)
Plant Design Discharge (m^3/s)	60	60
Gross Head (m)	112	111.9 ~112
Installed Capacity (MW)	54	56.4
Mean Annual Energy (GWh)	373.69	377.16*
Plant Factor (%)	79	76.3

*(Using mean of daily flow data for the years 1966 to 2015)

Table 11.3 Comparison of FSR (2021) and FSR (2017) Parameters

Power and Energy Parameters	As in Feasibility Study 2017, Conducted through Consultants	As in Feasibility Study, 2021, Conducted by WAPDA
Design Discharge (m^3/s)	40	60
Gross Head (m)	106	112
Power Capacity (MW)	32.5	54
Mean Annual Energy (GWh)	256.66	373.69
Plant Factor (%)	92.7	79

11.2 GOVERNOR SYSTEM

Feasibility study states compressed air charged bladder type pressure accumulator for governor pressure oil system, however as per present international practice, Nitrogen charged bladder type pressure accumulators are more frequently used for such purpose. Hence, we recommend to keep both the options open for the contractor.

11.3 INLET VALVE

Butterfly type valves to serve as shut off for turbines mentioned in the feasibility study report (FSR) are suitable regarding head, cost, maintenance and performance.

Under clause 11.13, the word “cast steel” written against sealing system need to be replaced with “Rubber seal / Stainless steel seat”.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

In clauses 9.11.2 & 15.8.11, spherical valves need to be replaced with butterfly valves.

11.4 MECHANICAL AUXILIARY SYSTEMS

Mechanical auxiliary systems play vital role in almost every hydropower plant for its successful operation. Some of the mechanical auxiliary systems mentioned in the feasibility study report have been rationalized / added which are specified in the subsequent paragraphs.

11.4.1 Cooling Water System

Feasibility study report is silent about the provision of cooling water system which is considered integral part of a hydropower plant mechanical auxiliary system. A cooling water system will be installed in the powerhouse to supply sufficient cooling water for:

- Generator oil coolers.
- Oil coolers of turbine and Generator bearings.
- Turbine shaft seal.
- Governor (if required).

An open loop cooling system shall be provided for Attabad Hydropower station. Cooling water shall be directly taken from each penstock branch and run through a Coarse - Duplex Strainer and connected to a common raw water header through isolating valves.

Each unit will be equipped with its own cooling water system, but these will be interconnected to facilitate maintenance of the system and the operation during part-load operation during the winter season.

Water for the shaft seal will be taken from the downstream side of the cooling water filter system, passed through a fine-filter and then transferred to the shaft seal for cooling.

11.4.2 Oil Handling System

In the feasibility study report, stationary type oil filtration plant (centralized oil purification / handling system) is provided for turbine oil system. We do not anticipate to have centralized oil handling system for such size of plants and recommend to eliminate it. Instead, mobile / portable oil purifier provided to filter / purify the lubricating / hydraulic oil is sufficient. We also recommend to use common grade of oil for the unit lubrication and governor pressurized oil system to facilitate the delivery of oil when replacement oil is required. Provision will be made to guard against water pollution resulting from accidental oil spills in the powerhouse.

11.4.3 Fire Protection System

In clause 11.14.11, feasibility study states: “Oil storage rooms shall also be provided with CO^2 filled cylinders with auto release system initiated by smoke and fire detectors installed in the room”. We do not agree to provide auto release CO^2 for oil storage area due to safety hazard for humans and recommend to replace it with automatic water spray system. Water spray system shall also be provided for cable gallery. Additionally, foam fire-extinguishers will be provided at strategic locations in the oil storage and cable gallery areas.

In table 11.4 of feasibility report serial number 2 & 3, fire protection system for GIS building and Penstock Valve House are mentioned whereas there is no GIS building and Penstock valve house in the project. This needs to be corrected.

NFPA 851, Recommended Practice for Fire Protection for Hydroelectric Generating Plants mentioned in the report has been merged with NFPA 850, Recommended Practice for Fire

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Protection for Electric Generating Plants and High Voltage Direct Current Converter Stations. Hence NFPA 850 will be applied.

- **Fire Water Supply**

Overhead tank/s to fulfill water requirement as per NFPA-850 will be provided. The contractor shall submit overhead tank/s design along with proposal for its location for approval of the owner / owner's representative.

11.5 POWERHOUSE (PH) LAYOUT

Discrepancy regarding powerhouse dimensions is found, in clause 9.11.2 of Main Report Powerhouse dimensions are L-63 x W-20 x H-35 meters whereas in drawings the dimensions are L-45 x W-17.8 x H-22.5 meters (from foundation to crane corbel level).

After analyses of these dimensions, we recommend following changes / improvements:

- PH length (including loading/unloading bay) of 45m mentioned in the drawings should be increased to 52m. Unit center to center distance should be increased from 10m to 11m.
- Inner width of machine hall 14.5m should be increased to 15m, however total width of PH has to be increased from 17.8m to 29m excluding upstream and downstream walls for creating sufficient space to adjust auxiliary E&M equipment and other necessary areas in the PH.
- Machine hall floor level should be changed from 2306.2 m to 2308.0m, however other levels seem appropriate.
- In PH X-section drawing, the height of PH from foundation to crane corbel should be increased from 22.5m to 23.0m (revised corbel level will become 2322m). The height from crane corbel to roof inner level is not mentioned, however after consulting manufacturers' catalogues, we recommend that it should be at least 3.5m for EOT crane installation and availability of sufficient head space for its future maintenance. Inner roof level will be 2325.5m.
- The provision of draft tube stoplogs upstream of draft tube gates as shown in the powerhouse layout drawings are considered unnecessary.

11.6 PENSTOCK

Fewer details are provided in the feasibility study report regarding penstock. Certain shortcomings are also noted which are mentioned hereunder.

- Inconsistencies found with regards to penstock diameter and length in the main report and drawings which need correction.
- Material for steel penstock is missing. We recommend that material of penstock including branches and manifold shall be pressure vessel steel conforming to ASTM A516 Gr-70 or other equivalent international standard subject to approval of the owner or owner's representative. If thickness of any part of the penstock exceeds 38mm, normalized material shall be provided.
- Nothing is mentioned about length of each penstock branch, however diameter of 2.1m is specified which shall be rounded off to 2.0m. Each branch ends at connection with main inlet valve of 1.83m dia. via reducer.
- Sleeve type expansion joints are missing which shall be provided after each anchor block.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- Hold down straps for exposed penstock are missing which shall be provided.

11.7 HYDRAULIC STEEL STRUCTURES

11.7.1 General

This section includes the function, performance criteria and certain shortcomings which are mentioned in the subsequent paragraphs. Fewer details are provided in the feasibility study report regarding gates, stoplogs and trashracks. Also, proper description of civil structure for installation of Hydraulic steel structures (HSS) are not provided. However, all the civil structures for which Hydraulic steel structure will be installed are as flowing:

1. Power Intake Structure

- Power Intake Gates
- Power intake Stoplogs
- Power Intake Trash rack

2. Weir Structure

- Flushing Section Gate
- Flushing Section Stoplogs

3. Tailrace Structure

- Draft Tube Gate

11.7.2 Power Intake Structure

Twin intakes have been provided with gates and a set of stoplogs for control of water intake into the power waterway system. Two bays are provided at each waterway structure with trash rack required at the entrance to prevent entry of debris into the power waterway system. Hence, as per Vol-II -drawings there will be four sets of trash racks whereas in main report only one set is mentioned. The equipment provided at power intake will be as following:

1. Two (2) hydraulically operated fixed wheel gates.
2. One (1) set of stoplogs at upstream of Gate.
3. Four (4) sets of Trash racks at entrance of each bay.
4. One Trashrack cleaning machine.
5. One gantry crane operating on a runway spanning the entire structure will be provided for maintenance of intake gates and stoplogs.

- **Power Intake Gates**

Power intake Gates must control the flow into the headrace tunnel during filling of the waterways and isolate the reservoir from the waterway for inspection and maintenance of the waterway. Therefore, at each power intake structure one Fixed Wheel Gate will be installed, which will act as Emergency gate and fulfilling aforementioned controls. Each gate will be operated by oil hydraulic servomotor. For each set of maintenance / service gates a common oil pressure unit has been considered. Moreover, the oil pressure units will be interconnected to each other in order to promote safety.

Main Data:

Type of Gate	Fixed Wheel Gate
Number of Gate Openings	Two (2)
Number of Gates	Two (2), one in each waterway

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Number of embedded parts	Two sets
Type of Hoist	Hydraulic Cylinder
Approximate head on gate sill	~18.5m
Sealing	Four Sided

- **Power Intake Stoplogs**

One set of steel stoplogs will be provided at immediately upstream of each intake gate. It will be lowered when inspection or maintenance of the intake gate is required. The upper panel of stoplog will be provided with a filling valve in order to rise the stoplogs under balance condition. The stop log will be raised and lowered by a rail mounted gantry crane.

Main Data:

Type of Stoplogs	Vertical Slide
Number of Sets	One set
Handling of Stoplogs	25t Gantry Crane with lifting beam
Approximate head on gate sill	~18.5m
Sealing	Four Sided

- **Power Intake Trash rack**

A trash rack will cover the entrance to each power intake. The trash racks will be of the non-withdrawal type, consisting of fixed inclined trash rack panels supported by streamlined cross beams. The trash rack panels and the corresponding supporting structures will be designed to withstand the design pressure with a safety factor of 1.5. The bars of the trash racks will be spaced so as to block floating debris large enough to damage the turbines. This way floating debris is prevented from entering the waterway.

A trash rack cleaning machine mounted on rails on the intake structure deck will remove trash and debris collected by the trash racks.

Type of Trash rack	Inclined, Fixed type
Number of Sets	4 sets
Handling of Trash racks	initially with mobile crane and afterwards with the help of winch machine provided with cleaning machine
Cleaning of Trash racks	Trash rack Cleaning Machine (pay load capacity = 1 Ton)

11.7.3 Weir (Sediment Flushing Channel / Under sluice)

Following hydraulic steel structures are provided in the FSR:

1. Three (3) hydraulically operated Radial gates.

2. One Set of Stoplogs at upstream of Gate.

3. One set of Stoplog at downstream of Gate

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

As the under sluices utilized for sediment flushing are being avoided in the proposed alternative layout due to geotechnical issues in this review report, therefore, above gates and stoplogs will be excluded.

- **Alternative Flushing Tunnel**

To flush out sediment that is likely to be deposited in front of the intake structure, a new tunnel of 5.5m diameter is proposed in this review report. The flushing tunnel intake will be placed near the power tunnel intake at a distance of about 7m and at a lower level than the power intake structure. It is proposed that flushing tunnel intake will be similar to power tunnel intake and have following hydraulic steel structures (starting from upstream).

- One set of vertical lift maintenance stoplogs, (welded steel structure) handled by Gantry crane / EOT crane.
- One vertical lift fixed wheel gate to control water having hydraulic type hoist (quantity of the gates will be decided during detail design stage).
- One no. gantry / EOT crane (for installation and handling of stoplogs; installation of gate and its removal for future maintenance).

During detail design stage, the EPC Contractor will design and prepare arrangement of flushing tunnel intake structure (including HSS design) viewing best engineering practices subject to approval of the Employer / MC.

11.7.4 Tail race Structure

- **Draft tube Gate**

The draft tube of each turbine unit will be provided with (01) vertical lift bulkhead gate in order to dewater the turbine for installation, maintenance, inspection and repair of turbines. The operation shall be under balance head condition (created through filling valves) with the help of electric overhead travelling crane. The provision of draft tube stoplogs is uncertain/confusing as mention in main report clause 11.15.7.2 and also depicted /shown on drawing (AFS-PH-435), but not included in scope at any other part of report. Provision of stoplog along with bulkhead gate will be unnecessary as the draft tube gate will be enough to fulfill the above mentioned requirements.

Type of Gate	Vertical lift bulkhead type with filling valve
Number of Gate Openings	Three (3)
Number of Gates	Three (3)
Number of embedded parts	Three sets
Type of Hoist	Overhead travelling crane with lifting beam
Approximate head on gate sill	~12m
Sealing	Four Sided

11.8 SUMMARY OF REVIEW FINDINGS

A summary of Review findings for Hydromechanical studies is presented in Table 11.4

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

TABLE 11.4: Summary of Hydraulic Steel Structures Mentioned in the FSR (2021) and Shortcomings Identified in the Review Remarks									
Description	**Type of HSS**	**Qty.**	**Embedded Parts Qty.**	**Clear Opening Dimensions (W x H)**	**Water Level (m)**	**Sill Elevation (m)**	**Head (m)**	**Type of Hoist**	**Shortcomings Identified in the FSR and Review Report Remarks**
Power Intake									
Power intake gate	Fixed Wheel Gate	2 Nos.	2 Set	4m x 5m		El. 2402.50	18.5	Hydraulic cylinders	
Power intake Trashrack	Inclined Fixed/non-withdrawal type	1 set	1 Set	4.5m x 5m		El. 2404.0		Mobile crane	There are 4 no. of bays/ intakes for which at least 4 sets of trash racks are required, whereas in main report table 11-9 only 1 set is mentioned.
Power intake Stoplogs	Vertical slide	2 set	2 Set	4m x 5m		El. 2402.50	18.5	Gantry crane (rail mounted) or mobile crane by lifting beam	
Trash rack cleaning machine									
Gantry Crane (25t)	Electrically operated Gantry Crane	1							

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

TABLE 11.4: Summary of Hydraulic Steel Structures Mentioned in the FSR (2021) and Shortcomings Identified in the Review Remarks									
Description	**Type of HSS**	**Qty.**	**Embedded Parts Qty.**	**Clear Opening Dimensions (W x H)**	**Water Level (m)**	**Sill Elevation (m)**	**Head (m)**	**Type of Hoist**	**Shortcomings Identified in the FSR and Review Report Remarks**
Weir (Sediment Flushing Channel / Under sluice)									
As the under sluices utilized for sediment flushing are being avoided in the proposed alternative layout due to geotechnical issues in this review report, therefore, above gates and stoplogs will be excluded.									
Alternate Flushing Tunnel									
Stoplogs	Vertical Slide Type	1 set	1 Set					Gantry / EOT Crane	The Gantry crane provided for handling of power intake stoplogs same will be utilize for handling of flushing tunnel stoplogs.
Intake Gate	Fixed Wheel Gate	1 no.	1 Set					Hydraulic cylinders	
Gantry / EOT Crane	Electrically operated	1 no.							
Tailrace Structure									
Draft tube Bulkhead Gate with filling valves	Vertical lift Bulkhead	4	3	3m (H)		El.2295.00		Overhead Travelling Crane	For three draft tube openings, four gates are provided which need to be corrected as three. It is written: “One electrically operated overhead travelling crane will be provided for handling the draft tube gates and inlet stoplogs of tailrace tunnels with the help of lifting beams.” This is incorrect, there are no tailrace tunnels and so the stoplogs. This need correction.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

12 REVIEW OF ELECTRICAL EQUIPMENT STUDIES

12.1 GENERAL

Electrical equipment general layout / arrangement drawings are missing in Feasibility Study Report (FSR). The same will be added during preparation of Draft EPC Tender Documents. It is assumed that there is no problem regarding transportation of heavy construction and permanent equipment as mentioned in Section 1.6 of FSR, “Access to the Project Area”

Reference Standards details for each electrical equipment are missing in FSR. All equipment under these Technical Specifications will be manufactured and tested in accordance with the latest revision of IEC/IEEE/BS/ASTM international standards. The same will be added for each Electrical Powerhouse Equipment during Draft EPC Tender Documents.

In general, there are many contradictory statements in the Feasibility Study Report (FSR). Discrepancies found during Feasibility Review for each Electrical Powerhouse Equipment are described in following sections.

12.2 REVIEW OF POWERHOUSE ELECTRICAL WORKS STUDIES

The Electrical Equipment/Components of the Powerhouse are as below.

- Generators & Excitation System(s)
- Generator Circuit Breaker(s)
- Power Transformer(s)
- Station Service Transformer(s)
- Unit Auxiliary Transformer(s)
- Medium & Low Voltage Switchgear(s)
- Control & Instrumentation System
- Protection & Relay System
- DC & UPS System
- Cables
- Illumination & Small Power System
- Emergency Diesel Generator (EDG)
- Electrical Workshop
- Earthing and Lightning Protection System
- Fire Detection and Alarm System

12.2.1 Generator & Excitation System

Under section 12.3, of FSR, it is mentioned that *“A flywheel of suitable inertia will also be mounted on the same shaft to keep the constant speed of the generator & avoiding the fluctuations/harmonics resulting from varying loads and switching surges.”* This statement is not valid for Project of this size and will be deleted.

Under section 12.3, following specified in FSR *“Generator terminals are connected by isolated phase bus (IPB) to Generator circuit breaker (GCB).”* Isolated phase bus duct is utilized for large size generators with higher current rating. This section needs to be reviewed during preparation of Draft EPC Tender Documents.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Under Table 12-1, power factor 0.85 is specified. As per requirement of Pakistan Grid Code, power factor range for generator should be 0.8 lagging to 0.9 leading. Power factor needs to be corrected during preparation of Draft EPC Tender Documents.

Under Section 12.3.2, following is specified in FSR, *"The generators are capable to run at 15% continuous overload without exceeding the temperature limits of class F insulation."* This statement is not supported in any international standard and it shall be deleted.

Under Table 12-1, Nominal capacity of each generator is given as 21.2MVA (18MW). Considering the efficiency of turbine 93% instead of 91.5%, the generators nominal capacity and associated equipment rating will be revised and provided in the draft EPC bidding documents.

12.2.2 Generator Circuit Breaker

Under 12.1, 2nd para, 2 GCBs are mentioned, whereas in 3rd para, it is mentioned that *"The generators shall be connected to their respective unit transformers (three phase) through GCB (3 GCBs).* However, all three generators are connected through circuit breakers (commonly known as GCB) to Unit transformers and the same shall be provided in the draft bidding documents.

12.2.3 Power Transformer

Under Section 12.5, following specified in FSR, *"An allowance of 10% continuous overload is also proposed."* This statement needs to be checked and verified in accordance with requirement specified in IEC 60076.

Under Table 12-2, transformer nominal capacity 22MVA specified. This is not standard rating for power transformer. MC will provide the generator step-up transformer rating in the draft EPC bidding documents in accordance with the generator rated capacity.

Under Table 12-2, OFF Load Tap changer is specified. It is highly recommended to specify an ON-Load Tap Changer for power transformer and the same shall be proposed during preparation of Draft EPC Tender Documents.

There is no explosion prevention system specified for power transformer. The same will be considered during preparation of Draft EPC Tender Documents.

12.2.4 Station Service Transformer

Under section 12.6, one (01) No. Station Service Transformer has been proposed with 2 MVA capacity, 11/132 kV voltage rating, ONAN cooling and Dry/Oil Type. ONAN cooling with Dry type is not correct. This section needs to be reviewed during preparation of Draft EPC Tender Documents.

12.2.5 Unit Auxiliary Transformers

Under section 12.7, two (02) No. Unit Auxiliary Transformers have been proposed each with 630 kVA capacity, 11/0.4 kV voltage rating and ONAN cooling type.

For Unit Auxiliary Transformers, MC recommend to use Dry Type Transformers. MC will provide the three-unit auxiliary transformers along with the vector group in the draft EPC bidding documents.

Under section 12.7, two (02) No. Auxiliary Transformers have been proposed each with 400 kVA capacity, 11/0.4 kV voltage rating and ONAN cooling type.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Impedance of 4% for these type of transformers needs to be reviewed during preparation of Draft EPC Tender Documents. Vector Group is also missing for these transformers.

12.2.6 Medium & Low Voltage System

- **Powerhouse**

Under section 12.8.2, it has been mentioned that switchgear planned to be located in a separate room in the 132 kV switchyard. This statement needs to be reviewed during preparation of Draft EPC Tender Documents.

Under Section 12.8.2, it has been mentioned that there are some 11kV feeders to supply power to rural areas. In this regard, MC will not consider the provision of 11kV feeders from Attabad plant in draft EPC bidding documents. It is recommended to power-up the nearby rural areas from the local grid.

Under section 12.8.2, There are some important parameters of MV Switchgear which are missing and needs to be specified e.g. LSIG Digital Trips, Protection Class, Busbar Material, Continuous Current of Bus and Bus bar Insulation etc.

The details of CT, PT etc. are missing in the report which needs to be augmented during preparation of Draft EPC Tender Documents.

Under section 12.8.2, Single Line Diagram and Rated Short Circuit Current needs to be verified during preparation of Draft EPC Tender Documents.

- **Medium and Low Voltage AC Supply**

Under Main Single Line Diagram, 0.85 Power Factor has been specified which needs to be corrected as 0.8 lagging, 0.9 leading as per NEPRA Grid Code.

Under section 12.8.3, there are some important parameters of LV Switchgear which are missing and needs to be specified e.g. LSIG Digital Trips, Protection Class, Busbar Material, Continuous Current of Bus, Bus bar Insulation and Separation class as per IEC for LV Switchgear etc.

Further, Station Service Transformer capacities and quantities will be verified during preparation of Draft EPC Tender Documents.

There is nothing stated in FSR about Motor Control Centres (MCCs). We recommend to add the details of the same during preparation of Draft EPC Tender Documents.

12.2.7 Control & Instrumentation System

Under Section 12.19.2, MC will not consider the provision of control and instrumentation system for the spillway/weir in the draft EPC bidding documents as it is mentioned in section (18) that the ungated spillways shall be proposed.

Under Section 12.19.3, comprehensive detail is mentioned regarding interface of Attabad Lake HPP with Existing NTDC/NPCC SCADA System. However, in Section 13.2 of this report it is mentioned that entire region of Gilgit Baltistan is not connected with the national grid due to its mountainous terrain. Even there is no any Regional Load Dispatch Centre available in the entire region. This mismatch needs to be clarified.

MC understand that currently there is no Regional Load Dispatch Centre or NTDC/NPCC SCADA System exists/available in the entire region. At this stage, we only require to have provision of SCADA System for providing future interlinking with Regional Load Dispatch

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Centre or NTDC/NPCC SCADA System (future provision). The tele-control gateway shall be used for communication with Regional Load Dispatch Centre or NTDC/NPCC SCADA System.

General description regarding the design philosophy of the Plant Control System (PCS) and main functions/features of the Unit Local Control Panels (ULCPs), Local Control Panels (LCPs), Operator Workstation, Engineering Workstation etc. are not specified. The same will be specified during preparation of Draft EPC Tender Documents.

Automatic Load Frequency Control (ALFC) of generators from the NPCC is mentioned. We recommended that this requirement is not necessary for Attabad Lake HPP.

Under Section 12.19.1, it is mentioned that the generating unit operation will be carried out **remotely** from the machine hall floor level of the **underground powerhouse**. However, in Section 7.1, it is mentioned that **surface powerhouse** is viable at site.

MC will provide the specifications for surface powerhouse in the draft EPC bidding documents.

12.2.8 Protection Equipment

Under Section 12.9.2, it is specified that all relays shall preferably be of the same make (manufacturer) to build a uniform modular system. While the next para specified that general principal for the protection is that all parts of installation are covered by two high speed protection schemes which are independent to avoid common mode failures. These two requirements contradict each other and shall be corrected. Protection schemes whether “Primary & Backup” OR “Duplicate Protection” will be re-evaluated during preparation of Draft EPC Tender Documents.

Instrument transformers requirements for protection equipment is not specified.

There are some protections, which are not specified in FSR. All required protections shall be considered during preparation of Draft EPC Tender Documents.

12.2.9 DC & UPS System

Under section 12.13, one 220V battery system, with one main distribution switchgear and battery charger is proposed in FSR. The proposed scheme in FSR and as shown on single line diagram is not suitable and reliable. Moreover, there is no backup system for Emergency Lighting System covered in FSR.

We recommend 220 V DC supply system with two (02) no. DC distribution boards, two (02) no. Rectifiers, one (01) no. battery bank of ample capacity and two (02) no. battery chargers. Where 48 V DC or 24 V DC voltage is required, DC/DC converters shall be used. 220 V DC distribution boards shall be fed from 400 VAC switchgear through rectifiers.

Regarding UPS, we recommend one (01) no. 230 V AC UPS System. Normally UPS will be fed from 400 AC Switchgear. In case of failure of normal power supply, UPS will be fed from 220 V DC supply system through two (02) No. DC/AC inverters. The recommended scheme for UPS will be specified during preparation of Draft EPC Tender Documents.

12.2.10 Cables

Under Section 12.14, technical parameters of cables are missing. We recommend to add the technical parameters of cables during preparation of Draft EPC Tender Documents.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

12.2.11 Illumination & Small Power System

Under Section 12.15, LED lighting system is mentioned in the start of the section. However, technical details of fluorescent light fittings are mentioned in this section.

MC will provide the specifications of LED lighting system in the draft EPC bidding documents.

12.2.12 Emergency Diesel Generator

Under section 12.16, capacities and quantities of emergency diesel generators will be re-evaluated during preparation of Draft EPC Tender Documents keeping in view the loads of each area.

12.2.13 Electrical Workshop

Workshop details will be re-evaluated during preparation of Draft EPC Tender Documents.

12.2.14 Earthing & Lightning System

Under section 12.18, earthing system has been specified. Moreover, there is no earth resistance value specified. Further, lightning protection system is not covered in FSR which is an essential part of building/outdoor equipment protection.

We recommend earthing and lightning protection system for the powerhouse, switchyard and intake area with earthing resistance less than 1 ohm for each specific area. EPC contractor shall measure the earth resistivity and will perform earthing calculation in accordance with IEEE 80-2000 standard. The same will be specified during preparation of Draft EPC Tender Documents.

12.2.15 Fire Detection & Alarm System

Fire Detection & Alarm System is not specified in the FSR which will be added during preparation of Draft EPC Tender Documents.

12.2.16 Drawings

- **Single Line Diagrams**

Single Line Diagrams for Powerhouse, AC Distribution and other drawings needs to be reviewed / updated during preparation of Draft EPC Tender Documents.

- **Plant Control System Drawing (Asf-Em-455)**

The Plant Control System (PCS) drawing is not in-line / coordinated with the requirements specified in the relevant section of the FSR. Separate Control System for Auxiliaries and DC System are shown in the drawing and there is no description regarding the functionality of these Control Systems. Moreover, separate Control System for Intake/Tailrace is shown in the drawing which is incorrect as intake and tailrace are two separate and distant structures of the Project.

The updated / revised drawing of Conceptual Layout of Plant Control System (PCS) will be added during preparation of Draft EPC Tender Documents.

12.3 REVIEW OF SWITCHYARD STUDIES

12.3.1 Review Findings

Following are the review findings and comments for Switchyard studies carried out at Feasibility stage.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- Short circuit study is not available with us. However, we have considered short circuit rating of the equipment as 40kA as per latest practice of NTDC.
- Only the time frame of seven (07) months is mentioned for the construction of 132kV Switchyard. Kindly clarify us regarding the total time frame required/estimated for the completion of the 132kV Switchyard including preparation of Tender Documents, Evaluation of Bids, Award of Contract, Construction phase and Defects Liability Period etc.
- Proposed switchyard will be of 'Conventional AIS' type as mentioned in the Switchyard Main Single Line Diagram. It is noted that the word 'GIS' is mentioned at several places in the Feasibility Report for the type of 132kV Switchyard. We have considered 132kV AIS switchyard keeping in view the availability of land and difference in GIS price.
- The location of the switchyard shall be finalized during the detail design stage. However, the tentative location of 132kV switchyard will be provided in the draft EPC bidding documents.
- Bus coupler should be included as two different supplies will be connected with the 11kV busbar.
- Bus coupler should be provided for LV AC (400V) system.
- MC will provide the scope of remote end line bays (including Step-Down Transformers) in the Transmission lines (Lot-II) of draft EPC bidding documents.
- 132kV switchyard /switchgear control system will be based on IEC 61850 for SAS system with provision to control from DCS of power house.
- DC distribution panel to be provided in switchyard control room even D.C. supply feeder will be provided from power house.
- Clearances and equipment insulation levels to be coordinated with the altitude of switchyard area from sea level.
- 132/11kV power transformer MVA rating shall be coordinated with colony and other present & future load requirement as exact load of the power transformer is not available with us.
- MC understand that three (03) transmission line circuits (one double circuit transmission line circuit and one single circuit) with twin bundle rail conductor for 67MVA is more than requirement. Single circuit with single rail conductor per phase is enough for power evacuation. For (N-1) contingency maximum two circuit (one double circuit or two single circuit transmission lines) will serve the purpose. However, T/L Expert should decide the number of lines keeping in view the actual power transmission envisaged for future. We have considered single rail conductor/per phase for transmission line and 132kV switchyard equipment rating will be as under:
- 132kV Circuit Breaker (CB) 1250 A with 40kA short circuit rating
- 132kV Disconnector Switch (DS) 1250 A with 40kA short circuit rating
- 132kV Current Transformer (CT) 1250 A with 40kA short circuit rating
- 132kV busbar rating 2000 A with 40kA short circuit rating
- In case of any change in short circuit level and number of lines the configuration of 132kV switchyard and equipment rating have to be revised accordingly.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- Table 14-17 i.e. ‘cost estimate for 132kV Switchyard Equipment’ of ‘Volume-I main report of feasibility study of Attabad lake HPP’ indicates US $ price column as per the dollar exchange rate of 157 PKR. Prices should be revised as per the latest dollar exchange rate. Moreover, the cost of power transformer, tariff metering equipment and civil works shall be included.

12.3.2 Main Single Line Diagram and Protection Single Line Diagram

- **Main Single Line Diagram (ASF-EM-451)**
- Current transformers (CTs) have not been indicated on the main single line diagram (ASF-EM-451). The same shall also be included.
- 132kV Bus bars ratings have not been indicated on the drawing. These shall be as 2000A, 40kA and 145kV current carrying capacity, short circuit level and rated voltage level respectively.
- 132kV Bus bar VTs have not been indicated on the main single line diagram (ASF-EM-451). The same should be included.
- It is not clear whether tariff metering of 132/11kV power transformer will required or not.
- Disconnector switch at HV side of step-up transformer shall also to be included.
- Line earth switch shall be shifted toward line side.
- VT for synchronism check to be provided on HV side of step-up transformer.
- Line trap and CCVT have not been indicated on the main single line diagram (ASF-EM-451). The same should be indicated on the drawing.
- Secure metering system (SMS) equipment such as CTs and CVTs for main and backup tariff metering system to be included at HV side of each unit transformer.
- **Protection Single Line Diagram**

Protection scheme to be revised as detailed below.

132kV Transmission Line Protection

- Distance Set-I with built-in autoreclosure, fault recorder, over current, stub protection.
- Distance Set-II with built-in autoreclosure fault recorder, over current, stub protection.

132/11kV Transformer

- Transformer differential protection and over current protection shall also be included/indicated on the drawing.
- REF shall also be included/indicated on the drawing.

12.3.3 11/132kV Unit Transformer

- Differential Set-I with built in overflux thermal overload, REF, HV, neutral over current voltage restraint over current.
- Differential Set-II with built in overflux, thermal overload, neutral over current, HV over current, LV over current voltage restraint over current.
- Over current protection to protect stub area in case of both differential relays are out of service shall also be included/indicated on the drawing.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- Overall generator transformer differential is not required as per adopted scheme.
- Circuit breaker failure protection scheme should be included.
- 132kV centralized busbar protection should be included.
- Trip circuit supervision protection should also be included.

12.4 REVIEW OF DISTRIBUTION STUDIES

Following are the review findings and comments on Distribution studies carried out at Feasibility stage.

- Sizes of the Distribution Transformers/DG sets shall be finalized at the detailed designing stage keeping in view the exact normal/emergency load requirements to be fed from the referred Transformers/DG Sets.
- WAPDA Standards/Specifications shall be followed for finalization of the basic design parameters of the electrical equipment/material.
- Technical specifications of the electrical equipment/material shall be prepared at the detailed design stage clearly indicating following parameters:
- Supplier details w.r.t their in house testing procedures, machinery/ skilled staff, testing equipment/tools to ensure after sales services support.
- Warranty/guarantee procedures/requirements to ensure maintenance/trouble free operation of the equipment and system thereof.
- Manufacturing standards of the material/equipment to check the compliance of the product as per applicable international standards.
- Operation & Maintenance setup of the manufacturer/supplier in the vicinity of the project for smooth operation of the system.
- Valid authorizations of the manufacturers (outside the country) for the local suppliers for warranty claims and to establish genuineness of the product.
- Factory Acceptance Tests (FATs) and Site Acceptance Tests (SATs) details to confirm/verify the delivered material in line with the project requirements.
- Requisite applicable type/routine test reports/certificates to check tested values/results in line with the parameters declared in the brochures/technical data of the equipment/material.
- Payment terms /measurements of the installed/delivered material.
- Ratings/sizing of the electrical components/equipment/material like Transformers, DG Sets, cables, Switchgear components, light fixtures, switches, sockets, wiring, conduits/pipes and all allied/associated accessories shall be finalized at detailed designing stage.
- In addition to the recommended lux levels, other lighting requirements like uniformities, Glares etc. shall also be defined for the particular areas/rooms/buildings.
- In various areas fluorescent and High Pressure Sodium Vapour Light fixtures/lamps are mentioned. Keeping in view the energy efficiency aspects (low wattage & higher efficacy) LED indoor as well as outdoor light fixtures shall be proposed for the subject project.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- Separate earthing arrangements shall be made for metallic parts of the equipment/structure and the Circuit Protective Conductor (CPC).
- Costs of the electrical works cannot be reviewed as quantities/ratings of the electrical equipment/material are not available at this stage.
- Complete architectural plans of the colony/ buildings including external areas shall be required from EPC contractor for detail design review.

12.5 REVIEW OF SCADA AND TELECOM STUDIES

12.5.1 Functional Overview / Scope of Work

The following to be included in the SCADA and Telecommunication system hall.

- An In-plant Instrumentation and Control system allowing monitoring and control of the plant (referred hereafter as the station) including generators, all auxiliaries, the associated switchgear, and 132 kV switchyard.
- Establishment of end-to-end digital power line carrier (DPLC) and protection signaling links.
- Installation of Power line coupling equipment for coupling the DPLC equipment to the overhead transmission lines.
- Main Distribution Frame (MDF) for interconnection of PAX to DPLC and DAM/CC/ ADM equipment for speech communication.
- Establishment of duplicated data communication links between Attabad switchyard and NPCC Islamabad.
- Establish complete fiber optic & digital protection signaling links using OPGW to be supplied.
- Operational telephone exchange (PAX) system at Attabad S/S including interconnecting and interface equipment required at Attabad S/S and the peripheral substations for complete integration with NTDC telephone network provided for NPCC.
- SCADA system for remote monitoring and control of Attabad switchyard from NPCC. Database modification and augmentation in mimic display at NPCC.
- Interconnection of SCADA Data Gateway (SDG), telephone PAX and protection relays to the DPLC and optical fiber equipment for communication over DPLC and Fiber Optic links.
- Establishment of two data links from Attabad Substation to NPCC Islamabad on physically separate routes. Scope includes the works to be done at the intermediate substations.
- 48V DC power system at Attabad S/S for powering the equipment.
- Extension and interconnection with the existing PAXs at peripheral substations.
- Site Survey by the Contractor of the existing facilities to determine required interface works and submittal of the Site Survey Report within four weeks of Contract Award. The Survey Report shall be comprehensive and provide detailed information of existing facilities.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- Engineering, design and supply of any devices required for proper interface and working of fully functional telecommunication and SCADA systems even if not specifically mentioned in Scope of Work/Price Schedules.

- Co-ordination with other contractor(s) shall also be deemed to be included in Contractor's scope of work.

12.5.2 Station Instrumentation and Control (I&C) System

This section covers the design, supply, installation, testing and commissioning of Monitoring and Control system (MCS) for 132 kV Attabad substation. Monitoring & Control system for 132kV substation shall include control, monitoring, fault recording, events recording and supervision functions complete with equipment interfaces for the entire substation including but not limited to following.

- Control of substation equipment including circuit breakers, disconnectors and earthing switches to be included.
- Interfacing with protection relays to be included.
- Measurements of voltages, currents, frequency, watts, and VARs through transducers.
- Measurement of status indications.
- Alarm annunciations.
- Interfacing with station voltage regulation equipment for indication and control.
- Event logging and fault recording functions based on inputs from relays and other substation devices/equipment.

12.5.3 Recommendations

1. As per Clause 12.19.4, two alternatives have been discussed for SCADA / Tele-Control by NPCC. Please be noted that as per NTDC's latest requirement all new substations / powerhouses shall be connected via Gateway instead of Remote Terminal Unit (RTU). Therefore, it is recommended to connect the powerhouse/ switchyard (SCADA) via Gateway as discussed in Alternative-2.

2. As per Clause 12.19.8, it has been stated that, "The equipment for teleprotection will have the flexibility for transmission over any communication medium i.e. PLC or OPGW." Please note that, the equipment related to Fiber Optic System (SDH, PDH, AFOC, ODF etc.) is missing in the feasibility report. It is recommended to include complete details of the Fiber Optic System equipment.

3. As per Clause 12.19.9, it is stated that, the Public Address system shall be required at powerhouse only. It is recommended to install the PAS system in 132kV Switchyard & Residential camp also.

4. As per Clause 12.19.12 wherein it is stated that, CCTV system shall be required for the powerhouse. It is recommended to install the CCTV system at switchyard, residential camp & complete powerhouse for the fool-proof security.

5. It is recommended to provide internet & TV Services (Triple Services including Telephone) for the residential camp.

6. Please note that it is recommended to install a separate Telephone exchange (PABX/PAX) for the powerhouse & switchyard.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

7. As per Clause 12.19.7.3, it is stated that, “The control room will be additionally connected to the public telephone system to guarantee the communication with the power plant in case of failure of the PLC system”. It is recommended an additional public telephone system (external connection) for powerhouse, switchyard & residential camp. It is recommended to provide public telephone system for the external communication.

8. It is recommended to provide a separate LAN within Powerhouse, switchyard & residential camp.

PUBLIC PROCUREMENT REGULATORY AUTHORITY (PPRA) EPADS

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

13 REVIEW OF TRANSMISSION LINE STUDY

Transmission line studies for Attabad Hydropower project carried out at Feasibility stage have been reviewed and following are the review findings.

13.1 TRANSMISSION LINES FROM ATTABAD LAKE HPP

The capacity of the double circuit transmission line is sufficient for evacuation of the 54 MW power of the proposed ALHPP and future generation of power.

In order to meet 'N-1' reliability criteria, double circuit 70km transmission line will also be necessary because in case of contingency outage of one circuit, the complete power will be lost. The option of single circuit is also otherwise not feasible because system voltage and stability will remain at stake even under normal operating conditions, if full capacity of about 130 MW on single circuit line at (40° C min. at wind vel. Of 0 m/s with Current carrying capacity of 626 Amperes for Rail conductor considering Power factor as 0.9.at 132 kV) is utilized with future local generation.

Hence keeping in view the 'N-1' contingency criterion as well as possibility of induction of additional power from future power projects in the area, double circuit transmission line is also recommended up to the existing 33Kv Grid station at Sost.

However, keeping in view the need of Power in current scenario, 132kV Single Circuit Transmission Line is sufficient to fulfill the Power requirements. Therefore, the scope of 132kV Single Circuit T/Line to Sost Grid has been considered in the EPC Contract.

13.2 TYPE OF TOWERS AND BASIC DATA

ZM family of towers are recommend to be used only for the 132Kv transmission line to be constructed in normal terrain. Because of steep gorges area and uncertainty of length of different spans at this stage when no detailed survey has been carried out, and the route may involve crossing of valleys, rivers etc., it would become very difficult to manage to construct the line with ZM type towers, rather we expect to install heavier towers of 220Kv on most of the locations. It is therefore recommended to use mix of 220Kv towers EA, EG & JKD types with few ZM type tower locations especially when ACSR Rail conductor is used. These 220Kv towers would also help covering long spans while maintaining the required strength of the line. Accordingly the cost estimate of the line should also be revised..

The Deflection Angle of ZM-1 mentioned as 30° is a typographical error.

The deflection Angle is **0-2°** for ZM-1 Type Tower.

13.3 INSULATORS

Normally 80KN insulators are used in case of LYNX conductor. For Rail conductor 100 KN insulators are recommended in suspension and 120 KN in Tension assemblies because of long spans in crossings and abnormal/steep hilly terrain. Also to cater for ice loading , after study, we might require to increase the length of strings that would necessitate to use 220kV towers. Additional quantity of insulators as such required for these lines should also be valued in the cost estimate.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

13.4 LOAD FLOW STUDIES

The evacuation of power generated at Attabad Lake HPP, is proposed through a 27km, 132kV double circuit of Rail conductor, from ALHPP to the existing (to be upgraded to 132/66/11 kV) Aliabad Grid station and further disperse the power in the Regional Grid Network (RGN).

Along with double circuit 132 kV transmission line to Aliabad, a 132 kV single circuit, with Rail Conductor, of 70 km transmission line is also proposed up to the existing 33kV grid station Sost which is already in operation to cater for the domestic electricity demand and likely to be upgraded to 132/33/11 kV grid station.

Review of the proposed Power Evacuation scheme has revealed that the proposed Double circuit of Rail Conductor at 132kV from ALHPP to Aliabad Grid Station would capable of evacuation of the power generated at ALHPP and upcoming Power Projects in the area, in addition to satisfying the N-1 criterion, as Rail Conductor can carry 20MVA power.

Presently Gilgit-Baltistan area grid of 140 MW capacities is operating in many islands and is not connected to any grid system. Presently the power network is based on Off-Grid and the aim of the project is to bring them on On-Grid in the region and readiness for further connection to the National Grid.

Because of non-availability of Data of any Regional Grid Network and it's inter connection with National Grid, Load Flow Studies cannot be performed at this stage. However Load flow Studies should in added in the EPC scope, which should be performed prior to the COD of the Project.

14 REVIEW OF PROJECT QUANTITIES AND COST ESTIMATES

14.1 GENERAL

Project Quantities and Cost Estimate studies are under Chapter 14: Project Quantities and Cost Estimates of Volume-1: Main Report of the Feasibility study 2021. It presents the estimation of quantities for Attabad Lake Hydropower Project on the basis of feasibility drawings. Following are the review findings for quantity and cost estimation of various works of the project.

14.1.1 Rate Assumption

Escalation allowance by EPC shall be taken care of while quoting the rates for material, manpower and equipment as feasibility rates are based on WAPDA CSR of March 2021.

14.1.2 Price Index

For Local & Foreign cost component the rate of 1 US$. EPC shall consider the actual conversion rate of local currency rate at the time of bidding while quoting his rates.

14.1.3 Development of Unit Rates

Review of Unit Rate development for Labor Cost and Material cost during the course of Feasibility studies is given hereunder.

Labor Cost

The rates of wages for the skilled, un-skilled and operators for various construction equipment are based on market wages in Hunza District of March 2021 shall be considered by EPC at the time of bidding.

Material Cost

The material cost considered in the feasibility study is based on the prevailing rates of March 2021 which shall be adjusted as per the material cost at the time of bidding by EPC Contractor.

14.1.4 Rate Analysis

The rate analysis was worked out for FSR by assuming that,

- Work will be carried out for 8 hours per day and
- 26 working days per month

The EPC Contractor will work at site as per his planning which may exceed to round the clock working in two shifts and work throughout the month during summer season keeping in view the Project construction timelines.

14.2 QUANTITY AND COST ESTIMATE OF MAIN WEIR AND FLUSHING SECTION

The estimated cost for the construction of Main Weir as per MC modified Alternative-I A proposal will be on much lower side as mentioned in Feasibility study for which needs to be confirmed by EPC Contractor after finalizing detail design.

The estimated cost for the construction of sediment flushing section as per MC modified Alternative-I A proposal for the construction of flushing tunnel will be quite on lower side as mentioned in Feasibility study for which needs to be confirmed by EPC Contractor after finalizing detail design.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

14.3 QUANTITY AND COST ESTIMATE OF GEOTECHNICAL WORKS

Table 14-2 (Feasibility Report Volume 1) shows that the quantity of excavation at Main Weir, Cofferdams and in under sluices is 92.78% of total excavation. This aspect is illustrated in Table 14.1.

Table 14.1 Review of Quantity Estimates for Excavation Works

Description	Reported Quantities	Proportion of work
Project Excavations	**cum**	**%**
Main Weir	1,008,000	38.87
Under Sluices	1,400,000	53.98
Power Intake, Low Pressure Headrace Tunnel, Surge Tank and Penstock	98,160	3.78
Powerhouse and Tailrace Channel	87,044	3.35
TOTAL	**2,593,204**	**100**

The accuracy of the excavation estimates is unlikely due to availability of cross-sections 50 m apart. Furthermore, disturbance of slided mass can result in further sliding which may increase the quantity of excavation.

The main risks for the increase in estimated cost for the proposed alternative from geotechnical point of view are listed below.

a. The increase in the cost of soil improvement to be applied under the project components.

b. The risk of increase in excavation volumes in the weir location. Especially on the right bank.

c. The risk of slopewash movement in the neighbourhood of powerhouse triggered by the construction activities.

14.4 QUANTITY AND COST ESTIMATE OF HYDROMECHANICAL WORKS

- Steel penstock per ton. Cost mentioned in the table 14-11 of Feasibility report is on lower side and need to be increased.

- Review Comments on hydro-mechanical equipment cost given in Table-14-14 of Feasibility report are given below.
  i. Cost of hydraulic steel structures is on lower side and need to be increased,
  ii. Cost of power intake stoplogs is missing which need to be included,
  iii. Cost of weir gates and stoplogs is missing which need to be included.

- Review Comments on hydro-mechanical equipment cost given in Table-14-15 of Feasibility report are given below.
  i. Cost of hydro-mechanical equipment is a bit on lower side and need to be increased,
  ii. Workshop equipment cost is considerably low and need to be increased,
  iii. Cost of spare parts and erection & testing equipment and maintenance tools is missing which need to be included,
  iv. Cost of two (02) powerhouse elevators is considered whereas its quantity mentioned in the clause 11.14.18 is one (1). It needs correction.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

14.5 QUANTITY AND COST ESTIMATE OF TRANSMISSION LINE WORKS

- It is recommended that instead of cost estimates made on some thumb rule, the detailed survey should be carried out at the earliest well before the Tender of the project for EPC contract is floated, and the quantities closer to the actual requirement should be given in the BOQ.
- More time will be required for carrying out the detailed survey due to difficult mountainous area.
- It will reduce the time period of the EPC contract.
- Proper BOQ and Cost Estimate of the Transmission line could be prepared after detailed survey, however a tentative Cost Estimate could be prepared on estimated quantities.
- It is also advisable that as soon as the detailed survey of line is completed, soil investigations should also be arranged to determine the type of foundation required and estimate the cost involved in closer margin.

14.6 QUANTITY AND COST ESTIMATE OF PENSTOCK

The length of steel Penstock will be shortened due to relocation of Powerhouse as per MC alternative proposal, hence the estimated cost for the construction of steel Penstock will be reduced as mentioned in the Feasibility Study for which needs to be confirmed by EPC after finalizing detail design.

14.7 QUANTITY AND COST ESTIMATE OF POWERHOUSE AND TAILRACE CHANNEL

The length of the Tailrace Channel will be increased due to the relocation of Powerhouse as per MC proposal, hence the cost for construction of Tailrace Channel will be increased to some extent as mentioned in the Feasibility Study for which needs to be confirmed by EPC after finalizing detail design.

14.8 REVIEW OF ANNEXURE A EQUIPMENT, MATERIAL AND LABOUR RATES

The cost of construction Equipment, cost of construction material and labour rates listed in this Annexure are on lower side and EPC contractor has to evaluate these costing as per his requirement as per the prevailing market rates for these resources.

14.9 COMPARISON OF QUANTITIES FOR FEASIBILITY STUDY AND REVIEW STAGE STUDY

A tentative comparison has been done for quantities of the Project components from Feasibility stage selected layout “Alternate-I A” and Review stage layout “Modified Alternate-I A”. Details of Feasibility stage layout and Review stage layout are described in chapter 7 of this report. Quantities comparison is given in Table 14.2 through Table 14.7.

15 REVIEW OF CONSTRUCTION PLANNING AND COST ESTIMATES

15.1 FACTORS AFFECTING PROGRESS OF CONSTRUCTION WORKS

The EPC Contractor shall plan the construction schedule keeping in view the non-productive periods of project especially two months severe winter season when the ambient temperature is below freezing point at site and the construction materials storage shall also be ensured properly protected from severe cold weather.

15.2 PROCUREMENT AND STORAGE OF MATERIALS

15.2.1 Cement

The EPC shall consider the provision of weather proof Cement silos for feeding of concrete batching plants round the year without the intrusion of moisture and will also consider the shelf life of Cement. The source approval for Cement will be subjected to the compliance of relevant standards of ASTM C-150. For mass concrete in project, use of pozzolonic material with the cementious material will also be subjected to the results of Aggregates having ASR value (Alkali Silica Resistance) or having heat of hydration more than specified limits.

15.2.2 Coarse Aggregate

Coarse Aggregates sources of Passu and Powerhouse area will be used for concrete production. The marble present in Passu area and Rounded Boulder Gravel Silt (RBGM) at Powerhouse Area can be used as coarse aggregate by certain amount of processing, i.e. crushing, washing, screening and blending. The suitability of coarse aggregate will be subjected to the complying the requirements of relevant ASTM Standards.

15.2.3 Fine Aggregate (Sand)

Huge quantity of shiskat sand deposits downstream of Attabad Lake can be checked by the EPC for the production of concrete for the project. The suitability of fine aggregate will be finalized on complying of the sand with the relevant standards of ASTM.

15.2.4 Reinforcing Steel

The reinforcing steel G-60 or reinforcing steel G-40 will be approved on the source selection and the complying of reinforcing steel with relevant standards of ASTM. Proper reinforcing Steel yard is required to be developed by EPC Contractor with sufficient stock of material to match with the pace of site work.

15.2.5 Explosive Materials

Sufficient Explosive Material will be required at site for drilling & blasting of hard rock strata and shall be utilized within its expiry date.

15.2.6 Steel Plates and Steel Formwork

The steel plates and steel formwork to be used for embedment and for concrete works shall be of good quality complying with the requirements of their relevant international standard.

15.2.7 Water and Stone for Riprap and Fill Material

The water to be used for construction and drinking purpose shall be potable and fit for drinking along with the complying of relevant health standards. Rip Rap stone to be used for protection works of structure shall be complying with the requirements of hydraulic design and relevant

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

test standards. The fill materials to be used for different structures shall be selected as per the requirement and complying with the relevant standards.

15.3 REVIEW OF CONSTRUCTION PLANNING AND METHODOLOGY

The key for the timely completion of the Project is the construction of low-pressure Headrace Tunnel whose length is 2.3 km and this activity is on critical path which EPC contractor has to consider during preparation of Project Execution Schedule and arrange the resources accordingly

15.3.1 Care and Handling of Water

The two temporary coffer dams were proposed to be constructed as per Feasibility Report. First coffer dam on upstream of sediment flushing channel / under sluice and second on upstream of overflow weir. The alternative proposal by MC mentioned in Chapter 7 for construction of sediment flushing tunnel underneath the Power Intake in lieu of sediment flushing channel / under sluice will be carried out together through adit from downstream and the rock ridge on upstream will act as coffer dam for their construction and this rock ridge will be drill and blast after completion of construction whereas the placement of stepped flexible Gabion Mattress on existing weir crest will be carried out during low flow season.

EPC Contractor needs to submit the Method Statement for Care and Handling of Water for finally selected layout during detail design studies along with the detail design of coffer dam (if any) and dewatering scheme for a safe working area.

15.3.2 Sediment Flushing Tunnel / Channel (Under sluice)

The excavated material of sediment flushing tunnel / Channel (under sluice) will be disposed-off at spoil areas planned near the Powerhouse site as the spoil area designated shall have sufficient area to accommodate the surplus excavated material. The construction of sediment flushing Tunnel / channel (Under Sluice) is envisaged to be completed in 8 months period depending upon the available resources at site.

Upon the completion of sediment flushing tunnel underneath the Power Intake, lake water will be diverted through this structure, to commence construction activities on power intake and overflow weir section and will act as diversion tunnel.

15.3.3 Power Intake

The excavation and concreting activities at power intake structure are envisaged to be completed in 12 months period. After the completion of power intake structure, a trash rack cleaning machine (TRCM) will be installed for removal of debris in front of trash racks. A gantry crane will be installed for placement and removal of the stoplogs designed on the basis of their weights.

15.3.4 Overflow Weir / Ungated Spillway

The stone apron will be provided at the upstream and downstream side for overflow weir having stepped flexible Gabion Mattress on top of existing crest level for weir. Before placing stone apron and Gabion Mattress, the ground will be properly adjusted and compacted and if required covered by a filter fabric. The overflow weir is envisaged to be completed in 6-month period. Upon completion of overflow weir, the working area will be re-flooded to match the lake water level.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

15.3.5 Access Tunnels / Adits for Headrace Tunnel

The excavation of these two access tunnels for headrace tunnel one on the Power Intake side and the other is on the surge tank side will be done using the drill and blast technique which will also be used for the low-pressure headrace tunnel.

15.3.6 Low Pressure Headrace Tunnel

After the completion of construction activities of low-Pressure headrace tunnel, the access tunnels / adits will be plugged on both sides with the concrete mix of special type. Total time of construction around 25 months has been estimated for the excavation, rock support measures and concrete lining of low-pressure headrace tunnel

15.3.7 Surge Tank

After completion of excavation, the concrete lining in this structure will be taken up immediately by starting from its bottom to top with slip forms moving in an upward direction towards the tank collar. A total of 12 months has been allocated for completion of the underground excavation and concrete works of the surge tank.

15.3.8 Penstock

The total time for construction of Penstock (Steel lined portion & concrete Portion) starting from surge shaft to Powerhouse is estimated to be 10 months depends upon the availability of steel plate complying with the relevant standard used for fabrication of steel liner.

15.3.9 Powerhouse Civil Works

All these activities related to powerhouse construction will be completed in 15.5 months. The Powerhouse architectural works will be completed parallel to testing and commissioning of units as the architectural finishes items to be used for Powerhouse shall comply with the relevant standards.

15.3.10 Unit Erection

A proper coordination will be required between Civil & Mechanical EPC Contractor's site teams for unit erection works in Powerhouse which will ensure timely completion of the Project.

15.3.11 Mechanical & Electrical Installations

The total time for excavation, concreting of foundations in Powerhouse and installation of vertical Francis turbines, generators, transformers and auxiliary systems is estimated to be 21 months which require timely placement of order for manufacturing to the approved vendors, custom clearance from Port and uninterrupted transportation of Equipment to site.

15.3.12 Tailrace Channel

The detail design of tailrace channel shall be carried out in such a manner that the flow will smoothly discharge into Hunza river from turbine draft tubes of turbines keeping all the hydraulic parameters within the permissible limits.

15.3.13 Switchyard

The construction of control building is also required along with the construction of 132 kV Switchyard where Power and Control Panels for switching of different bays will be carried out. All the Power and Control cables through cable trenches will terminate in these panels.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

15.3.14 Transmission Lines

Two transmission lines, one from Attabad switchyard to Aliabad grid station (double circuit approx. 27km) and other from Attabad switchyard to Sost grid station (single circuit approx. 70km) shall be constructed. The total construction period for both transmission lines of 23 months will be achieved subjected to the approval of detail design, route survey and availability of construction materials.

15.3.15 Assembly of Electro-Mechanical Equipment

The transportation of heavy Electro-Mechanical Equipment shall be planned by EPC in such a way that the equipment shall arrive at site with the foundation ready to receive the equipment directly on it to avoid protection from wear and tear.

15.3.16 Testing and Commissioning

The two months duration for the final testing and commissioning shall be planned by EPC in such a manner that the design flow required to guarantee the full installed generation capacity of the Project.

15.4 REVIEW OF PROJECT IMPLEMENTATION SCHEDULE

During detailed design and execution of actual works, EPC Contractor may develop his own construction schedule in such a way that most of the works can be taken up simultaneously as per the resource allocation on various project components in order to complete the project in the shortest possible time. The requirement of coffer dam construction can be assessed by EPC on the basis of methodology used for the construction of sediment flushing tunnel underneath the Power Intake and placement of stepped Gabion Mattress on existing weir crest.

15.5 CONSTRUCTION MANAGEMENT

15.5.1 Project Executing Agency

WAPDA as Project Execution Agency will also coordinate with Gilgit Baltistan's authorities and departments for any issues arising about the project execution, which require resolution by inter-departmental interaction for smooth Project execution.

15.5.2 Consultants

During the Construction Phase of the Project, the Consultants will in general review & monitor the detailed design, construction procedures, Inspection & Testing Plans, Quality assurance & Quality Control Manual, manufacturing, procurement, installation, commissioning & testing of works by the EPC Contractor. The Consultant's services will be in close coordination with the Project Executing Agency WAPDA.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

16 REVIEW OF ENVIRONMENTAL IMPACT STUDY

16.1 GENERAL

The Volume 6 of Feasibility study 2021 represents the Environmental and Socioeconomic Impact Assessment (ESIA) Report. WAPDA has submitted the ESIA Report to Gilgit Baltistan Environmental Protection Agency (GBEPA) in August 31, 2022 to initiate the process of No Objection Certificate (NOC) / Environmental Approval. The title of document should be Environmental Impact Assessment (EIA) or Initial Environmental Examination (IEE) as per regulations being followed by Gilgit Baltistan Environmental Protection Agency (GBEPA), not an Environmental and Socioeconomic Impact Assessment (ESIA). Moreover, an executive summary should be included in the document.

Following are the section/chapter wise review findings and comments for Volume 6 of the Feasibility report.

16.2 CHAPTER 1: INTRODUCTION

1. Please refer to ***Section 1.3: Environmental and Social Impact Assessment (ESIA)***

- After the 18th Amendment protection of the environment became a provincial subject, so it is better to use Gilgit Baltistan Environmental Protection Act, 2014, instead of Pakistan Environmental Protection Act, 1997.
- Screening had been carried out for EIA while the title of document is ESIA, needs correction.
- Either the proposed project is being funded by World Bank or not, as it referred the World Bank guidelines (OP 4.0).

2. Please refer to ***Section 1.4 Project Categorization***

- Since the proposed project falls under the schedule II requiring an EIA, while the name of document is ESIA, there is no provision of ESIA under IEE/EIA Regulations 2000.
- If the project is not being funded by donor agencies, then there is no need to mention the WB, ADB and JICA, their requirements are more stringent than national/provincial laws in specific aspects.
- As it is mentioned that the proposed project involve installation of 132kV transmission line as well, so the consent of GB EPA was obtained that either a consolidated document/EIA or separate documents/EIAs for hydropower and transmission line will be submitted to GBEPA? Both Hydropower and 132kV Transmission Line may have adverse environmental and social impacts.

3. List of EIA team is not provided. Project Location map showing the location and area of influence needs to be provided to assess/have an idea of environmental and social impacts of the area.

16.3 CHAPTER 2: PROJECT DESCRIPTION

1. Project Alternatives are not provided/discussed, including no project option, based on cost, design, location and other technical aspects considered while designing different components of hydropower and associated transmission lines.
2. Project layout plans are not provided.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

3. Limited design details are provided for 132kV Transmission Line, it needs to be elaborated to properly encounter the possible environmental and social risks and impacts.
4. Safety consideration during operation are not provided.
5. Construction planning aspect is also not provided including but not limited to: details of construction camps, work force required during construction and operation phase, water requirements, power requirements, material requirements and source, construction schedule, project cost etc.

16.4 CHAPTER 3: REGULATORY LAWS AND THE INSTITUTIONAL FRAMEWORK

1. GB Environmental Protection Act 2014 is the core act in Gilgit Baltistan dealing with environment related issues, which has not been discussed in the main report.
2. Following, but not limited to, Acts are not considered in the report:

- Prohibition of Employment of Children.
- Gilgit-Baltistan Forest.
- Fisheries
- GB Disaster Management.
- Protection against Harassment of Women at the Workplace.

3. Pakistan is a member/signatory of several international organizations; the report is silent regarding International Treaties and Conventions.
4. Please refer to ***Section 3.4.1 Land Acquisition Act (LAA), 1894***, in addition to LAA, 1894, it is mentioned that the proposed project fulfil the requirements of World Bank, again if the project is not being funded the WB then no need to follow its guidelines, as these are more stringent than LAA, 1894 and may face difficulties while complying.
5. The relevancy of each act may be provided that either it is applicable to the proposed project or not.
6. Guidelines for the preparation of EIA report are not provided such as Guidelines for Public Consultations, Guidelines for Sensitive and Critical Areas and Guidelines for the preparation and review of Environmental reports.

16.5 CHAPTER 4: BASELINE CONDITIONS

1. Overall, the baseline information (physical, biological and socio-economic environment) provided in the report is generic and representing almost whole province (Gilgit Baltistan). The baseline information needs to be revised and should be project specific.
2. Sources of secondary information are not provided, supporting maps of the project area may also be provided.
3. Time period of climatic data is not provided.
4. Either the Environmental Monitoring was carried by EPA certified Laboratory or not?
5. Number of Monitoring points along with location is not discussed, only results of one (01) point of ambient air and noise is provided. Moreover, comparison with NEQS is also not provided.
6. Separate noise values are not provided for daytime and nighttime intervals as per NEQS.
7. Detail regarding the sensitive receptors of the project area are not provided. It may help in actual impact assessment and their mitigation measures.
8. Please refer to ***Section 4.1.10: Land Use***, The land use of project area needs to be provided where the project interventions are proposed instead of whole province (Gilgit Baltistan).
9. Please refer ***Section 4.1.18: Surface Water,*** Environmental Monitoring, Sampling and Testing of water quality is not provided as per NEQS.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

10. Please refer to ***Section: 4.2.6 Endangered, Threatened or Vulnerable Species of Fauna***, *the endangered, threatened and vulnerable species in the project area are Markhor (Capra flconeri) Snow leopard (Unica unical) Ladakh urial (Ovis vignei) Woolly flying squirrel (Eupegaurus cinereus.).* It needs to be rechecked, the relevant expert carried the ecological survey or not?
11. Please refer to ***Section 4.3: Social and Economic Environment***, either the socio-economic survey was carried out with the project affected persons or not, as no information about no. of respondents interviewed, their socio-economic conditions, sample size, project acceptability etc. is provided.

Stakeholder Consultations

1. Stakeholder Consultation is an important part of the environmental studies, this chapter is missing in this report.

16.6 CHAPTER 5: ESIA AND MITIGATION MEASURES

1. Please refer to ***Section 5.1: General***, multiple funding agencies have been mentioned in this report, if the proposed project is not being funded by the ADB, then no need to mention that impact assessment has been carried out using checklist developed by ADB.
2. Please refer to ***Section 5.2: Impact Assessment Procedure***, Impact evaluation matrix is not provided.
3. Please refer to ***Section 5.3: Impacts During Construction***, Impacts may be categorized into different phases of project like pre-construction, construction and operation phase for better assessment.
4. Land acquisition is a critical issue, while this impact is not covered in this chapter. Hoverer, in ***Section 6.8: Land Requirements for The Project (Chapter 6)***, it is mentioned that land (government and private) will be acquired for the proposed project.
5. Overall, the impact assessment (physical, ecological and socio-economic environment) is generic keeping in view the extent of project, it needs to be revised based on project activities and quantified. In addition, following impacts but not limited to, are also anticipated due to the proposed interventions which are not addressed: wastewater generation, solid waste management, siting of construction camps, emergency response, land acquisition, labour influx, child and forced labor, COVID-19, gender issues, community health and safety etc.
6. Since the proposed project involves the installation of 132kV Transmission Lines, the present impact assessment is not covering this aspect.
7. In baseline conditions, it is mentioned that in project area there are endangered, threatened and vulnerable species, the impact assessment is silent in lieu of these species.
8. Impact assessment is based on the project specific baseline for the physical, biological and social profile, since the existing Baseline Conditions (***refer chapter 5***) presented for the whole province instead of project specific area. Keeping in view the above, the impact assessment needs substantial improvement.

16.7 CHAPTER 6: ENVIRONMENTAL MANAGEMENT AND MONITORING PLAN

1. Please refer to ***Section 6.2: Mitigation Management Matrix (MMM)***, under this section, a table needs to be provided including impacts, mitigation measures, responsibilities, monitoring frequency, and monitoring indicators etc.
2. Institutional Arrangement for Implementation of EMMP during construction and O&M phases is not provided. Further, roles and responsibilities of implementing agencies is also not provided.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

3. Following guidelines, but not limited to (as per advice of Environmental Specialist), need to be provided for the preparation of site specific environmental and health & safety management plans: *Tree Plantation / Reforestation Plan, Health, Safety and Environment (HSE) Management Plan, Emergency Preparedness and Response Plan, Restoration and Rehabilitation Plan, Waste Management Plan, Disaster Management Plan, Drinking Water Supply and Sanitation Plan, Traffic Management Plan, Change Management Plan, Resource Conservation Plan etc.*
4. Please refer to ***Section 6.6: Impact Monitoring Program***, detailed monitoring plan needs to be provided including monitoring parameters, location, monitoring mechanism, frequency, duration etc.
5. Please refer to ***Section 6.9: Environmental Mitigation and Land Acquisition Cost***, Costs related to Land Acquisition, HSE, Environmental Monitoring, Tree Plantation, Environmental, Social & Health and Safety Experts are not provided.
6. This ESIA including EMMP should be made a part of bidding document to ensure the compliance, there a separate section / a paragraph needs to be provided showing the inclusion of ESIA including EMMP into the contract documents.
7. Reporting and Documentation section is also not provided.
8. Trainings and Awareness Plan including type of training, staff/participants, schedule, responsibility etc. also not provided.
9. Appropriate Grievance Redress Mechanism (GRM) is not provided to resolve the complaints.

16.8 CONCLUSIONS AND RECOMMENDATIONS

This chapter is missing in the Feasibility Report.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

17 REVIEW OF ECONOMIC AND FINANCIAL ANALYSIS

17.1 GENERAL

The Attabad Hydropower Project will be located on Hunza River. The project is 20 km from Karimabad, 120 km from Gilgit and 735 km from Islamabad. Initial Feasibility of Attabad Lake Hydropower Project (ALHPP) was conducted by Govt. of Gilgit-Baltistan in 2016-17, with the estimated installed capacity of 32.5 MW. In 2019, WAPDA updated the project feasibility study with proposed installed capacity to 54 MW with a 2320 m long headrace low pressure tunnel on the left side of Hunza River. According to Feasibility Report 2019, It will have an installed capacity of 54MW, capable of producing 374 GWh of average annual energy per year. According to the construction schedule provided in the Consultant's Report, the total construction time for ALHPP is about thirty-six (36) months.

This review report briefly discusses the economic and financial analysis of the feasibility report, as prepared by WAPDA in 2019. The financial and economic parameters associated with project benefits and costs were studied and compared with reference to Economic and Financial Analysis (Chapter 17 of Feasibility Study Report) along with the judgment from other similar nature projects.

The objectives of the review were to verify the main parameters, analysis and results of economic and financial analysis of ALHPP and provide review comments, suggestions and recommendations, if any.

Following are the key aspects covered during the study.

i) Review of assumptions and calculation of economic parameters, conversion factors, prices etc.
ii) Review of methodology and parameters adopted for estimation of economic benefits of hydropower.
iii) Review of Economic Internal Rate of Return (EIRR) and sensitivity tests.
iv) Review of assumptions and parameters used for financial analysis.
v) Review of estimation of energy revenues.
vi) Review of composition of total investment cost of the project, including price escalation, interest during construction and cost of project financing.
vii) Review of financial profitability, financial internal rate of return (FIRR) etc.
viii) Review of unit generation cost.
ix) Indication of shortcomings (if any) and suggestions for improvement.

To ascertain the financial and economic viability of the said project, the analysis has been reviewed on the basis of efficiency criterion of public investment using "discounted cash flow" technique. The parameters like "Net Present Worth", "Benefit Cost Ratio", and "Internal Rate of Return" have been reviewed in detail by rechecking calculations.

Following are the main comments/observation on economic and financial analysis of the project.

17.2 REVIEW OF ECONOMIC ANALYSIS

- Opportunity cost of capital/cut-off discount rate has been taken as 12% for deciding the economic viability of the project.
- Standard Conversion Factor (SCF) has been calculated as 0.91 on the basis of data from 214-15 to 2018-19. In some places, the figure of 0.90 was used. The data on total exports, import duty and sales tax on imports (Table-17-6) was not found correct. Once

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

substantiated with updated data of import/export and tax/subsidies statistics, SCF has been recalculated as 0.871.

- Shadow wage rate for labour has been used as 0.75 in the Feasibility report.
- Economic cost has been estimated as Rs. 18410 Million, using the base cost of Rs. 20028 Million.
- While converting the financial investment cost of ALHPP to economic cost, the taxes have not been deducted from the base cost. Taxes are transfer payments and usually excluded in economic cost.
- Economic appraisal has been undertaken mainly on the basis of conventional avoided costs of equivalent thermal plant. The LNG based thermal power plant (OCGT) was indicated as alternate equivalent thermal power source. The investment cots of alternate thermal power plant has been assumed as USD 1.0 Million (at the given exchange rate of 1USD=157 Pak Rupee), which seems on a higher side. This investment cost has been phased in two years (50% each).
- The installed capacity of equivalent thermal power plant is not mentioned in the document.
- Annual O & M cost of OCGT plant has been assumed as 3% (USD 0.004/kWh), which seems reasonable.
- LNG price (fob) has been taken as USD 7.48 MMBtu. The fuel cost has been calculated as Rs. 8.42 per Kwh. The fuel cost need to be updated as per latest prevailing prices.
- Saving of fuel and O & M cost of alternate thermal power plant has been taken as major economic benefits of ALHPP.
- Emission reduction benefits of ALHPP in economic analysis were calculated on the basis of CDM financial price of USD 1.5 per Ton of CO2, which is not correct. The economic benefits of CO2 emission reduction are based on “Global Social Cost of Carbon” rather than on financial price of CDM.
- The operating cost of hydel station is mentioned as 1% of base cost. The difference of civil and electro-mechanical items has not been adopted.
- EIRR of ALHPP was calculated as 22.54% and 22.36% for with and without emission scenario. Sensitivity analysis showed that EIRR calculated was robust and remained above opportunity cost of capital (12%) even under worst assumption of simultaneous increase in project cost and decease in project benefits.

17.3 REVIEW OF FINANCIAL ANALYSIS

- Project cost has been worked out at price level of 2021, with an exchange rate of 1USD=157 Pak Rs.
- Project base cost has been calculated as Rs. 20028.920 Million, phased in three years.
- Price escalation (during construction) has been estimated as Rs. 1000.537 Million, using annual inflation rate of 6.5% for local cost and 2% for foreign cost.
- Keeping in view the historic increase in US CPI, foreign escalation rate need to be reconsidered.
- Source of financing is not mentioned in the Feasibility study.
- Interest During Construction (IDC) was not calculated, shown as zero.
- Total financial cost (without IDC) was calculated as Rs. 21246 Million.
- While doing the amortization of financial investment cost for calculating the Unit Generation Cost, the interest rates for local and foreign cost financing have been kept same (12.20%), which may be different if there is different sources of financing.
- Unit generation cost has been estimated as Rs. 5.67 per kWh, which seems attractive.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- The energy sale price has been assumed as Rs. 13.40 per kWh for estimating energy sales revenues. If the energy is intended to be sold in GB, this seems higher sale price as the existing tariff rate in GB is lower (under Rs. 10 per kWh).
- Annual energy revenues have been estimated as Rs. 5007 Million while CDM revenues (@ USD 1.5 per Ton) were found as Rs. 29.92 Million.
- FIRR has been estimated as 19.27% and 19.17% for with and without CDM benefits.
- Sensitivity analysis of FIRR has not been performed.
- Payback of investment cost has been estimated as 5 years, however backup calculation is not given.

17.4 RECOMMENDATIONS FOR FURTHER IMPROVEMENT OF STUDIES

Following are the important recommendations for improving the robustness of economic and financial analysis of the said project:

- For economic analysis, taxes and duties need to be exempted from economic cost.
- Energy sale price need to be reconsidered, keeping in view existing tariff in GB.
- A detailed sensitivity study to check the robustness of financial model is required which would ultimately impact the financial viability of the project.
- The financial analysis needs to be updated on the basis of careful and through project cost reviews.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

18 CONCLUSIONS AND RECOMMENDATIONS OF REVIEW STUDY

The Dam due to landslide created a Lake behind it at Attabad not only possess a threat but at the same time an opportunity for making use of the head due to this Earthen Dam. Due to lake formation, there is potential drop of more than 100 m in 2.5 km river reach. The mean annual flow of Hunza River at Attabad Lake is 204 m^3/s. The Project Layout is to be configured considering the power demand and demand pattern of regional grid. Attabad Lake storage can be used for daily peaking. A design discharge with peaking storage facility is to be selected to generate the installed capacity 95% time of the year in peak hours. From the available flow data and estimated flow series at Project Area, a discharge of 60 m^3/s has been taken as design discharge for power generation.

A modification in Feasibility stage Alternative- IA layout is proposed by MC based on Feasibility Report review findings and site visit observations. The modifications, as summarized hereunder, are to be checked for technical and economic viability during Detail design stage by EPC Contractor.

If a flushing tunnel is added underneath the intake area at distance of 7m away in the plan and its outlet after the most disturbed area, it will increase the life of Power house for many years. A tentative discharge of about 72 m^3/s for flushing tunnel will be required which is available plenty of time throughout the year. Only risk involved in this concept will be outlet portion of the flushing tunnel which will lie in overburden area. Cut and cover conduit or even open channel can be provided in this overburden area. In worst conditions, if some damage occurs to outlet structure, it can easily be repaired any time because flushing will not be done throughout the year.

Another aspect if in case all past slided mound at Weir site is washed away at weir site, then a temporary coffer dam can be constructed for constructing new/ fresh weir / dam in this area.

In case we move intake structure to weir location and in case all slide material washed away then in this scenario to restore electricity from Power house we have to wait for restoration of weir / dam first then Power house will be in operation condition.

To strengthen the present weir / dam area MC propose a gabion mattress overlay in all area of weir site to avoid long term damages during flood season.

The reduction in the total project excavation by avoiding excavation for abutments and foundation of overflow weir will considerably reduce the overall cost of the project due to presence of slided mass on right and left banks both.

Based on verification study and calculations, the solution finalized in the Feasibility study with installed capacity of 54MW and 79% plant factor is most optimized solution. However, as per recommendations from Mechanical expert, efficiency of turbine can be taken as 93%. MC endorse the selection of turbine with 93% efficiency which may result in little higher installed capacity of about 57 MW.

Based on review of Feasibility Report, MC validate the data and importance to construct the Attabad Lake Project as early as possible.

ALHPP is found to be technically feasible, economically viable and environmentally acceptable and will fulfill electricity needs particularly for Hunza City and in general for Hunza, Gilgit and Ghizar Regions. Therefore, recommended for implementation at the earliest.

1 GEODETIC SURVEY CONTROL

A geodetic control lays the foundation for the creation of an accurate topographic survey. The system permits the spatial referencing of all identifiable land features using permanent structures and control points.

1.1 REFERENCE SURVEY BENCHMARK

During the topographic survey, two permanent benchmarks named BM-01 and BM-02 were found that were established during the feasibility study. These benchmarks were found stay able and intact. Figures are shown below.

Figure 1.1: Permanent Benchmarks in Project Area

These benchmarks were used as reference control points for the extension of survey control network and to conduct the aerial topographic survey.

The details of coordinates of benchmarks are listed below.

Table 1.1: List of R Geodetic Survey Control Points (CPs)

REFERENCE SURVEY CONTROL POINTS			
Name	**Easting (m)**	**Northing (m)**	**Elevation (m)**
BM-1	481492.111	4017731.973	2384.005
BM-2	482044.978	4017941.760	2360.841

The location map of the reference benchmarks is given in Figure 1.2.

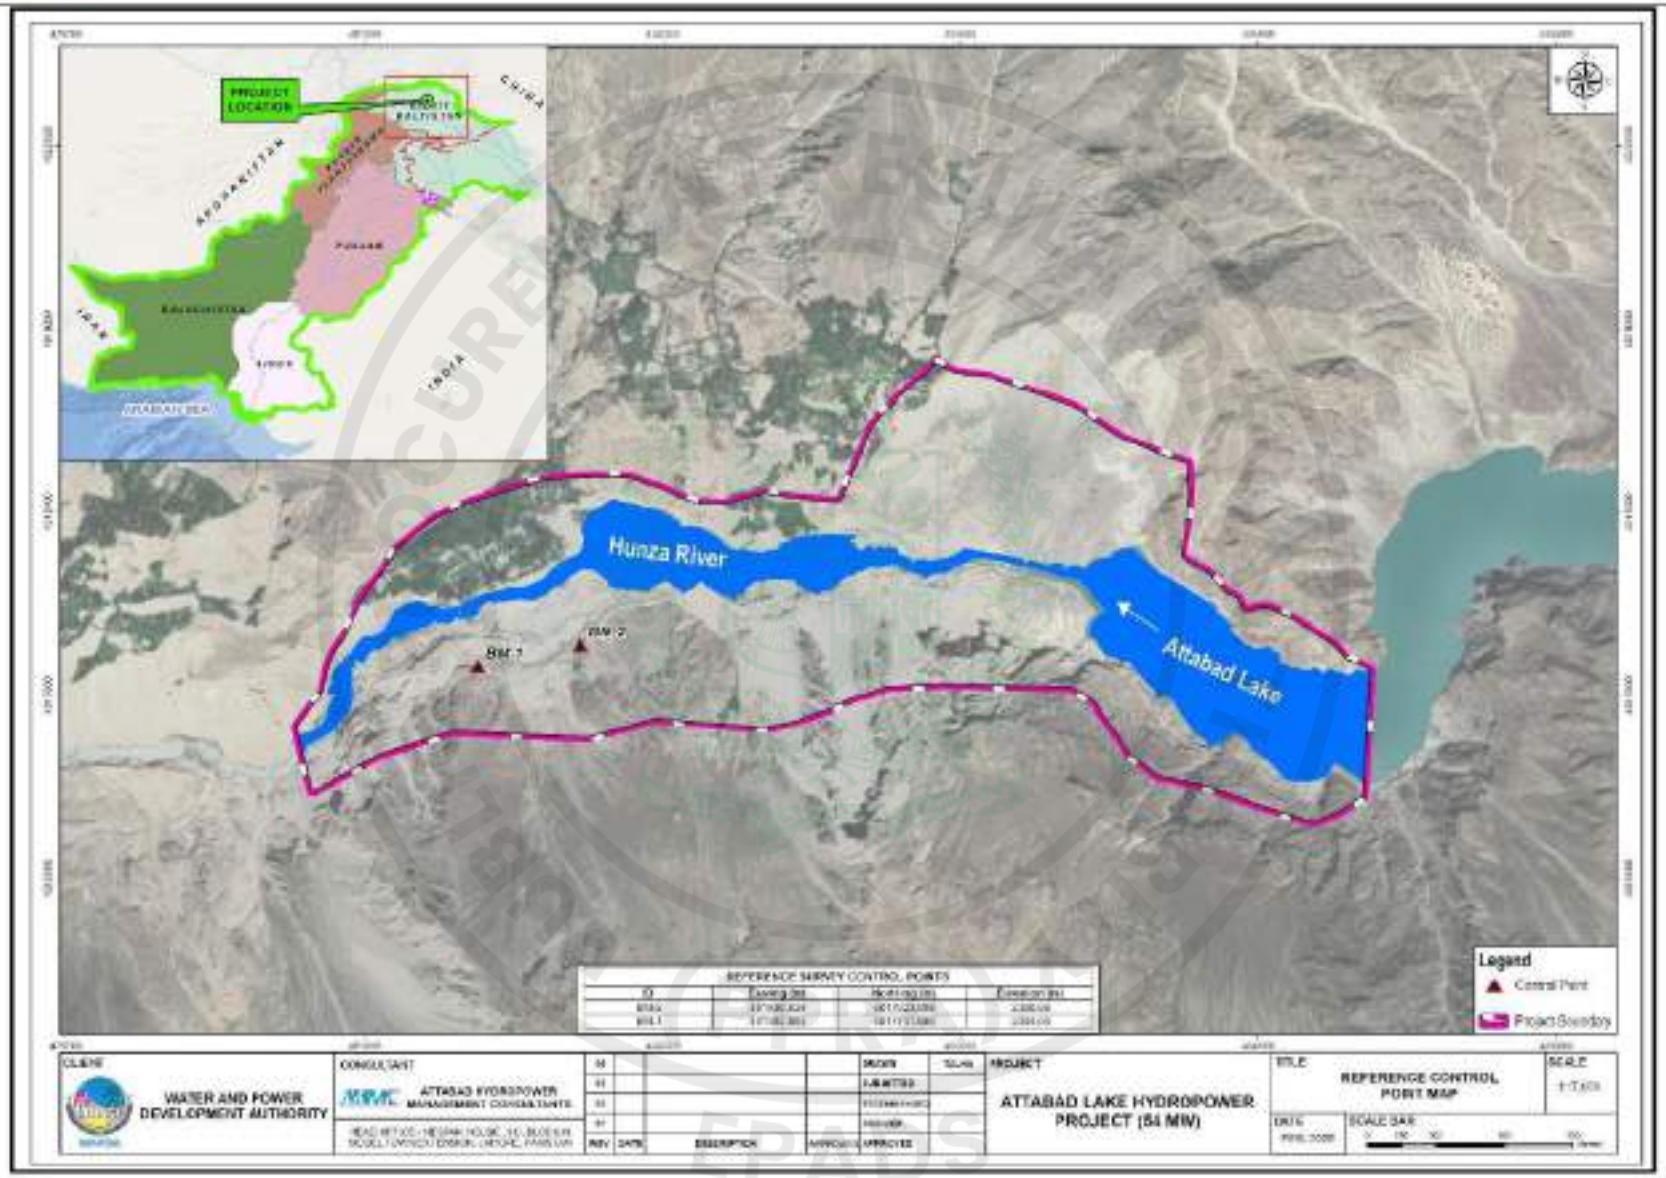

Figure 1.2: Location Map of Reference Survey Control in the Project Area

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

1.2 ESTABLISHMENT OF CONTROL NETWORK

A wide variety of GPS satellite networks were available and processed to establish reliable baselines in static mode and hence were used to densify the project control network through static survey technique. Unlike terrestrial triangulation, trilateration, and EDM traverse surveying, the shape or geometry of the GPS/GNSS network design is usually not as significant. Care was taken to avoid including trivial baselines in the final network adjustment. No previous benchmark/control was found in the project site. Therefore, a new control network was established using Trimble Dual-frequency DGPS.

Table 1.2: List of Established Geodetic Survey Control Points (CPs)

Serial No.	Control Point Name	Easting	Northing	Elevation
		(Meter)	(Meter)	(Meter)
1	ALD2B	481298.784	4017715.022	2396.44
2	APH-5	483642.674	4018013.34	2490.69
3	ALD-6	484047.319	4017955.711	2478.97
4	ALD-7	485705.464	4017439.092	2457.45

The listed above coordinates are computed in ground coordinates with UTM (Universal Transverse Mercator) projection system in zone 43 N.

The location map of the Control Points (CPs) is given in Figure 1.3.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

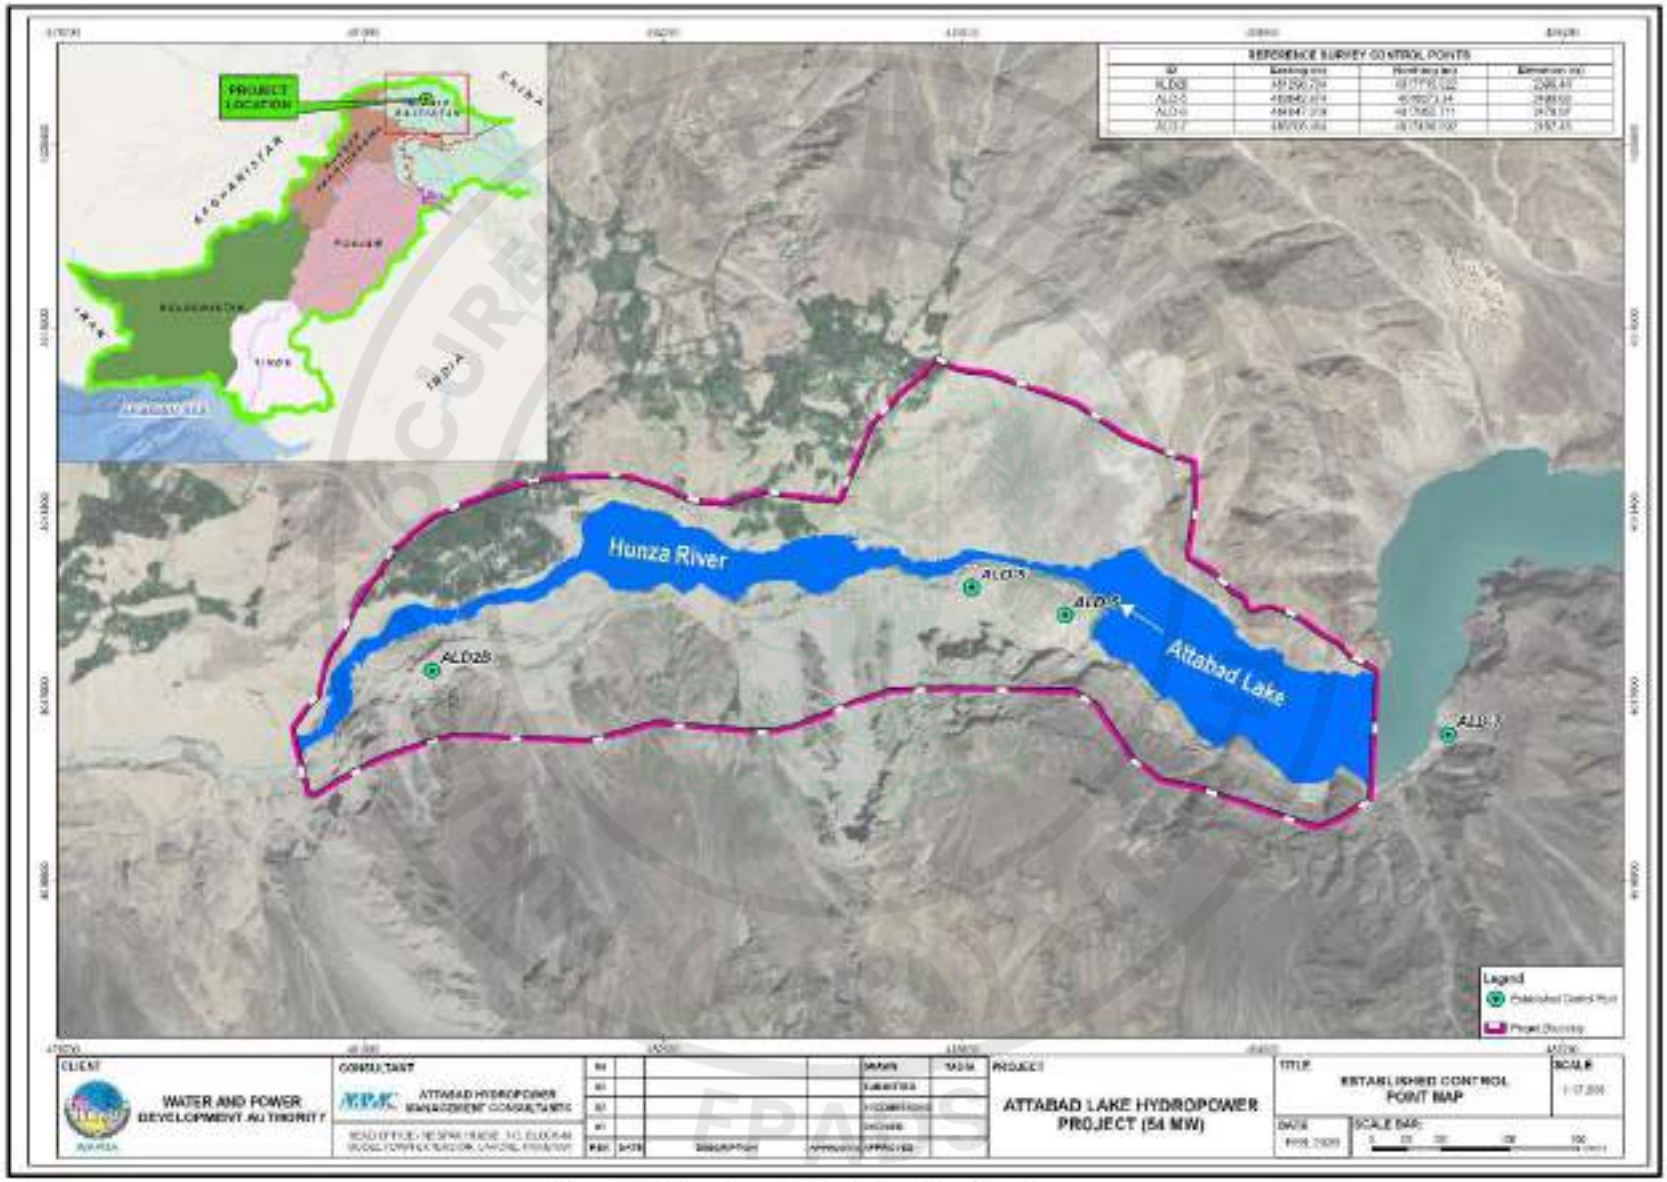

Figure 1.3: Location Map of Established Control Map

The on site views during the establishment of the control network as shown in Figure 1.4:

Figure 1.4: Onsite Views of Control Points (CPs)

1.3 LOCATION OF MONUMENTS AND SURVEY MARKERS

The most effective precaution taken to ensure marker's stability and survival is to choose an appropriate location. Therefore, good judgment has been exercised.

The survey team selected the locations of the monuments based on the following aspects:

- **SECURITY:** The security of a survey monument is the foremost in the list of evaluation considerations. To avoid the susceptibility to damage or destruction by local people, animals, etc., the selected location should be safe and secure.
- **AVOIDANCE OF FLOODPLAIN:** Markers located in floodplains may be buried in sediment or washed out due to erosion. To avoid such damages, the floodplains were avoided during site selection for monuments.
- **ACCESSIBILITY:** Accessibility of the markers is a vital criterion in the selection of the location for survey markers. These yields are time-saving for observation and workability.
- **STABILITY:** The markers are subject to the effects of geologic and soil activity. The consistency of the soil, soil type, vegetation, and its roots, surface geology, and corrosion were considered for the selection of the location of the control monuments.
- **SATELLITE VISIBILITY:** Since all the markers are being observed and established using the GNSS system, hence the satellite visibility was also considered for the selection of the location of the marker. Sites that provide maximum visibility above the horizon, plus 15 degrees were selected.
- **INTER-VISIBILITY:** The locations were precisely refined in such a way that all the markers should be inter-visible to adjacent markers. This ensured the usability of terrestrial survey equipment such as the Total Station for survey works during construction.

1.4 DESIGNATING SURVEY CONTROL MONUMENTS

It is a standard practice to assign understandable names to the control monuments for identification. In this case, Control Points were named "PH" while Ground Control Points were shown with the "GCP" acronym.

1.5 DATUM AND COORDINATE SYSTEM

The survey was conducted in the WGS-84 datum, UTM (Universal Transverse Mercator) zone 43 N (Northern Hemisphere) using geodetic parameters as listed below.

All of the quoted coordinates in this report are referred to the following parameters:

- Spheroid: WGS-84
- Semi-major axis (a): 6378137 m
- Semi-minor axis (b): 6356752.314 m
- Inverse Flattening (f): 298.25722

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

The project area lies in the UTM 43 Northern Zone. The parameters for Universal Transverse Mercator (UTM) Zone 43 N are as under:

- Latitude of Origin: 0.000000° equator
- Central meridian: 63.000000° E
- False easting: 500000.00000 m
- False northing: 0.000000 m
- Scale factor: 0.999600
- Linear Unit: Meter (m)

1.6 TOOLS AND SOFTWARE

A Trimble® R9 GNSS system and Trimble R2 GNSS system were used for the establishment of horizontal and vertical control networks within the periphery of the project boundary.

The data collected by GNSS was processed by using the licensed software Trimble® Business Centre (TBC) v5.4. It comes with the dedicated Geoid Model for Pakistan based on EGM (Earth Gravitational Model) 2008 Geoid Model. This model was used to derive orthometric heights (elevations) of the control network during the processing of GNSS data.

1.7 PRECISION AND ACCURACY STANDARDS

The Geodetic Survey Control Network was established by following the international standards and protocols. Special care was taken in setup of equipment in filed like measuring the antenna height and centering. The specifications of GNSS equipment are shown below.

Positioning	Mode	Horizontal Accuracy (RMS)	Vertical Accuracy (RMS)
RTK (OTF)	Synchronized	1 cm + 1 ppm (× baseline length)	2 cm + 1 ppm (× baseline length)
	Low Latency	2 cm + 2 ppm (× baseline length)[3]	3 cm + 2 ppm (× baseline length)[3]
L1 C/A Code Phase	Synchronized/ Low Latency	25 m + 1 ppm RMS	50 m + 1 ppm RMS
Static/ FastStatic	N/A	5 mm + 0.5 ppm (× baseline length)	5 mm + 1 ppm (× baseline length)
WAAS	N/A	Less than 5 m[3]	Less than 5 m[3]

Special protocols were adopted in post-processing and the accuracy was achieved according to the standards.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

2 PREPARATION OF TOPOGRAPHIC SURVEY PLAN

As stated, all the data was processed with reference to the geodetic control network. The topographic survey data and aerial mapping were executed in the metric system.

The final Ortho-rectified very high-resolution image of 4 cm pixel size, was used for visual interpretation. Spatial features were digitized on the ortho-rectified image that included:

- Road
- Tracks
- Orchid
- Lake
- River
- Built-up
- Structures
- Road Debris
- Transmission Pole
- Trees
- Transmission Line
- Agriculture Boundary
- Drain

These vector features were incorporated into the map to develop topographic survey drawing.
The contours were extracted from Digital Terrain Model (DTM) at 0.5m interval.

Furthermore, GIS based map book was generated at a 1:1000 scale for the Topographic Survey Plan in the metric System having fifty-six (56) sheets of A3 page size (**"Annexure –A"**).

EXECUTIVE SUMMARY

Water and Power Development Authority (WAPDA) intends to develop 54 MW Attabad Lake Hydropower Project (ALHPP[1]) on Attabad Lake situated in the Hunza Valley of GB, Pakistan. ALHPP (36°8'28.87"N and 74°49'19.44"E) has been identified on Hunza River on Attabad Lake. Attabad Lake was formed on January 4, 2010, when a huge mass from the right bank of Hunza River slided down near Attabad Village and blocked Hunza River. The inflow filled upstream valley created a reservoir 12 km long till the end of May 2010. Attabad Lake is about 15 km upstream of Ganish Bridge and about 111 km upstream from Gilgit. Therefore, ALHHP will utilize the Attabad Lake water and head for the generation of the Hydel Electricity. Therefore, due to the implementation of Attabad Lake HPP, no major adverse impacts are anticipated.

Presently, there is a huge demand and supply gap of electricity in GB resulting in load shedding along with low voltage issues. Locals have no option for commercial and industrial demand to be partly fulfilled from diesel generators. Apart from the high cost of fuel, the use of these diesel generators is affecting the environment as well as tourism in the area.

WAPDA hired a joint venture of Attabad Hydropower Management Consultants (AHMC) with M/s National Engineering Services Pakistan (NESPAK) as its lead firm for the Review / Validation of the Feasibility Study, Procurement of the EPC Contractor, and Contract Management & Administration of ALHPP. As a part of this Contract, review of the Environmental Impact Assessment (EIA) Study (prepared by WAPDA in 2021) was also included in the scope of work. This EIA study has been updated based on the available information at this stage of the Project as an additional scope of work. The proposed project will be implemented in EPC Contract mode therefore; Detailed Engineering Design including Basic Design will be available after the selection of EPC Contractor.

As per Gilgit Baltistan Environmental Protection Act, 2014 the project Proponent should acquire NOC / Environmental Approval from EPA, GB before the start of the construction of any Project. As per Pakistan Environmental Protection Agency Review of Initial Environmental Examination and Environmental Impact Assessment Regulations, 2000.The proposed Project falls under Schedule II (Category A "Energy": Hydroelectric Power Generation over Fifty (50) Mega Watt), which requires an EIA to initiate the process of NOC from Gilgit Baltistan Environmental Protection Agency (GB EPA). Thus, to fulfil the legal requirements an EIA Study has been carried for the proposed Project.

This EIA study has been prepared to address the requirements detailed in the Gilgit Baltistan Environmental Protection Act, 2014 addressing environmental and social aspects and considerations. In addition, the EIA Study also addresses the requirements defined in the applicable national and local regulations.

The main components are: Weir (Overflow Structure) and its associate structures, Sediment Flushing Tunnel, Headrace Tunnel, Surge Tank, Penstock, Powerhouse, Tailrace and Switchyard. Reservoir has already been created as a result of natural disaster. Total land to be acquired is approximately 183 acres for project components which includes both Private and Government land. The estimated total land to be acquired is 777.5 acres due to the

[1] *The term ALHPP in this report is referred as Proposed Project.*

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

impounding of reservoir up to maximum conservation level including free board i.e. El. 2424 m.a.s.l, including river bed. The proposed Project site is accessible through Motorway from Islamabad to Thakot (M-15) and afterwards by Karakorum Highway (KKH) from Thakot to Project Area.

Following are the salient features provided in **Table ES-1**:

Table 1-1: Salient Features of the Proposed Project

Sr. No.	Items	Description
1	Location	27 km from Aliabad Town
2	River	Hunza River
3	Catchment Area	8901 km^2
4	River Mean Annual Flow	209 m^3/s
5	Purpose	Power Generation
6	Type of Development	High Head Run of River with Peaking
7	Type of Weir	Overflow
8	Weir Crest Elevation	2414 m.a.s.l
9	Weir Crest Length	60 m
10	Weir Height	30 m
11	Design Flood	3250 m^3/s
12	Maximum Conservation Level including free Board	2424 m.a.s.l
13	Maximum Flood Level	2421 m.a.s.l
14	Minimum Operating Level	2412 m.a.s.l
15	Gross Head	112.0 m
16	Net Head	106.0 m
17	Installed Capacity	54 MW
18	Headrace Tunnel Length	2320 m
19	Headrace Tunnel Diameter	5.5 m
20	Penstock Length	480 m
21	Penstock Diameter	3.6 m
22	Type of Turbine	Francis (Vertical)

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Sr. No.	Items	Description
23	No. of Units	03
24	Design Discharge	60.00 m^3/s (20 m^3/s to each unit)
25	Length of Weir	55 m
26	Length of Power tunnel	2320 m
27	Type of Powerhouse	External
28	Annual Energy	374 GWh
29	Plant Factor	76.5 %
30	Tailrace Length	88 m
31	Design Life	30 Years

The proposed project will be implemented by the EPC Contract including Detailed Engineering Design.

The proposed project construction schedule spans over a period of 55 months, which include 36 months for construction activities and 19 months for pre-construction activities. The estimated cost of the proposed Project is PKR 24.246 billion.

The various alternatives which have been considered during the conduct of the study are: No Project Option (NPO), Project Layout Flexible overflow structure Alternatives, Flushing Tunnel Alternatives, Penstock reduced length Alternatives, relocated Powerhouse Alternatives, and increased length of Tailrace Channel.

For the collection of baseline information checklists / proformas, Satellite Imagery (Google Earth), and General Topographic (GT) sheets were used. Study Area / Area of Influence (AOI) was delineated based on field surveys (primary data), Consultant's experience, study of available maps and data collected through secondary sources and results of the consultation with the relevant departments. In this report, the Study Area/AOI is considered as area where the Project impacts on the Environment due to the proposed Project activities are assessed.

The segment of Hunza valley wherein the various components of the proposed project are situated reflects very high relief conditions marked by relatively steeply inclined extensive mountain slopes along right side of the valley as compared to the left bank mountain slopes. The mountain slopes are mostly marked by erratic slopes instabilities along with relatively less extensive segments of casuistic slopes. The Project Area lies in Karakorum Block, where rocks of meta igneous provenance are exposed. The rock units represent acidic igneous rocks including Granodiorite and Granitic Gneiss. Many local as well as regional faults are present in Project Area.

According to Seismic Provisions in the Pakistan Building Code 2007, the Project area falls in Seismic Zone 2B (moderate), which represents Peak ground acceleration from 0.16 to 0.24g, where g represents acceleration due to gravity.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

The climate of Hunza valley is characterized by mild summer and cold winters. Wide spread snow fall occurs in winter. During winter the northern winds blow constantly bringing the temperature down considerably. At Hunza, the mean temperature recorded from 2010-20 is 21.20 °C in July, the hottest month and the coldest month is January with an average temperature of -0.42 °C. Hunza receives maximum rainfall in spring i.e., in April.

In the Study Area, no proper solid waste management system exists. The areas lack proper sewerage system with only some open drains constructed in the vicinity for the discharge of wastewater.

Major Land use of the proposed project is barren hilly land and some built up area at the site of powerhouse while agricultural land is also present in the reservoir considering maximum conservation level of 2424 m.a.s.l.

Five distinct zones of flora in the Study Area can be identified including Dry Alpine Scrub, Moist Alpine Pastures, Dry Alpine Plateau Pastures and Sub Alpine Scrub and Birch Forests. A large number of medicinal plants grow in the natural forests of Hunza Valley. There are no endangered species of fauna, Community Controlled Hunting, Protected Areas game reserve, wild sanctuaries and National Park found in the Project Area. Agriculture and livestock grazing area are also important aspects and present in the Project Area.

According to socio-economic survey in the Study Area, 58 respondents were selected from villages/settlements (Sarat, Ganish, Attabad, Ayeenabad, Shishkat, Gulmit, Gulkin, and Passu) of Hunza district. The respondents of the study area included local residents, farmers, shop keepers, pedestrians, drivers, and Govt employees etc. the survey findings revealed that there is no group of people that can be termed as “Indigenous Community”.

The stakeholder consultations were held with relevant departments such as GB EPA, Revenue Department, Water & Power Dept. GB, District Health Department Hunza, District Agriculture Department Hunza, District Education Department, Wildlife Department Hunza, Forest Department Hunza, and Fisheries Department Hunza etc. Moreover, Four (04) community consultative meetings were held with more than 42 participants in the Study Area. The major categories participated in these meetings were local population, community groups, landowners, and Project Affected Persons (PAPs).

Impact assessment has been conducted for various phases of the proposed Project and the project envisages following potential positive impacts:

- The Project not only reduces or replaces equivalent electricity generation sources with all the associated environmental benefits but it will also help to avoid all associated pollution caused through extraction, processing, storage and transportation of conventional fuels required for fossil fuel power generation plants.
- The sustainable power supply with the development of the proposed Project is likely to attract more tourists in the Project area and will increase the local business and recreational activities.
- The proposed Project will also provide skilled and unskilled jobs during the implementation phase and a limited number of jobs during operation and maintenance.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- Hunza and Nagar valleys have precious mineral resources which have remained unexploited. The availability of electricity will certainly develop a set up on large scale to preserve fruits and for exploration of minerals.
- The requirements of electricity have increased in homes, both public and private offices, education institutions, hospitals, and health care centers in towns and habitats in the remote rural areas of valleys in Gilgit-Baltistan region, the electricity shortfall can be decreased with implementation of this Project.
- Access roads will be built as part of the Project and will facilitate the people for goods and services accessibility. After completion of the Project, these facilities and infrastructure will be available to the general public. Moreover, health facilities created during the construction phase will be available to local communities

Following potential adverse impacts have been anticipated during different especially construction phase of the proposed Project:

- Permanent Land acquisition;
- Temporary Land on rental/lease basis;
- Cutting of trees/bushes falling within the proposed Project Boundary.
- Landslide Hazards;
- Temporary Impact on aquatic fauna;
- Disturbance to infrastructure and public utilities;
- Disturbance to the public movement during construction;
- Noise and air pollution due to the working of construction machinery during construction and traffic during O&M phases of the Project;
- Solid waste and wastewater generation during construction;
- Oil spillages from construction machinery, resulting in soil and water contamination;
- Occupational and community health and safety issues; and
- Social and Cultural Conflicts.

Sedimentation, Environmental flow, dam safety and emergencies etc. are the anticipated environmental impacts during operation and maintenance phase of the proposed project.

The impact assessment, revealed that with the help of appropriate mitigation and control measures provided in this EIA Study, most of these potential impacts will either be avoided altogether, or their likelihood of occurrence and severity will be reduced, thus making this project environmentally and socially feasible.

WAPDA will establish a Grievance Redress Committee (GRC) to facilitate the resolution of complaints by Project Affected People (PAPs) and grievances about the project's environmental and social performance. The GRC will be coordinated by the Chief Resident Engineer and Environment Head. The GRC will address affected people's concerns and complaints promptly, using an understandable and transparent process.

The Environmental constraints will have to be monitored by concerned agencies, including Environment Specialist of Proponent and GB EPA. An EMP has been developed as part of the report which provides a detailed mitigation matrix that covers impacts, mitigation measures roles and responsibilities and timings to avoid, minimize or mitigate the adverse impacts of the

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

project.

The EIA, EMP, mitigation and monitoring programs, contained herewith are recommended to include within the bidding documents for project works for all project components. The Bidding documents shall clearly state that the EPC Contractor will be responsible for the implementation of the requirements of the EMP through his own Site Specific Environmental Management Plan (SSEMP) and Site Specific Health and Safety Management Plan (SSHSMP), based on the guidelines provided in the EIA report, which will adopt all of the conditions of the EMP and add site specific elements as per advice of Environmental Specialist. This will ensure that all potential bidders are aware of the environmental requirements of the project and its associated environmental costs.

The tentative cost estimates to implement EMP is estimated as **PKR. 126.5 Million**. This tentative cost will be included in the overall project cost. This cost will be reviewed and firmed up periodically to ensure realism.

PUBLIC PROCUREMENT REGULATORY AUTHORITY (PPRA) EPADS

1 INTRODUCTION

1.1 PROJECT BACKGROUND

Water and Power Development Authority (WAPDA) intends to develop 54 MW Attabad Lake Hydropower Project (ALHHP[2]) on Attabad Lake situated in the Hunza Valley of GB, Pakistan. ALHPP (36º8'28.87"N and 74º49'19.44"E) has been identified on Hunza River on Attabad Lake. Attabad Lake was formed on January 4, 2010, when a huge mass from the right bank of Hunza River slided down near Attabad Village and blocked Hunza River. The inflow filled upstream valley created a reservoir 22 km long till the end of May 2010. Attabad Lake is about 15 km upstream of Ganish Bridge and about 111 km upstream from Gilgit. Therefore, ALHHP will utilize the Attabad Lake water and head for the generation of the Hydel Electricity. Therefore, due to the implementation of Attabad Lake HPP, no major adverse impacts are anticipated. The location of the Project is shown in **Figure 1.1**.

Presently, there is a huge demand and supply gap of electricity in GB resulting in load shedding along with low voltage issues. Locals have no option for commercial and industrial demand to be partly fulfilled from diesel generators. Apart from the high cost of fuel, the use of these diesel generators is affecting the environment as well as tourism in the area.

Gilgit-Baltistan of Pakistan is blessed with abundant renewable hydropower resources. More than 95% of Pakistan hydel potential is located in mountainous areas of Gilgit-Baltistan (Gilgit-Baltistan), Khyber Pakhtunkhwa (KPK) and Azad Jammu and Kashmir (AJK). The reconnaissance study of hydel potential for whole Gilgit-Baltistan is almost complete, and identified potential sites are still to be optimized in terms of capacity, cost and need of power for growing load centers

On November, 2015 Prime Minister Government of Pakistan announced the construction of Attabad Lake Hydropower Project (ALHPP), Accordingly Government of Gilgit-Baltistan undertook its Feasibility Study through Annual Development Programme (ADP) for Financial Year 2016-17. In the beginning Feasibility Study of ALHPP of 32.5 MW was carried out by local consultant of Gilgit-Baltistan. On July 2019, a meeting was held between Chairman WAPDA and Chief Secretary Gilgit-Baltistan. It was agreed that Feasibility Study would be again carried out by Hydro Planning Organization (HPO), WAPDA because of its expertise in the field of Hydro Power Planning. WAPDA prepared a feasibility report for the proposed project in June, 2021. The proposed Project is scheduled to be implemented by the EPC Contractor.

WAPDA hired a joint venture of Attabad Hydropower Management Consultants (AHMC) with M/s National Engineering Services Pakistan (NESPAK) as its lead firm for the Review / Validation of the Feasibility Study, Procurement of the EPC Contractor, and Contract Management & Administration of ALHPP. As a part of this Contract, review of the Environmental Impact Assessment (EIA) Study (prepared by WAPDA in 2021) was also included in the scope of work. This EIA study has been updated based on the available information at this stage of the Project as an additional scope of work. The proposed project will be implemented in EPC Contract mode therefore, Detailed Engineering Design including Basic Design will be available after the selection of EPC Contractor.

[2] *The term ALHPP in this report is referred as Proposed Project.*

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

1.2 OBJECTIVES OF THE PROJECT

Following are the main objectives of the Project:

- The prime objective of the implementation of the Project is to develop the Power Potential, available in GB on sustainable basis by providing cheaper, renewable, environmental friendly and most needed power, keeping in view the present and future requirements of Pakistan especially rural and remote areas for the development of the country; and
- Transmit energy to Hunza and adjoining suburbs for meeting Power requirements of the region. Ensured availability of Power will reduce reliance and consumption of diesel, timber and other fuels. This will overall reduce the Greenhouse Gases (GHGs).

1.3 NEED FOR EIA STUDY

The proposed project is located in GB therefore, GB Environmental Protection Act 2014[3] is the core environmental law for the proposed Project. Hence for the proposed Project, the GB EPA is the concerned authority with respect to environmental approvals.

According to the Pakistan Environmental Protection Agency Review of Initial Environmental Examination and Environmental Impact Assessment Regulations 2000, the proposed project falls under category A of schedule II (Energy: Hydroelectric power generation over fifty megawatts), which requires EIA before commencement of construction.

Thus, to fulfil legal requirements, an EIA study has been conducted for the proposed Project to initiate the process of NOC/ environmental approval from the GB EPA.

1.4 THE PROPONENT AND CONSULTANT

The proponent of the project is Water and Power Development Authority (WAPDA), Government of Pakistan while the Consultant is Attabad Hydropower Management Consultants (AHMC). The details are given as under:

a) Proponent Contact Address

Office of the Project Director
Attabad Lake Hydropower Project
Aliabad, Hunza, GB
Phone: +92-042-99204981, +92-05813-920813
Email:pdalhpp@gmail.com

b) Consultant Contact Address

Attabad Lake Hydropower Project Management Consultants (AHMC)
37-B, Block – N, Model Town Extension, Lahore-54700
Phone: +92 42 35194885
Email: alhpp.nespak@gmail.com

[3] *Section 16 (1) of the Act states that: "No proponent of a project shall commence construction or operation unless he has filed with the Agency an initial environmental examination or environmental impact assessment, and has obtained from the Agency approval in respect thereof."*

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

1.5 NATURE, MAGNITUDE AND LOCATION OF THE PROJECT

The proposed Project is a hydroelectric power generation having 54 MW capacity. The proposed Project comprises various components of linear and non-linear nature. The main components are: Weir (Overflow Structure) and its associate structures, Sediment Flushing Tunnel, Headrace Tunnel, Surge Tank, Penstock, Powerhouse, Switchyard and Tailrace.

The proposed Project is located at about 119 km from Gilgit city and 27 km from Aliabad town in Hunza Valley. The Powerhouse location is on the left bank of river and easily accessible from Karakoram Highway. The intake weir site is selected at current exit point of Attabad Lake which was formed in the year 2010 due to a huge natural landslide from right bank mountain.

PUBLIC PROCUREMENT REGULATORY AUTHORITY (PPRA) EPADS

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

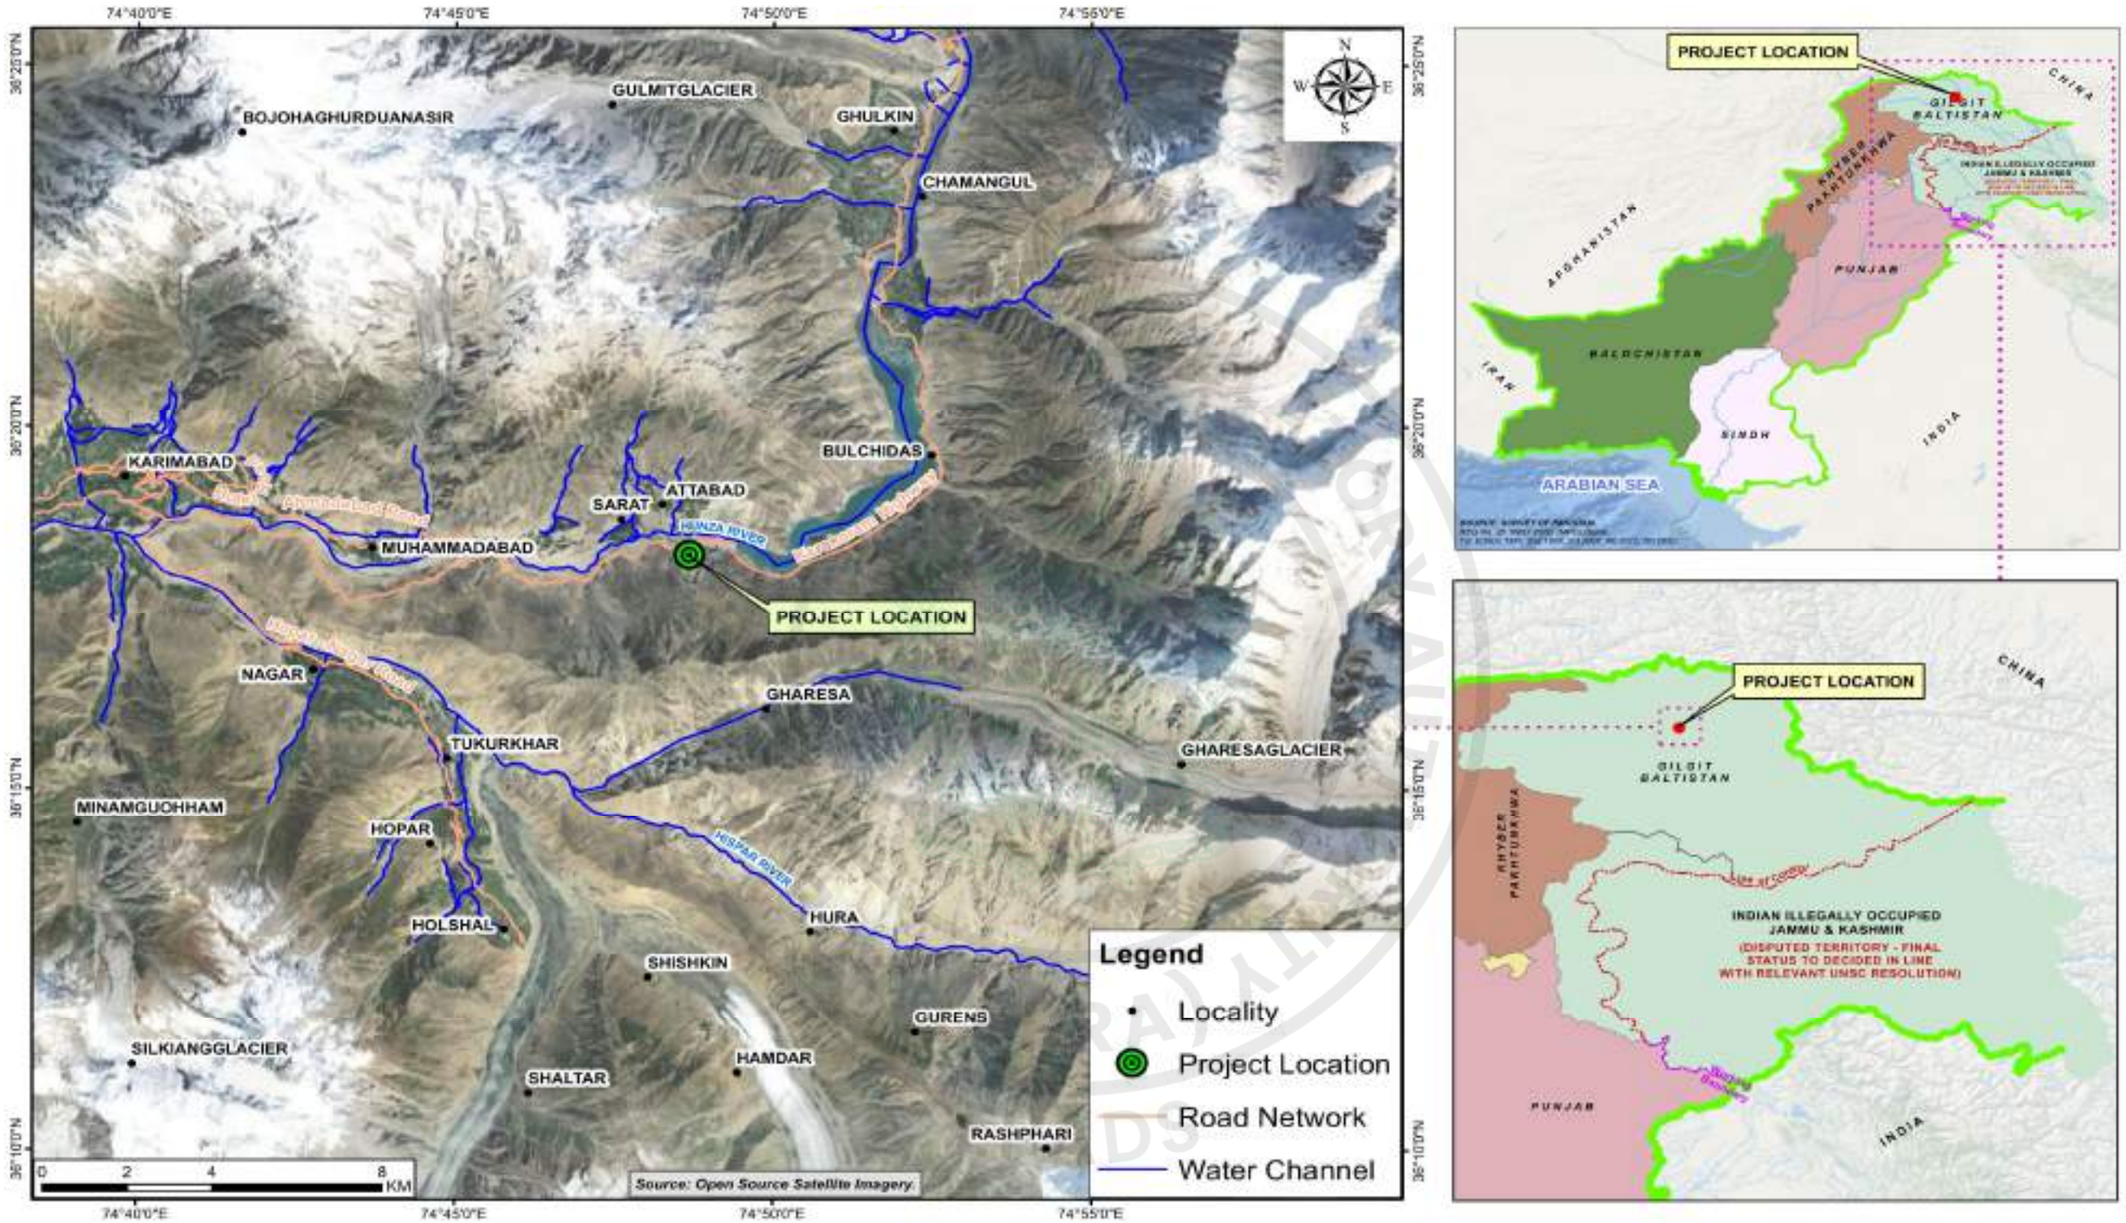

Figure 1-1: Project Location Map

1.1 OBJECTIVE OF EIA

The prime objective of the EIA study is to fully meet the statutory requirements set forth by the GB Environmental Protection Act - 2014 and to facilitate decision making by the GB EPA regarding grant of NOC/Environmental approval for the proposed Project.

The overall objective of this EIA is to elucidate the anticipated aspects of the proposed intervention and to propose necessary mitigation measures to prevent/minimize adverse impacts on surrounding environment and community. To achieve this objective, an assessment of the existing environmental conditions of the project area is a prerequisite and therefore, included after collecting the baseline data of major environmental attributes acquired from primary and secondary sources. This EIA has been prepared to ensure adequate environmental and social management during construction and implementation stages of the proposed project. It provides mechanisms to ensure that potentially significant environmental and social impacts of the proposed project are identified, assessed and mitigated as appropriate.

More specific objectives of this EIA report are to:

- Facilitate proponents of the project in ensuring environmental and social sustainability of the project;
- Establish a baseline of existing social and environmental conditions prior to project initiation by collecting secondary and primary data/information on physical, biological and socio-economic environment of the project area;
- Identify potentially significant environmental and social impacts (both positive and negative) during all stages of the project;
- Avoid, minimize, and suggest mitigation and compensation measures for significant adverse impacts;
- Conduct, record, report and ensure public consultation, participation with major stakeholders; and
- Provide EMP for all stages of the project as a tool for the implementation of the suggested measures along with monitoring and evaluation mechanism with adequate resources including implementing agencies capacity building.

1.6 DELINEATION OF THE STUDY AREA/AREA OF INFLUENCE (AOI)

For an EIA Study, a clear delineation of the Study Area/ Area of Influence (AOI)[4] is required. Study Area/AOI is the area within which the potentially significant impacts of the proposed Project activities (direct or indirect) are envisaged. In this report, the Study Area/AOI is the area where the Project impacts on the environment due to the proposed Project activities are assessed. The proposed Project comprises various components of linear and non-linear nature.

Based on the available Google Earth Imagery and ARC GIS software, Project components were overlaid on the existing Project Area Imagery. Utilizing the information collected through the study of previous documents including the Feasibility Study, reconnaissance visit, consultations with the locals and concerned departments and foreseen impacts of the

[4] *Term Study Area/ Area of Influence (AOI) interchangeable in this document. Moreover, the Study Area/AOI also includes actual project area.*

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

hydropower, a tentative Study Area of 10 to 20 m was delineated which was firmed up during the detailed design stage. Map of the Study Area is shown as **Figure 1.2.**

Based on the proposed Project components, geographical location and nature of the Project following is the description of the Study Area of the Project:

The catchment area of Hunza River upstream of the Project Site is about 8,900 km² which mostly consists of glaciers and snow deposits. Hunza River cuts through the Karakoram Range and flows approx. 250 km with an average slope of 0.90% from north to south before it merges into the Gilgit River. The discharge of Hunza River has its peak in months from May to September due to melting of snow/glaciers. Based on the hydrology, proposed Project activities have no potentially significant impacts on whole catchment area. Below is the description of the Study Area component wise.

a) **Weir Area:** The overflow weir is a concrete gravity type, un-gated section (60 m wide) with downstream stilling basin along with the construction of upstream and downstream coffer dams to facilitate the working of the main civil structures. The weir would be founded on overburden / slided mass with crest elevation of 2414 m.a.s.l.

b) **Sediment Flushing Tunnel: T**he sediment flushing tunnel will be constructed at the left side under Headrace Tunnel section, consisting of low level tunnel with gated arrangement. The invert level of sediment flushing tunnel section is planned at El. 2380 m.a.s.l. The sediment flushing tunnel would be founded mostly on hard rock with minor outlet length on slided mass.

c) **Headrace Tunnel:** From power intake, approximately 2,320 m long low pressure headrace tunnel (horse shoe shape), having 5.5 m diameter would run along the left bank of Hunza River leading to surge tank.

d) **Surge Tank:** A circular surge tank having 10 m diameter and 45 m high will be constructed at the intersection of the headrace tunnel and penstock.

e) **Penstock:** A Penstock of 3.6 m diameter will be laid under the left bank slopes for conveying water from headrace tunnel to Powerhouse. The penstock will cross horizontally the rock starting from the bottom of surge tank lined with an embedded steel lining.

f) **Power House:** The Powerhouse is proposed 52 m long, 25 m wide and 22.5 m high with four floors at different levels. The main hall would accommodate three vertical Francis Turbine units, each of 19.3 MW, along with three Generators, switchgear cabinets, trifurcation of penstock pipes and erection bay.

g) **Tailrace Channel:** The draft tube of each turbine unit will drain water in the 88 m long tailrace channel and it finally will be discharged into Hunza River.

h) **Switchyard:** A surface AIS 132 kV switchyard will be located near Powerhouse.

i) **Residential Colony:** A colony containing offices, residential blocks for O&M Staff including Engineers, supervisory and lower staff, rest house, mosque, basic health unit, shops and other allied services including roads, water supply / sewage disposal system and the electricity arrangement etc. will be developed near Powerhouse Site.

j) **Contractor's Camp Area:** The contractor's construction camp and construction of operation and maintenance staff building are proposed to be established near the

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Powerhouse Site. The exact location of the contractor's construction camp will be finalized by the EPC Contractor at detailed design stage.

k) **Quarry Area:** The details of the identified material sites are discussed in the Chapter 3 of this report. The final source of material will be finalized by the EPC Contractor at detailed design stage.

l) **Access Roads (Temporary and Permanent):** The project will also include the construction of both temporary and permanent access roads.

m) **Reservoir Area:** The reservoir area of the lake extends upstream to Gulkin Village. The total length of the reservoir is approximately 12 km based on 2424 m.a.s.l.

PUBLIC PROCUREMENT REGULATORY AUTHORITY (PPRA) EPADS

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

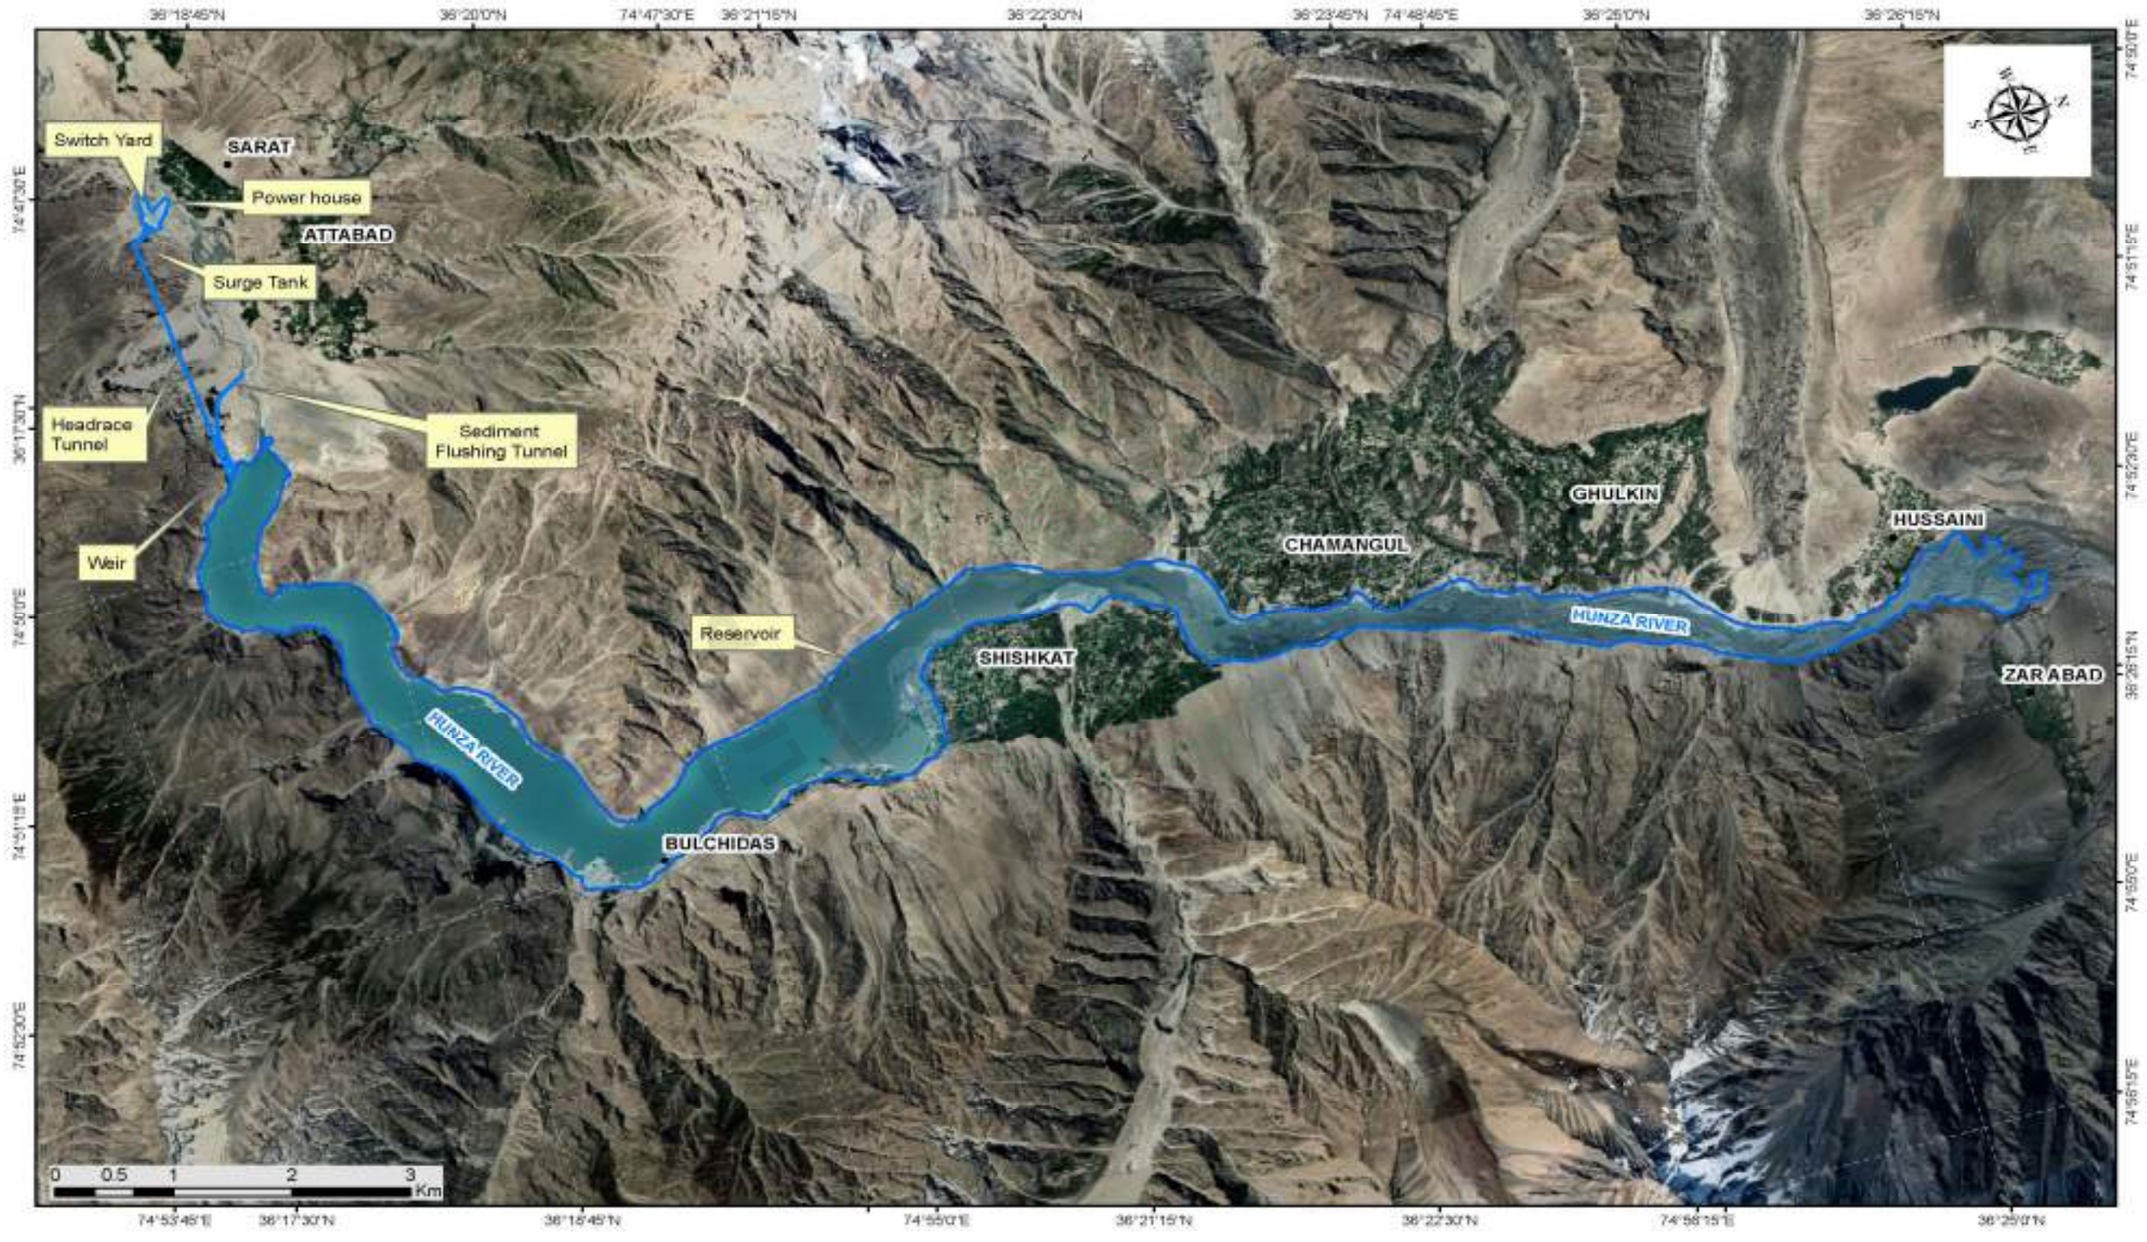

Figure 1-2: Study Area Map

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

1.2 EIA TEAM

A multidisciplinary team was formulated to conduct the study. The team comprises the following professionals (refer **Table 1.1**):

Table 1-1: EIA Study Team

Sr. No.	Name of Expert	Designation
1.	Mr. Muhammad Shariq Ahmed	Head ERSD
2.	Mr. Muhammad Farooq	Biodiversity Expert
3.	Ms. Uzma Iqbal	Senior Environmental Scientist
4.	Mr. Hafiz Muhammad Abid Saleem	Senior Environmental Engineer
5.	Mr. Shoaib Aziz	Senior Engineer
6.	Mr. Kamran Ahmed	Senior Sociologist
7.	Mr. Waleed Farooq	HSE Engineer
8.	Mr. Muneeb Yousuf	GIS Expert

1.7 APPROACH AND METHODOLOGY ADOPTED

This EIA study has been updated based on the available information as an additional scope of work. The proposed project will be implemented by the EPC Contractor including Detailed Engineering Design. Following is the approach and methodology adopted to update the EIA study.

a) Orientation

Meetings and discussions were held among the members of the EIA and design Team. This activity was aimed at achieving a common ground of understanding of various issues related to proposed Project. Subsequent to the concept clarification and understanding, a detailed data acquisition plan was developed for the internal use of the EIA consulting team. The plan identified specific data requirements and their sources; determined time schedules and responsibilities for their collection; and indicated the logistics and facilitation needs for the execution of the data acquisition plan.

b) Desktop Studies

After the award of the contract, the Consultants acquired various Project specific studies, relevant studies to the regions, available maps, Google Earth Imagery of the Area, published reports, previous Feasibility Study Report, 2021 etc.

After the acquisition of data, reports, maps and relevant information, Consultant relevant experts started the desktop studies. The main objective of the desktop study was to conceptualize the Project, familiarize with the project layout, design, status of the Project, identification of the issues related to the Project.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

c) Analysis of Alternatives

It is a mandatory requirement for any EIA study to analyze each potential alternative available that could have been developed to meet the objectives and recommend the option which is environmentally and economically feasible.

In order to select the most viable route keeping in view the technical, environmental, economic and social constraints, the analysis of different alternatives was carried out for the selection of the most feasible option. Moreover, the NPO was also considered. This exercise confirmed the justification for the need of the proposed Project.

d) Environmental and Social Baseline Information

After the selection of the most project option, based on satellite images and the delineation of Study Area/AOI, detailed environmental survey was carried out within the Study Area. Detailed investigations/surveys were carried out for environmental parameters on which any adverse or positive impacts were envisaged by the implementation of the proposed project. Prior to the start of field activities, comprehensive checklists, proformas and maps were developed covering the main parameters for physical, biological and socio-economic environment. Primary and secondary data has been compiled and analyzed to update baseline conditions in the Study Area.

e) Stakeholder Consultations

The consultants identified project stakeholders during inception/scoping stage and held meetings and e-communication with them during the surveys to receive feedback on the expected environmental issues related to the project impacts and suggested mitigation measures. Meetings were carried out with the project affectees, relevant departments to discuss the issues/constraints and get their views and feedback to mitigate the potential environmental impacts associated with the implementation and operation of the proposed project.

f) Anticipated Impacts Assessment and Mitigation Measures

A logical and systematic approach was adopted for impact identification and assessment. The process began during the screening and continued through scoping which identified the key issues and classified them into different categories. The tools, which were used for impact assessment, are:

- Checklists;
- Matrices; and
- Overlays.

Identification of potential environmental and social impacts in terms of their nature, magnitude, extent, location, timing and duration were carried out. The impacts were correlated to the project location, design stage, construction as well as operation stage. Based on the impacts prediction methods and as a result of public/stakeholder consultations, NESPAK screened the adverse environmental impacts for inclusion in the mitigation measures and environmental management plan. The same process was followed for the identification of social impacts. Public consultations (which provided feedback of the impacts from the stakeholder's viewpoint) were used to screen out the insignificant impacts. Matrices and overlays were used for the evaluation of temporal and spatial impacts respectively.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

The Consultants proposed practicable, economically feasible and socially acceptable mitigation measures for the significant adverse environmental and social impacts. These measures were based on exploring the ways to achieve the project objectives causing least disturbance to the existing environment by alternative ways, proposing changes in the project design, through improved monitoring and management practices.

g) Environmental Management Plan

An EMP has been prepared to ensure the adequacy and effectiveness of the proposed protocol by clearly identifying the roles and responsibilities of the agencies responsible for implementation, monitoring and auditing of EMP activities, existing and suggested framework, necessary approvals, training needs and the required further studies. The EMP also includes organizational setup, a monitoring mechanism, monitoring plan, environmental and social parameters to be monitored with their frequency. Similarly, costs for environmental monitoring, ecological and social component/social mitigation measures were also included as part of the EMP. Environmental monitoring, evaluation, auditing and reporting mechanism were also proposed in the EMP.

1.8 ORGANIZATION OF REPORT

This report contains ten (10) chapters. The contents of chapters are described as follows:

- **Chapter 1**– "Introduction" describes introduction, location of project, objective and purpose of the EIA report, approach and methodology;
- **Chapter 2** – "Legislative Requirements and Framework" elucidates the current legal framework including national, local laws, policies, guidelines which is applicable to the proposed project in the context of environment and sustainable development;
- **Chapter 3** – "Project Description" furnishes an overall description of the project, including its features and key components, construction planning, timeframe and cost etc.
- **Chapter 4** – "Analysis of Alternatives" presents the Analysis of Alternatives such as No Project Option, Project Layout, Headrace, Penstock and Powerhouse Location;
- **Chapter 5** – "Description of the Environment" comprises a detailed narrative of the existing (baseline) conditions of the project area, with respect to its physical, biological and socio-economic environment;
- **Chapter 6** – "Stakeholder Consultation" provides summary of consultative sessions with the local community as well as with other stakeholders including local politicians, local government officials for their opinions and suggestions on the project;
- **Chapter 7** – "Anticipated Environmental Impacts & Mitigation Measures" elaborates the likely impacts of the project on the physical, biological and socio-economic environment during the pre-construction, construction and operation stages and lays down the proposed measures to mitigate the adverse impacts of the project;
- **Chapter 8 –** "Grievance Redress Mechanism" provides the mechanism to address the complaint of workers and locals;
- **Chapter 9** – "Environmental Management Plan" provides the mechanism to be adopted for the implementation of measures and monitoring the environment during all stages; and

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- **Chapter 10** – “Conclusion and Recommendations” gives the conclusion of the impact assessment study and recommendations for the construction and operational stages.

PUBLIC PROCUREMENT REGULATORY AUTHORITY (PPRA) EPADS

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

2 POLICY, LEGAL AND ADMINISTRATIVE FRAMEWORKS

2.1 GENERAL

This chapter provides an overview of the policy framework and legislation that applies to control the environmental consequences as a result of proposed Project implementation and operation. The proposed Project needs to comply with all the applicable environmental policies, laws, guidelines, acts and legislations of Government of Pakistan (GoP) and the Government of GB.

2.2 SUMMARY OF RELEVANT STRATEGIES, POLICIES, ACTS AND LEGISLATION

The summary of major relevant strategies, policies, acts and legislation from environmental perspective are briefly described in **Tables 2.1 & 2.2** below:

Table 2-1: Main Strategies/Policies Related to Environment and Relevance to the Project

Sr. No.	Policy/Strategy	Brief Coverage	Relevance to Project
1.	National Conservation Strategy, 1992	Pakistan National Conservation Strategy (NCS), which was approved by the federal cabinet in March 1992, is the principal policy document on environmental issues in the Country. The NCS outlines the Country's primary approach towards encouraging sustainable development, conserving natural resources and improving efficiency in the use and management of resources. The NCS has 68 specific programs in 14 core areas in which policy intervention is considered crucial for the preservation of Pakistan's natural and physical environment.	The core areas that are relevant in the context of the proposed Project are pollution prevention during construction and conserving biodiversity and forestry.
2.	National Environmental Policy, 2005	In March 2005, GoP launched its National Environmental Policy, which provides a framework for addressing the environmental issues. Section 5 of the policy commits for integration of environment into development planning as instrument for achieving the objectives of National Environmental Policy. It also provides broad guidelines to the Federal Government, Provincial Governments, Federally Administered Territories and Local Governments to address their environmental concerns and to ensure effective management of their environmental resources.	Clause (b) of sub-section 5.1 states that EIA related provisions in Environmental Protection Act, 1997, will be diligently enforced for all developmental projects.
3.	National Forest Policy, 2015	The goal of this policy is to foster the sustainable development of Renewable Natural Resources (RNR) in Pakistan, through maintenance and rehabilitation of these essential resources and enhancement of sustainable livelihoods	Proposed project involves tree cutting so the relevant clauses of preservation of the policy will be applicable, however, no

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Sr. No.	Policy/Strategy	Brief Coverage	Relevance to Project
		of rural masses, particularly women, children and other deserving groups. The various components of the policy include: • Reducing poverty, powerlessness and unemployment; • Population planning in critical ecosystems; • Reducing the impact of socio-economic factors; • Providing substitutes to firewood in the mountain-woods; • Reducing political interferences in Forestry and Wildlife Departments; • Renovating and invigorating the institutions of RNR; • Supporting Local Governments in the sustainable development of their RNR; • Policies for fragile ecosystems; • Riverside forests; • Irrigated plantations; • Preservation of sensitive and unique forests; • Wildlife conservation; • Rangelands and desert ecosystems; and • Planting trees and fodder on farmlands.	forest area falling within the project boundary.
4.	Pakistan Labor Policy, 2010	The main objective of the Labor Policy, 2010 is the social and economic well-being of the labor of Pakistan. The Labor Policy, 2010 has following 4 parts: • Legal Framework; • Advocacy: rights of workers and employers; • Skill development and employment; and • Manpower export.	The labor will be employed for construction of the proposed Project. The provision of policy will apply to all the labor employed during the execution of the project.
5.	National Climate Change Policy, 2012 (Updated in 2021)	The National Climate Change Policy provides a framework for addressing the issues that Pakistan faces or will face in future due to the changing climate. In view of Pakistan's high vulnerability to the adverse impacts of climate change, in particular extreme events, adaptation effort is the focus of this policy document. The vulnerabilities of various sectors to climate change have been highlighted and appropriate adaptation measures spelled out. The policy cover measures to address issues in various sectors such as water,	The proposed project involves the renewable energy resource development which will have positive impacts on the regional as well as global climate change issues. The analysis shows that 373.69 GWh of electricity will be generated annually by this project which will displace about 149,476 ton of CO^2 at 0.40 kg/kWh. One ton of CO2 corresponds to CER which is currently valued about 1.5 US$.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Sr. No.	Policy/Strategy	Brief Coverage	Relevance to Project
		agriculture, forestry, coastal areas, biodiversity and other vulnerable ecosystems. Notwithstanding the fact that Pakistan's contribution to global Greenhouse Gas (GHG) emissions is very small, its role as a responsible member of the global community in combating climate change has been highlighted by giving due importance to mitigation efforts in sectors such as energy, forestry, agriculture and livestock. Furthermore, appropriate measures relating to disaster preparedness, capacity building, institutional strengthening; technology transfer; introduction of the climate change issue in higher education curricula; ensuring environmental compliance through IEE and EIA in the development process; addressing the issue of deforestation and illegal trade in timber; promoting Clean Development Mechanisms (CDM); and raising Pakistan's stance regarding climate change at various international forums, have also been incorporated as important components of the policy. The policy thus provides a comprehensive framework for the development of Action Plans for national efforts on adaptation and mitigation.	Therefore, the CDM benefits worth will be 29.921 million PKR per annum.
6.	National Sustainable Development Strategy, 2012	The National Sustainable Development Strategy is an attempt to define sustainable development and the pathway to a "green economy" in Pakistan's context. It lays out an adaptive system and approach that can be continuously improved, through regular updates, to respond to evolving challenges. The focus has been on integrating not only across the three overall dimensions of economic, social and environment but also integrating the goals with the existing development paradigm with the aim of shifting it on to a more sustainable pathway.	This strategy is applicable as the project involves the construction of hydroelectric power to improve the power availability with least environmental burden.
7.	National Electricity Policy, 2021	The Ministry of Water and Power of the Government of Pakistan has developed an ambitious power policy to support the current and future energy needs of the country. This bold strategy will set Pakistan on a trajectory of rapid economic growth and social	The proposed project is a renewable energy production facility, and it will reduce the gaps between energy availability and demand.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Sr. No.	Policy/Strategy	Brief Coverage	Relevance to Project
		development. Simultaneously, it will address the key challenges of the power sector in order to provide much needed relief to the citizens of Pakistan. This document will frame the broad contours of the energy policy articulating the vision for the power sector, highlighting its key challenges, setting major goals, summarizing policy principles, and highlighting the strategy devised to achieve Pakistan's aspirations	
8.	National Disaster Risk Reduction Policy, 2013	National Disaster Management Authority (NDMA), being the lead focal agency for disaster preparedness and management, has therefore, embarked upon formulation of a comprehensive National Disaster Risk Reduction Policy through wider consultations with all stakeholders including all provinces, state of AJ&K and regions. This policy covers disasters risk reduction in a more holistic way and introduces a proactive and anticipatory approach by laying special emphasis on risk assessment and prevention.	This policy will be elicited if any unforeseen natural and manmade disaster occurs during construction and operation phase.
9.	National Action Plan for COVID-19 Pakistan	GoP has launched the National Action Plan for COVID-19 Pakistan to combat the challenge of prevailing virus, also available at https://www.nih.org.pk/wp-content/uploads/2020/03/COVID-19-NAP-V2-13-March-2020.pdf. The GoP has launched the real-time data portal for COVID-19 http://covid.gov.pk/. These measures are mostly relating to the containment and awareness and capacity building. Besides this COVID-19 daily situation report is also available at https://www.nih.org.pk/wp-content/uploads/2020/04/COVID-19-Daily-Updated-SitRep-03-April-2020.pdf.	This Action Plan for COVID-19 is applicable to the proposed project as it is being launched during this pandemic.

Table 2-2: Main Legislation/Acts Related to Environment and Their Relevance to the Project

Sr. No.	Act	Brief Coverage	Relevance to Project
1.	Gilgit - Baltistan Environmental Protection Act, 2014	The GB Environmental Protection Act 2014 was enacted by Govt. of GB on May 06, 2016. The act has Eleven (11) Parts out of which part VI is related to environmental examination and assessments. This act is applicable to almost all environmental parameters such as air, water, soil, and noise	The provision of the act is applicable to proposed Project for conducting an EIA according to section 16 and to obtain environmental approval/NOC from the GB EPA. The proposed Project will also ensure the

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Sr. No.	Act	Brief Coverage	Relevance to Project
		pollution, as well as to the handling of hazardous wastes. The Act provides the framework for protection and conservation of species, wildlife habitats and biodiversity, conservation of renewable resources, establishment of standards for the quality of the ambient air, water and land, establishment of Environmental Tribunals, appointment of Environmental Magistrates, IEE and EIA approval. Penalties have been prescribed for those contravene the Act. The key features of the Act have a direct bearing on the requirement for an Initial Environmental Examination and Environmental Impact Assessment for development projects.	compliance with all other relevant sections of this Act.
2.	Pakistan Environmental Protection Agency Review of Initial Environmental Examination and Environmental Impact Assessment Regulations, 2000	These regulations set out: • Key policy and procedural requirements for filing an EIA; • The purpose of environmental assessment; • The goals of sustainable development; • The requirement that environmental assessment be integrated with feasibility studies; • The jurisdiction of the Provincial EPA and Planning & Development (P&D) Departments; • The responsibilities of proponents; • Duties of responsible authorities; • Provides schedules of proposals that the project requires either IEE or an EIA; • The environmental screening process of the projects under schedule I, II and III; and • The procedure for the environmental approval for filing the case with the concerned EPA for the granting of the NOC.	The provisions of these regulations are applicable for environmental screening of the project, which implies that an EIA is required for the proposed project. After submission of EIA to GB EPA, the process for environmental approval/NOC will be initiated.
3.	National Environmental Quality Standards, 2000	The National Environmental Quality Standards (NEQS) were first promulgated in 1993 and have been amended in 1995 and 2000 which includes standards for liquid effluent, industrial gaseous emissions, ambient air, drinking water quality, noise levels and standards for motor vehicle exhaust, diesel vehicle, and petrol vehicles.	All projects to be implemented in GB must comply with NEQS during all the phases i.e. construction and operation.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Sr. No.	Act	Brief Coverage	Relevance to Project
4.	Guidelines for Environmental Assessment	EPA has published a set of environmental guidelines for conducting environmental assessments and the environmental management of different types of development Projects. The guidelines that are relevant to the proposed project are listed below. • Guidelines for the Preparation and Review of Environmental Reports, Pakistan Environmental Protection Agency, 1997; • Guidelines for Sensitive and Critical Areas, 1997; • Guidelines for Public Consultation, Pakistan Environmental Protection Agency, May, 1997; and • Sectoral Guidelines: Pakistan Environmental Assessment Procedures, Pakistan Environmental Protection Agency, October 1997.	These guidelines are applicable to the proposed project and have been considered during the preparation of the EIA.
5.	Forest Act, 1927	The Act reserve the areas having forest cover, or significant wildlife, to regulate movement and transit of forest produce, and duty leviable on timber and other forest produce. It also defines the procedure to be followed for declaring an area to be a Reserved Forest, a Protected Forest or a Village Forest.	Proposed project involves tree cutting so the relevant clauses of preservation of this act will be applicable, however, no forest area falling within the project boundary.
6.	Northern Areas Wildlife Preservation Act, 1975	This Act provides for the establishment of national parks, wildlife reserves and wildlife sanctuaries and the issuing of hunting licenses and certificates of lawful possession. It regulates hunting, prohibits the use of in humane methods and imposes certain other limitations, such as time of day, season and area in which hunting is permitted. The First Schedule to the Act contains a list of animals divided according to the categories of “small game” and “big game”.	All activities at the Project site will be carried out keeping in view the provisions of this act. Moreover, there is no notified protected site in and near the project area.
7.	Northern Areas Fisheries Act, 1975	This act is related to the fisheries in the GB. The act mainly describes the prohibition of destruction of fish by explosive and destruction of fish by poisoning water. The act also describes the fish size not to be kill and capture specified in the second column of the First Schedule. Moreover, the action also	The Act is directly applicable to the proposed project since it is planned on a potential fish habitat.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Sr. No.	Act	Brief Coverage	Relevance to Project
		describes the separate penalties for the violation of section 4, 5 or 9 and section 6, 7, 8 or 10.	
8.	Land Acquisition Act (LAA), 1894 Including Later Amendments	The Land Acquisition Act, 1894, is a "law for the acquisition of land needed for public purposes and for companies and for determining the amount of compensation to be paid on account of such acquisition". The exercise of the power of acquisition has been limited to public purposes. The principles laid down for the determination of compensation, as clarified by judicial pronouncements made from time to time, reflect the anxiety of the lawgiver to compensate those who have been deprived of property, adequately. The land needed for the construction of development projects will be acquired under normal conditions based on prevailing market prices or negotiated prices between client and the owners of land. Section 17(4) of the LAA will not be used in the absence of an emergency. Instead, the land will be purchased under willing-seller willing-buyer deal at agreed upon market rates and the seller will have the option not to sell the land, in case an acceptable deal for both the parties is not reached.	This act is applicable as the proposed project involves the permanent acquisition of land.
9.	Factories Act, 1934	The Factories Act provides regulations for health, safety and welfare of workers, disposal of solid wastes and effluents, and damage to private and public property, handling and disposal of toxic and hazardous materials.	This act will be applicable during the construction phase of the proposed Project. The EPC Contractor will respect the provision of this act during the execution of the proposed Project.
10.	Pakistan Antiquities Act, 1975	The Antiquities Act, 1975 (amended in 1990) states the following: • "Ancient" is any object that is at least 75 years old; • All accidental discoveries of artefacts must be reported to the Federal Department of Archaeology; • The Government is the owner of all buried antiquities discovered on any site, whether protected or otherwise;	No notified archaeological site has been identified within the proposed Study Area. However, the law will be applicable to the project mainly due to its two provisions: ▪ According to the law, any construction activity within 61 m or 200 ft. of protected antiquities, are prohibited. ▪ The provisions of this act would also be applicable, if any accidental archaeological discoveries may occur during the

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Sr. No.	Act	Brief Coverage	Relevance to Project
		• All new construction within a distance of 200 feet from protected antiquities is forbidden; • No changes or repairs can be made to a protected monument, even if it is owned privately, without approval of the responsible authorities; and • The cultural heritage laws of Pakistan are uniformly applicable to all categories of sites regardless of their state of preservation and classification as monuments of national or world heritage.	excavation works for the construction of proposed Project.
11.	Explosives Act, 1884	It provides regulations for handling, transportation and use of explosives.	Under the Explosives Act, the EPC Contractor is bound by regulations on handling, transportation and using explosives during quarrying, blasting and other purposes.
12.	The Protection against Harassment of Women at the Workplace (Amendment) Act, 2022	The Protection Against Harassment of Women at the Workplace Act refers to sexual harassment at the workplace.	This Act will be applicable to the project if women are employed for the construction of the proposed Project.
13.	Employment of Children Act, 1991	Article 11(3) of the Constitution of Pakistan prohibits employment of children below the age of 14 years in any construction, or any other hazardous employment. In accordance with this Article, the Employment of Child Act 1991 prohibits child labor (a child is under 14 years old).	The relevance of this act to the project will be to prohibit child employment for construction of the proposed project.
14.	National Disaster Management Act, 2010	National Disaster Management Act, 2010 was passed by Parliament of Pakistan in 2010. The Act applies to whole Pakistan. The Act was passed in backdrop of 2010 Floods in Pakistan and strengthens Disaster Management system.	For the proposed Project, GB Disaster Management Authority (GBDMA) is responsible. The EPC Contractor will follow the guidelines of updated Contingency Plan prepared by the GBDMA.
15.	Hazardous Substances Rules, 2003	The rule describes the procedure of handling, transportation and disposal of hazardous substances and hazardous waste. General safety precautions for handling hazardous substances as well as safety precautions for workers, and notification requirements in the event of	This rule is applicable to the proposed Project due to involvement of hazardous waste handling, use and disposal during different construction activities at the construction stage.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Sr. No.	Act	Brief Coverage	Relevance to Project
		an accident are also described in these rules.	
16.	Building Code of Pakistan, 2007	The provision of BCP shall apply for engineering design of building like structure and related components. The construction in violation of the Building code shall be deemed as violation of professional engineering work. Moreover, a certificate for the proposed action will be obtained from concerned Control Authority.	These codes shall be used in structural design of building area components constructed under this proposed project.

2.3 COMPLIANCE PROCEDURE FOR OBTAINING NOC FROM GB EPA

Review of IEE and EIA Regulations, 2000 provide the necessary details on the preparation, submission, and review of the IEE and the EIA reports. Categorization of projects for IEE and EIA is one of the main components of these regulations. Projects have been classified on the basis of expected degree of adverse environmental impact.

The proposed project falls under Schedule II (category A Energy: Hydroelectric power generation over fifty megawatts), which requires an EIA to initiate the process of NOC from GB EPA.

The regulations stipulate that within ten working days of the IEE or EIA study having been submitted, GB EPA will confirm that the document submitted is complete for the purpose of review. During this time, should the agency require the proponent to submit additional information, it will return the IEE or EIA to the proponent for revision, clearly listing those aspects that need further discussion. Subsequently, GB EPA would make every effort to complete an IEE review within forty-five days and an EIA review within ninety days of filing (refer **Figure 2.1**).

The prescribed procedure for review of EIA by the GB EPA is described in Review of IEE and EIA Regulations, 2000. The agency will communicate its approval or otherwise within a period of two months from the date that the initial environmental examination is filed, and within a period of four months from the date that the EIA is filed complete in all respects in accordance with the regulations, failing which the initial environmental examination or, as the case may be, the EIA shall be deemed to have been approved, to the extent to which it does not contravene the provisions of this Act and the rules and regulations

.

2.4 INTERNATIONAL PROTOCOL/CONVENTIONS

As Pakistan is a member of a number of international organizations such as United Nations Organization (UNO), Organization of the Islamic Cooperation (OIC), South Asian Association for Regional Cooperation (SAARC), Economic Cooperation Organization (ECO) etc., so it has to follow the international protocols and obligations related to the environment. The major protocols, ratification dates by Pakistan and obligations related to the proposed project are provided in the **Table 2.3**.

Table 2-3: International Agreements/Conventions Relevant to the Project

Sr. No.	Agreement/Convention	Ratification	Description/Relevance
1	Convention on Biological Diversity, 1994 **Web Link:** https://www.cbd.int/	Signed in 1992 and ratified in 1994.	The Convention on Biological Diversity (CBD) has three main goals: conservation of biological diversity (or biodiversity); sustainable use of its components; and fair and equitable sharing of benefits arising from genetic resources. This is applicable to the Project for conservation of biological diversity during the Project life.
2	The Rio Declaration, 1992 **Web Link:** http://www.unep.org/documents.multilingual/default.asp? documented =78 &articled = 1163	Signed on 13th June 1992, and ratified on 1st June 1994	The Rio Declaration comprises 27 principles which address important issues such as; sustainable development to integrate environmental protection into the development process; common but differentiated responsibilities to conserve, protect and restore the earth's ecosystems; public participation and information access at the national level, reduce and eliminate unsustainable patterns of production and consumption. The provision of the declaration is applicable for environmental protection during the Project life.
3	Kyoto Protocol, 1992 **Web Link:** http://unfccc.int/kyoto_protocol/items/ 2830.php	Ratified in 2005	The Kyoto Protocol is a protocol to reduce greenhouse gasses that cause climate change. It was agreed on 11th December, 1997 at the 3rd Conference of the countries to the treaty when they met in Kyoto, and entered into force on 16th February, 2005. As of November 2007, 175 countries have ratified the protocol. One hundred and thirty seven (137) developing countries have ratified the protocol, including Brazil, China, India

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Sr. No.	Agreement/Convention	Ratification	Description/Relevance
			and Pakistan but have no obligation beyond monitoring and reporting emissions. The protocol is applicable to reduce the emissions from Project construction activities.
4	The Basel Convention, 1989 **Web Link**: http://www.basel.int/theconvention / overview/tabid/1271/default.aspx	Ratified 26th July 1994	Basel Convention on the control of trans-boundary movements of hazardous wastes and their disposal is an international treaty that was designed to reduce the movements of hazardous waste between nations, and specifically to prevent transfer of hazardous waste from developed to Less Developed Countries (LDCs). It does not, however, address the movement of radioactive waste. The Convention is also intended to minimize the amount and toxicity of wastes generated, for environmentally sound management as closely as possible to the source of generation, and to assist LDCs in environmentally sound management of the hazardous and other wastes they generate. The provisions of this convention implies to minimize the amount of waste generated and its management during construction and O&M phases.
5	Convention on the International Trade of Endangered Species (CITES), 1975 **Web Link:** https://www.cites.org/	Pakistan signed the Convention in 1973 and ratified it in April 1976.	The convention entered in to force on 1st July 1975. The principal obligations of contracting parties to the CITES are to safeguard the trade in rare or endangered species and it established a permit system to control imports and exports of wild fauna and flora. According to this convention species threatened with extinction whose movement between countries is prohibited except for conservation purposes such as captive breeding, species whose commercial trade is permitted but export permits are needed. The National Council for Conservation of Wildlife (NCCW) is the CITES Scientific and Management Authority in Pakistan. The provision of this convention will be respected during the project

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Sr. No.	Agreement/Convention	Ratification	Description/Relevance
			implementation.
6	UNESCO Convention on the Protection of the World's Cultural and Natural Heritage, 1972 **Web Link:** http://whc.unesco.org/en/ convention text/	Pakistan ratified this convention on 23rd July 1976.	Convention concerning the Protection of the World Cultural and Natural Heritage - requires parties to adopt a general policy on the protection of the natural and cultural heritage, to set up services for such protection, to develop scientific and technical studies, to take appropriate legal, technical, scientific and administrative measures and to foster training and education for such protection. The provision of this convention will be respected during the project implementation. However, there is no notified archaeological site within the Project Boundary.
7	The Rotterdam Convention on Chemicals, 1998 **Web Link:** http://www.pic.int/	Pakistan signed this convention on 9th September, 1999 and ratified on 14th July, 2005	The convention promotes shared responsibilities in relation to importation of hazardous chemicals. The convention promotes open exchange of information and calls on exporters of hazardous chemicals to use proper labeling, include directions on safe handling, and inform purchasers of any unknown restrictions or bans. Signatory nations can decide whether to allow or ban the importation of chemicals listed in the treaty, and exporting countries are obliged to make sure that procedures within their jurisdiction are complied.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Sr. No.	Agreement/Convention	Ratification	Description/Relevance
			The convention is applicable with reference to proper labeling and safe handling of hazardous chemical if used during the Project implementation.

PUBLIC PROCUREMENT REGULATORY AUTHORITY (PPRA) EPADS

3 PROJECT DESCRIPTION

3.1 GENERAL

This Chapter presents the technical details of proposed project including location, accessibility, components (such as Weir, Sediment Flushing Tunnel, Headrace Tunnel, Surge Tank, penstock, Powerhouse, Tailrace, Switchyard etc.), construction aspects, implementation schedule and project cost etc.

3.2 OBJECTIVES OF THE PROJECT

Following are the main objectives of the Project:

- The prime objective of the proposed Project is to develop the Power Potential, available in Attabad Lake on sustainable basis by providing cheaper, renewable, Environmental friendly and most needed power, keeping in view the present and future requirements of Region especially rural and remote areas;
- Transmit energy to Hunza Valley and its suburbs for meeting power and energy requirements; and
- Ensured availability of power will reduce reliance and consumption of diesel, timber and other fuels. This will overall reduce the Greenhouse Gases (GHGs) as cutting of trees will be reduced.

3.3 PROJECT LOCATION

ALHPP has been identified on Hunza River on Attabad Lake. Attabad Lake was formed on January 04, 2010, when a huge mass from the right bank of Hunza River slided down near Attabad Village and blocked Hunza River. The inflow filled upstream valley created a reservoir 22 km long till the end of May 2010.

The proposed Project is located at Hunza River/ Attabad Lake situated in Hunza-Nagar District, GB. The proposed project Site is located about 119 km from Gilgit Town and 27 km from Aliabad town in Hunza Valley. Project Location Map is shown in **Figure 1.1**.

3.4 PROJECT ACCESSIBILITY

The proposed Project site is accessible through Motorway from Islamabad to Thakot (M-15) and afterwards by Karakorum Highway (KKH) from Thakot to Project Area. Power house site is located on the left bank of Hunza River near Salmanabad Village. Access to the Project Site, along the Attabad Lake is quite convenient with steep slopes and moderate bends. No problems are expected to occur during the transportation of heavy construction and permanent equipment for the Project as well as the heavy construction materials. However, the road towards Power House Site needs improvement and widening of the track to cater for the transportation of the heavy construction material and machinery. The accessibility map of the proposed Project is shown in **Figure 3.1**.

3.5 CATCHMENT AREA

The catchment area of Hunza River upstream of the Project Site is about 8,900 km² which mostly consists of glaciers and snow deposits accumulated in the mountainous region usually during winter. Hunza River cuts through the Karakoram Range and flows approx. 250 km with an average slope of 0.90% from north to south before it merges into the Gilgit River. Many large size glaciers like Batura, Passu, Ghulkin, Gulmit, Bliglong, Minapin, Hasanabad and Muchlobel Glaciers drain in Hunza River. The water from main streams including Chaprot,

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Hasanabad and Molma Nullahs from large as well as small valleys also drains into the Hunza River. The discharge of Hunza River has its peak in months from May to September due to melting of snow/glaciers due to rise in temperature.

PUBLIC PROCUREMENT REGULATORY AUTHORITY (PPRA) EPADS

3.6 PROJECT COMPONENTS

Following are the main components of the proposed Project and the salient features are provided in **Table 3.1**:

- Weir and its associate structures;
- Sediment Flushing Tunnel;
- Headrace Tunnel;
- Surge Tank;
- Penstock;
- Powerhouse;
- Tailrace; and
- Switchyard.

Table 3-1: Salient Features of the Proposed Project

Sr. No.	Items	Description
1	Location	27 km from Aliabad Town
2	River	Hunza River
3	Catchment Area	8901 km^2
4	River Mean Annual Flow	209 m^3/s
5	Purpose	Power Generation
6	Type of Development	High Head Run of River with Peaking
7	Type of Weir	Overflow
8	Weir Crest Elevation	2414 m.a.s.l
9	Weir Crest Length	60 m
10	Weir Height	30 m
11	Design Flood	3250 m^3/s
12	Maximum Conservation Level including free Board	2424 m.a.s.l
13	Maximum Flood Level	2421 m.a.s.l
14	Minimum Operating Level	2412 m.a.s.l
15	Gross Head	112.0 m
16	Net Head	106.0 m
17	Installed Capacity	54 MW
18	Headrace Tunnel Length	2320 m

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Sr. No.	Items	Description
19	Headrace Tunnel Diameter	5.5 m
20	Penstock Length	480 m
21	Penstock Diameter	3.6 m
22	Type of Turbine	Francis (Vertical)
23	No. of Units	03
24	Design Discharge	60.00 m^3/s (20 m^3/s to each unit)
25	Length of Weir	55 m
26	Length of Power tunnel	2320 m
27	Type of Powerhouse	External
28	Annual Energy	374 GWh
29	Plant Factor	76.5 %
30	Tailrace Length	88 m
31	Design Life	30 Years

3.7 PROJECT DESIGN

An overflow structure will be constructed to divert the flow of Attabad Lake at Hunza River into power intake. Before construction of overflow structure, a deep sediment flushing tunnel will be constructed this will act as a diversion tunnel during construction of overflow structure. After the construction of the proposed Project at operational stage sluice tunnel will act as sediment flushing tunnel. The diverted water enters into the head race tunnel about 2320 m long. The tunnel is followed by surge shaft. Water will enter into 480 m long penstock pipe branching into three units at the end through manifold. These high-pressure penstock pipes and feed three turbines, 19.3 MW each. The proposed Project with design discharge 60 m^3/s will generate the rated power round the year. The detailed components and cross sections are shown from **Figure 3.2** to **Figure 3.6**. The brief detail of each component is provided in the following sections.

3.7.1 Coffer Dams

Two temporary coffer dams will be constructed for the proposed Project if required i.e., Stage-I coffer dam and Stage-II coffer dam. Stage-I coffer dam will be constructed upstream of sediment flushing tunnel with crest level at El. 2380 m.a.s.l The construction of Stage-II coffer dam at upstream of overflow weir section with crest level at El. 2422 m.a.s.l., will be initiated after the completion of works of sediment flushing tunnel. On the completion of Stage-II coffer dam, the Hunza River / Attabad Lake water will be diverted through sediment flushing tunnel. The Stage-II coffer dam is envisaged to prevent entry of water into the working area for construction of overflow structure in dry portion.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

3.7.2 Sediment Flushing Tunnel

The suspended sediments transported by Hunza River and entering the power intake will unavoidably result in a certain wear and tear resulting in need for overhaul and replacement of runners. For this purpose, the sediment flushing tunnel will be constructed at the left side under the Power Tunnel section, consisting of low level outlets and during construction of overflow structure will be used as diversion tunnel. The invert level of sediment flushing tunnel is planned`` at El. 2380 m.a.s.l. The sediment flushing tunnel would be founded mostly on hard rock and with minor outlet on overburden / slided mass.

3.7.3 Power Intake

A two bay intake structure shall be constructed on left bank of Attabad Lake upstream of main weir for passing the design discharge. The Intake level will be 22 m above the invert level of sediment flushing tunnel section to keep the area upstream of the intake sediment free. It shall be equipped with a trash rack to prevent intrusion of debris (like timber, leaves, trees etc.) into the waterways and with a hydraulically operated gate for emergency closure and for isolating the waterways for inspection and maintenance.

3.7.4 Overflow Structure / Spillway

The overflow structure is a concrete gravity type, un-gated section (60 m wide) with downstream stilling basin. The overflow structure would be founded on overburden / slided mass. The overflow structure crest (El. 2414 m.a.s.l) will be of ogee type which will transfer the water from Attabad Lake reservoir in a smooth decline to the downstream. A stilling basin downstream of weir will dissipate the energy by creating a hydraulic jump and shall prevent downstream erosion.

3.7.5 Headrace Tunnel

From power intake, approximately 2320 m long low pressure headrace tunnel (horse shoe shape), having 5.5 m diameter would run along the left bank of Hunza River leading to surge tank. The upstream level of tunnel is El. 2402 m.a.s.l whereas downstream level is El. 2385 m.a.s.l.

3.7.6 Surge Tank

A circular surge tank having 10 m diameter and 45 m high will be constructed at the intersection of the headrace tunnel and penstock to prevent the adverse effect of water hammer pressure or flow variation due to turbine load fluctuation on the headrace and other structures.

3.7.7 Penstock

A Penstock of 3.6 m diameter will be laid under the left bank slopes for conveying water from headrace tunnel to 03 Vertical Shaft Francis Turbines to be housed in Powerhouse. At the end, the penstock shall be trifurcated into penstock manifolds with reduced dia. In the first section up to 80 m, the penstock will cross horizontally the rock starting from the bottom of surge tank. This section can be considered as an extension of headrace tunnel, lined with an embedded steel lining. The second section, 400 m long will be the embedded penstock descending towards the Powerhouse.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

3.7.8 Powerhouse

The Powerhouse is proposed 52 m long, 25 m wide and 25 m high with four floors at different levels. Machine Hall floor would be at El. 2313 m.a.s.l and powerhouse top shall be at El.2325 m.a.s.l. The main hall would accommodate three vertical Francis units, each of 19.3 MW, along with three generators, switchgear cabinets, trifurcation of penstock pipe and erection bay.

The three generating units will be housed in the Powerhouse, with the operating floor at El. 2306.2 m.a.s.l. A large erection bay is provided to maximize the ability to work on multiple units at a time to save time. Each turbine is connected via a main inlet valve to a steel penstock.

3.7.9 Tailrace Channel

The draft tube of each turbine unit will drain water in the 88 m long tailrace channel and it finally will be discharged into Hunza River. The tail water level is therefore maintained to retain the minimum setting for turbines.

3.7.10 Switchyard

A surface AIS 132 kV switchyard will be located near Powerhouse. The civil works of the switchyard area will be started after the construction of powerhouse superstructure. The switchyard equipment will be transported to its location through access road to Powerhouse. The erection of switchyard equipment will be done using the 5 ton mobile crane. Cabling for instrumentation, monitoring and controls along with cable terminations will be completed before the start of unit testing.

3.7.11 Residential Colony

An area of 2.5 Acres will be required for the construction of office, residential block for O&M Staff including Engineers, supervisory and lower staff, rest house, mosque, basic health unit, shops and other allied services including roads, water supply / sewage disposal system and the electricity arrangement etc. near Powerhouse Site. The Colony once completed will be utilized for the management personnel of the Employer and Consultant till the project construction completes, to facilitate the communication and management. After the completion of the project the colony will be utilized by Operation & Maintenance (O&M) staff.

3.7.12 Contractor Camp

The EPC Contractor will be responsible for the construction of adequate accommodation and temporary facilities for the workforce prior to start of main works. All utilities including electricity, water supply, sewerage system and approach roads will be provided by the EPC Contractor at construction camps & offices and in residential area. The EPC Contractor will ensure that all these facilities fulfill the requirements for residential camps, site offices, yards, construction sites etc.

Camp site will be selected keeping in view the availability of adequate area for establishing camp site, including parking areas for machinery, stores and workshops, access to communication and local markets, and an appropriate distance from sensitive areas in the vicinity. Keeping in view the following criteria guidelines, the EPC Contractor has to identify the construction camp sites before start of the construction activities:

- There should be no resettlement issue for the location of the camps;

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- Camp site should be away from the residential areas and sensitive receptors;
- Selection of sites for construction camps shall be near the project area having proper access to the nearby main/link road;
- The camps must be located in a place where the drainage from and through the camps will not threaten any domestic or public water supply;
- Camp site must be adequate in size to prevent overcrowding of necessary structures;
- The camp site should consider avoiding any damage of property, vegetation, irrigation, and drinking water supply systems;
- The camp site must not be subject to periodic flooding; and
- There should not be any ecological sensitive areas e.g. wildlife sanctuaries, game reserves, national parks, forest areas, etc. near to the construction camp site.

The Contractor Camp is planned near Powerhouse Site.

3.7.13 Other Site Facilities

The other site facilities that will be required by the EPC Contractor for the construction of Project are described below. Most of these facilities are planned near proposed Powerhouse site, where suitable wide land is available.

- ***Materials Laboratory*** equipped with the equipment for test on soil, rock, concrete, aggregates, bricks, embankment materials and filter materials;
- ***Temporary Facilities / Buildings*** such as steelwork and carpenter's workshops, mechanical equipment repairing workshop, fabrication workshop, storage yards for storing equipment, machinery, aggregate, sand, cement, steel reinforcement, scaffolding, bricks, chemicals, explosives to be used during blasting operations and fuel tanks etc.;
- ***Temporary Roads*** connecting camp & other temporary facilities with the sites of main structures in the project area, other than the access roads;
- ***Religious Facilities*** within the camp areas for performing religious activities;
- ***Health Facilities*** including portable First Aid Station equipped to provide primary care for emergencies relating to injuries, burns, broken bones etc. Arrangements shall be made with the closest major hospital to cater for accident and hospitalization cases;
- ***Emergency Fire Protection Facilities*** in all offices and buildings to cater for any fire hazard including hose, fire extinguishers, pails and shovels etc.;
- ***Wireless Communication System*** for communication between site personnel, site offices and the working areas;
- ***Security Facilities*** including security check posts at main entrance of camp/site. All the work areas, storage areas and such other area where construction activity is proceeding shall be guarded by the security guards and watchmen for security; and
- ***Spares and Standby Equipment*** to ensure continuity and proper completion of operations, including diesel power generating sets, earthwork plant, concrete mixing and transportation plant, grouting equipment, dewatering plant and other key plant and equipment required to ensure work progress.

3.7.14 Detailed Engineering Design

The proposed project will be implemented in EPC Contractor mode therefore, the EPC Contractor will be responsible for the Detailed Engineering Design and will be approved by

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Project Consultants engaged for construction supervision. The EPC Contractor will design all Permanent works and all necessary Temporary works.

3.8 LAND ACQUISITION

The land will be acquired for the Project components such as powerhouse, weir and associated structures, access roads and project colony. Total land to be acquired is approximately 183 acres (05 acres for Contractor's Camp, 60 acres for Project Colony and Powerhouse Area, 103 acres for Intake Area and Access Corridor and 15 acres for Spoil Area) for project components which includes both private and government land. The estimated total land to be acquired is 777.5 acres due to the impounding of reservoir up to maximum conservation level including free board, including river bed. Private land will be acquired by the Client as per Land Acquisition Act 1894 including later amendments.

The land required for the establishment of contractor camps, stores and workshops will be acquired on temporary basis by direct negotiation and agreement with the owners. Temporary acquisition will principally be the responsibility of the EPC Contractor.

3.9 PROJECT ADMINISTRATIVE JURISDICTION

The proposed project falls under administrative jurisdiction of Hunza Nagar District, GB.

3.10 CONSTRUCTION ASPECTS

3.10.1 Construction Materials

The materials used for construction purpose would include coarse aggregates (crush), fine aggregates (sand), steel, water, asphalt, reinforcement, cement etc. Water, stone of required quality is available in the project area. Coarse and fine aggregates for concrete can be obtained locally, subject to meeting ASTM gradation requirements. Asphalt, reinforcement and cement material will be transported from nearby factories.

The bulk of construction material can be gained by quarrying. The material balance counts for a surplus of excavated material from the weir site & associated structures, headrace Channel, powerhouse, tailrace, switchyard has to be deposited in the area or used for other construction sites. Required construction material for either cutoff wall or upstream impervious blanket shall be properly investigated by means of test pits for its required quantity and quality for detail/construction design by EPC Contractor.

3.10.2 Procurement of Construction Materials

a) Cement

It has been estimated that about 31,485 tons cement (ordinary Portland cement) would be required to meet the project construction activities. The nearest cement factories to the Project site are: Bestway Cement (Farooqia, 675 km), Askari Cement (Wah, 685 km), Fauji Cement (Fateh Jhang, 710 km), Askari Cement (Nizampur, 755 km) and Cherat Cement (Nowshera, 790).

b) Coarse Aggregate

The rock quarries have been identified at Passu and Powerhouse area. The marble present in Passu area and Rounded Boulder Gravel Silt (RBGM) at Powerhouse Area can be used as coarse aggregate by certain amount of processing.

c) Sand

High quality of large sand deposits are available in the tail end area of Attabad Lake near Shishkat Bridge for use in the proposed Project.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

d) Reinforcing Steel

The quantity of reinforcing steel required for the Project will be about 3,300 tons, with a monthly average consumption of about 155 tons. The nearest location from where the reinforcing steel bars of the desired specification are available is Islamabad (735 km from Project Site).

e) Explosive Materials

In the main weir and flushing tunnel areas, extensive volume of excavation is of slided materials having large size boulders, which may require blasting. There are certain areas, where rock excavation would also be involved like power intake, headrace tunnel and surge tank etc. The Wah - Bofors factory in Wah (near Rawalpindi) is capable of supplying all the explosives and blasting consumables required for the Project.

f) Steel Plates and Steel Formwork

Steel sheets of various thicknesses are produced at the Steel Mills at Karachi, which can be used to fabricate steel formwork. Alternatively, steel items can be imported from abroad. Most likely source of steel plate could be nearby countries such as China and Iran.

g) Petroleum Products

Petroleum products will be mainly diesel with comparatively minor quantity of gasoline and lubricants, which can be procured directly from the source i.e. the oil refineries, spread in the country, for the operation of machinery and vehicles. The storage tanks would be established at the Project site with total capacity of around 40,000 litres, sufficient for around one month of operation, to cope with extraordinary conditions like land sliding on the KKH or fuel shortages, etc.

h) Water and Stone for Riprap and Fill Material

The Hunza River water will be used in the making of concrete. The results of water samples taken from Hunza River indicate that water is suitable for mixing & curing of concrete. The large boulders with sufficient quantity present in the slided mass can be used as riprap material to control the erosion by water. Silty sand, sandy silt and gravelly sand available in the river bed and in slided mass (in ample quantities) can be used as fill material for the protection of slopes and construction of coffer dam etc.

3.10.3 Work Force

The construction of the proposed Project shall be carried out by WAPDA through EPC Contractor. Total workforce required for the proposed project including supervisory staff, skilled and unskilled labour is approximately 300-350 numbers during construction phase. The workforce will be originated from GB and different regions of Pakistan and from oversees.

3.10.4 Construction Activities and Required Machinery

Construction activities involve following:

- Earth work (clearing of vegetation/ trees and top soil);
- Access Road work; and
- Structure works.
- E&M Works

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

The list of the machinery and the equipment required for the proposed Project is provided in **Table 3.3.**

Table 3-2: Machinery and Equipment Requirement

Sr. No.	Type of Machinery/ Equipment	Sr. No.	Type of Machinery/ Equipment
1	Dump Truck	12	Self-Propelled Pneumatic Roller
2	Front End Loader	13	Asphalt Distributor
3	Dozer	14	Batching Plant
4	Grader	15	Concrete Transit Truck
5	Vibratory Roller	16	Concrete Pump
6	Water Tankers	17	Excavator
7	Aggregate Spreader	18	Water Pumps
8	Three Wheel Rollers	19	Cranes
9	Tandem Roller	20	Vibrators
10	Asphalt Plant	21	Generators
11	Paver		

3.10.5 Water Requirement

Water requirement during construction phase will be met from Hunza River. The water can be uplifted from the Hunza River through pumps to meet the domestic demand and requirement of project construction activities like concrete preparation and wet drilling during excavation for water carrying channel. The water consumption is estimated to be 35,000 liters /day[5] for 350 construction workers of the proposed Project.

Wastewater Generation

The wastewater generation is estimated to be 28,000 liters/day for 350 construction workers for the proposed Project[6]. The estimated wastewater generation will vary during the operational stage of the project.

3.10.6 Solid Waste Estimation

Due to construction activities waste will be generated at construction site and contractors camp. The EPC Contractor will provide the estimated quantity of excavation material during

[5] *Tentative Work Force Requirements Including Client and EPC Contractor Staff"*

= (350) x (100) = 35,000 liters/day

[6] *Design Criteria of Public Health Engineering for Water Supply, Sewerage and Storm Water Drain (Domestic sewage generation = 80% of water consumed/day*

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

the construction phase. These wastes will be generated due to the construction activities and the up to the extent possible the excavated materials will be reused, where applicable, for construction purposed. Solid waste generated during construction and camp sites shall be safely disposed in demarcated waste disposal sites.

The solid waste generation is estimated to be 157.5 kg/day (as per 0.45 kg/capita/day waste generation)[7] for 350 construction workers.

3.10.7 Power Requirement/ Power Source

The main source of electricity/electric power during construction phase will be arranged by the EPC Contractor for construction camps and construction machinery. The main sources of energy required at the project are diesel, petrol, natural gas and electricity.

3.11 PROJECT IMPLEMENTATION SCHEDULE

The proposed project construction schedule spans over a period of 50 months, which include 36 months for construction activities and 14 months for pre-construction activities.

3.12 COST OF THE PROJECT

The estimated cost of the proposed Project is PKR 24.246 million[8].

[7] *The World Bank Report 2012 – What a Waste: A global review of solid waste management. Based on UNEP estimates for waste generation in the Asia Pacific. Average is 0.45 kg/capita/day*

4 PROJECT ALTERNATIVES

4.1 GENERAL

This Chapter presents the Analysis of Alternatives such as No Project Option, Project Layout, Headrace, Penstock and Powerhouse Location. The details provided in the following sections:

4.2 NO PROJECT OPTION

Electricity has become a basic need of human beings and is one of the most important ingredients of economic development. There exists a strong correlation between energy utilization and rate of economic expansion of any country. In Pakistan per capita energy consumption is very low. With the ever-increasing gap in the demand and supply in the national grid the short fall reached to an extent that an electricity crisis arises in the country which resulted in long hours of load shedding even in the main cities of the Pakistan as well as cities and towns of GB.

The Central Hunza is located on the right bank of Hunza River, extending from Murtazabad up to Attabad Village Central Hunza is the hub of tourism in Gilgit-Baltistan. National and international tourists flow remain at peak during summer season. As a result, hotel industry is booming, whereby, other small-scale businesses i.e. transport sector, cottage industry, local markets and automobile workshops are most likely to flourish in the near future. The increase in tourism industry has significantly enhanced the energy demand of the area. Furthermore, the area is having multiple business opportunities due to its location on the China Pakistan Economic Corridor (CPEC), which will result in fast growth of economic activities, thus increase in the energy demand being interlinked with each other.

The supply from the existing hydropower projects is currently not sufficient to meet the existing demand, therefore it is supplemented through standby diesel generators during peak hours, mostly in winter season. Due to abrupt surge of Shishper Glacier situated in the catchment of Hasanabad Nullah, the powerhouses on Hassanabad Nullah are under the threat of Glacier Lakes Outburst Flood (GLOF). The Govt. has limited resources to address the issue of sustainable electricity supply in the area. The private sector is reluctant to invest in Gilgit-Baltistan's energy sector, which is due to absence of a Power Policy and non-connectivity of the area with the National Grid. Therefore, it is necessary to develop projects on other water resources to facilitate central Hunza.

Presently, there is high supply and demand gap; therefore, load shedding is common in summer, while it becomes very acute in winter. The commercial and industrial demand is partly fulfilled from privately owned diesel generators. The diesel generators are mainly used by the hotels, small businesses, banks and other consumers which can afford the high running cost. Apart from the cost the use of these diesel generators is creating environmental pollution (i.e. noise and air), which is also affecting the tourism in the area.

Thermal power generation is more expensive, being dependent on the imported oil, and is less environmentally friendly due to high emission rate of Green House Gases (GHGs). The power shortfall situation is being tackled through load management by shedding and supplying the power to various areas and sectors alternatively.

Hydropower generation is very attractive for sustainable development of the country as it reduces the need for imports and can abate substantial amount of GHG emission by substituting for largely gas and oil based power generation. The no project option would

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

therefore require the installation of more thermal units which will further aggravate the economy and will become a major source of environmental degradation.

Attabad Lake was formed on January 4, 2010, when a huge mass from the right bank of Hunza River slided down near Attabad Village and blocked Hunza River. The inflow filled upstream valley created a reservoir 12 km long till the end of May 2010. Attabad Lake is about 15 km upstream of Ganish Bridge and about 111 km upstream from Gilgit. Therefore, ALHHP will utilize the Attabad Lake water and head for the generation of the Hydel Electricity. Therefore, due to the implementation of Attabad Lake HPP, no major adverse impacts are anticipated.

Based on above, it is concluded that the Project of 54 MW is technically, economically and environmentally feasible. Therefore, NPO is not a feasible option.

4.3 PROJECT LAYOUT ALTERNATIVES

In order to optimize the location of the Project in terms of benefits and potential impacts on the environment, following project location alternatives were discussed:

4.3.1 Alternative-I: Project Layout on the Left Bank

The left bank has been examined in detail to propose Project Layout with power intake, 2.3 km low pressure headrace tunnel, surge tank, embedded penstock and surface powerhouse near Hunza river, 2.5 km downstream of Attabad Lake.

The main access road to Project Area from down country is KKH passes on the left bank in Project Area leading to Chinese Boarder through Khunjerab Pass. After landslide, about 7 km highways tunnel has been constructed on the left bank because about 19 km was submerged in the lake. The access to the area and for construction activities, the left bank is the suitable bank to propose the Project Layout. Since the slide did not initiate from left bank the slopes are more stable. The geological conditions favour intake, headrace tunnel and surface powerhouse. The slided area of about 500 m is to be stabilized by excavating material on the left bank.

The following observation have been made:

- An overflow structure is to be constructed to pass the 1000-year flood. The river diversion during construction is to be managed through a deep cut channel on the left bank. Later on, the same deep channel is to be used for sediment flushing by installing gates;
- For power intake, there is sound rock formation on the left bank just upstream of weir site. The access to the area can be made through adit and headrace tunnel. Steep slopes and weak geology have been observed for the headrace, penstock and powerhouse area;
- Headrace tunnel can be constructed at lower elevation of highways tunnel in same geological formation up to surge tank. The access to surge tank and headrace tunnel is available through old KKH;
- From surge tank to powerhouse area, embedded penstock can be laid down over mild slope terraces. The anchor block can be placed over rock/boulders; and
- At the proposed site, surface powerhouse can be constructed. Surface powerhouse, tailrace channel and bifurcated penstock can be placed at required elevation by excavating the alluvium.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

4.3.2 Alternative-II: Project Layout on the Right Bank

A Project Layout on the right bank have been studied with intake 1.6 km upstream and powerhouse 2.0 km downstream of overflow structure. A low pressure tunnel about 2.3 km length is to be constructed to utilize the available head at ALHPP.

The Project Layout on the right bank has geologically disturbed area and Attabad slide originated from the right bank and slided material fallen on the left bank. On the right bank of the River, there is excessive loose material present and it is considered susceptible to rock fall and minor slides due to its being fragmented. The accessibility to the right side is difficult and construction and operation of scheme on the right bank is technically unfeasible.

The right bank of the river is where the slide basically was initiated from, therefore, there is excessive loose material present and the mountain side is quite fragmented. Clearing the overburden to reach the rock face will not only require a lot of excavation, but also the site will remain susceptible to rock fall and minor slides due to its being fragmented. Operability of Project components on this bank will remain a challenge.

Considering the Project construction, operation and maintenance, environmental issues, stability of structures, the left bank layout has been preferred over that of the right bank and is selected for further studies.

For Feasibility Study, field investigations like topographic survey, geological mapping, borehole drilling, test pits, environmental survey, flows and sediment observations have been carried out. For the identified dam / weir and the powerhouse site on the left bank of Hunza River near Attabad, topographic survey has been carried out, which is duly connected with Survey of Pakistan (SOP) Grid. The long term flow data of Hunza at Danyor Station has been used to estimate the daily flows and flow duration curves at the weir site. All the field data helped to finalize the structure locations and sizes for a technically feasible and economical layout. Similarly, environmental and social constraints have been studied.

Considering topographic, geological and environmental conditions at the weir and upstream valley, an overflow structure at El. 2414 m.a.s.l has been proposed with normal operating pond level as 2414 m.a.s.l. The tailrace outlet of ALHPP has been planned at El. 2300 m.a.s.l.

Based on the above analysis, Project Layout on the Left Bank Option has been selected for the proposed Project.

4.4 HEADRACE ALTERNATIVES

Two (02) options have been studied on the left bank of Hunza River. i.e.:

- Alternative -I A Headrace Tunnel Option; and

4.4.1 Alternative-I A Headrace Tunnel Option

The proposed Project has been envisaged with a 14 m high weir on Hunza River identified, 4 km downstream of Attabad Lake confluence with Hunza River and the powerhouse near Batakundi Village. The Project Layout includes power intake, sand trap, headrace tunnel, surge shaft, in addition to ungated weir spillway and surface powerhouse on the right bank.

For the water ways from intake to surge shaft, two options have been considered; either headrace tunnel or pressure pipe. These two options have been studied with respect to powerhouse and preliminary cost estimates.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

The salient features with this option are as under:

Overflow Height	4.0 m
Normal Reservoir Level	2414.0 m.a.s.l.
Minimum Operating Level	2412.0 m.a.s.l.
Live Storage	3.0 Million m^3
Mean Annual Flow	209.0 m^3/s
Design Discharge	60.0 m^3/s
Turbine Level	2300.0 m.a.s.l
Maximum Net-Gross Head	112.0 m
Minimum Net-Gross Head	108.0 m
Headrace Tunnel Length	2320 m
Penstock Length	480 m
Type of Turbine	Francis
Installed Capacity	54.0 MW
Annual Energy Generated	374.0 GWh
Plant Factor	76.5 %

4.5 PENSTOCK ALTERNATIVES

Both the embedded penstock and tunnel options are considered for the conveyance of lake water for power generation along the left bank of the Attabad Lake. On the basis of field observations, on topographic survey, geological & geotechnical investigations, the embedded penstock route passes through overburden and its construction/installation will be quite hazardous as observed during geotechnical investigation. The cost comparison of tunnel and embedded penstock has also been carried out to check the suitability of conveyance of lake water. Cost comparison also shows that power tunnel option is more appropriate in view of least cost with less operation and maintenance issues that may encounter in case of embedded penstock alternative. Necessary geological studies, mapping and geotechnical studies including topographic surveys of cross drains along tunnel route and embedded penstock have also been carried out.

4.6 POWERHOUSE LOCATION ALTERNATIVES

Powerhouse location is affected by factors primarily associated with availability of head, favorable geology, availability of land and accessibility besides impact of powerhouse construction on habitants in the area (locality). Issues relating to protection against land sliding and flooding have also been taken into account. Keeping the above in view, only one location has been considered for powerhouse for both the alternates.

A surface power house is being considered on the left bank of Hunza River about 300 m upstream of Sarat Bridge. The terrace is large enough space for powerhouse, switchyard, offices and/or staff residences in the close vicinity of the powerhouse. The river bed level at the site is 2306 m.a.s.l.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

5 DESCRIPTION OF THE ENVIRONMENT

5.1 GENERAL

An environmental baseline study is intended to establish a database against which potential project impacts can be predicted and managed later. This section covers a comprehensive description of the environment of project area, including the resources which are expected to be affected directly by the project, as well as, those indirectly affected by the construction and operation of the project. The existing environmental conditions of the proposed project have been considered with respect to physical, biological and socio-economic aspects within Study Area i.e. (Area of Influence) from boundary of the proposed Project, as shown in **Figure 1.2**.

The existing information to establish a database for the proposed project was collected from review of published literature and through the site visits/surveys carried out in the project area. To comprehend the existing environmental conditions, site survey was conducted and salient observations were duly noted. Situation of prevailing air quality, noise level, water and wastewater quality were also monitored through laboratory testing. The socio-economic baseline survey of the proposed project area was conducted through consultation with the community. People of the project area were interviewed to get their opinions and feedback regarding the construction of the proposed apartment buildings

5.2 PHYSICAL ENVIRONMENT

The following section provides an overview of the information on physical environment of the proposed Project study area collected from primary as well as secondary sources. The major parameters covered include topography, land use, soils, geology, seismicity, climate, water resources and other parameters as described in the following sub-sections.

5.2.1 Topography and Geomorphology

The Project Area is located on Hunza River at Attabad Lake which was formed in the year 2010 due to a huge slide from right bank mountain. The project site is about 15km upstream from Ganish Bridge of Hunza. Its distance is about 20 km from Hunza and 115 km from Gilgit. The project area is located in district Hunza. Topographically, Hunza valley has a varying relief.

The segment of Hunza valley wherein the various components of the proposed project are situated reflects very high relief conditions marked by relatively steeply inclined extensive mountain slopes along right side of the valley as compared to the left bank mountain slopes.

The mountain slopes are mostly marked by erratic slopes instabilities along with relatively less extensive segments of casuistic slopes. The mass wasting regimes active in the project area are drastically influenced by a broad spectra of variables such as geo-mechanical conditions, moisture distribution and dynamic loading. Most abundant slope hazards include but not limited to rock fall / debris flows, rolling slopes in unconsolidated loose overburden and mud/debris flows in sub-parallel rectilinear secondary drainage.

Tupopdan peaks 6,106 metres (20,033 ft) lies near the Project Area also known as 'Passu Cones' is the most photographed peak of the region. The other nearby high peaks are Pasu Sar, Shispare Sar, and Batura.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

The powerhouse location is on the left bank of river and easily accessible from Karakoram Highway. The intake weir/dam site is selected at current exit point of Attabad Lake.

The topography map of the project area is shown in **Figure 5.1**.

5.2.2 Regional Geology

Tectonically, project area lies in the Karakoram Block towards the north of the Karakoram Thrust (MKT) and Main Mantle Thrust (MMT) which are considered to be the manifestation of the tectonic collision between Indian Plate (Continent) with the Kohistan Island Arc and then with the Eurasian plate (Continent). The Himalaya, Karakorum and Hindokush are considered to be the highest mountainous ranges in the world.

5.2.2.1 Site Geology

The Project Area lies in Karakorum Block, where rocks of meta igneous provenance are exposed. The rock units represent acidic igneous rocks including Granodiorite and Granitic Gneiss. Many local as well as regional faults are present in Project Area.

Soil units present in the Project Area are

- Angular Boulder Gravels with Sand and Appreciable Amount of Fines (ABGM): Most of the slopes are covered by material comprising of ABGM. This is colluvial material broken from the rock units, rolled down slope and settled at the foothill or along the slopes. ABGM material is present in the sediment flushing tunnel, surficial deposits in power tunnel alignment and in part of tailrace channel.
- Rounded Boulder Gravels with Sand and Appreciable Amount of Fines(RBGM)
- Terrace Deposits which consist mainly of unconsolidated mixtures of clay, silt, sand and gravels with occasional boulder sand. Terrace deposits are present at a relatively higher elevations in the project area.
- Morainic Deposits consists mainly of material ranging in size from large boulders to clay size particles, angular to sub-angular, poorly sorted, elongated and have flat surface, powerhouse area is covered by moraine deposits with clayey silt to silty clay.

Both fine and coarse aggregates for construction of overtopping concrete weir and other associated structures are present in the vicinity of Project Area in ample quantities. Clayey silt for blanketing/ impervious material, coarse aggregate and rip rap have been investigated and proposed as barrow area while sand and fill materials are proposed to be excavated from river bed.

Figure 5.2 provides map for the location of the proposed Project in regional geological prospective.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

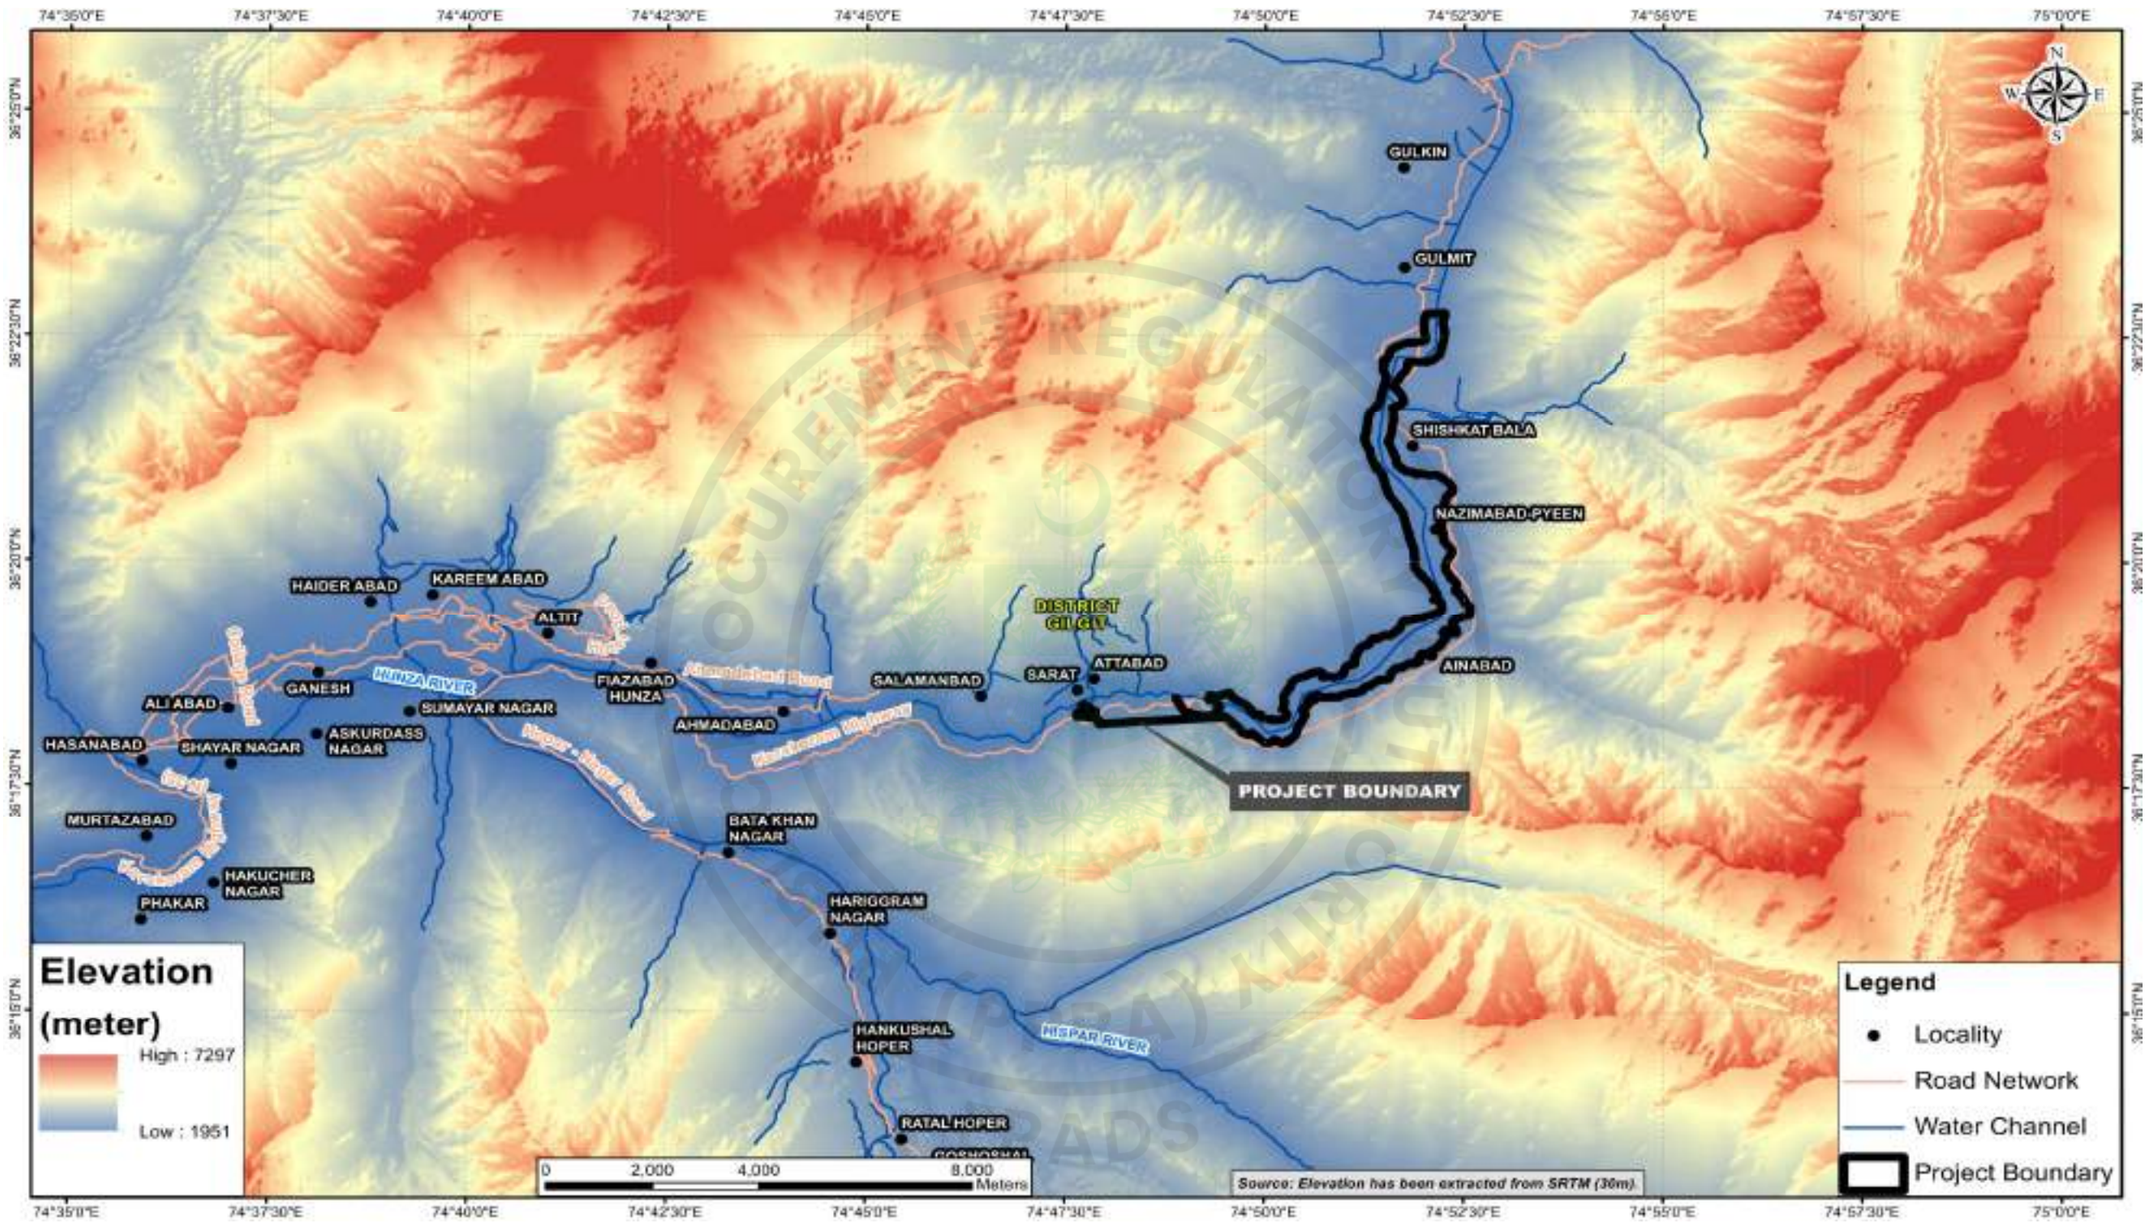

Figure 5-1: Topography Map

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

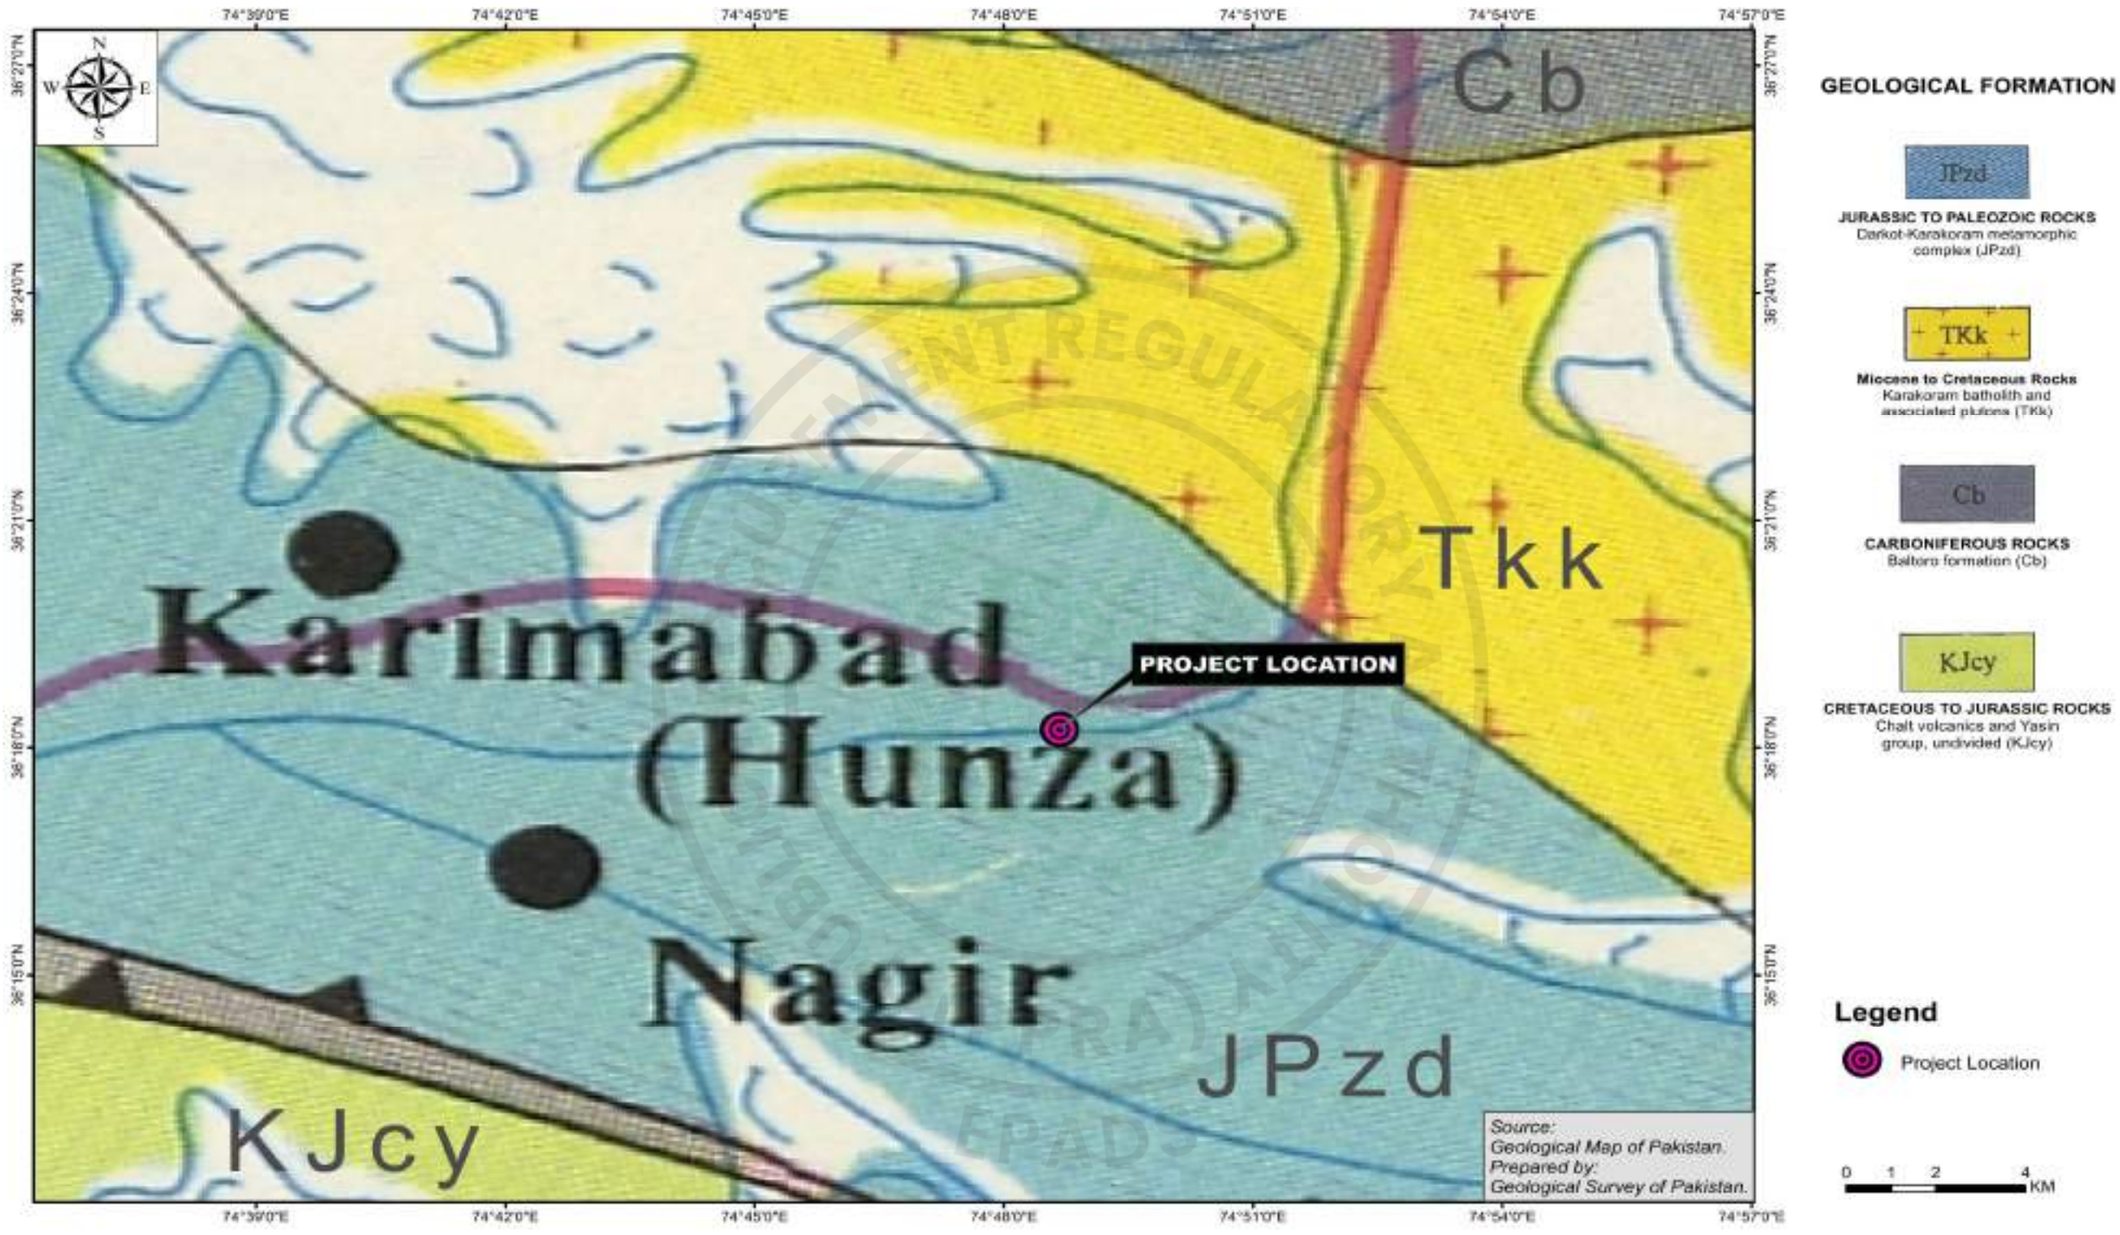

Figure 5-2: Regional Geological Map

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

5.2.3 Seismicity

The project area lies in the region of Northern Pakistan which has high frequency of earthquakes especially in the Himalayan orogenic belt. This belt represents the contact between Indo-Pak and Eurasian plates, which has always been the source of moderate to large earthquakes including Kangra (1905), Bihar-Nepal (1934), Assam (1897) and 2005 Kashmir earthquakes with significance consequences. The presence of some of the active faults like Main Karakorum Thrust (MKT), Main Mantle Thrust (MMT), Raikot Fault, Riwat Fault, Panjal Khairabad Fault, Jhelum Fault and Main Boundary Thrust (MBT) etc make the GB region tectonically very active.

According to Seismic Provisions in the Pakistan Building Code 2007, the Project area falls in Seismic Zone 2B (moderate), which represents Peak ground acceleration from 0.16 to 0.24g, where g represents acceleration due to gravity. Seismic zoning map of the Project area is given in **Figure 5.3.**

PUBLIC PROCUREMENT REGULATORY AUTHORITY (PPRA) EPADS

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

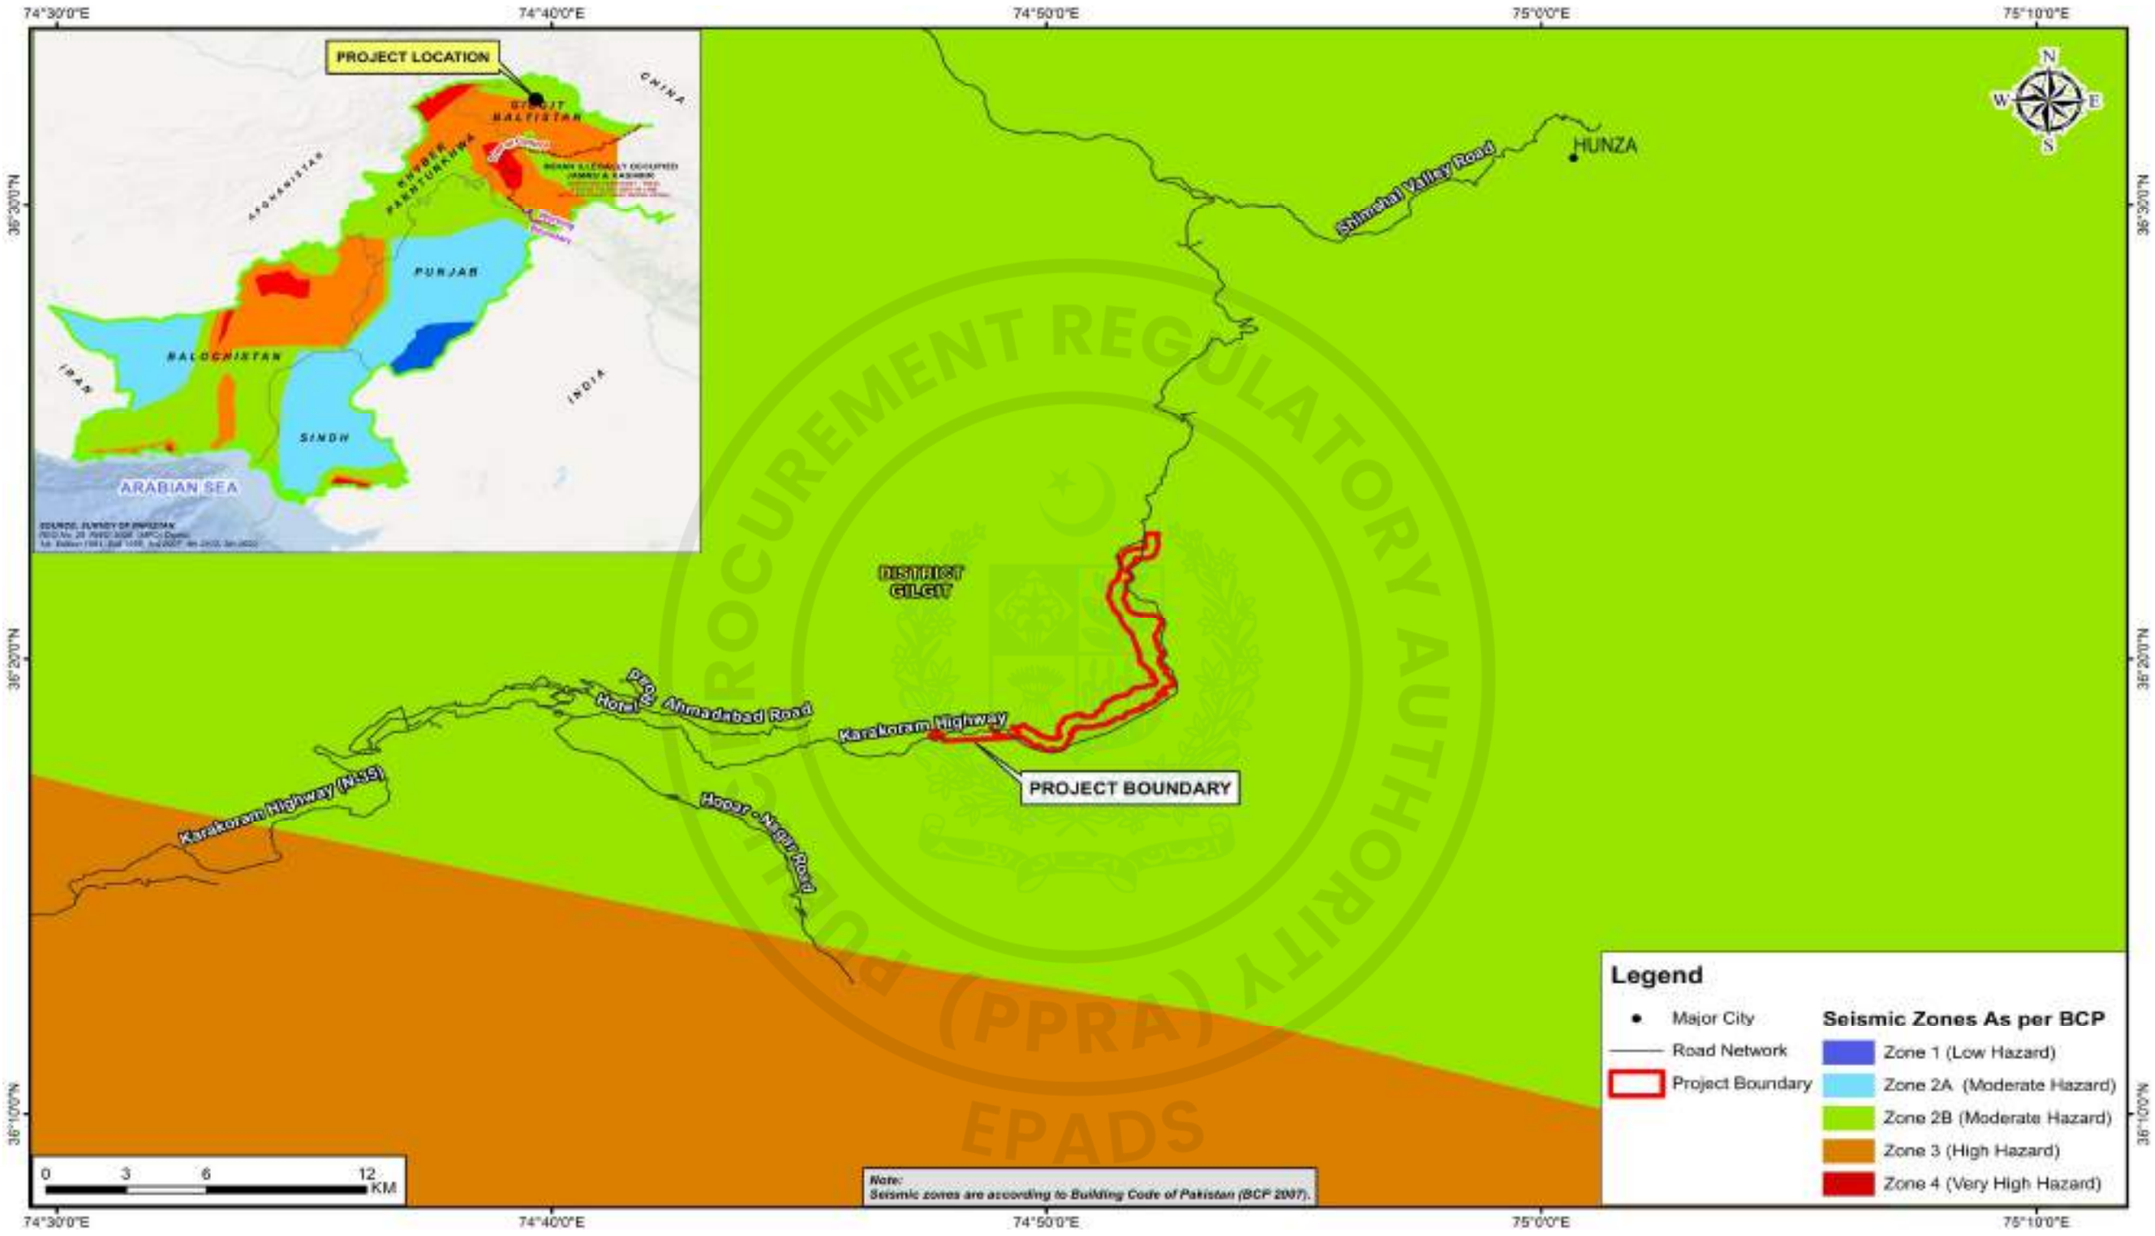

Figure 5-3: Seismic Zoning Map of the Project Area

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

5.2.4 Land Erosion

The glaciers of the GB and KPK have very high “activity indices”, an index for the total amount of water passing through the glacier system per annum. As a result, they have high flow rates in terms of the glacier melt, ranging between 100 and 1,000 meters/year. As a result of these high rates of flow, these glaciers aggressively erode their beds and transport the eroded materials to the headwaters of rivers, which causes the transport of sediments into the major rivers of the region. The exact proportion of sediment due to glacial erosion is still not measured; however, it could be stated that these account for the huge load of the sediments passing through the upper Indus system especially Hunza River, Shyok River and Shiger River.

Landslides are very common features in the project area because of the high steep terrain. Erosion and sediment input to the river is a function of landslides and riparian erosion processes. There are frequent talus accumulations along the side slopes of the river. These are typically in a state of stable equilibrium at their current slope angle and environment but become unstable when the equilibrium is disturbed. Excess water and earthquakes often trigger landslides.

5.2.5 Hydrogeology

Glaciers and snow are the principal water source in Gilgit-Baltistan, located in the extreme north of the country, home to some of world’s highest mountain ranges and to three of the world’s largest glaciers, Biafo, Baltoro and Batura. The province, which has a population of two million, is also the place from where the country sources much of its water through its lifeline, the Indus River. The melted water from snow fields and glaciers enters streams, which feed manmade channels that take water to settlements for agriculture, livestock and domestic requirements, including drinking.

The water supply systems in GB are primarily based on the use of surface waters which include rivers, springs and streams. This means that people face moderate to acute water scarcity during the winter months when glacier melt is reduced. The use of ground water is uncommon, except for a few riverside villages, where people draw water from shallow wells. There are many sources of surface water in GB, some of the surface water sources situated near project area are mentioned as follows:

- Hunza River is the principal river of Hunza in Gilgit–Baltistan, Pakistan. It is formed by the confluence of the Shimshal River including Chapursan, and Khunjerab River which are fed by glaciers. It is joined by the Gilgit River and the Naltar River, before it flows into the Indus River. The river cuts through the Karakoram Range, flowing from north to south.
- Borith Lake lies approximately 2 km to the north of Gulmit, a saline body of water occupying a small hollow at an elevation of 2,500 meters (8,200 feet). The lake can be reached via a 2 km unpaved jeep route from Husseini village, which lies adjacent to Gulmit village. It is also accessible by a 2-3 hour trekking route directly from Gulmit, across the end of the Ghulkin glacier.
- Attabad Lake a part of the project area, is a lake located in the Gojal region of Hunza Valley in Gilgit−Baltistan, Pakistan. It was created in January 2010 as the result of a major landslide in Hunza River at Attabad. The Lake has become one of the biggest tourist attractions in Hunza, offering activities like boating, jet-skiing, fishing and other recreational activities.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- Shimshal River is located very close to the Project Area. It is formed from three main sources such as Khurdopin Glacier, Shimshal Pass and Zardgorban. The river also receives water from other sources before flowing into the Khunjrab River and finally ending in Hunza River near the Project Area.
- Shiskat Nullah Gojal and Shishkat Spring Gojal are main streams present near the Project Area, which are being used for the drinking purpose by the people of Hunza. As per the study conducted by GB EPA in 2019, the water quality of both the streams is fit for drinking purposes as the water is free from heavy metals. The main surface water sources in the Study Area are shown in **Figure 4.9**.

5.2.6 Flooding

Flooding of the Hunza River at the weir site is not a common feature although some floods of high intensity have been recorded in the past at upstream site e.g. the Glacial Lake Outburst Floods (GLOF) at Shimshal River.

Flood has been estimated from the available record. The maximum peak daily discharges of Danyor Bridge station at Hunza Rivers for every year recorded. The instantaneous peaks will definitely be higher than the measured daily flows. Instantaneous peak flows of Danyor Bridge station for the period 1966 to 2024 have been calculated and generated one day maximum peak Instantaneous flow for every year at proposed weir site. The estimated instantaneous peak flow for the period of 1966-2024 at Attabad Lake is graphically represented in the **Figure 5.4**.[9]

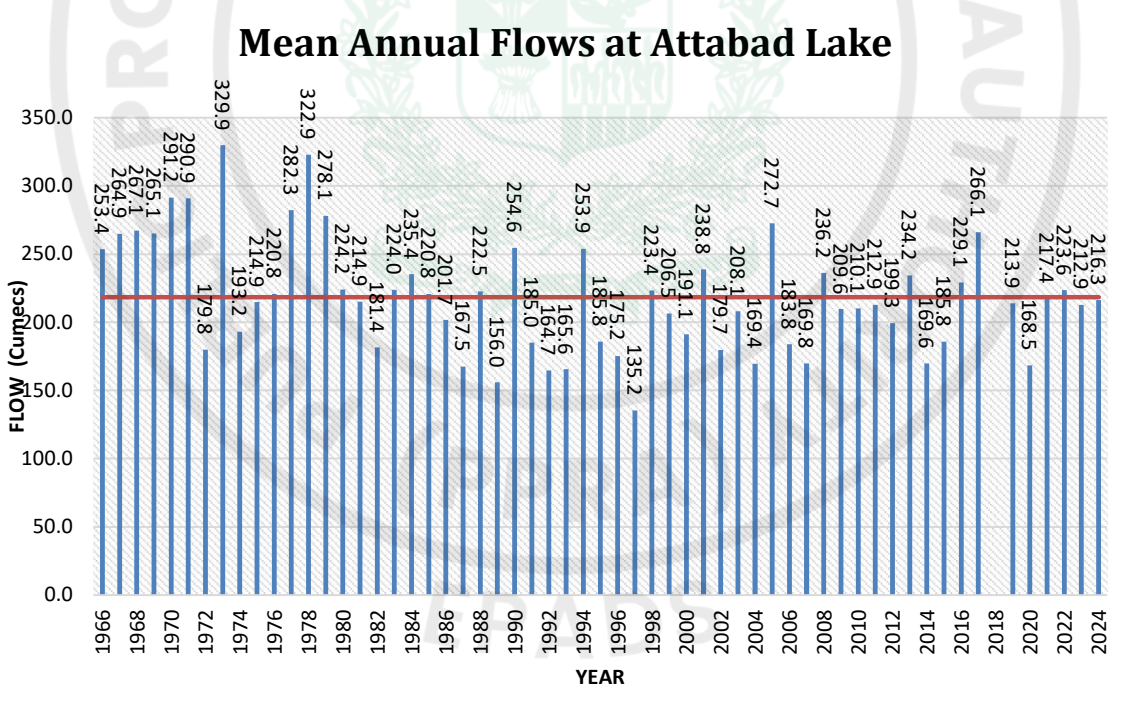

Figure 5-4 Instantaneous Peak Flows at Attabad Lake HPP Site

[9] *Source Feasibility Report, 2021*

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Flood has been estimated at the proposed weir site by using Peak Instantaneous flows of Attabad Lake for a period of 1966-2024. Flood Frequency Analysis (FFA) has been carried out by using different distributions (Gumble, Lognormal & Pearson type 3). Keeping in view the flood estimation against returns periods by using different distributions, it is recommended to adopt Gumble Distribution against 10,000 years of return period with flood outcomes of 3,250 m³/s for the selection of design flood at the proposed weir site. A design flood of 3,250 m³/s, corresponding to a 10,000-year return period, has been selected for the design of hydraulic structures at the weir site. [10]

The flow in Hunza River varies greatly at different times of the year, the discharge is at a minimum during the colder months when Attabad Lake is frozen, and there is a rise of water in spring and early summer season when glaciers melt.

Recently a massive GLOF occurred in Hunza district's Hassanabad village sweeping away the Hassanabad Bridge on the Karakoram Highway. The Shisper Glacier started discharging 5,000 cusecs of water owing to premature melting, leaving Hunza, Gilgit disconnected.

5.2.7 Climate

The climate of Hunza valley is characterized by mild summer and cold winters. Wide spread snow fall occurs in winter. During winter the northern winds blow constantly bringing the temperature down considerably. At Hunza, the mean temperature recorded from 2010-20 is 21.20 °C in July, the hottest month and the coldest month is January with an average temperature of -0.42 °C. The mean maximum temperature is 26.34 °C in July and mean minimum temperature are -3.8 °C in January respectively. Hunza receives maximum rainfall in spring i.e. in April. **Table 5.1** to **Table 5.3** provides climatic condition in project area. Graphical representation is given in **Figure 5.5 to Figure 5.7.** [11]

Table 5-1: Average Minimum and Maximum Temperature in Hunza from 2010-20

Sr. No.	Month	Minimum Temperature °C	Maximum Temperature °C	Mean Temperature °C
1	January	-3.8	2.96	-0.42
2	February	-0.7	5.5	2.4
3	March	2.73	10.18	6.45
4	April	6.89	15.97	11.43
5	May	10.23	19.627	14.93
6	June	14.11	23.97	19.04
7	July	15.87	26.34	21.10
8	August	16.33	26.01	21.17

5.2.8 Solid Waste and Sewerage System

In the Study Area, no proper solid waste management system exists. Most of the solid waste is found to be stored in the form of small heaps at various locations near the villages and People use their solid waste in the vegetable field as fertilizer. Animal waste especially cow dung is used for farm manure or used for burning after drying (though rarely). Few waste bins have been observed along the Karakoram Highway and at popular tourist locations in Hunza to encourage waste management. The major constituents of solid waste in the area are paper, plastic, and organic waste (food waste, garden waste, animal waste). GB Waste Management Company (GBWMC) and Karakoram Area Development Organization (KADO) are the waste management companies in the Hunza district which focuses on waste management and recycling system by encouraging waste management practices.

The study area lacks proper sewerage system, only some open drains constructed in the vicinity for the discharge of wastewater. More than 50 percent of the houses have improvised pour flush pit latrines. The remaining 50 percent of the household use locally made toilets, dry pits or defecate in the fields. Wastewater (sludge) from kitchen, bathing and washing is discharged into small drains/ water courses leading to the nala or directly to small fields outside the houses.

5.2.9 Land Use

The Project Area including reservoir comprises mostly of the barren/open area and cultivated area. However, graveyard and some built up area is also present in the Project Area. The land use of the proposed project boundary and reservoir are provided in the **Tables 5.4.** The land use of the Project Area is shown in the **Figure 5.9.**

Table 5-4: Summary of Land Use within Study Area of Project

Sr. No.	Land use Type	Project Boundary		Reservoir
		Area (Acres)	Percentage	Area (Acres)
1	Agricultural Land	---	---	14.276
2	Built-up	0.446	2.35%	8.460

5.2.10 Environmental Sensitive Receptors

Sensitive receptors are mainly people or other organisms that may have a significantly increased sensitivity and exposure to the pollutants and social disturbance, due to the developmental projects. Thus, sensitive receptors are necessary to be identified, to evaluate the potential impacts of the proposed project on public health and the environment. The project area is situated in base of the mountain which is a barren land. There are no sensitive environmental receptors present in the Area of Influence of the project. However, the lake itself is a sensitive receptor. One graveyard is also present in the Reservoir Area.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

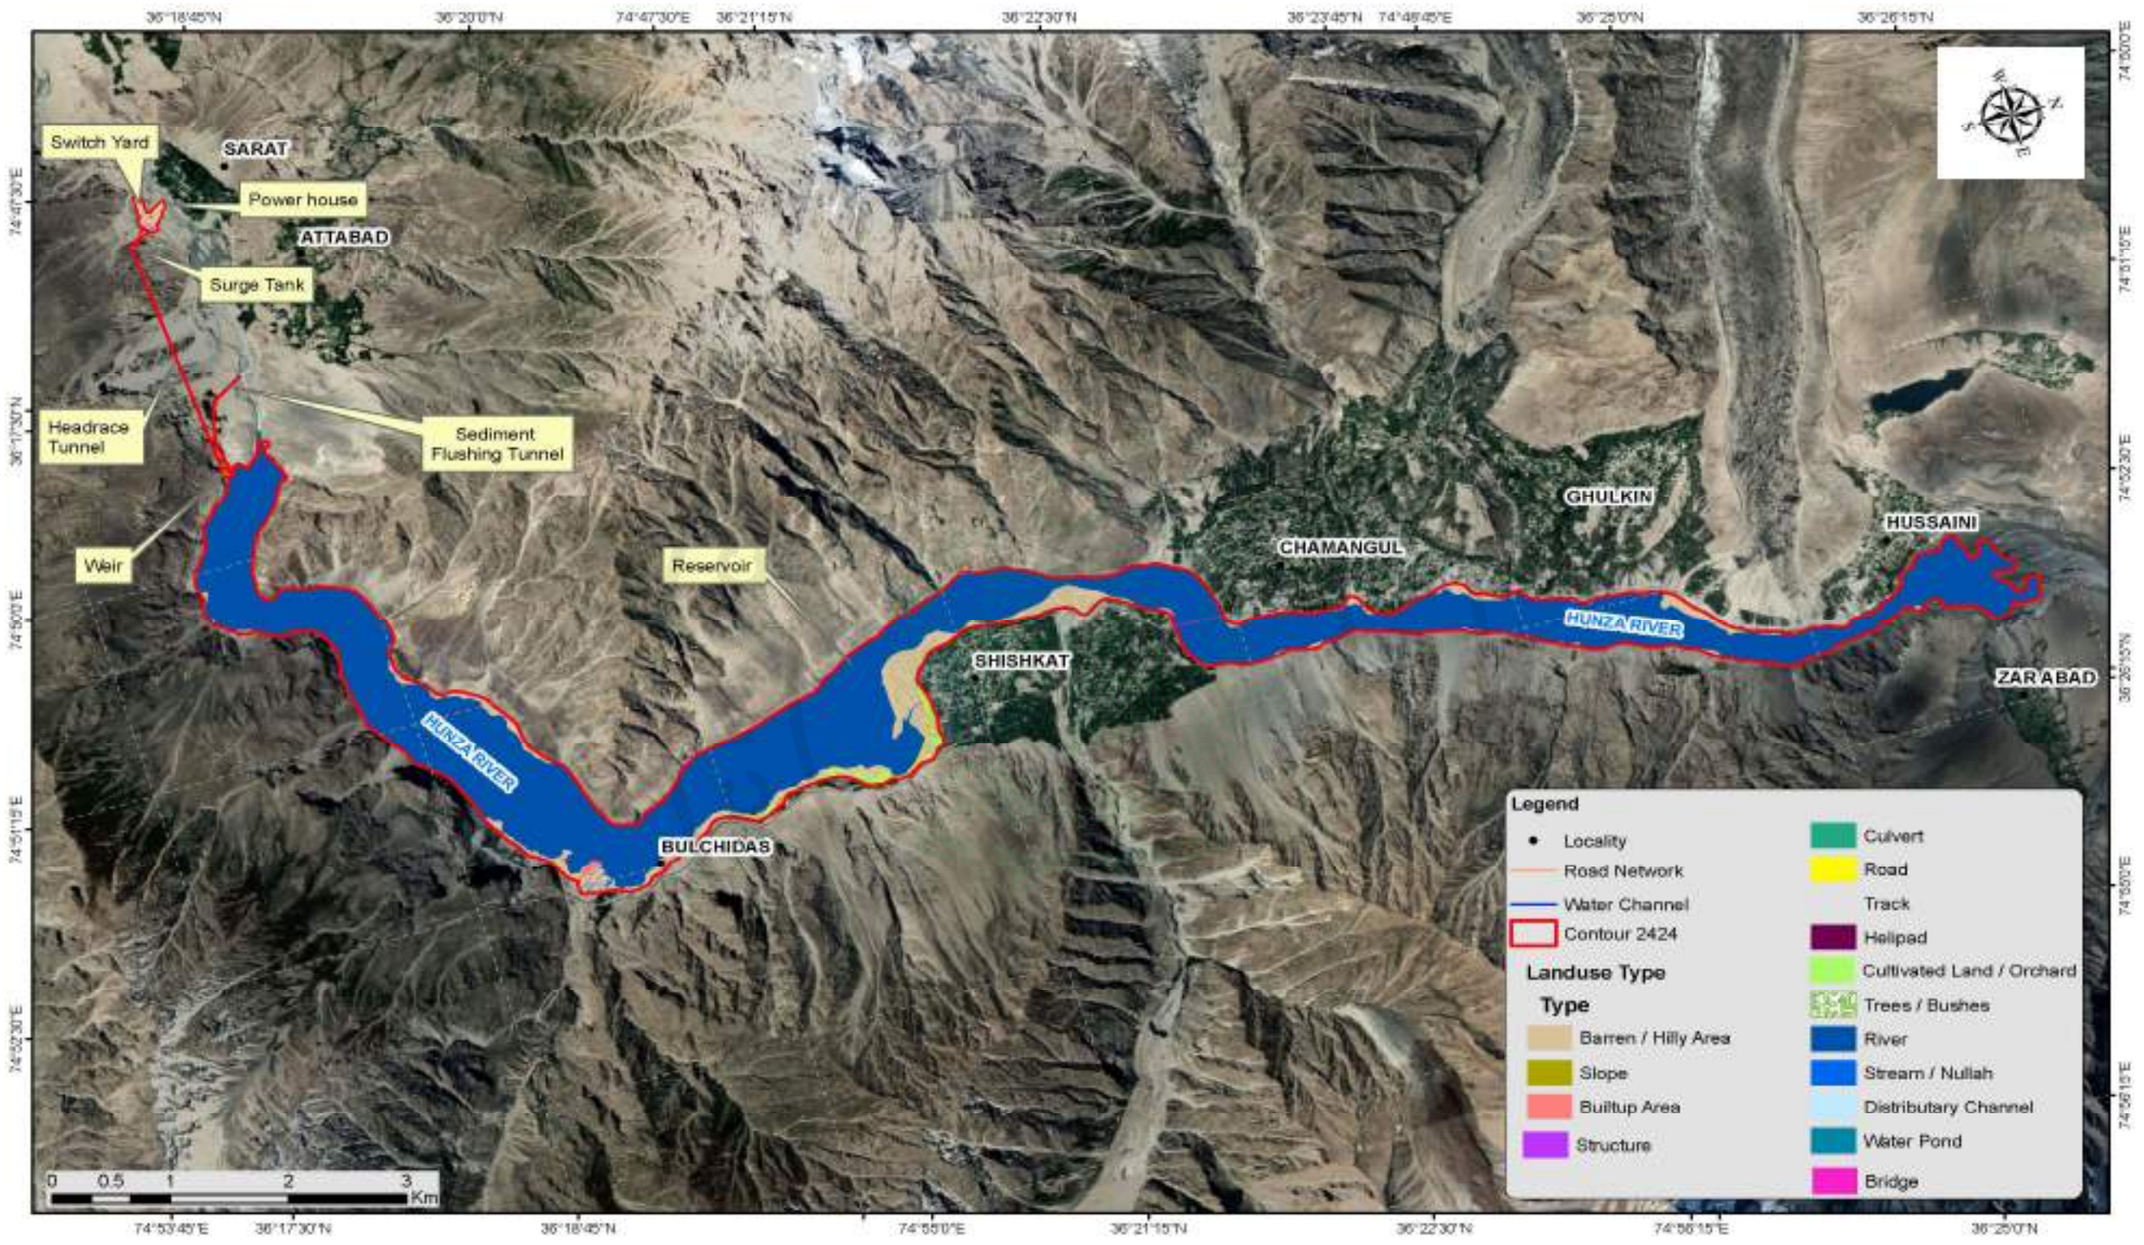

Figure 5-9: Land use Map of the Study Area

5.2.11 Environmental Parameters for Monitoring

The environmental monitoring of parameters like ambient air quality, noise level, surface water and groundwater help us to analyze the prevailing environment conditions in and around the study area, and to protect it from any adverse activities due to the proposed Project implementation.

The environmental parameters for ambient air, noise level, surface water and groundwater monitored during preparation of EIA of ALHPP in 2021 has been taken for the current EIA.

5.2.12 Air Quality and Noise Level

The ambient air quality monitoring for Carbon Monoxide (CO), Sulfur Dioxide (SO_2), Nitrogen Oxides (NO_x) and Suspended Particulate Matter (SPM was carried at near the proposed Project Site. Noise level was also measured near the project area. Based on the environmental monitoring, the following range of concentration of gaseous pollutants is estimated on the roadside at Gulmit (**Table 5.5**):[12]

Table 5-5: Range of Gaseous Pollutant Concentration & Noise Emission Level

Range of Variation	CO ppm	SO2 ppb	NOx ppb	SPM g/m3	Noise dB(A)
Minimum	0.65	05	05	45	40
Maximum	0.9	10	12	90	70
Average	0.7	07	07	70	55

g/m^3: grams per cubic meter

The noise level near the river is fairly high and range between 50 to 65 dB without traffic, mainly due to the flowing water colliding against rocks and boulders.

5.2.13 Surface/Wastewater Quality

In the project area, the Hunza river carries water of various streams (nallahs)of snowmelt, and rainwater fall. The people use the water of these nallahs for drinking, household and agriculture purposes. Generally, there is no shortage of clean potable water in the project area as it is very difficult to fetch the water of river and nallahs due to the very steep slopes. People mostly use water from nallahs for drinking, washing and other domestic purposes. As these waters flow over land they pick up sediments, salts, toxic elements, pulverized organic matter and bacteria from the surface. Water samples were taken covering the complete affected area within the project area. The laboratory results of these samples summarized in **Table 5.6 & 5.7** reveal that all the parameters are within the permissible limits when compared with drinking water quality standards of WHO, except the presence of Escherichia coli pathogenic bacteria which causes gastroenteritis in human beings.[13]

6	Gulmit Glacier Near Hunza River	0 col/100ml	8.0	<5 NTU	29.7 ppm	59.4µs	7ºC	Clear	Odorless	Tasteless
Conclusion:		Results show that the turbidity in Shamshal Nullah by entering Hunza water sample exceed the National Standards for Drinking Water Quality of Pakistan.								

PUBLIC PROCUREMENT REGULATORY AUTHORITY (PPRA) EPADS

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

The laboratory results of these samples reveal that all the parameters are within the permissible limits when compared with drinking water quality standards of WHO, except the presence of Escherichia coli pathogenic bacteria which causes gastroenteritis in human beings.

5.2.14 Mining

Mining is one of the common professions in small parts in Hunza. Locals have developed mining at their own level with their own resources. People use to explorers the Mines by their own resources without any support of Government. However, in project area, no mining activity was observed.

5.2.15 Natural Disaster

The project area and its surrounding valleys are highly susceptible to natural disasters such as landslides, flash floods and avalanches, which affect civic life of areas within project vicinity. Atta Abad Lake, itself is an example of a massive landslide in 2010 and dammed the Hunza River. Attabad village was completely devasted and six small villages and 25km of KKH was completely submerged in Attabad Lake . GLOF events are becoming common in the project area as the areas is surrounded by some very large glaciers which can

5.2.16 Tourism

Attabad Lake has now become a spot of tourist attraction. A large number of tourist visits the area every year. The local communities get employment as tourist guides and transporters.

5.3 ECOLOGICAL ENVIRONMENT

5.3.1 Methodology

The available literature was thoroughly reviewed to have a better understanding of the project area and its surroundings including habitat, flora and fauna. The route alignment was thoroughly examined based on the primary and secondary data (Flora of Pakistan - M.I.Sheikh, Birds of Pakistan -Z.B.Mirza, Mammals of Pakistan-T.J. Roberts, previous EIAs of the proposed area, Manual of silviculture for Pakistan [1965] Champion, Sir H.G.; Pakistan Forest Institute, Peshawar, Seth, S.K. Khattak, G.M.). The data from primary and secondary sources was collected and adopted as such giving reference to the source. The stakeholder Forest, Wildlife, Agriculture, Fisheries and EPA departments were also consulted and relevant data was acquired from them. This survey broadly covers ecosystem sensitivities (If any), vegetation, other flora and fauna. Only the trees and vegetation in the vicinity of Power House, around the Lake and Communities were also consulted during the process of EIA and their view point and suggestions were incorporated in the Plan. The Project area comprises of Hydro Power station and Transmission Lines from Attabad to Sost and Attabad to Karimabad which linearly stretch over major part of the District. However the impacts of Transmission Line component of the project were not tangibly quantified at this stage. The Biological component of the Project area represents almost entire district in terms of flora, fauna aquatic life and agriculture sectors. The specific information related to aquatic life in the Attabad Lake was collected along with the information of other parts of the Project area.

5.3.2 Introduction and General Information Related to Biological Component of the Project Area

Biological Environment study includes the study of all those factors such as wild animals, plants or aquatic life, bacteria that affect human life as in a particular place or period.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Biodiversity is the core component of Biological Environment. Habitat loss is considered as the leading cause of loss of world's biodiversity. Most species need undisturbed habitat to find food, water, shelter, and mates. But people are altering habitats all over the world. In such areas, the activities causing habitat loss include commercial logging (not based on technical and sustainable basis), land development, over-grazing, fuel wood collection, construction of roads, and building new settlements. All these actions change landscapes, natural water flows, and the species composition in the area. Moreover, changes in climate and land use patterns is also reducing the amount of snowfall and rain upon which the habitat depends.

As far as the Biological Environment of the project area is concerned, the high altitudes, rugged mountains and sweeping glaciers make much of the region of Gilgit -Baltistan uninhabitable. Only two per cent of the Northern Areas (NAs) estimated to be suitable for agriculture through irrigation by diverting stream water. However, so far only one percent of the total area is being cropped. Approximately nine per cent of the areas are covered by natural forests and open scrub, 22 per cent area constitutes alpine pasture, and remaining 68% is mostly bare rock, under permanent snow and glaciers.

5.3.3 Flora

A study was carried out on the Biodiversity of Hunza District including Khunjerab National Park (KNP) to establish baseline information about existing plant wealth and wildlife including flora, reptiles, birds and mammals in order to make some vantage points for future monitoring of key wildlife species. Using different direct and indirect investigation techniques, 14 different valleys and Nullahs of Hunza and KNP were surveyed and observations on various habitats were recorded.

The wide variety of climatic conditions in the region, coupled with the extreme variations in altitude and aspect, has created a wide array of vegetation and ecological zones. Five distinct zones can be identified including Dry Alpine Scrub, Moist Alpine Pastures, Dry Alpine Plateau Pastures and Sub Alpine Scrub and Birch Forests. So far, 62 plant species belonging to 45 genera and 25 families were identified. Of them, 4 grasses and one species of Liliaceae were determined. This represent the Project area and finding of the study were verified during field visit of the Project area. The detail of ecological zones is as follow:

a. The Dry Alpine Zones and Permanent Snowfields

This ecological zone is characterized by vast glaciers, boulder fields and sheer cliffs. This zone predominates at high altitudes, around the major peaks of the Karakoram Mountains. It covers most of upper Hunza and the northern parts of Baltistan.

b. Alpine Meadows and Alpine Scrub

This zone covers the areas between the high valleys and the permanent snowfields, between 3,500 and 3,800 meters. It is characterized by lush, green and well-watered alpine meadows, located on valley bottoms or high plateau surrounding the main watercourses. Alpine meadows occur in almost all the higher regions of Gilgit, Baltistan, Ghizar and Diamir and Hunza particularly where mountains extend above the tree line. The meadows support a wide variety of wildflowers, grasses, sedges and other plants.

c. Sub-Alpine Scrub

The sub-alpine scrub zone occurs throughout the higher mountains of the Himalaya, Hindu Kush and Karakoram, and is found in Gilgit, Skardu, Ghizar, Astore and Hunza. However, it is often confined to small ravines on the upper slopes. The vegetation consists of small deciduous species such as Betula utilis, and evergreens such as Juniperus communis and

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Rhododendron hypenanthemum.

d. Dry Temperate Coniferous Forest

These forests are usually found on the inner or northerly slopes of the Himalaya, between 1,500 and 3,400 meters. They occur in parts of Gilgit, Diamir and Baltistan Districts, and are characterized by single species stands of conifers. Typical tree species include Picea smithiana, Cedrus deodara and Pinus wallichiana, with an understory of Quercus ilex and Junglus regia and scattered shrubs of Artemisia maritima and other species.

e. Dry Temperate Evergreen Oak Scrub

This is an intermediate zone, lying between 1,500 and 2,500 meters. The vegetation is dominated by dry oak forest (Quercus ilex). Occasionally individual stands of evergreen species are also found, including Pinus gerardiana, Pinus wallichiana, Cedrus deodara and Juniperus spp.

f. Medicinal Plants

A large number of medicinal plants grow in the natural forests of Gilgit-Baltistan, especially Astore Valley and Hunza Valley. The following is a list of important medicinal plants found in the project area (**Table 5.8**).

Table 5-8: Important medicinal plants report in GB Forests

Sr. No.	Botanical Name	Local Name		Botanical Name	Local Name
1	Aconitum Chasmanthum	Mohri	12	Onasin echioides	Laljari
2	Aconitum Hetrophyllum	Partis	13	Orchus-latifolia	Salib misri
3	Aconitum lavae		14	Picrohiza-kurrva	karroo
4	Angelioa glauca	Chora	15	Podophyllum-emodi	Ban kakri
5	Arterrisia bravifolia	Rund	16	Rheun emodi	Rhewand chini
6	Carum spp.	Kala	17	Sausuria-lappa	Kuth
7	Ephedra spp.	Oman	18	Saxifraga ciliate	Zakhmay hayat
8	Ferula feotida	Heeng	19	Shymus serpyllum	Bannanajwainu
9	Ferula narthex	Heeng	20	Swertia chiretha	Chiretta
10	Lavatria	Resha	21	Valeriana wallichii	Mushak bala
11	Macrotomia-	Gao	22	Viola serpans	Banafsha

g. Forestry

Forests in GB cover an area of 281,600 hectares. Majority of these are found in the districts of Diamer, Baltistan, Gilgit and Ghizer. However the Hunza District including the project area has 0.75% of the area under forest. The forests provide timber, firewood, torchwood, grazing land and medicinal plants.eg. kuth (*sassuria, lappa*) black cumin, and other non-timber forest products (NTFP) including pine nuts (chilghoza), mushrooms, honey, berries of sea buckthorn, and animal products. The forests are important watersheds for the downstream population. Many species of wild animals and plants depend on these forests for survival. Fuel wood is the main resource harvested from the forests, followed by timber. The young branches of trees provide an important fodder source from March to May, when other fodder sources are scarce. Fuel wood is collected from low and high pastures, private land, fruit trees, and purchased from local markets. Generally, fuel wood is collected in spring and autumn and is stored for

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

use during winters. Wood is also harvested to make agricultural and household tools and utensils while some types of bark, leaves, and berries are widely used for medicinal purposes.

Forestry is important for fuel, timber, in addition to control of the soil erosion and reduction in silt load in lakes and rivers. In the Gilgit-Baltistan only Diamer district is rich in forest while the other five districts including Hunza have nominal forest of Juniper. The forests consist of blue pine, spruce; willows and shrub consist of rosa species.

A new program of planting trees over private land by AKRSP and 10 Billion Trees Tsunami in the valley is operational. The forest areas including uncultivated wasteland are State Forests owned by the government. Wood is used for timber, fire and fuel wood throughout the year. Firewood is used during winter season. Based on data used by AKRSP each house on average use 100 monds of fire and fuel wood during a year. On the other hand, fire and fuel wood collected from common property is 63 mounds per annum. Forest trees are rich source of fodder. It was noted that 12 mounds of fodder are also collected by each household from the forest. The natural forest although has been extensively exploited. In the Hunza valley more forest plants are planted to reduce the pressure on existing forest. For this purpose, an average 130 trees of Poplar by each household and 90 plants of willow per household are planted under this Program.

In Ten Billion Tree Tsunami 4.4 Million trees were planted in 2019-20 year through Gilgit forest circle, Diamer Astore Forest Circle, Baltistan Forest Circle, Wildlife Divisions, AKRSP and through Agriculture Department in Gilgit Baltistan. The detail of planting in the year 2021 is given in **Table 5.9** as under.

Part of activities already has been undertaken in the Project Area.

Table 5-9: Plantation Plan in Hunza District for the year 2021[14]

Sr. No	Activities	Sites	Area /KM	Total nos. of plants to be planted
1	Avenue Plantation	Nasirabad to Aliabad	45 km	30,000
2	Slope plantation	Attabad lake	700 Kanal	25,000 (first Phase)
3	Block Plantation	Hussaini	1680	50,000 (first Phase)
4	Block Plantation	Gulkin Shahabad	948 Kanal	25,000 (first Phase)
5	Block Plantation	Khuramabad	1500 k	50,000 (first Phase)
6	Free Distribution of	Across Hunza	-	150,000
7	Urban Planation	District Head Quarter	-	15,000
Total			-	345,000

With action plan of 10 TBTTP, it will improve the production and procurement of forest and fruit plants, rehabilitation program of natural forest and awareness campaign for forestry will help in plantation of trees in the region.

5.3.4 Agriculture

The Hunza district spread over an area of 10,109 sq.km (1,010,900 ha) which is 14% of the total area of Gilgit-Baltistan. Hunza District is bounded on the south by the Nagar District and Shigar District and on the west by the Ghizer District. The district headquarter is the town of

[14] *Source: Forestry & Wildlife Department GB) Plantation site Khuramand & Zarabad, Hunza*

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Karimabad. Administratively, Hunza district is composed of two tehsils namely Ali Abad and Gojal. The number of villages are 46, the population in 2017 was 50,000, dwelling in about 6,494 households with average household size of 7.7 persons. With a growth rate of 2.74, the estimated population of the district is 57,236 persons in 2022. Overall literacy rate is 71% - male 80% and female 65%

According to Agriculture Department Gilgit-Baltistan, total agricultural land of the district is 6,453 ha out of which 2,114 ha is cultivated while 4,339 ha is cultivable waste. The land use statistics of district Hunza is given in **Table 5.10.**

Table 5-10: Land Use Statistics of District Hunza

Sr. No.	Type of Land	Area (Ha)	Percentage
1.	Agricultural Land	6,453	1%
2.	Forest Land	5,003	0.75%
3.	Range Land & Pastures	194,498	19%
4.	Rivers/Lakes	32,480	3%
5.	Settlements	46,016	5%
6.	Snow/Glaciers	313,896	31%
7.	Rocks/Barren Land	412,555	41%
8.	Total	**1,010,901**	**100%**

a. Current Features of Agriculture in District Hunza

The crops grown and cropping pattern in Hunza is influenced by the elevation which ranges from about 8,000ft to above 10,000ft. From 8,000ft to 8,500ft transitional double cropping system is practiced while above 8,500ft single cropping pattern is followed in the district. The major cereal crops of the districts are wheat, barley, maize and buckwheat. The vegetables grown are potato, tomato, peas, cabbage, cucumber, carrot, radish and beans. The fruits of the districts are apricot, apple, cherry, grapes, pear, peaches, pomegranate, mulberry, walnut and almond. Fodder is also produced in sufficient quantity. It is important to note that farmers grow mix of crops for subsistence. Therefore, the land is used for growing multiple crops in the same season. A typical cropping pattern followed in district Hunza is given in the **Table 5-11** below.

Table 5-11: Cropping Pattern of Hunza District

Elevation	Cropping Pattern
2438 m (8,000ft) to below 2591 m (8,500ft)	Wheat followed by maize or peas, and vegetables and fodder - OR
Cropping season Feb - Oct	Potato followed by peas, and vegetables and fodder - OR
Transitional double cropping	Wheat followed by buck wheat, and vegetables and fodder

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Elevation	Cropping Pattern
	Fruits are grown
2591 m (8,500ft) to below 2743 m (9,000ft) Cropping season Mar–Oct single cropping	Potato, and vegetables and fodder – OR Wheat, and vegetables and fodder - OR Barley followed by buckwheat, and vegetables and fodder OR Maize, and vegetables and fodder
	Fruits are grown
above 2743 m (9000ft) Cropping season late Apr–September single cropping	Potato, and vegetables and fodder - OR Wheat, and vegetables and fodder - OR Barley, and vegetables and
	Fruit in limited quantities in relatively lower altitudes and no fruits on higher altitudes

b. Future agricultural potential in Hunza

The following potential has been identified after analysis of the consultations with Agriculture Department and farming community as well as assessing the market potential pertaining to various agro-ecological zones of the district including the Project area (refer **Table 5.12**)

Table 5-12: Potential of crops in various agro-ecological zones of Hunza

Type	Potential crops	Remarks
Potential in Warm & Cold Temperate zone		
Cereals	Wheat (winter sowing), Maize. Quinoa and buckwheat may be high potential	Among cereals, wheat in winter and maize as a second cereal crop are priority. Quinoa has been proposed as a high potential super food crop in Nagar during summer at the peripheries. Buckwheat may also be a future potential. It used to be cultivated earlier and this trend may be regenerated.
Vegetables	Potato, capsicum, peas	Potato and Capsicum are in high demand from the market from this zone. This zone in Hunza also specializes in Peas, sown in February / March and harvested in May /June which is early harvest having advantage in the market. Tomato vertical cultivation is cultivated in May and fruits in July over a long stretch. Cucumber and bottle gourd are also suitable to be cultivated in vertical formation.

c. Fruit Culture in GB and Hunza District including Project area

The main strength of the economy of Gilgit-Baltistan (GB) depends largely on dry fruits and agriculture. This area is famous for its almond, apricot, cherry and other dry fruits production in the world, but the most popular fruit is almond; a huge variety of almond is found in all

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

districts of GB. Each type has its own specific characteristics. Gilgit-Baltistan produces about 120,650 tons of almonds per year[1]. Farmers of GB could earn billions of rupees through almonds export. The fresh and dried almonds in Gilgit-Baltistan are famous for its rich taste and organic nature. Pollution free environment and abundant water resources make it ideally suitable for natural growth of fruits and vegetables.

Gilgit-Baltistan faces problems with advantages in respect of fruit sector like long and difficult road journey, lack of storage facilities, non-availability of export quality packing material, quality control for grading and facilities for disinfection decrease the worth of fruits and cannot be dispatched to various markets of the country. Gilgit-Baltistan could be a business hub between Pakistan and China in the wake of China Pakistan Economic Corridor (CPEC) and Hunza District can be used as a gateway between both the countries. In this scenario people of GB could get huge benefits by exporting its finest quality of almonds and other dry fruits to China. The irony is the lack of infrastructural facilities and efficient road network to reach timely to market network.

People of GB have more opportunities in the agriculture sector and organic farming. Climate and abundant water resources make it ideally suitable for marvelous growth of this sector in Gilgit Baltistan, where immense potential is yet to be exploited. The nearest large city from GB is Rawalpindi/Islamabad. Under these conditions one of the options available is to process the fruits at location to increase its shelf life and to add to its value, so that it may be transported economically.

d. Fruit Crops[1]

Gilgit-Baltistan including district Hunza (Project area) has a very favorable climate for producing diverse fruits, particularly apricots. For centuries, the farmers of the region have been practicing horticulture as part of their livelihoods management strategy. Horticulture contributes about 83 percent of the entire income generated from agriculture. Similarly, within the horticulture, fruits contribute 60 percent. There are about 5.749 million fruit trees (3.653 million fruit bearing and 2.096 million non-fruit bearing).production volume of 169,373 tons produced over an area of 25,012 hectares. Major fruits produced in the area include apricot, apple, grapes, pears, peaches, pomegranate, cherry, mulberry, walnut and almond.

i. Livestock Rearing[1]

Livestock in GB (including Hunza) plays a central role in the rural economy as rural farmers use livestock for both dairy and meat production. They also use the manure, skins, and hides for income generation. Livestock contributes 35-40 percent to the overall agriculture income[15]. The production potential of livestock is too low to meet the demand of meat and dairy products. This gap is filled from importing meat from other parts of the country. As a part of subsistence farming, every household rears some kind of livestock.

Many different breeds of sheep, goats and cattle are found in Gilgit-Baltistan. Sheep breeds include the Baltistani, Gojali and Kohai Ghizar varieties. Goat breeds include Baltistani, Pamiri, Gojali, Kohai-Ghizar, Jarakheil, Gaddi and Kaghani. Farmers also keep cattle, yaks and various cross breeds of the two known as zo/zomo. Yaks are typically kept in the high regions

[1] *(Source: Rangelands and their Interfaces in the Hindu Kush Himalayas, 2013, ICIMOD)*

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

such as Gojal, Baltistan and parts of Ghizar and Hunza Districts. Preferred animals are yaks *(Bos grunniens), Zo* (cross infertile breeds of yaks and domestic cow), and *Zomo* (female fertile breed). Zo are used as source of meat or sold to meet domestic requirements. In addition, each household maintains local breeds of cows for subsistence milk production.

These are highly valued animals and very important to the local economy as they provide milk, wool, draught power and manure. Yaks are physically well-adapted to high altitudes. Their heavy wool and other thermo regulatory mechanisms enable them to tolerate extreme weather conditions.

g - Problem in Agriculture Sector

Gilgit-Baltistan is a remote mountainous region of smallholders with comparatively higher incidence of poverty. Agriculture productivity is generally low due to poor access to quality inputs, huge postharvest losses (45% for apricot and 10% for potato), lack of local processing and value addition and poor access to markets. Production is scattered and fragmented over large areas and of variable quality with difficult access and there are no aggregation platforms. Varietal selection is inappropriate and most farmers produce fruits and vegetables of multiple varieties; many of which are not in demand in the market or have poor shelf life. There is a poor connectivity among the actors and stake holders along the value chains of key products. Supportive policies and incentives are often weak or entirely missing. In view of these challenges, there is need to undertake research and studies on the following aspects of Agriculture sector.

1. To determine the potential of agriculture in areas of Gilgit-Baltistan;
2. To identify investment opportunities in Gilgit-Baltistan; and
3. To determine challenges of farming community in this area and to provide recommendations/suggestions.

5.3.5 Fauna

This diverse range of vegetation and ecological zones also supports a rich faunal diversity, including an estimated 54 species of mammals and 230 species of birds. About 23 species of reptiles and 6 of amphibians have been reported from GB. Among reptiles 9 species are of lizards and 14 of snakes, while among amphibians 2 species of frogs and 4 of toads. Very little information is available on insect diversity in GB; however, about100 species of butterflies have been reported from GB. The project area does not support any habitat of endangered wildlife species.

Occurrence of some rare species has been reported in Hunza District including KNP. These include species like Lammergeyer and Golden eagle. Few sightings of Lesser Kestrel have also been reported in lower Hunza near Hunza River. The main diverse group of birds is the Passeriformes species. These are mostly Warblers, Tits, Flycatchers, and Buntings. Some of the restricted range species like Snow Partridge and Himalayan Monal pheasant are extremely rare and may be at the verge of extinction from many of their earlier strongholds. According to Birdlife International (2001) report there are 27 species of Pakistan, which are threatened internationally out of which 7 species are found in GB.

Hunza has very scattered settlements with meager population. Considering its wildlife resources to be protected and preserved, shooting, trapping of wild animals is not allowed except with a special permit. The number of animals or birds killed or captured is also restricted and specified in the permit. Snow leopard and Ibex are already declared as endangered and

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

other species of mammal are also scarce. But trophy hunting is allowed which is beneficial to the local community as the 70% of the funds go to local community which is used for the development of the local area. The detail of fauna in the Project area is given in **Table 5.13**.

Table 5-13: Fauna available in Project area of Hunza District

English Name	Urdu Name	Scientific Name
Red fox	Lombrei	Vulpesvulpes
Lynx	Seaa gosh	Felis lynx
Wolf	Bharia or Bahdia	Canis lupus
Maramot	Barfani choh Tershoon	MaramotaCandata
Alpine weasel	Gilhari	Mustelaaltacia
Musk rat	Chachondar	Mustelaaltacia
Himalayan snowcock	Ramchakur	Mustelaaltacia Tetraogallushimalayencis
Chukor	Chukor	AlectorisChukor
Eagle	Shaheen	Aquila Chrysaetos
Hawk	Gid	-
Falcon	Ooqaabor Ooqabaa	-
Pie	Jample	UrocissaEryphrohyncha
Hopoe	Hodhodh	Upepaepaps
Pigeon	Kabutar	-

a. Insects

The Project Areas is rich in biodiversity of insects including butterflies found in the project area, particularly during the humid months of July and August. In addition, caterpillars, bugs, beetles, black bees, weevils, mosquitoes, ants, green aphids, codling moths, leaf miners, mitts, fruit flies, woody aphids, stray grass hoppers, leaf hoppers, mealy and woolly bugs, peach leaf curling aphids, scale insects, walnut weevils, blister mites, and dusky veined aphides are all found in the NA including the project sites.

b. Endangered, Threatened or Vulnerable Species of Fauna

There are no endangered species of fauna found in the Project Area.

c. Community Controlled Hunting Areas

The concept of biodiversity conservation through community development was piloted in a few selected valleys by International Union for Conservation of Nature -IUCN under a Global Environment Facility (GEF)/ United Nations Development Programme (UNDP) project in Gilgit, Baltistan and Chitral during the period 1995-1998. The success of the project resulted in expanding the concept to a larger canvass and today there are 53 communities-controlled hunting areas CCHAs. Out which 12 CCHAs fall in Hunza District. The participating communities are required to write a management plan for conservation and sustainable use and monitor the population of species targeted for trophy hunt. The major species being managed for trophy hunt are Markhor, Ibex, and Urial. The communities are issued permits by government for the number of animals that can be safely hunted. Communities sell permits nationally and internationally through outfitters. Eighty percent of the income from successful hunt goes to local community while 20% goes to government to cover administrative costs.

There are no Community Controlled Hunting Areas falling in the Project Area.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

d. Protected Area

In order to safeguard the biodiversity of key ecological systems, Government of Gilgit-Baltistan has declared 7 National Parks to protect and conserve bio-diversity of Gilgit Baltistan. These include Handarb National Park, Khunjerab National Park, Deosai National Park, Central Karakorum National Park, Qurumber National Park, Himalaya National Park and Nanga Parbat national Park. Out of these National Parks the Khunjerab National Park is situated in Hunza District. In the protected forest, the forest owned by Government as per Forest Act-1927, all activities are prohibited until and unless permitted by the government. Usually, removal of fallen, dying, and dead trees is not banned, however, grazing, sometimes, is regulated to ensure regeneration. In Gilgit Baltistan, designated protected forests cover an area of 445,712 ha and are mostly found in Ghizer, Astore, Skardu, Hunza and Gilgit Districts. Out of that 64,512 ha is conifer forests while 3, 81,200 ha are scrub forests (IUCN, 2003).

Aga Khan Rural Support Programme (AKRSP), International Union for Conservation of Nature (IUCN), Wildlife Conservation Society (WCS) and World Wide Fund (WWF) are the main international organizations who over the last two decades have played a crucial role in creating awareness among communities for sustainable management of biodiversity resources. The then Ministry of Environment also implemented a Program for Mountain Areas Conservation (PMAC) to promote biodiversity conservation in Gilgit Baltistan through community participation. This program was completed in 2011. As a result of these efforts the Gilgit Baltistan offers a model for community based management of forestry resources.

Despite of all these conservation initiatives and efforts by government and international organization, fast depletion of forest ecosystems has been observed in the last two decades. The following strategies and actions are being taken to achieve the objectives of conservation, sustainable use and equitable sharing of benefits.

There are no Protected Areas falling in the Project Area.

e. Game Reserves

The Game Reserves areas set aside for conservation of key game species, however, hunting and shooting is allowed except under a special permit. There are 8 Game Reserves in GB out of which 1 Game Reserve is located in District Hunza. The detail of these Game Reserves is given as follow (**Table 5.14**):

Table 5-14: Game Reserves Areas

Game Reserve	Area (km2)	Key Species
Danyore (Gilgit)	443	Markhor, ibex, Urial, snow leopard, lynx, wolf, fox, etc and bird species
Kilikmintika (Hunza Gojal)	650	Ibex, Marco polo sheep, snow leopard, brown bear, fox, marmot, etc and bird species
Nazbar Nallah (Ghizer Yasin)	334	Ibex, snow leopard, brown bear, wolf, fox, etc and bird species
Chassi Bowster (Ghizer Phander)	370	Ibex, snow leopard, wolf, brown bear, fox, etc and bird species
Pakora (Ghizer Ishkoman)	75	Ibex, snow leopard, wolf, fox, etc and bird species

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Game Reserve	Area (km2)	Key Species
Askore Nullah Skardu	129	Ibex, snow leopard, wolf, fox, etc and bird species

There is no game reserve, wild sanctuaries and National Park present in the Project Area.

5.3.6 Aquatic Ecology

Gilgit-Baltistan is blessed with highest potential of cold and clean water resources in shape of lakes, canal, reservoirs, rivers, and water logged areas that offer ideal habitat for trout and other cold water fish species. There is dire need to get maximum benefit from these resources through technological advancement in production, processing and marketing. Both the public and private sector are fully involved in order to judicially exploit this potential both in natural waters as well as its development in culture conditions.

Hunza Valley is blessed with great water resources comprised of streams and alpine lakes fed by the snowmelt and glacier waters. The fish fauna in Hunza Valley is relatively poor due to high turbidity, low water temperature and high water speed.

a. Fisheries

Fisheries department Hunza was established in the year 2012 with the core aim to develop and promote Fisheries and aquaculture activities in newly created district. District Hunza has rich aquatic resources of aquaculture and fisheries in forms of bluish lakes, gashing rivers, torrential streams, seasonal and perennial springs etc.

District Hunza being gate way to the CPEC and hub for tourist has great potential in terms of natural resources and well aware educated man power can contribute and play vital role in the development of the area. The scenic beauty and natural water resources of Hunza attracts a great influx of national and international tourist every year, which may directly or indirectly contribute to the economy of local people and the region.

Fisheries department Hunza has come up with novel approach and ideas to get maximum benefit from wise use and sustainable exploitation of natural resources in multiple ways with special focus on introduction and installation of cage culture system in Attabad Lake under controlled environment to enhance production with stocking and multiplication of fine varieties of fish in nature. At the same time, it has also been planned to promote sport fishery providing enabling environment and other related facilities for tourists and fish anglers.

For this the Attabad Lake having crystal clear water offers as natural gene pool reserve, ideal for excessive multiplication and better growth of many indigenous and exotic fish species.

b. EXOTIC FISH SPECIES OF HUNZA

i. Salmo Trutta Fario (Brown Trout)
ii. Onchorynchus Mykiss (Rainbow T rout)

c. INDEGENOUS FISH SPECIES

Among the 15 identified indigenous fish species in GB the following six fish species found in Project Area:

- Shizothorax plagiostomus
- Shizothorax Nasus
- Ptychobarbus Conirostris

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- T riplophysa T erwasae
- Triplophysa Yasinensis
- Diptychus Maculatus

5.4 SOCIO-ECONOMIC ENVIRONMENT

The socio-economic aspects were studied with respect to human and economic development and quality of life values of the population in the Project Area. The human and economic development mainly focuses on population and communities, infrastructure availability, institutions, transportation network, prevailing land use, power sources and agricultural pattern. Quality of life includes socio-cultural values, public health situation, recreational resources & development and archaeological/historical and cultural sites etc. Baseline information was gathered from literature, study reports, districts census reports and through field surveys comprising interviews and meetings by the Consultants' social team, using survey tools. During the field survey interviews and meetings with the different categories of respondents were conducted and observations were also recorded after giving due consideration during survey.

PUBLIC PROCUREMENT REGULATORY AUTHORITY (PPRA) EPADS

5.4.1 APPROACH AND METHODOLOGY FOR THE STUDY

The methodology was developed after thorough review of the Terms of References (TORs), the quantum of work/expected outputs and the prescribed period of study. The survey mainly used quantitative methods and included supplementary qualitative information and analysis, wherever possible. The design of the assessment was limited to measuring the overall socioeconomic condition of the population living in the proposed project area. **Table 5.15** presents a summary of the objectives, key indicators, tools, and survey methods used for data collection.

Table 5-15: Survey Objectives, Key Indicators, and Methods

Sr. No.	Objectives	Key Indicators	Method	Tools
1.	• Demographic Profile • Occupation • Income of the respondents • Source of income • Expenditures • Asset ownership	• Demographic information (age, education status, health status, work status of household members) • Income levels and sources • Expenditure level • Assets – quantity, value, and ownership • Liabilities-loan amount and sources • Available social amenities (electricity, sewerage, telephone, Sui gas, etc.)	• Sample household interviews	• Socioeconomic Proforma
2.	• Availability of Social Amenities (access to and use of public services, such as access to water and sanitation, education, health, etc.) • Perception about the proposed project.	• Availability, use, and sources of household facilities (water, sanitation, fuel) • Availability, access, and use of public facilities (education, health, sanitation, civil acts registration, etc.)	• Sample household interviews • Community Discussions	• Sample household interviews, and • General Discussions with local community members

5.4.2 Literature Review

Immediately after the mobilization, the consultant reviewed all the available information/data, reports and studies related to project, the detail is as followed;

- Foot Prints of the project,
- District census report for the Hunza district, and
- Project area location maps

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

5.4.3 Field Reconnaissance Visit

The reconnaissance site visit was conducted to develop an understanding of the proposed project. The visit helped to prepare key milestones detailing socio-economic and poverty issues as well as possible project impacts.

5.4.4 Sampling Technique

In order to achieve the target of the study, random sampling technique was adopted to select adequate and representative sample from proposed project area to make the survey findings more compatible with the highest level of statistical confidence and thus get meaningful sociological facts/findings. Accordingly, 58 respondents were selected from the project area and detail is provided in **Table 5.16.**

Table 5-16: Number of Respondents

Sr. No.	Settlements/Villages	Number of Respondents
1.	Sarat	06
2.	Ganish	08
3.	Attabad	06
4.	Ayeenabad	05
5.	Shishkat	07
6.	Gulmit	07
7.	Gulkin	09
8.	Passu	10
	Total	**58**

5.4.5 Developing Survey Instruments

The TORs of the Consultant highlight the importance of collecting primary data; hence the consultants designed the questionnaires covering the various types of information regarding socioeconomic aspects, poverty indicators and availability of the social amenities.

5.4.6 Implementation of Data Collection Survey

The field methodology was prepared for data collection, used by the field teams during the execution of the study. A map of the proposed project area was obtained prior to the survey to facilitate the identification of sample respondents in the project area. Nonetheless, following techniques were applied in data collection.

5.4.7 Rapid Appraisal Methods

Rapid appraisal method was used which is quick way to gather the views and feedback of beneficiaries and other stakeholders. Rapid appraisal methods include (i) Key informant interview, (ii) Community group interview and consultations, and (iii) Direct observation.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

5.4.8 Participative Approach

- A two-ways approach was adopted and respondents were given the opportunity to express their concerns and views freely about the project;
- Community groups were the target of the study;
- The participatory tool like group meeting was applied to identify and listing of the beneficiaries;

5.4.9 Data Processing and Analysis

The following steps were undertaken to ensure proper data processing and analysis.

- The collected data/information from the field was computerized;
- A tabulation plan was prepared;
- Data was processed according to separate category of the indicators for analysis; and,
- All analyzed data was tabulated for interpretation and deriving conclusions and recommendations.

5.4.10 FINDINGS OF SOCIO–ECONOMIC SURVEY

The main objective of the socio economic survey was to analyze socioeconomic and cultural characteristics of the intended project beneficiaries in order to understand their interrelationships, dynamics, and inequalities and to identify opportunities and constraints in accessing the project benefits by all beneficiaries or a segment of them (based on gender, ethnicity, level of income, geographical remoteness etc.)

h) District Hunza at a Glance

The Hunza District is one of the 14 districts of the Pakistani territory of Gilgit-Baltistan. It was established in 2015 by the division of Hunza-Nagar District in accordance with a government decision to establish more administrative units in Gilgit-Baltistan. The district headquarter is the town of Karimabad. Hunza Valley is also hosting the ancient watchtowers in Ganish, Baltit Fort, and Altit Fort. Watchtowers are located in the heart of Ganish Village. Baltit Fort stands on top of Karimabad, whereas Altit Fort lies at the bottom of the valley. The local languages spoken include Burushaski, Wakhi and Shina.

i) Must Know Facts of Hunza

- First ever district to ban the use plastic and polythene bags. (First ever in Pakistan & South Asia).
- First ever district to ban on use of tobacco –smoking is strictly prohibits at public places, hotels and restaurants.
- Hunza is known for its rich culture, traditions and customs, therefore, known for hospitality, politeness and generosity.
- People are highly civilized & cultured since the literacy rate is 98%.
- Hunza is known for its longevity meaty organic food and clean environment.

j) Geography of District Hunza

The Hunza District is bounded on the north and east by the Kashgar prefecture of Chin's Xinjianj Uyghur Autonomous Region, on the south by the Nagar District and Shigar District, on the west by the Ghizer District and on the north-west by the Wakhan District of Afghanistan's Badakhshan province. The Hunza District represents the northernmost region of the Indian subcontinent. It is home to the historic passes through the Karakoram Mountains (the Killik, Mintaka, Khunjerab and Shimshal Passes) through which trade and religion passed

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

between Central Asia, China and India for centuries. The present day Karakoram Highway passes through the Khunjrab Pass to enter China's Xinjiang Uyghur Autonomous Region.

k) Tourist Attractions in Hunza Valley

Hunza boasts great biodiversity and natural beauty, the valley has dramatic natural beauty and there are many places which have attractions for the tourists. Hunza is one of the most exotic places in Pakistan. Several high peaks rise above 7,000 m in the surroundings of Hunza Valley. The valley provides views of several mountains, including:

Rakaposhi 7,788 m (25,551 ft), Ultar Sar 7,388 m (24,239 ft), Bojahagur Duanasir II 7,329 m (24,045 ft), Diran peak (7,266), Spantik (7027m), Ghenta Peak 7,090 m (15,631 ft), Hunza Peak 6,270 m (20,571 ft), Darmyani Peak 6,090 m (19,980 ft), and Bublimating (Ladyfinger Peak) 6,000 m (19,685 ft).

Some lakes like Attabad Lake, Borith Lake, Shimshal Lake, and Hassanabad Lake are located in Hunza.

Khunjerab Pass is a 4,693-meter-high mountain pass in the Karakoram Mountains. It is in a strategic position on the northern border of Pakistan and on the southwest border of China and is also located in Hunza. Eco-friendly hiking treks like Ondra, Poygah, Gulmit, and Leopard Trek Shiskhat are also known for their views.

l) Administrative Setup of District Hunza

Administratively, the Hunza District comprises two tehsils, the Aliabad Tehsil and Gojal Tehsil. The villages of lower Hunza and central Hunza are located in the Aliabad Tehsil, whereas the villages from the Attabad Lake up to the Khunjrab Pass are located in the Gojal Tehsil. In lower Hunza, Shina is the main language, whereas in central Hunza, the dominant language is Burushashki and in upper Hunza, Wakhi is the main language.

District administration is exercised by the Deputy Commissioner (DC) with the assistance of Assistant Commissioners. The Hunza police force is command by the Superintendent of Police (SP).

m) Attabad Lake at a Glance

Attabad Lake is located in the Gojal region of Hunza Valley in Gilgit−Baltistan, Pakistan. It was created in January 2010 as the result of a major landslide in Attabad. The lake has become one of the biggest tourist attractions in Gilgit−Baltistan, offering activities like boating, jet-skiing, fishing and other recreational activities.

n) Demography and Population

Total area of Hunza district is 11,660 km2 (4,500 sq mi). Total population of hunza district according to census survey report 1998 is 243,324.

o) Ethnic Groups and Religions

Most of the people of Hunza are Ismaili Shia Muslims who are the followers of Prince Karim Aga Khan IV, while in the area of Ganish Village over 90% are Asna Ashri Shia Muslims.

p) Culture

The culture of the Hunza district is unique to its people**.** They eat simple and healthy foods like Hunza bread, apricot products, dry fruits, and meat. They don't eat oily and spicy foods.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

q) Languages

The local languages spoken include Burushaski, Wakhi and Shina, while Urdu and English are the official languages spoken.

r) Education

Education plays a pivotal role in changing social and economic condition of the individuals. The literacy rate here is 98%. The female education ratio matches the males in Hunza district. Education has always been a top priority for the residents. New public and personal sector educational establishments are growing wide to impart schooling to the younger people.

s) Aga Khan Development Network (AKDN)

After the annexation of Hunza and the abolition of the principal state a space concerning rule, law, administration and organization was created. It took a long time for the government institutions to fill this gap. AKDN is an international network and as part of Aga Khan Foundation (AKF) deals with issues such as education, rural development, culture, health services, housing programs and quite a few others. With its headquarters in Geneva and having been founded in 1967, The AKF is an international agency for development co-operation. Within the sub-branches of the AKDN, the Aga Khan Rural Support Program (AKRSP) is for rural development. The activities of the AKDN have shaped the development of the valley extraordinarily. Its various offices provide jobs for higher qualified Hunza cuts when they return from their studies in down country. Employment is also provided in the public sector in the rural areas. The AKDN extends its activities to establishing healthcare facilities and educational institutions. The AKRSP was established in Gilgit and covers 84% of the household in Gilgit-Baltistan. The AKRSP started supporting institutional development on the local level in 1982 by establishing community-based organizations (CBOs) like Village Organizations (VO) and Women Organizations (WO). These associations were established all over Hunza within a few years. It initiated developmental projects in this area aiming at improvement of the condition of the rural population and providing basic facilities to the masses, with special emphasis on infrastructure.

t) Health Facilities

The villages in the Hunza Valley have somewhat better healthcare facilities than rest of the GB except Gilgit and Skardu. Aga Khan Health Service (AKHS) and Government health workers are providing health facilities in the area. They provide first aid facilities and also give family planning guidance to the people.

5.4.11 Demography of Sampled households

a) Gender Composition

The socio-economic survey was carried out to understand the demographic and socio-economic characteristics of the population in the project area. According to the survey of sampled households, the male population was high as compared to the female population in the project area. On average the male population was 53% compared to the 47% female population among the sampled families. As per the survey, the household size was 6.2 persons per household. The detail of the population of sampled households is given in **Table 5.17**.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Table 5-17: Gender Composition of Households' Population

Total Respondents	Population and Family Size				Total Population	Average HH Size
	Male	Percentage	Female	Percentage		
58	191	53	169	47	360	6.2

b) Age Group

Age is another important demographic characteristic which has a bearing on employment and mobility. The findings of the survey revealed that 24% of the respondent were between 21 to 30 years of age & 45% were between 31 to 45 years of age group and 31% of the were above 45 years of age group respectively. The data regarding the distribution of respondents by age is categorized and depicted in **Table 5.18.**

Table 5-18: Age Group of Respondents

Sr. No.	Frequency Distribution	Number	Percentage
1.	21-30	14	24
2.	31-45	26	45
3.	Above 45	18	31
Total		**58**	**100**

c) Education Level

A person if he could read a newspaper or a journal of the same standard and could write the simple letter in any language defined as a literate in the Census of 1998. Education is one of the key factors in assessing the socio-economic condition of any area and is a more contributing factor than income for uplifting the living standards in society. The literacy rate is barrier with limited educational infrastructures.

Based on sample survey (**Table 5.19**), 100% respondent population was literate. In term of education distribution, 12% of the respondents got the education till primary level (five years of schooling), 9% of the respondents have the education up to middle level (8 years of schoolings), and 26% & 21% of the respondents were matriculates and intermediate respectively. However, 33% of the respondents had the education till graduation level and above.

Table 5-19: Educational Level

Sr. No.	Educational Status	Number	Percentage
1.	Primary	7	12
2.	Middle	5	09
3.	Metric	15	26
4.	Intermediate	12	21

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

5.	Graduation & Above	19	33
Total		**58**	**100**

d) Source of Income

Household income could be the best indicator to assess the actual socio economic situation of the target communities. The majority of the respondents living nearby project area was engaged in agriculture, running restaurants and tourism business and some of them were doing private jobs to earn their livelihood.

The occupations have been categorized based on primary source of income. The sample survey revealed that the majority of the respondents 55% were associated with different kind of businesses including boating, jet-skiing, tourism, honey farming, dry fruits, restaurants, hotels and shop keeping etc. followed by 9% engaged in agriculture and 14% were doing private jobs, while 12% and 10% of the respondents were engaged in the field of driving and daily wages labor respectively. **Table 5.20** shows the occupation of the respondents.

Table 5-20: Source of Income

Sr. No.	Professional Status	Number	Percentage
1.	Business/shop	32	55
2.	Agriculture	5	09
3.	Private Job	8	14
4.	Driver	7	12
5.	Labor	6	10
Total		**58**	**100**

e) Monthly Household Income

During the socioeconomic survey, it was observed that monthly household income of the 12% respondents was up to Rs. 25,000 per month. Whereas, 10% households were earning between the range of Rs. 25,001 to 35,000 per month. However, 28% were earning between the ranges of Rs. 35,001 to 45,000. The majority of the households (50%) were earning above Rs. 45,000 per month. **Table 5.21** below shows the average monthly household income of the respondents.

Table 5-21: Monthly Household Income

Sr. No.	Distribution	Number	Percentage
1.	Up to 25,000	7	12
2.	25,001 to 35,000	6	10
3.	35,001 to 45,000	16	28
4.	Above 45,000	29	50
Total		**58**	**100**

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

f) Monthly Household Expenditures

Household expenditure depends on the earning of the households. 24% respondents reported their monthly household expenditure up to 25,000 due to their low income. However, 16% respondents reported their expenses within the range of 25,001 to 35,000 per month. Whereas, 38% respondents reported their monthly expenditures between the ranges of 35,001 to 45,000 in order to fulfill their family needs, while 22% of the respondents reported their monthly expenditures above Rs. 45,000 in order to fulfill their family prerequisites. The information relating to the household expenditure in respect of sample population is shown in **Table 5.22.**

Table 5-22: Monthly Household Expenditures

Sr. No.	Distribution	Number	Percentage
1.	Up to 25,000	14	24
2.	25,001 to 35,000	9	16
3.	35,001 to 45,000	22	38
4.	Above 45,000	13	22
Total		**58**	**100**

g) House Ownership Status

Housing is a major element of people's material living standards. It is essential to meet basic needs, such as shelter from harsh weather conditions, and to offer a sense of personal security, privacy and personal space. Good housing conditions are also essential for people's health and affect childhood development. Further, housing costs make up a large share of the household budget and constitute the main component of household wealth.

Regarding the ownership of the houses, findings of the study indicated that 100% of the sampled respondents owned their houses.

h) Type of the Houses

The Housing conditions of the respondents have been analyzed according to the type of houses in which they were residing. Majority of people use rock stones, concrete blocks, sand with cement for walls and floors whereas use wood for roofs.

i) Source of Drinking Water

Drinking water, also known as potable water or improved drinking water is water safe enough for drinking and food preparation. Access to safe drinking water is not only a basic need and a precondition for healthy life, but is also a basic human right. The quality of water is directly linked to the quality of health.

Springs are the only source of drinking water for the local communities. According to the local people the water is clean and safe for drinking purpose. People fetch spring water for drinking and cooking. Most of the people have access to water supplies but these water supplies also carries the water of springs which is managed through pipelines to make an easy access.

j) Satisfaction about Water Quality

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

During the survey, local people were asked about the quality of the drinking water. The data revealed that 100% respondents were satisfied with the quality of water. According to the respondents that the water of springs is very good for health because it carries minerals and extract of natural herbs.

k) Source of Energy for Cooking and Heating

Source of energy for cooking and heating purpose was also inquired during the survey from the respondents. In winters, 100% households uses wood for cooking and heating of the houses due to severe cold weather conditions. However, during the summer season almost 85% of the households use wood for cooking and heating whereas, rest of the 15% percent uses LPG as source of cooking. Hence, Sebagton Shrub wood is used for cooking and heating purpose while the wood of old Apricot, Apple, Popular and local trees is also used for cooking and heating. **Tables 5.23 & 5.24** indicates the sources which are being used by the respondents for cooking and heating purpose.

Table 5-23: Source of Energy in Winter Season

Sr. No.	Source of Energy	Number	Percentage
1.	Wood	58	100
Total		**58**	**100**

Table 5-24: Source of Energy in Summer Season

Sr. No.	Source of Energy	Number	Percentage
1.	Wood	45	78
2.	LPG	13	22
Total		**58**	**100**

l) Basic Social Amenities in the Proposed Project Area

Social infrastructure and amenities are key to creating sustainable communities. This assessment sets spaciousness of a household's dwelling, household amenities like availability of electricity and modern appliances, nature of access to water, fuel for cooking and type of sanitation facilities available as primary indicators for assessing standard of living.

The result of the survey revealed that 100% of the households had electricity facility while the facility of water supply was available to 79% of the respondents, basic health unit facility was available to 100% of the respondents. Facility of schooling was available to 100% of the respondents. Moreover, facility of mobile service was also available to 100% of the respondents. Providing proper sewerage system to the communities is the responsibility of the government, and this particular facility was not available in the area. The information in respect of access to social amenities and their quality of services is given in **Table 5.25**.

Table 5-25: Basic Social Amenities in the Proposed Project Area

Sr. No.	Social Amenities	Available (%)	Satisfactory (%)
1.	Electricity	100	50

2.	Water Supply	79	100
3.	BHU	100	90
4.	School	100	100
5.	Mobile Service	100	100

Source: field survey

m) Mode of Transport

It was observed that most of the respondents travelled by foot when traveling between nearest villages in the valley in the absence of proper road infrastructures. Whereas, in order to move to other cities or villages where road infrastructure exists, most of the respondents use their own transports either in shape of bike or car. **Table 5.26** describes mode of transport being used by the respondents asked during sampled household survey. About 38% of respondents were using their own transport and 21% reported the usage of public transport. While, 41% of the respondents were using both means of transport (private & public).

Table 5-26: Mode of Transport

Sr. No.	Mode of Transport	Number	Percentage
1.	Own Transport	22	38
2.	Public Transport	12	21
3.	Both (private & public)	24	41
Total		**58**	**100**

5.4.12 GENDER ASPECTS / ROLES AND RESPONSIBILITIES

The importance of gender equality, women's empowerment and the realization of women's rights in achieving sustainable development has been increasingly recognized in recent decades. This recognition is evident in a number of international norms and agreements, including principle 20 of the Rio Declaration on Environment and Development, adopted in 1992, in its statement regarding the full participation of women being essential to achieving sustainable development. The women of the proposed project area are hardworking, they have a vital role in maintaining domestic functions. During the field survey, the questions were asked from the respondents about the female participation in different activities of daily life. The survey revealed that participation of women in various household activities in the proposed project area is generally high (100%) in the case of household activities to take care and maintenance work of the household and take part in outdoor activities with their family members such as honey farming, fast food restaurant, help out in agricultural activities, fetching water, collecting fuel wood, cooking, washing, cleaning, looking after children etc. The **Table 5.27** depicts the routine activities and participation level of the female household members.

6 PUBLIC CONSULTATION

6.1 GENERAL

Timely and broad-based stakeholder involvement is an essential element for an effective environmental assessment, as it is linked with Project Planning, appraisal and development in general. Public involvement during Environmental Impact Assessment (EIA**)** has a tendency to improve project design environmental soundness and social acceptability.

This section describes the outcome of the stakeholders' consultation sessions held with different stakeholders that may be directly or indirectly affected by the proposed project. Public consultations are also mandatory for development projects. The adequacy of the public consultation and information disclosure is one of the basic criteria used to determine the project compliance with the national / international safeguard policies.

Under the proposed project, stakeholder consultations were carried out in the Study Area with the locals, Government Departments and general public. These consultations were carried out from 05th October to 06th October, 2022. The major categories of the people who participated in the public consultations were the local population and community groups. The Project management and implementation authorities are committed for undertaking public consultation at local levels as a part of Project planning/design for getting necessary environmental permissions.

This Chapter presents the objectives, process, and outcome of the consultations carried out with the key stakeholders of the Project during the present EIA study. A consultation framework, describing the consultations to be carried out during the subsequent phases of the Project implementation ensuring ongoing and inclusive dialogues with key stakeholder is also provided in this chapter.

6.2 OBJECTIVES

The objectives of stakeholder consultation were to contribute to the openness, transparency and dialogue. Special efforts were made to ensure that the communication with the public should be efficient and well balanced. The concerned stakeholder groups were identified to participate in the assessment process. Specific tasks and purposes of consultations with stakeholders have been given in the **Table 6.1.**

Table 6-1: Tasks and Purposes of Consultations

Task	Purpose of Consultation with Stakeholders
Why consultation with the stakeholders?	• To build trust to ensure sustained support for the proposed project and build resilience for times of crisis. • To learn about public concerns that need to be addressed and taken into account in designing of the Project concept and preparation mitigation measures and programs. • To learn about the strengths, skills and organizations that the stakeholders can bring to support Project planning and implementation.
Modes and benefits of consultation	• Listening and dialogue with stakeholders to keep the Project at tuned to public concerns early, to pre-empt breakdowns in public confidence. • Engaging the public as advocates for the Project construction and to support the implementation of social, resettlement, and environment and health programs.

Other objectives of public involvement include:

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- Informing the stakeholders about the proposed Project;
- Providing an opportunity to those who remained unable to present their views and values, therefore allowing more sensitive consideration of mitigation measures and trade-offs;
- Providing those involved with planning the proposal with an opportunity to ensure that the benefits of the proposal are maximized and that no major impacts have been overlooked;
- Providing an opportunity for the public to influence the Project design in a positive manner;
- Increasing public confidence in front of proponent, reviewers and decision makers;
- Providing better transparency and accountability in decision making;
- Reducing conflict through the early identification of contentious issues, and working through these to find acceptable solutions;
- Creating a sense of ownership of the proposal in the minds of the stakeholders; and
- Developing the Project which is truly sustainable.

More intangible benefits flow from the public involvement as the participants realize that their ideas can help to improve the Project. People gain confidence and self-esteem through taking part in the decision-making process and perceptions are expanded by meeting and exchanging views with people who have different values and ideas.

6.3 STAKEHOLDER IDENTIFICATION

The first step for the stakeholder consultation is the identification of the stakeholders. WAPDA is the Project Proponent for the proposed Project. As per definition, stakeholder is an entity which is concerned with the proposed Project in any way. Direct stakeholders are those entities which are directly concerned with the Project. The Project has both primary as well as secondary stakeholders.

The primary stakeholders include all the PAP's according to their loss of assets and living conditions, Provincial and District Level Government Departments of GB such as Environmental Protection Department (EPD), Irrigation Department, Agriculture Department, Wildlife Department, etc. However, the secondary stakeholders include the public and private agencies involved in the implementation of the Project.

Following is a list of major stakeholders consulted for the proposed Project:

6.3.1 District Level Stakeholders

- Gilgit-Baltistan EPA
- WAPDA GB;
- Forest Department, Hunza;
- District Administration;
- Wildlife Department, Hunza;
- Fisheries Department, Hunza;
- Agriculture Department, Hunza;
- District Health Department, Hunza;
- District Education Department, Hunza;
- Karakoram International University, Hunza

6.3.2 Village Level Consultations

- Project Affected Persons (PAPs)-Individual Interviews;

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- Community Consultations;
- NGOs;
- Local Ismaili Council Gulmit

Details regarding roles and responsibilities of the concerned agencies and departments are given below **Table 6.2.**

Table 6-2: Roles of Concerned Agencies/Departments

Sr. No.	Name	Roles
1.	Environmental Protection Agency	• EPA is the regulatory authorities and mainly responsible for the development and implementation of the environmental policies and strategies in order to integrate the environmental issues and sustainable development approaches into the legal and regulatory frameworks as per GB Environmental Protection Act 2014; • EPAs are responsible for the issuance of Environmental Approval of the proposed Project; and • EPA-Punjab is responsible for the compliance of EMP and Environmental Approval provision during the construction and operation phases of the Project.
2.	WAPDA	• WAPDA is an autonomous and statutory body under the administrative control of the Federal Government and divided into three sectors Water, Power and Finance. • Water Wing of WAPDA is responsible for planning, designing and execution of Water Resources Development Projects in the sector of irrigation, drainage and hydropower. Inter-provincial major surface water Projects including large dams are also operated and maintained by Water Wing, WAPDA. • Roles of Power wing were redefined as Hydel Power Generation and O&M of power houses. • The Charter of Duties of WAPDA is to investigate, plan and execute schemes for the following fields: o Generation, Transmission and Distribution of Power; o Irrigation, Water Supply and Drainage; o Prevention of Water logging and Reclamation of Waterlogged and Saline Lands; o Flood Management; and o Inland Navigation.
3.	Agriculture Department	• Ensuring food security; • Enhancing productivity through better varieties and improved management practices; • Promoting high value crops, fruits and vegetables; • Promoting export of high value agricultural products; • Promoting efficient use of water and other inputs; • Improving soil health; • Development of culturable waste lands; and • Ensuring fair returns for the growers in marketing of their produce.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Sr. No.	Name	Roles
4.	Forest Department	• Protection, improvement and maintenance of existing forests; • Increase forests by planting new trees; and • Extension and advisory services to the general public about tree plantation.
5.	Wildlife Department	• To save and protect wildlife.
6.	Fisheries Department	• Responsible for the Conservation, Management and Development of Natural Fisheries resources through the enforcement of Punjab Fisheries Ordinance and Rules; • Promote aquaculture practices in private sector to bridge gap of protein deficiency in the diet of common man; and • Provide white meat to improve the health of people, utilize the untapped Fisheries resources to obtain maximum production, increase our share in the national economy.
7.	Revenue Department	• Provide land ownership data of the project affected parties (PAPs) which include but not limited to the ownership record, land categorization and price details. • Responsible for implementation of all relevant Sections of LAA, 1894.

Consultations with district level departments were carried out through meetings while consultations with locals, village people, directly affected people etc. were undertaken during the baseline survey of the Study Area. The consultation is an on-going process which should be continued during the project life cycle i.e. even after submission of EIA.

6.4 DEPARTMENTAL CONSULTATIONS

The stakeholder consultations were held with relevant departments. The details of the departmental officials contacted are given in **Table 6.3.**

Table 6-3: List of Government Officials Consulted

Sr. No.	Designation	Name of Department/ Office
1.	Director -EPA	EPA Gilgit
2.	Assistant Commissioner Gojal	Revenue Department
3.	Project Director, Attabad Hydro Power Project ,Hunza	Water & Power Dept. GB
4.	District Health Officer	District Health Department Hunza
5.	Agriculture officer Hunza	District Agriculture Department Hunza
6.	District Education Officer	District Education Department
7.	Conservator of Parks and Wildlife	Parks and Wildlife, GB

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Sr. No.	Designation	Name of Department/ Office
8.	DFO-Wildlife	District Wildlife Department Hunza
9.	District Forest Officer	District Forest Department Hunza
10.	Assistant Director Fisheries	District Fisheries Department Hunza
11.	Director-KIU	Karakoram International University, Hunza

6.4.1 Views & Suggestions of the Officials of Departments

The responses of the government officials about the construction of the Dam were recorded during the discussions. Generally, the officials were of the view, that the construction of the proposed project will have a positive impact on the economy of the area in term of availability of water for the irrigation purpose. The **Table 6.4** indicates the detail of issues raised/discussed and suggestions given during the consultation:

Table 6-4: Detail of Issues/Points Raised/Discussed during Departmental Consultations

Sr. No	Agency / Department / Stakeholder	Representative's Details	Date	Apprehensions and Suggestions
1	Water and Power Development Authority (WAPDA)	Mr. Iqtadar Hussain, Project Director, Attabad Hydro Power Project ,Hunza 0333-4481116	04-10-2022	Project Director was briefed about the activities for the update/review of the EIA report. He commented that all the stakeholders should be properly appraised about the project and the relevant communities should be consulted.
2	Forest and Wildlife Department GB	Mr. Jilal Ahmed, Conservator of Parks and Wildlife, GB 0355556999	06-10-2022	The official was briefed about the advantages and present scenario of the proposed project. Mr. Jilal appreciated the proposed project and commented that this project will bring socio economic benefits to the communities and will solve the problem of shortage of electricity of in the area. He further suggested that the transmission line from Attabad to Sost and Attabad to Aliabad (Hunza) would be passing through some of the Community Controlled Hunting Areas (CCHAs). During the implementation of the project, the wildlife of the area should be protected and due care should be taken to create least disturbance for the wildlife.
3		Mr. Muhammad Jaffar, DFO, Hunza	04-10-2022	Mr. Jaffar was briefed about the project. He suggested that the project will go long way for the betterment of the area. The fruit and forest plants

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Sr. No	Agency / Department / Stakeholder	Representative's Details	Date	Apprehensions and Suggestions
		0355553086, 0346-9701825		will be affected due to construction of transmission line for which the PWD has schedule of compensation. The stakeholders must be paid well in time for compensation of the effected trees.
4		Mr. Muhammad Akram, DFO Wildlife, Hunza 03129753399	06-07-2022	NESPAK team briefed about the project. He was appreciative of the forth-coming project. He appreciated and commented that the proposed Project will be a game changer for the area as shortage of energy and load shedding has tremendous impact on the economy and social life of the area. He further apprised the team that the transmission line from the Attabad to Sost will trail through Community Controlled Hunting Areas (CCHAs). Therefore, during the execution of the project the necessary safeguards must be taken to avoid any disturbance and damage to the wildlife of the area.
5	Agriculture Department	Ms. Farhana Shah, Agriculture officer, Hunza 0349-5024259	04-10-2022	The official was briefed about the advantages and present scenario of the project. She was appreciative of the proposed project and commented that the project will involve the cutting of fruit trees for the construction of transmission lines therefore the compensation to the effected land owners for the cutting of trees should be paid as per prevailing schedule of rates of PWD.
6	Fisheries Department	Mr. Shahbuddin, Assistant Director Fisheries, Hunza 0355-555251	04-10-2022	The official was briefed about the advantages and present scenario of the project. He was highly appreciative of the project and apprised the team that the Attabad lake is rich in Fisheries resources and Cage fishing is introduced in the Attabad lake. It will help the communities to get extra income for their livelihood. He further suggested that during the construction phase of the project due care should be taken to avoid any damage to the aquatic life and fisheries.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

6.5 COMMUNITY CONSULTATIONS

For ascertaining the perceptions of different stakeholders about the project (during/ after construction) meetings were held with local communities and anticipated project PAPs within the project area of influence. These meetings were held in an open atmosphere, in which participants expressed their views freely. Informal group discussions were also held as an additional tool for the assessment of the perceptions of the stakeholders about the project and potential impacts both positive and adverse likely to occur due to its implementation. The views of the local residents and general public were formally recorded and effort was made to make those beneficial for the Project.

6.6 APPROACH FOR THE CONSULTATION AND INFORMATION DISSEMINATION

A series of public consultations were required to get the feedback/concerns of the different category of stakeholders including local communities and other general public residing in and near about the project area.

Consultation process included meetings with specific proposed project area residents, community meetings/consultations and semi-structured interviews with the local community members. During the consultation process, the stakeholders were briefed about the project objectives and scope. Their fears and suggestions were recorded.

These Consultations were conducted at following two levels:

- Community/Public Consultations
- Individual meetings with PAPs

Public Consultation was carried out in order to establish stakeholder's opinion regarding project implementation. The following methods were used for public consultation with project stakeholders:

- Scoping Sessions
- Formal Meetings
- Informal Meetings
- Individual Interview

6.6.1 Locations of the Public Consultations and Participation

The detail of the locations with number of participants is provided in the **Table 6.5**

Table 6-5: Consultation Locations and Number of Participants

Sr. No.	Village	Number of Participants
1.	Ganish	07
2.	Gulmit	06
3.	Attabad	11
4.	Passu	18
Total Participants:		**42**

6.6.2 Findings of Community Consultations

Extensive consultations were conducted with the local communities and anticipated PAPs in the proposed project area to record their views and incorporating in the project planning. Four (04) consultative meetings were held with locals in the proposed project area. The major categories participated in these meetings were local population, community groups,

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

landowners, and particular project affected persons. All participants were briefed about the importance of the project and its impacts.

During the consultations, it was assessed that mostly people were aware about the project, its benefits and adverse impacts. During discussions, participants showed keen interest in discussion, gave valuable suggestions and also raised various questions. The local people expressed their willingness and cooperation with the project staff during survey and implementation of the project.

The question raised and response given are provided in **Table 6.6** whereas, list of participants has been provided in the **Annex-I.** Moreover, pictorial view of the community consultations, data collection and other filed activities is depicted as **Photo log.**

Table 6-6: Consultation Meetings

Sr. No.	Questions/Concerns Raised By Participants	Responses of Team Consultant
1.	What will be the exact location of the reservoir and where the Dam will be constructed?	The participants were briefed about the tentative location of the proposed reservoir area and location of dam axis through projects' maps and drawings. However, the final location of dam and its allied structures will be finalized after detailed Geotechnical and seismic studies.
2.	How compensation for the land to be acquired will be paid and who will pay compensation?	Compensation will be given to all PAPs including the land owners. Land evaluation will be completed by Revenue Department after the demarcation of RoW of the proposed project and compensation package will be prepared for all land affected PAPs. For land compensation land amount will be transferred to the District Revenue Department which will be responsible to pay the amount to the PAP's.
3.	Various surveys were conducted for the propose Dam but, there is no visible progress on the ground.	Feasibility and detailed engineering designing of the mega projects involves various studies which takes time. After completion of the respective studies, it is assessed that either the respective project is feasible or not. After approval of feasibility and detailed engineering design, projects are commenced and civil work is initiated on the ground. Respective project will also commence very soon in future once the necessary studies and field investigations are carried out/completed.
4.	When construction of the proposed project will get start?	After completion of the feasibility study and final approval of the detailed design, the construction work will be started.
5.	Due to construction activities as well as influx of labor, movement of the citizens particularly of females, residing in the local area will be restricted.	In order to tackle this situation, construction will be carried out in scheduled hours. So that after construction hours, local community, particularly females can easily move in the area. People would be aware about complete construction

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Sr. No.	Questions/Concerns Raised By Participants	Responses of Team Consultant
		activity plans so that they can move in the area freely and safely.
6.	Dust and noise will disturb the nearby residential and commercial structures during construction.	All protective measures will be taken to keep safe the local community from noise and dust. Contractor will be bound to take all protective and precautionary measures to keep safe the health and properties of the local people. Internationally approved practices will be adopted in this regard.
7.	Skilled and unskilled work force should be hired from local community. It will enhance the acceptability of the proposed project among local people.	Contractor will be bound to hire the skilled and unskilled work force from the local community at priority. It will enhance the acceptability of the project among the masses as well as provide proper livelihood to the deprived and marginalized community.

6.7 STAKEHOLDER CONSULTATIONS FRAMEWORK FOR CONSTRUCTION AND OPERATION PHASE

Key stakeholders of the Project include provincial and district level government departments such as EPD-GB, Agriculture Department, Forest Department, Wildlife Department, Fisheries Department, Project directly affected people, land owners and local people. The community members will be compensated by project proponent and they will be encouraged to participate in project activities during construction and operation phases. The consultations are recommended be made in future to facilitate the community at the local level.

The consultations should be carried out during the construction and operation phases of the Project. Efforts are recommended to maximize the consultations during the project implementation. The consultations will be carried out with the objectives to develop and maintain communication linkages between the project promoters and stakeholders, provide key project information to the stakeholders, and to solicit their views on the project and its potential or perceived impacts, and ensure that views and concerns of the stakeholders are incorporated during the implementation with the objectives of reducing or offsetting negative impacts and enhancing benefits of the proposed Project. The framework for the future consultations is elaborated in **Table 6.7.**

Table 6-7: Future Consultations Framework

Sr. No.	Stakeholders	Project Phase	Frequency of Consultation
1	Provincial Government Departments	• Pre-Implementation • During the Project Implementation	• One round of consultation before start of implementation of project. • Monthly during construction phase and bi-annually during operation phase of the project.
2	District Level Government Officials	• Pre-Implementation • During Project Implementation	• One round of consultations before start of implementation of project. • Monthly during construction stage and bi-annually during operation phase of the project.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Sr. No.	Stakeholders	Project Phase	Frequency of Consultation
3	PAPs	• Pre-Implementation • During the Project Implementation	• One rounds of consultations before start of implementation. • Fortnightly during construction stage and bi-annually during operation phase of the project.
4	Surrounding Villages	• Pre-Implementation • During Project Implementation	• One round of consultation before start of implementation. • Quarterly during construction stage and bi-annually during operation phase of the project.
5	Local Elders	• Pre-Implementation • During Project Implementation	• One round of consultations before start of implementation of project. • Monthly during construction stage and bi-annually during operation phase of the project.
6	Women	• Pre-Implementation • During Project Implementation	• One rounds of consultations before start of implementation. • Fortnightly during construction stage and bi-annually during operation phase of the project.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

7 GRIEVANCE REDRESS MECHANISM

The grievance redress mechanism (GRM) is important for developmental projects where ongoing risks or adverse impacts are anticipated. This mechanism serves as a way to meet requirements, prevent and address community concerns, reduce risks, and assist larger processes that create positive social change. The major objective of GRM is to implement and maintain a procedure for handling the environmental and social concerns of the project stakeholders. This procedure will include a redress mechanism scaled to the project's identified risks and adverse impacts, focusing on stakeholders.

WAPDA will establish a Grievance Redress Committee (GRC) to facilitate the resolution of complaints by Project Affected People (PAPs) and grievances about the project's environmental performance. The GRC will be coordinated by the Chief Resident Engineer and Environment Head. The GRC will address affected people's concerns and complaints promptly, using an understandable and transparent process.

7.1 COMPOSITION OF GRC

The GRC will work directly under the supervision of the Chief Resident Engineer. The following members are recommended to form a GRC to look into environmental matters.

- WAPDA Environment Cell
- Environment and Social Head of E&ST
- Representatives from PAPs
- Environmental Engineer of Management Consultant
- Environmental Engineer of Construction Contractor

The Environment and Social Head of E&ST will nominate one member of GRC and shall act as Project's Environmental Grievance Officer (PEGO). He will review the case on merit and address the problem in accordance with prevailing rules/ procedures applicable to such grievances as per EMP. The PEGO will then refer the case to GRC for the final decision, whether to update and make necessary amendments in EMP. The GRC will deliver its decision within thirty (30) days of registration of the case. If the affected person does not receive a response from GRC within thirty (30) days of the registry of the complaint, he/she can appeal to the Environment and Social Head of E&ST, who should act on the complaint/ grievance within two weeks of the day of its filing. If the affected person is not satisfied with the decision of the Environment and Social Head of E&ST, then it can be referred to higher authorities / relevant government departments for its resolution. As a last resort, he/she may submit the complaint to GB-EPA.

7.2 RESPONSIBILITIES OF GRC

The responsibilities of GRC will include the following;

- The GRC shall review, consider and resolve grievances related to environmental issues during implementation received by the PD office of the Project.
- Environmental Specialist of MC is responsible for conducting investigations on these grievances.

Any grievances presented to the GRC should ideally be resolved on the first day of the hearing or within a period of one week, in case of complicated issues requiring additional investigations.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

GRC is empowered to take the decision which is binding on WAPDA and considered final.

GRC meeting will be held in the PD office or other locations agreed upon by the committee. If needed GRC members will conduct field visits to verify and review the issues in dispute.

7.3 PROCEDURES FOR FILING THE COMPLAINTS

Any affected person can register his complaint through an application at the PD office. The PD will direct the Environment and Social Head of E&ST to address the complainant on the same day. The Environment and Social Head of E&ST will have a maximum of one week to resolve the complaint. If the complaint is not addressed within a week's time, then the complainant can raise a grievance with the GRC.

There are several ways one can report a grievance:

- Contact the PEGO of GRC over the phone. The contact details will be provided in the PD office.
- Send an email to the address provided in the PD- office.

The grievance will be reviewed and will be decided by the GRC. If the grievance is not concerned with the project-related activity or the project authority finds that they are working within the applicable GB-EPA standards, the grievance will not be further processed. In these cases, this will be explained in writing to the grievant.

In all the other cases the GRC will investigate whether they have failed to work to the intended standard and if they have identified measures that might be taken to protect against the incident occurring again.

The grievance mechanism will be made public through public consultations and information leaflets during implementation.

7.4 TYPE OF GRIEVANCE

The following are some environmental issues that could be subject to the grievance from the affected people, concerned public, and NGOs.

- Dust, noise, and air pollution from construction activities
- Nuisance
- Intensive schedule of construction activities
- Inappropriate timing of construction vehicle flow
- Traffic Movement
- Water Pollution
- Waste disposal
- Disturbances to flora and fauna
- Health and safety
- Criminal activities
- Failure to comply with standards or legal obligations
- Non Compliance of EMP
- Social and Cultural Issues.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

8 ANTICIPATED ENVIRONMENTAL IMPACTS & MITIGATION MEASURES

8.1 GENERAL

This chapter identifies the potentially significant beneficial as well as adverse impacts of the pre-construction, construction and operational phases of the proposed Project on the physical, ecological and socio-economic domains of the environment. Moreover, appropriate, technically viable and economically feasible mitigation measures have been suggested for each potentially adverse impact.

Attabad Lake was formed on January 4, 2010, when a huge mass from the right bank of Hunza River slided down near Attabad Village and blocked Hunza River. The inflow filled upstream valley created a reservoir 22 km long till the end of May 2010. Attabad Lake is about 15 km upstream of Ganish Bridge and about 111 km upstream from Gilgit. Therefore, ALHHP will utilize the Attabad Lake water and head for the generation of the Hydel Electricity. Therefore, due to the implementation of ALHPP, no major adverse impacts are anticipated.

8.2 METHODOLOGY FOR IMPACT IDENTIFICATION

Selection of an appropriate and customized methodology for the impact assessment is critical for the whole outcome of an EIA study. The identification, categorization and evaluation of impacts were carried out by using various tools such as impact screening checklist, impact assessment matrices and overlay. Based on the notion of significance criteria each impact was classified. Based on the vast experience of the experts in the field of impact assessment, identification of the potentially significant and non-significant environmental impacts different tools has been utilized as detailed below:

8.2.1 Screening Checklist

Based on the findings of desk studies, processed satellite imageries, previous studies, screening checklist was prepared to screen out the potentially significant adverse environmental impacts during the construction and operation phases of the proposed Project. The objective of the impact screening is to assess the significance of the issues related to the atmosphere, climate, water resources, land resources, ecological environment, socio-economic environment, transport, infrastructure and communication, natural risks, hazards and external constraints of the Project for the proposed development. After the compilation of baseline information, processing of acquired satellite imagery, the screening checklist was filled to screen out the positive and adverse impacts of the proposed Project during the construction and operational phases.

8.2.2 Impact Matrices

Various EIA methodologies are available for identification of impacts including the checklist and project impact matrix. Among these methods, project impact matrix was used as impact identification methodology for the identification of temporal based impacts.

The Impact Evaluation Matrix was developed by placing project activities along one axis (i.e. Y-axis), and on the other axis (i.e. X-axis) the different environmental parameters likely to be affected by the proposed project actions grouped into categories i.e. physical, ecological and socio-economic environment. For the impact assessment, project impact evaluation matrix is used by dividing the project action into different phases (design/pre-construction, construction and operational phases).

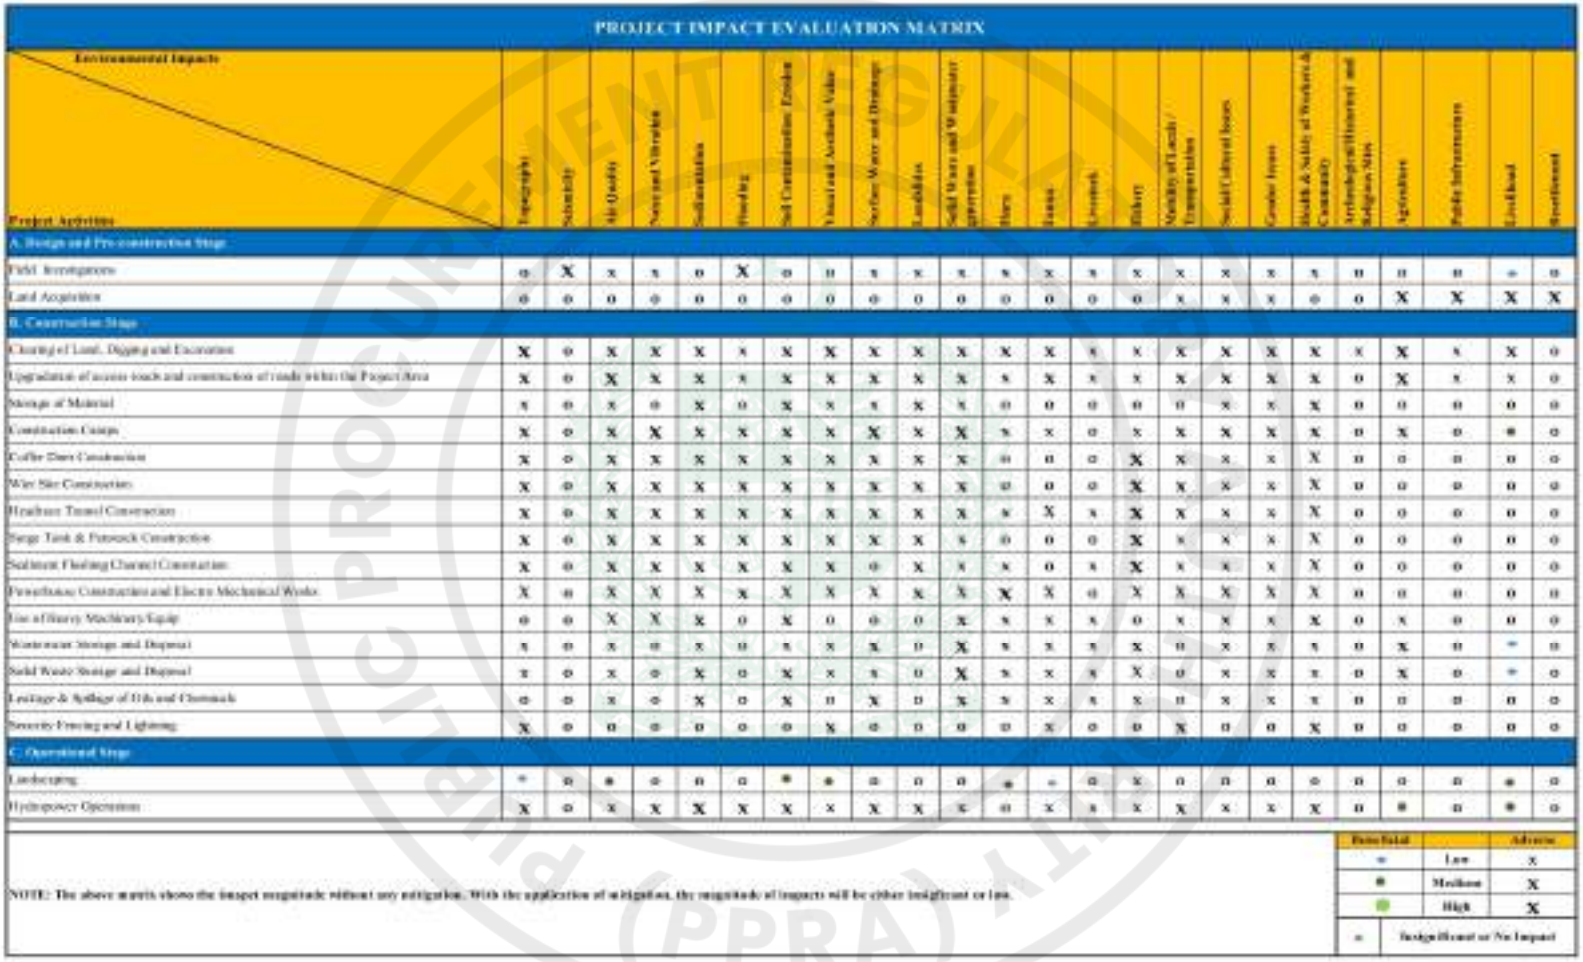
e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

8.2.3 Overlays

In order to identify spatial based impacts, overlays were used. An overlay is based on a set of transparent maps, each of which represents the spatial distribution of an environmental characteristic. Information for an array of variables such as land use, infrastructure, vegetation etc. is collected for the standard geographical units within the Study Area are recorded on a series of maps, typically one for each variable. These maps are overlaid to produce a composite map. The resulting composite maps characterize the area's physical, social, ecological, land use and other relevant parameters related to the location of the proposed project interventions (such as construction of Coffer Dams, Sediment Flushing Tunnel/Under sluice, Weir, Headrace Tunnel, Surge Tank, Penstock, Powerhouse, Tailrace Channel, Switchyard and Project colony).

8.2.4 Notion of Significance

The "notion of significance" was based on the following criteria:



- **Extent:** The scale of impact, i.e., limited to the immediate areas of development activity (the site); limited to within a distance reach of the development; affecting the region as a whole; or occurring at a national or international scale;
- **Duration and Frequency**: A prediction/forecasting of the lifetime of the impact: i.e., short-term; medium term; long term with the impact ceasing after the operational life of the development; or considered permanent and how many times the event will occur during that period;
- **Intensity:** A description of the intensity (magnitude/size) of the impact: i.e., high, medium, low, or negligible (no impact). The specialist studies must attempt to quantify the magnitude of impacts and outline the rationale used. Where appropriate, national standards are to be used as a measure of the level of impact;
- **Reversible/Irreversible:** Changes considered irreversible, for example, the loss of biodiversity within a river due to a change in water quality;
- **Probability:** The likelihood that the event will actually occur; and
- **Legal Restriction:** If the action is likely to affect, or be affected by a legal restriction.

Taking into account these criteria, potential significance was classified as either:

- **Low:** an impact for which no mitigation is necessary;
- **Medium:** an impact that requires effective mitigation; and
- **High:** an impact, which, if not mitigated, could stop the Project from proceeding.

The potentially significant impacts were then further investigated in detail to carry out a comprehensive assessment of the significant impacts.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

PROJECT IMPACT EVALUATION MATRIX

Environmental Impacts / Project Activities	Topography	Seismicity	Air Quality	Natural Vibration	Sedimentation	Flooding	Soil Contamination/ Erosion	Unusual Aesthetic Value	Surface Water and Drainage	Landslides	Solid Waste and Wastewater generation	Flora	Fauna	Livestock	Fishery	Mobility of Locals / Transportation	Social Cultural Issues	Gender Issues	Health & Safety of Workers & Community	Archaeological/Historical and Religious Sites	Agriculture	Public Infrastructure	Livelihood	Resettlement

Figure 8-1: Project Impact Evaluation Matrix

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

8.3 ANTICIPATED POSITIVE IMPACTS OF THE PROJECT

8.3.1 Environmental Benefits

The GB is known for their outstanding natural beauty, high peaks and landscape and it is a popular destination among tourists from both Pakistan and abroad. The GB offers tourists opportunities for outdoor activities such as hiking, fishing and trophy hunting. During construction phase of the project, the related equipment and influx of people will temporarily affect the visual and landscape values of this area. However, during operation phase the existence of the weir, headrace channel, powerhouse and other structures will change the visual amenity of the Project area impacting on the surrounding landscape and views.

The Project not only reduces or replaces equivalent electricity generation sources with all the associated environmental benefits but it will also help to avoid all associated pollution caused through extraction, processing, storage and transportation of conventional fuels required for fossil fuel power generation plants. The Project will avoid annual releases of about 149,476 tons of CO^2 from an equivalent thermal plant which have a corresponding reduction in atmospheric pollution.

The sustainable power supply with the development of the proposed Project is likely to attract more tourists in the Project area and will increase the local business and recreational activities. Impact relating to recreation activities is considered to be moderately positive.

8.3.2 Employment

Electric power is a prerequisite to any other investments. Without electricity both human and physical resources will remain unutilized for increasing welfare of the masses for providing income opportunities at or near the level being available to people in the developed part of the country.

The proposed Project will also provide skilled and unskilled jobs during the implementation phase and a limited number of jobs during operation and maintenance. This will be a bonus for the locals of the area; those are migrating to down country for employment. Considering the other planned hydropower projects in the region, a highly skilled human resource will be developed which can be used in hydropower projects planned in the near future.

8.3.3 Impact on the Local Economy

Increased incomes in the area will encourage the formation and growth of local businesses, which will result in new indirect employment opportunities. In combination with programs for assistance and advice, opportunities will arise both to improve agricultural productivity and to develop new businesses.

During the operation phase, the main economic benefits of the Project will be those resulting from increased power availability locally. The lack of reliable and economic power supplies is considered a key constraint in the development of the entire Project area.

8.3.4 Exploitation of Natural Resources

The non-availability of electricity is a major constraint to undertake farm cultivation program on a large scale. There are no cold storage facilities to preserve fruits which can earn substantial income to the orchard growers. Hunza and Nagar valleys have precious mineral resources which have remained unexploited. The availability of electricity will certainly develop a set up on large scale to preserve fruits and for exploration of minerals.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

8.3.5 Tourism

The Gilgit-Baltistan region and its valleys are tourist's paradises for tracking and mountaineering. At present a few opportunities under Govt.'s social and infrastructure development programs are available for the educated and skilled workforce in various trades. The reliable energy sources and transmission network are key factors for the development tourism and mountaineering.

8.3.6 Trade Route to China

The opening up of Gilgit-Baltistan region to China has provided an incentive to the local entrepreneurs for self-employment and outlets for income generation. Hunza is developing into a central city for economic activities for tourism. With the provision of the basic infrastructural facility of electricity, Hunza and its surrounding towns have the potential for development in the coming years. Sost is the last town of Gojal, Upper Hunza inside Pakistan on the Karakoram Highway before the Khunjerab Border. Currently, this region is also facing the shortfall of electricity and only Misghar power station is installed nearby this town. After commissioning the Proposed Project, current electricity shortfall scenario will be changed and routine trade will be accelerated.

8.3.7 Impacts on Social Life

The Project with an installed capacity of 54 MW will generate 373.69 GWh of electricity annually which will assist in meeting power demand of the Hunza Region. The project will implement several programs that are designed to improve living standard of the area. These programs will provide improved health, education and infrastructure facilities while other programs will provide alternative source of income and create improved employment opportunities.

Access roads will be built as part of the Project and will facilitate the people for goods and services accessibility. After completion of the Project, these facilities and infrastructure will be available to the general public. Moreover health facilities created during the construction phase will be available to local communities.

8.3.8 Clean Development Mechanism (CDM) Benefits

The CDM is an emission reduction (ER) trading agreement under the Kyoto Protocol between two countries, where greenhouse gas emission is reduced in a non-annex country and transferred to another country. Recently a number of international organizations such as Asian Development Bank (ADB) have established a means of purchasing (CERs) units. Unit can be traded in the open market on exchanging.

For the purposes of this analysis it is assumed that 373.69 GWh generated annually by this project will displace about 149,476 ton of CO^2 at 0.40 kg/kWh. One ton of CO2 corresponds to CER which is currently valued about 1.5 US$. Therefore, the CDM benefits worth will be 29.921 million PKR per annum.

8.4 ANTICIPATED IMPACTS DURING PRE-CONSTRUCTION PHASE

This section identifies the potentially adverse environmental impacts anticipated during the pre-construction phase of the Project along with their mitigation measures.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

8.4.1 Physical Environment

8.4.1.1 Impacts due to Field Investigations

Potential Impact

Low level adverse impacts on the air quality, increase in noise level, contamination of surface water quality and soil erosion due to the pre-construction activities like geotechnical investigations including drilling, topographical surveys and seismic investigation will affect the existing settings. Activities like drilling, blasting, movement of machines and setup of EPC Contractor and Consultant camps will also impact the soil, wildlife, noise levels etc. This impact would be of medium significance.

Mitigation Measures

Good engineering practices and Standard Operating Procedures (SOPs) are required to be adopted by the EPC Contractor to mitigate this impact.

Measures such as sprinkling of water on the roads and dirt tracks, use of water to reduce air pollution during the stone crushing operation and tuning of vehicles and equipment will reduce the air pollution. The excavated material will be managed by ensuring proper storage areas located far away from the water bodies. The choice and design of these measures such as reduction of slope gradient and height, reduction in slope angle, removal of unstable material, use of reinforcement material etc. will be the responsibility of the EPC Contractor. The EPC Contractor will be required to train his workforce in the storage and handling of materials, like oil, diesel, petrol and chemicals, etc., which may potentially cause soil contamination. Special measures will be adopted to minimize the impacts on the nearby settlements such as avoiding noise generating activities during night time, etc.

8.4.1.2 Seismic Hazard

Potential Impact

The Project area falls in Seismic Zone 2B (moderate hazard), which represents Peak ground acceleration from 0.16 to 0.24g, where g represents acceleration due to gravity. In this Zone, designing of various types of structures are done on the basis of Peak Ground Acceleration (PGA). A high intensity earthquake impacting the poorly designed project site can adversely impact the future development.

This factor requires special consideration of the designers keeping in view of the above points and the impact of the earthquake of October 08, 2005.

The main tectonic features around the project site within a radius of 200 km which could be controlling the maximum earthquake hazard are as follows: Hunza Fault, Main Karakoram Thrust (MKT) and Main Mantle Thrust.

The significance of impact is high to medium adverse.

Mitigation Measures

The proposed structure should be designed to withstand moderate to high earthquakes, a very careful analysis, followed by ICOLD Guidelines and using latest software, of the situation will be required during the design stage. For seismic hazard analysis, updated structural and seismic evaluations should be consulted. Moreover, geo-technical investigations must be conducted prior to construction phase.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Continuous monitoring of the behavior of faults will be required during the operation stage and contingency plans to deal with such a situation must be part of the project management. Instruments to monitor seismic activity must be installed at the time of construction.

Based on the analysis, the following earthquakes design parameters are concluded and recommended for the proposed project:

Operation Basis Earthquakes (OBE): OBE at return period of 145 years is recommended as follows: OBE Horizontal = 0.24 g and OBE Vertical = 0.17 g

Safety Evaluation Earthquakes (SEE): For the design of dam / weir, the following PGA 'g' values for SEE (Safety Evaluation Earthquakes) are recommended: SEE Horizontal = 0.44g and SEE Vertical = 0.29g

For the design of appurtenant structures, the following PGA 'g' values for SEE (Safety Evaluation Earthquakes) are recommended: SEE Horizontal = 0.38g and SEE Vertical = 0.26.

8.4.1.3 Impacts on Flooding

Potential Impact

Flooding of the Hunza River at the weir site is not a common feature although some floods of high intensity have been recorded in the past at upstream site e.g. the Glacial Lake Outburst Floods (GLOF) at Shimshal River.

Flood has been estimated from the available record. The maximum peak daily discharges of Danyor Bridge station at Hunza Rivers for every year recorded. The instantaneous peaks will definitely be higher than the measured daily flows. Instantaneous peak flows of Danyor Bridge station for the period 1966 to 2024 have been calculated and generated one day maximum peak Instantaneous flow for every year at proposed weir site. The estimated instantaneous peak flow for the period of 1966-2024 at Attabad Lake is graphically represented in the **Figure 8.2**.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

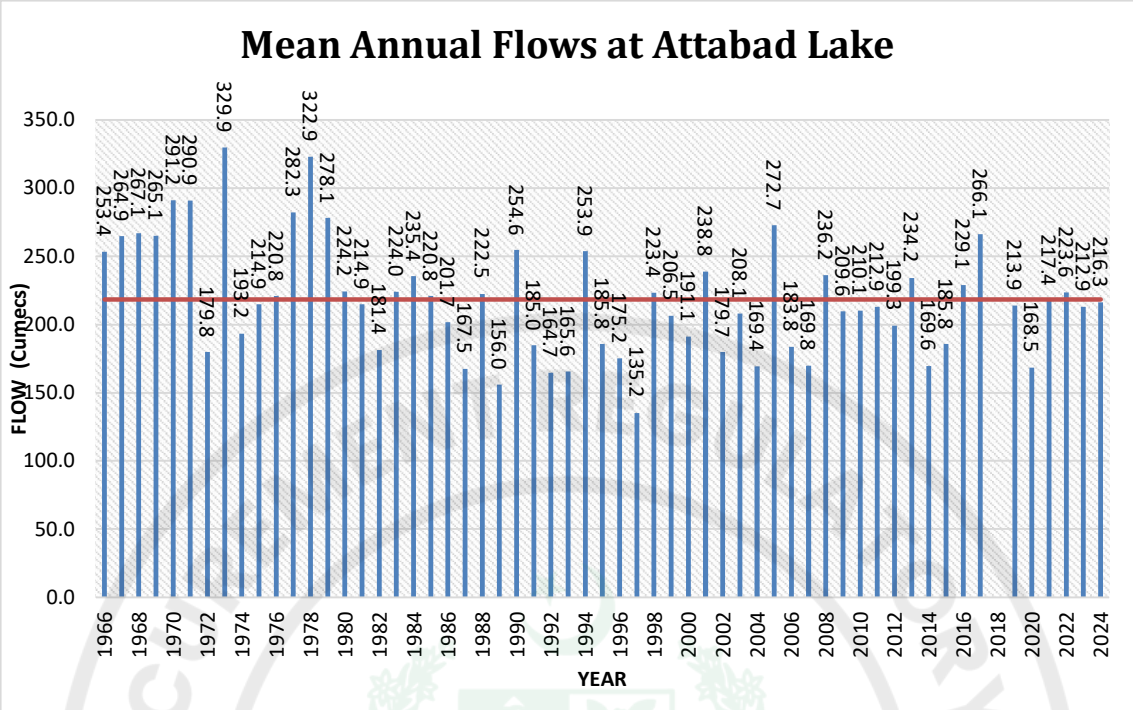

Figure 8-2: Instantaneous Peak Flows at Attabad Lake HPP Site

Keeping in view the flood estimation against returns periods by using different distributions, it is recommended to adopt Gumble Distribution against 10,000 years of return period with flood outcomes of 3,250 m³/s for the selection of design flood at the proposed weir site. A design flood of 3,250 m³/s, corresponding to a 10,000-year return period, has been selected for the design of hydraulic structures at the weir site. [16]

The flow in Hunza River varies greatly at different times of the year, the discharge is at a minimum during the colder months when Attabad Lake is frozen, and there is a rise of water in spring and early summer season when glaciers melt.

Recently a massive GLOF occurred in Hunza district's Hassanabad village sweeping away the Hassanabad Bridge on the Karakoram Highway. The Shisper Glacier started discharging 5,000 cusecs of water owing to premature melting, leaving Hunza, Gilgit disconnected.

As river water will pass through the headrace tunnel and overflow spillways, there is a chance that these tunnel and spillways could not accommodate the flows in abnormal years, which may pose a threat to the main structures and this impact may be treated as High Significant.

Mitigation Measures

Keeping in view the different types flood estimations and generation of high peaks due to GLOFs, it is recommended to adopt design flood of 10,000 years return period at weir site. Therefore, design flood of 3,250 m³/s at weir site has been assumed for the calculations of design of structures.

It is also suggested to have close monitoring of Glaciers in Hunza Region to have better judgment of GLOFs and remedial measures for the safety of Attabad Lake and downstream

[16] *Using Hydrologic Engineering Center's (HEC) Statistical Software Package (HEC-SSP) Software.*

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

areas. However comprehensive study will be undertaken during Detailed Engineering Design of the Project by EPC Contractor.

8.4.1.4 Resource Conservation

Potential Impact

Resources involved in the construction of proposed Project would include water, fuel and construction materials.

Excessive water consumption by the construction staff may stress water resources in the Project Area and in certain cases may disturb the existing water supplies in the Project Area. Construction material to be used for construction includes coarse aggregates, fine aggregates, asphalt, cement, sand, lining material, earthworks, reinforced and structural steel etc. . Almost all the materials to be used in the construction of proposed Project are non-renewable and therefore their efficient use is necessary for the future use.

Fuel will be used to operate construction machinery. Efficient use of energy resources is important to reduce air emissions. For conservation of energy, efficiency of the engines and burning processes is important. The impact significance is medium adverse.

Mitigation Measures

Following practices shall be adopted to conserve these natural resources:

- Use water bowser tanks for construction works and mineral water bottles/ ground water for drinking purpose;
- Reduction of wastage of water through training of workers involved in water use;
- Reuse of construction waste materials may be adopted wherever possible;
- The efficient and well maintained equipment and machinery should be used;
- The equipment and machinery should be turned off when not in use;
- Ensure adequate insulation to reduce heat loss through batching plants;
- Regularly monitor CO and CO2 content of the flue gases to verify that combustion systems are using practical excess air volumes; and
- A good camp design and an efficient worksite management plan can help the contractor to reduce the water demand, wastewater and solid waste volumes to the lowest levels.

8.4.2 Ecological Environment

8.4.2.1 Flora

Potential Impacts

During the pre-construction phase, activities such as installation of construction camps, construction of temporary/access roads and mobility of construction staff may damage the local vegetation/trees. As the heavy machinery and camps will be moved and installed, which require significant space due to which available vegetation is expected to be removed. This impact is medium significant and needs to be encountered prior to the start of construction stage.

Mitigation Measures

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- The camps, mobility of machinery and construction of temporary/access road should be properly planned and well designed to avoid any loss to local green cover;
- It is recommended to establish the construction camps where minimum or no vegetation exists, as per criteria provided in section 3.7.12;
- Similarly, the alternate routes for roads and location for camps are recommended where no loss of vegetation is expected; and
- An inventory of trees/vegetation may be prepared by the EPC Contractor with the help of concerned department (Forest) before clearing the site.

8.4.2.2 Fauna

Potential Impacts

As movement and installations of machinery and vehicles will take place so noise and habitat loss is expected. The routes of the available wildlife and other habitats may be affected due to camps set-up and machinery movements and installations. Temporary access road (if any) may also affect the habitat of locally available fauna. This impact is low significant.

Mitigation Measures

- The standard measures must be adopted to minimize noise due to machinery movements and installations;
- EPC Contractor shall ensure the compliance with NEQS.
- Wildlife movements and routes must be considered during activities and should be avoided to their maximum level;
- The camps shall be properly fenced and gated to check the entry of animals in search of eatable goods; and
- Wastes of the camps shall be properly disposed of to prevent it being eaten by local fauna/avi-fauna, as it may be hazardous to them.

8.4.2.3 Aquatic Life

Potential Impact

Fisheries Department Hunza has introduced several thousand fingerlings of exotic fish species namely Salmo Trutta Fario (Brown Trout) at Attabad lake and downstream river during the period from 2012 to date for propagation and the said specie has made breeding grounds at Attabad lake and downstream as well. Besides this a number of indigenous fish species also exist in the same water bodies having commercial as well as ecological importance. The destruction of habitat will have significant adverse impact on the aquatic life and fisheries.

Fish usually migrate from one place to another for search of food, shelter and spawning/breeding. Due to implementation of the proposed Project fish migration might be affected up to some extent. Water requirements and movement of aquatics along with other risks may also be anticipated due to the proposed project. This impact is categorized as medium to high significant.

Mitigation Measures

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- Annual restocking plan of fish fingerlings shall be included in the project to compensate the stock depletion due to decrease in fish breeding grounds.
- Fish ladder shall be in sure for freely movement of fishes;
- Fish screening system shall be developed so that fish may not be trap at fore bay or penstock pipe or channel.
- Besides the above mentioned points, a Fisheries research unit and a brown trout hatchery with research/management staff should be established at the project side for research purposes as well as impact assessment during construction as well as operational phases of the said project.
- The establishment of fish hatcheries under this project should be ensured by GB Fisheries Department, Hunza in close consultation and coordination with GB EPA;
- The minimum flow to be ensured through the weir during the whole year. In case the hydrological records are enhanced, the figure of minimum requirement for maintenance of aquatic ecosystem has to be revised likewise;
- To conserve the freshwater fishery resources, it is important to involve fisheries scientists and local communities in all study phases of proposed project;
- Moreover, the impact on fish fauna, both up and downstream of the project site specially the migration patterns and breeding grounds need to be taken into account during all stages of the project and should be monitored by the contractor specialized professionals in consultation with GB, Fisheries Department Hunza;
- GB, Fisheries Department has authority to update, change and add/ recommend any standard as per law of land and in best public interest; and
- The custodian Department should have a close liaison with GB EPA and Fisheries Department GB to ensure the conservational aspects of fisheries during all stages of the project to avoid any negative impacts on local natural environment.

8.4.3 Socio-Economic Environment

8.4.3.1 Permanent Land Acquisition

Potential Impact

Permanent land will be acquired for the Project components such as Powerhouse, Weir & Associated Structures, Access Roads and Project Colony. Total permanent land to be acquired is approximately 183 acres (05 acres for Contractor's Camp, 60 acres for Project Colony and Powerhouse Area, 103 acres for Intake Area and Access Corridor and 15 acres for Spoil Area) which includes both private and government land. This will result in loss of land. Similarly, due to the impounding of reservoir area, based on 2424 m.a.s.l, the estimated land required is 777.05 acres. However, the estimation of land requirement will be finalized after the detail design by the EPC Contractor.

The ownership record of affected land will be prepared by the Revenue Department according to separate categories of the land. The significance of impact is high adverse needs to be encountered prior to the start of construction stage.

Mitigation Measures

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Government owned land for the Project area will be acquired as per the policy of government of GB. While private land will be acquired as per provision of LAA, 1894. The process of land acquisition will start before the Project will enter into construction phase and section-4 of land acquisition act, 1894 will be notified by relevant agency.

The process of land acquisition and compensation should be followed in a transparent manner to minimize the impacts to provide judicious compensation to the displaced by providing sufficient budget in the project cost.

8.4.3.2 Temporary Land on Rental/Lease Basis

Potential Impact

During the construction activities, EPC Contractor will establish contractor camps, storage areas for materials and equipment including vehicles, workshops, stockpile yard, etc. EPC Contractor need to lease the land for these areas in the vicinity of the construction sites. These areas will be acquired on temporary basis by direct negotiation and agreement with the owners or negotiated with or decided by the district administration office. Temporary acquisition will principally be the responsibility of the contractor. The significance of impact is high to medium adverse.

Mitigation Measures

Land for above mentioned facilities will be directly rented from the private landowners by the EPC Contractor. The provisions of the Land Acquisition Act (LAA), 1894 will not be involved as the acquisition of the land will be temporary and will be covered by short-term lease agreements between the landowners and EPC Contractor. Temporary acquisition will principally be the responsibility of the EPC Contractor. Rental terms should be negotiated to the satisfaction of the concerned landowners and the agreement should be made in local language to make the process clear.

As mentioned the location of these areas are not finalized yet, therefore a criterion has been suggested which should be followed to avoid the adverse impact on the environment. The land for above mentioned facilities should be selected and leased prior to the start of construction phase.

Lease agreement should also govern the process of site restoration of the leased or rented land after the construction phase and will ensure through the terms of the construction contracts that landowners are compensated according to the terms of the lease agreements and the site restoration plans agreed upon by the EPC Contractor are duly carried out.

The following general site selection criteria have been suggested to be complied by the EPC Contractor:

- Minimize the resettlement, relocation of the existing infrastructure like roads, cultural and religious sites etc. and avoid the cutting of trees;
- It should be elevated to avoid floods and for other security reasons;
- Proximity to the major disaster and emergency management authorities;
- Avoid potentially security vulnerable areas;
- Minimize disturbance to the natural habitats of flora and fauna;
- Avoid densely populated areas/towns;
- Avoid wildlife sanctuaries, national parks and game reserves;

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- Appropriate distance from the sensitive receptors (for instance, minimum 500m); and
- Avoid cultural, religious and historical buildings.

8.4.3.3 Impact on Miscellaneous Structures

Potential Impact

In the reservoir area of the proposed project miscellaneous residential, commercial and community structures will be affected due to the project intervention. These structures will be demolished permanently and will have to relocate and move their dwellings elsewhere. The community and religious structures are very sensitive to impact and need special care during execution of the project; because people think that these structures might not be rebuilt if once demolished. A graveyards fall in the reservoir area of the proposed Project. Shifting and demolishing of the graveyard may cause serious social issues. Due to adverse impact on the residential, commercial, and community structures, human disturbance will occur which create magnitude social, gender, livelihood and cultural issues. This impact can be categorized as negative, local, high, permanent and irreversible. The inventory of structures along with the detailed measurement of structures will be completed by the EPC contractor during the phase of detailed planning.

Mitigation Measures

- Due consideration should be given to minimum and no impact on the residential, commercial, and religious structures;
- Compensation for the affected structures should be evaluated and provided as per market rates.
- Compensation should be given for all affected crops and trees;
- The effort will be made by making changes in design to avoid the sensitive and religious structures and to minimize the issues at possible extend. If needs demolishing/shifting, a mechanism will be developed for the restoration of these structures during the detailed design by the EPC contractor with the community consultation;
- Affected Persons should be compensated on full replacement cost of each category to construct a new structure of the same type; and
- Proper consultations and coordination's with project affected persons during resettlement process.

8.4.3.4 Other Social Issues

Potential Impact

During the planning and design phase of the project, it is anticipated that there will not be any potentially significant adverse impact on the socio-economic environment. Locals may be temporarily disturbed due to the field investigations and drilling activities, disturbance to electricity poles and existing track/roads within project boundary. This impact can be categorized as medium Significant.

Mitigation Measures

- Proper compensation and restoration mechanism of public utilities will be considered during the detailed design of the Project;
- Complete rehabilitation of affected public utilities will be ensured;

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- The provision in the design and budget for the relocation of the existing utility infrastructures wherever required shall be finalized in consultation with the concerned department;
- Close coordination with the concerned departments to curtail inconvenience to the residents of the Project Area;
- Timely public notification of unexpected disruption of services; and
- Good engineering practices shall be adopted to avoid or reduce these impacts.

8.5 ANTICIPATED IMPACTS DURING CONSTRUCTION PHASE

The construction phase impacts are mostly of a temporary nature and their magnitudes are subject to the engineering management practices adopted during construction. Such impacts are related to soils (erosion and slope stability), water quality, noise, air quality and disruption to the biological environment, public health, interruption of communications, at-risk population / safety, community stability, and cultural and religious values / properties. The anticipated impacts during the construction phase are discussed below.

8.5.1 Physical Environment

8.5.1.1 Aesthetics

Potential Impact

Attabad Lake is an important recreational site for the tourists including foreign visitors. Construction activities may result in some visual impacts. The construction activities will involve the cutting of trees/bushes, excavation, soil filling and cutting operation. This disturbs the natural scenic value of the environment. In addition to that the sitting of construction equipment and the lacks of resurfacing/replanting of exposed areas are also the leading factor to aesthetic reduction. The impact significance is medium adverse.

Mitigation Measures

The adverse environmental impacts related to the aesthetic could be effectively minimized at the construction phase. These will be mitigated by the control of clearing vegetation to the area in the construction limits and by plantation and quick re-vegetation during the construction phase. Good house-keeping, cleaning, efficient solid waste management system should be implemented to improve the aesthetics of the working environment.

8.5.1.2 Topography

Potential Impact

Construction activities are not expected to impact the topography of the area significantly except for those areas where physical activities including digging and excavation, storing or dumping sites for excessive material and movement of heavy construction machinery will be carried out. The excavated material will be generated due to the construction of various components of the Project such as construction of Coffer Dams, Sediment Flushing Tunnel/Under sluice, Weir, Headrace Tunnel, Surge Tank, Penstock, Powerhouse, Tailrace Channel, Switchyard and Project colony. The area where excavated material is to be dumped may also be impacted. The impact significance is medium to low adverse.

Mitigation Measures

The excavated material will require safe disposal by the EPC Contractor. Most of the excavated material could be used in back filling purpose, where applicable. A detailed development and operation plan for borrow areas must be prepared by the EPC Contractor

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

before the starts of extraction of material from each borrow area. EPC Contractor should strictly follow the provisions of approved plan in order to minimize any adverse impact associated with the borrow areas. Likewise, excavated material should be dumped at suitable and approved disposal sites.

8.5.1.3 Landslide

Potential Impact

The construction activities for the proposed Project interventions involving cutting of rocks by blasting (where applicable), excavation, dumping of soil and to create space for the headrace tunnel and other structures may disturb the stable geological formation of the area.

High seismic potential and unstable geological formations are two major causes of land sliding in the area. Landslides are common in the project area due to the high steepness, unstable geological formations on both sides of the river and common seismic activities. These affects could promote landslide in unstable area. Furthermore, due to the Project activities, especially in case of blasting or cutting of rocks in some areas, the formation will become loose and the risk of landslides will increase in the immediate vicinity of the construction sites, especially at the right bank of Hunza River, which may be considered as a high adverse impact. The impact significance is high to medium adverse.

Mitigation Measures

To avoid the major risks, all structures have been proposed on the left bank of Hunza River. Blasting should be avoided or minimized where possible, if inevitable then low intensity explosive material should be used instead of high intensity explosive material. It is strongly recommended to perform appropriate confirmatory geotechnical investigations all along the alignment of Headrace tunnel and other components for assessing strength parameters of natural material either rocks, moraines or scree. This shall be done so that safety of this major Project component and adjacent areas can be ensured through proper design of cut slopes.

Landslide risks shall be mitigated by the installation of safety barriers at construction sites, and monitoring and informing locals about construction schedules, and any weather events that might exacerbate landslide risk. Construction work will be avoided during rain to the extent possible. The EPC Contractor will prepare the Management Plan for blasting activities and implement the same after approval from the Management Consultant and Client.

8.5.1.4 Site Accessibility

Potential Impact

The proposed Project Area falls within the Hunza Valley which is located about 119 km from Gilgit city. The Project site can be accessed through Korakoram Highway (KKH) which is the only major mode of transportation in the Project area. Heavy vehicles will be utilized to transfer construction plants, equipment, construction materials, cement and fuel. These activities may have adverse impacts on the existing infrastructure. Apart from that it may cause air and noise pollution. The impact significance is high to medium adverse.

Mitigation Measures

The access roads to the hydropower site have to be pre-determined in consultation with the concerned departments. Access roads would have to be widened and/or improved to carry the anticipated load of traffic.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

During the course of construction of proposed Project, EPC Contractor will provide the signage and/or traffic control to the extent deemed necessary by the traffic utilizing or accessing the site roads. These signs will inform, control, warn, shift, or stop traffic on all site roads affected by the Project's heavy traffic. The following measures will be taken by the EPC Contractor during the construction phase for the effective implementation of the traffic plan:

- National and local traffic rules and regulations, instructions manual for motor vehicle and mobile machinery operation should be followed;
- No one will be allowed to drive motor vehicle or operate mobile machinery without a driving license;
- It should be prohibited to drive or operate vehicle in case of over fatigued or mental disease;
- Traffic speeds on unpaved roads should be limited to no more than allowable traffic speed;
- Traffic speed signs should be displayed prominently at all site entrances;
- A daily routine check-up of vehicles should be conducted no less than 5 minutes before its service;
- Use of appropriate signs, equipment, and traffic control measures that conform to the provisions in the traffic manual of city traffic police;
- Traffic inspection and security during transportation;
- Limit vehicular traffic designated access roads, construction laydown area, parking areas and the Project site;
- All damaged, destroyed or modified pavement legend, traffic control devices, signing and striping associated with the proposed development should be replaced as required prior to issuance of a certificate of occupancy; and
- Construction signs, lighting and barricading should be provided during construction as required.

The EPC Contractor should also be responsible to prepare a comprehensive Traffic Management Plan and follow the conditions of Contract Agreement.

8.5.1.5 Natural Drainage

Potential Impact

Construction activities such as excavation, filling and construction will affect the existing soil pattern in the Project Area including water pathways its surroundings. In addition, this will lead to changes in the existing drainage pattern. The conditions will be more hazardous during the flood periods and may affect the construction activities. The impact significance is high to medium adverse.

Mitigation Measures

During the construction phase, excavated material should be properly disposed of ensuring that it will not block the natural drainage paths. Open drains for drainage of rain/flood water should be constructed, if considered necessary during construction period.

8.5.1.6 Soil Contamination & Erosion

Potential Impact

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

During the construction phase of the proposed Project, large quantities of materials, chemicals, fuel and lubricants will be used apart from the generation of solid waste and liquid waste from the construction camps. Fuels and chemicals will be stored at the site for their immediate use, which will contaminate the soil if not handled properly particularly at asphalt plant sites, workshop areas and equipment washing yards.

Similarly, removal of vegetation and shrubs for the purpose of construction activities will lead to loosing of the soil, soil disturbances, and exposure of bare soil surface. This causes problems of soil erosion during rain. Similarly, steep gradients increase erosion on these slopes due to reduced water infiltration and increased runoff accumulation. Soil erosion may also occur in the workshop areas as a result of improper drainage system of equipment washing-yards and improper management of construction activities. The impact significance is high to medium adverse.

Mitigation Measures

- Sites disturbed by construction activities will be restored to their original conditions upon completion of construction work and photographic record will be maintained to ensure pre-post subproject conditions intact;
- Soil contamination by asphalt should be minimized by placing all containers in caissons;
- The EPC Contractor will be required to instruct and train their workforce in the storage handling and management of materials and chemicals that can potentially cause soil contamination;
- Material Safety Data Sheets (MSDS) will be strictly followed during handling and storage of chemicals;
- If any contaminated soils are found at the construction sites or at camp sites, they shall be removed and deposited in a sealed pit in at designated area;
- The EPC Contractor will be required to prepare training manual and modules for all the construction related activities along with the schedule of training program and submit to the Supervision Consultant for approval;
- Solid waste generated at the camp sites will be properly treated and safely disposed only in the demarcated waste disposal sites/areas;
- Subproject sites will be selected to avoid or minimize vegetation removal/clearing which would accelerate erosion and increase landslide risk;
- The EPC Contractor shall adopt good engineering practices that will help to control or minimize the soil erosion both at the construction sites and in peripheral areas. All the disturbed areas need to be protected against soil erosion by stripping and stockpiling of all the available topsoil for later re-vegetation. Special slope protection measures will be adopted in the sensitive areas; and
- Site restoration plan for the Project should be strictly followed.

8.5.1.7 Wastewater Generation

Potential Impact

Wastewater will be generated at the construction camps, from construction activities an residential colony (for EPC Contractor, the Consultant and the Employer staff). If the generated wastewater is not properly treated or disposed of, this may contaminate the surface water apart from soil contamination. Water from dewatering activities (during rainy season)

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

has the potential to contain suspended solids and oil and grease and if disposed of untreated may affect the soil quality. The **Table 8.1** provides anticipated composition and estimate of the wastewater to be generated during the course of the construction phase of the project assuming that on average the water demand per person is 40 liters per day and that 80% of the water demand will become wastewater.

Table 8-1: Estimated Wastewater Generated by Workers in Construction Camp

No. of Workers*	Estimated Total Water Demand** (liters/day)	Estimated Wastewater Generated (liters/day)***
350	14,000	11,200

* Refer Table 3-7 "Estimated Work Force Requirements"

** = (350)x(40) = 14,000 liters/day

*** = 14,000 (80%) = 11,200 liters/day

This 11,200 liters/day (approx.) of wastewater will be generated from the construction camps. This impact would be of medium significance.

Mitigation Measures

To dispose the liquid waste generated from the construction activities, the following steps will be taken by the EPC Contractor:

- Domestic and chemical effluents from the construction camp will be disposed by the development of on-site sanitation systems i.e. septic tanks (as provided in **Figure 8.3**);
- The domestic sewage will be treated with biological treatment technology and will be discharged as per NEQS. Proper monitoring to check the compliance of NEQS will be carried out;
- Proper monitoring to check the compliance of NEQS will be carried out. Septic tank will be located adjacent to the construction camp;
- Sewage from construction camps will be disposed of after proper pre-treatment;
- Water discharged to drains should contain a minimum quantity of suspended solids; and
- Site for construction camp will be selected at least 500 m away from the settlements.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

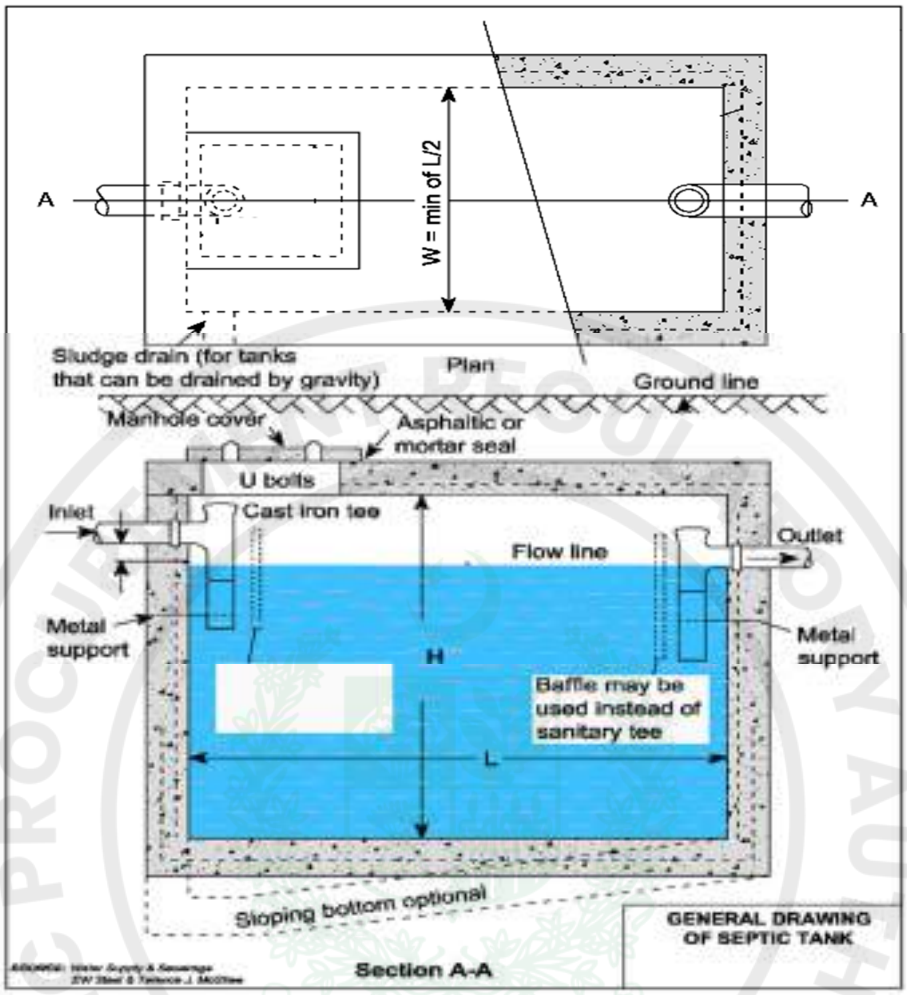

Figure 8-3: General Drawing of Septic Tank

8.5.1.8 Generation of Solid Waste (Construction, Municipal and Hazardous Waste)

Potential Impact

Different types of waste including construction (waste concrete and asphalt, empty containers, excavated material), municipal (from construction camps) and hazardous wastes (including empty containers of paint, lubricants, grease, fuel oil, electrical wiring, pipis etc.) are likely to be generated during the construction phase of the proposed Project and from the EPC Contractor's Camps (the solid waste generation is estimated to be 157.5 kg/day (as per 0.45 kg/capita/day waste generation)[17] for 350 construction workers) which may have potential to serve as breeding grounds for the disease spreading vectors and rodents. During the construction phase, significant quantities of rock will to be excavated. In order to reduce the amount of rock to be disposed, excavated rock can be used in the Project for different types of infrastructural works. The remaining spoil will be disposed in designated and safe disposal areas. Throwing away of solid wastes into water channels may cause blockages in drainage

[17] *The World Bank Report 2012 – What a Waste: A global review of solid waste management. Based on UNEP estimates for waste generation in the Asia Pacific. Average is 0.45 kg/capita/day*

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

channels, contamination of nearby water bodies and soil contamination (render them unfit for plantation).

Empty containers containing the toxic, flammable and corrosive materials may pose hazard to the workers. This may result in health risk to work force and public, if disposal site is improperly selected.

All these, if left unattended, can become a source of nuisance and environmental pollution in the subprojects area. Discarded materials and equipment may also pose traffic safety risks if left on or near transport routes. This impact is moderate adverse in nature.

Mitigation Measures

- Minimize the generation of spoils by recycling the excavated rock to the maximum extent possible by using them as aggregate material in the concrete works;
- Construction waste will be routinely collected and safely disposed of in clearly demarcated waste disposal sites located near each subproject site following international best practices;
- Waste disposal will be carried out following international best practices and will ensure that there are no negative impacts on soil, water bodies, existing waste management systems, transport routes, and aesthetic value of the area;
- The debris produced during construction would preferably be dumped at nearby depressions rather than being thrown away and left unattended. Leftover material would not be dumped into water bodies;
- The labor workforce (including community labor) will be trained on the handling, storage, and disposal of construction waste. Burning of waste shall be prohibited;
- PPEs shall be provided and worn by the personnel involved in construction activities and training them in their use;
- Waste containers with proper color coding will be provided on site to store different type of waste;
- Site Specific Solid Waste Management Plans (SWMPs) will be developed and implemented by Contractors; and
- It will be ensured that no waste or left over construction material is left behind in the cultivation fields.

8.5.1.9 Surface Water Quality

Potential Impact

Surface water quality of the Attabad Lake may get deteriorated due to the construction activities. During the construction phase of the proposed Project, materials like sand, gravel and stones will be required in large quantities. Extraction of the materials will also affect the surface water quality by increasing the sediment load. This water will be used during different construction activities. The movements of heavy vehicles on the unpaved tracks, excavation activities, cut and fill processes in the Project Area, fuel and chemical spills may deteriorate the quality of the surface water. These activities will also increase the sediments and turbidity of the water.

Waste streams can bleed toxic materials from items such as batteries, used computer equipment, leftover paints and pathogenic organisms include specific strains of bacteria like E. coli into the leachate of dumps. Leachate from waste piles caused by exposure to

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

precipitation and from residual liquids in the waste itself may contain organic matter, nutrients, metals, salts, pathogens, and hazardous chemicals. If allowed to migrate, leachate can contaminate surface water. This impact is moderate adverse in nature.

Mitigation Measures

The excavated material will be managed by ensuring proper storage areas located far away from the water bodies. All the solid waste from the camps should be properly collected at source by placing containers and disposed of through proper solid waste management system**.** To reduce the impact of sediment, load the EPC Contractor should make arrangements such as fine screens and drains to limit the siltation into the water bodies. A simplified sedimentation tank shall be built on the construction site for the primary treatment of the construction equipment wastewater, detergents and mud. Wastewater effluent from the Contractors' workshops and equipment washing-yards should be passed through gravel/sand beds to remove oil/grease contaminants before discharging into the natural streams. This is the general guideline principle for the contractor. Appropriate sanitation and water supply facilities will be provided in the labor camps.

Spillage of fuel/oils and other construction materials shall be contained with best handling/construction practices and strict skilled supervision. The EPC Contractor will ensure that construction debris does not find their way into the water bodies without proper treatment

Treating and disposing the sewage in a manner that the soil and water is not contaminated and ensure compliance with NEQS or international standards/guidelines, whichever is stringent will be followed.

8.5.1.10 Ambient Air Quality and Climate Change Aspect

Potential Impact

A large number of machinery and equipment will be deployed at site for the implementation of the Project. Different varieties of machinery/equipment will be required during the construction phase of the Project.

During construction period, the impacts on air quality are mainly due to material movement and the construction activities (particularly blasting of rocks, operation of batching and mixing plants, drilling, stone crushers) causing an increase of emission of carbon monoxide, sulfur oxides, nitrogen oxides, un-burnt hydrocarbons and other greenhouse gases, as well as fine particulate matter. The pollution causing activities during the construction phase are: loading/ unloading and stocking of construction material, transportation of construction and excavated material, diesel generator, construction equipment, vehicles rock cutting operations, site clearance, excavation, concrete batching and concrete mixer. The ambient air quality over the immediate influence area will be affected and the criteria pollutants levels and greenhouse gases in ambient air might increase, over longer distances depending on atmospheric conditions. Emission of greenhouse gases causes global warming and other climatic changes on regional and global scale. Cutting of trees will also reduce the carbon sequestering and overall increase the CO_2 content in atmosphere.

The impact of emissions is assessed to be temporary and moderate and is unlikely to have lasting impacts after construction work is complete.

Mitigation Measures

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- In order to reduce the dust emissions in the construction area due to material transport and construction activities, provisions will be made for sprinkling of water in the area where earth filling, excavation and other dust emissions causing activities being carried out. It will be ensured that the construction debris is removed on daily basis;
- Construction materials and spoil materials will be transported through trucks covered with tarpaulins. During windy conditions stockpiles of fine material will be wetted or covered with plastic;
- In no case, loose earth will be allowed to pile up along the approach roads/ public access areas;
- PPEs such as dust masks will be made available to the construction workers at the site to avoid potential health hazards;
- Idling of delivery trucks or other equipment will not be permitted during periods of unloading or when they are not in active use;
- Open burning of solid waste at construction site will not be allowed;
- All vehicles and other equipment used during construction will be properly and regularly tuned and maintained;
- Ensure compliance with the NEQS;
- Diesel generator should be fitted with acoustic enclosure and stack of appropriate height for the proper dispersion of emission;
- Awareness programs of causes and effects of climate change will be conducted for mitigating GHG emissions, ensure plantation of trees and use solar panels where possible;
- Regular monitoring of air quality in accordance with the formulated environmental monitoring plan (given in EIA).

8.5.1.11 Noise/ Vibration

Potential Impact

Noise and vibration will occur due to the operation of construction machinery and other equipment. The major sources of noise and vibration[18] are construction activities, movement of vehicles, construction equipment, blasting, drilling, pouring equipment, stone crushers and generators etc.

Existing environment of the area is free from noise pollution and the use of machines such as vehicles in the daily activities of the locals is almost negligible. During construction phase, the increase in traffic may also lead to increase in noise levels. Similarly, use of explosives during the excavation and construction will have a significant adverse impact on the safety of the workers. High background noise levels can cause significant disturbance to local wildlife, and have adverse psychological and physiological effects on individuals residing in nearby communities.

[18] *According to British Standards of Noise and Vibration, humans are particularly sensitive to vibration with the threshold of perception typically being in the range of 0.14 to 0.3 mm/sec. Peak Particle Velocity (PPV) and levels above this may cause annoyance. However, significantly higher levels than this can be tolerated for single short-term events and do not cause annoyance or disturbance to humans.*

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Significant noise pollution impacts are expected only during the construction phase of activities involving large civil works. The cumulative effects from several machines can be significant and may cause significant nuisances. In all cases, the impacts are likely to be short-term and mitigatable and will not have any lasting effects once construction activities have completed. The significant impact may be of high magnitude for the labor working in a place that is close to the area where explosives are in operation. This impact medium adverse in nature.

Mitigation Measures

- Construction vehicles and machinery will be kept in good working condition, and be properly tuned and maintained through the duration of construction work with the objective of minimizing excessive noise and vibration;
- High noise/vibration emitting equipment will be used during regular working hours (9 AM to 5 PM) so as to reduce the potential of creating a noise nuisance during the night to nearby communities. This equipment will be fitted with noise reduction devices such as mufflers and silencers wherever possible
- The vibration from major construction activities such as excavation, compacting, drilling, blasting, etc. are considered intermittent and short-term, and likely to be tolerated if prior warning is given to potentially affected residents;
- Vibration measurement will be carried out during construction phase by the EPC Contractor near the settlements;
- Personal Protective Equipment (PPEs) shall be provided and worn by the personnel involved in construction activities and training them in their use;
- Construction schedules will be disclosed to all nearby communities within vicinity of project sites prior to commencement of construction work;
- The EPC Contractor shall ensure the compliance with NEQS; and
- All complaints will be recorded and responded to in a timely and professional manner.

8.5.2 Ecological Environment

8.5.2.1 Flora

Potential Impact

The project will involve destruction of vegetation cover due to the implementation of proposed Project. It is initially examined that approximately 575 number of trees may be affected (**Annex - II**) due to proposed project activities. The number of possibly impacted trees is calculated by using Remote Sensing technique through GIS and field observation. Moreover, no impact on the production of medicinal plants is anticipated, as the area has least number of these plants.

Exhaust of noxious gases from movement of heavy machinery and dust will pollute air which will adversely affect health and vigor of plants. During construction activities the EPC Contractor's workers may damage the vegetation and trees (for use as fire-wood to fulfill the camps requirements). This impact is categorized as medium significant.

8.5.2.2 Loss of Agriculture Land

Due to the impounding of reservoir area, based on 2424 m.a.s.l, it is estimated that about 14.28 acres of crops of agriculture land may be affected. However, it is anticipated that there will be no impact on agriculture land due to the construction activities for other components

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

(such as weir, headrace tunnel, surge tank, penstock, powerhouse, switchyard and tailrace). This impact can be categorized as medium significant.

8.5.2.3 Pasture and Grazing Land

The Power House will be constructed on the communal land owned by the Ganish village, having grazing area. Similarly, impounding of reservoir area may also result in loss of vegetation cover which will subsequently affect the community's pasture and grazing area and livestock. This impact is categorized as permanent, irreversible and moderate in nature.

Mitigation Measures

- Incorporate technical design measures to minimize removal of trees, if possible;
- Cutting of trees and disturbance shall be avoided, as far as possible so, that negative effects on the process of natural regeneration of species are minimized;
- A tree plantation program shall be formulated with the recommendations and technical support of concerned Forest Department;
- As a principal, ten trees shall be planted in place of felling of one tree in consideration of mortality. Total 5,750 trees will be planted in lieu/compensation of 575 affected trees of similar floral function at the available spaces in/around the project area;
- Proponent shall implement the plantation program with the help of Forest Department and with the consultation of Supervision Consultant;
- The Forest Department shall involve the communities (if required) for carrying out plantation;
- Open fires should be banned in the area to avoid hazards of fire in the area;
- Clearing of vegetation cannot be avoided at the areas specified for project structures, but damage to the natural vegetation may be minimized by establishing camp sites, workshops and batching plants on waste/barren land rather than on forested or agriculturally productive land;
- However, if such type of land is not available, it shall be ensured that minimum clearing of the vegetation is carried out and minimum damage is caused to trees and undergrowth;
- Construction vehicles, machinery and equipment will remain confined within their designated areas of movement;
- The EPC Contractor's staff and labor shall be strictly directed not to damage any vegetation such as trees or bushes;
- EPC Contractor shall provide gas cylinders at the camps for cooking purposes and cutting of trees/bushes for fuel shall not be allowed;
- Compensation for the loss of crops to the land owners and cultivators as the case may be will be paid, in accordance with the prevailing market prices and uniformity in rates will be ensured within the local areas;
- The whole process of the payment to the farmers will be made transparent, judicious and without any discrimination or favour; and
- As far as possible, barren land without any crop will be selected for the camp sites and disturbance to the crops and natural vegetation will be avoided as much as possible.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

8.5.2.4 Fauna

Potential Impact

During construction phase the existing population of mammals and reptiles of the construction areas may be affected due to disturbance arising from construction activities involving excavation, movement of machinery and vehicular traffic, movement of labor, camping, blasting, excavation, drilling etc. The existing animals will leave the directly affected areas due to construction activities and human intervention. Some animals particularly reptiles may get killed during the earthworks operations.

Moreover, the movements of the mammals and reptiles will be restricted during the construction phase;

Birds as well will tend to move away from the construction areas and find shelter and food elsewhere due to the activities mentioned above for fear of being hunted / trapped.

Noise generated from machinery particularly during the night hours will even scare the wildlife residing in habitats located at some distance from the construction areas. Uncontrolled blasting may even disturb the wildlife of the Project Areas. Food and refuse at the EPC Contractor's camps may attract animals that might in turn be hunted by the workers. This impact is medium significant.

Mitigation Measures

- Care shall be taken during construction activities for avoiding purposely or chance killing of animals;
- If found any wild species and habitat during construing that must dealt carefully and local wildlife department officials should be called;
- Hunting, poaching and harassing of wild animals shall be strictly prohibited, and Contractor shall be required to instruct and supervise its labor force accordingly and clear orders should be given in this regard;
- EPC Contractor must be held responsible for instructing his work force accordingly and for enforcing this restriction. In addition, this shall have to be controlled by the Wildlife Department;
- Client must have obtained NOC from the relevant departments prior to construction phase;
- Special measures shall be adopted to minimize impacts on the wild birds, such as avoiding noise generating activities during the critical periods of breeding;
- Similarly, wastes of the camps shall be properly disposed of to prevent it being eaten by animals, as it may be hazardous to them; and
- Noise produced by construction activities may be kept to acceptable level and ensure compliance with NEQS.

8.5.2.5 Aquatic Ecology

During construction phase of proposed Project, cutting, blasting, excavation, drilling, extraction, removing and dumping activities of materials at large scale will contribute heavy sedimentation and soil erosion which may cause habitat destruction, contamination and toxic accumulation of waste not only at Attabad lake but its impact can be seen downstream up to confluence of Gilgit River and beyond. Heavy machinery and equipment shall be used during construction phase, which may also result in heaps of leftovers of explosives, grease,

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

chemicals, lubricants, and other harmful materials. These pollutants through run off rain water enter into the lake and river course increase toxicity of water causing rapid destruction of fish population and riverine ecology.

This situation can contribute up to great extent to destruct the aquatic life, ecology, breeding and spawning grounds of fishes, benthic fauna, food chain and abundance of micro and macro living organisms. This may lead rapid shortage of food like benthic population, phytoplankton, zooplankton, nekton etc. which play an important role to sustain food chain with different trophic level in any eco-system. This impact is categorized as medium to high significant.

Mitigation Measures

- Solid waste generated from construction and camp sites will be safely disposed in demarcated waste disposal sites and the EPC Contractor will provide a proper waste management plan, to avoid the water contamination;
- Land sliding and soil erosion are also the main factor to contribute silt load on river bed manifold causing damage to resting and nesting grounds of fishes. Construction of protective walls and gabions at certain points to make sure the stoppage of sliding debris. Plantation and vegetation cover can also be helpful for slope stabilization. Plants, herbs and shrubs reduce the level of pollution and toxicity at a great extent as bio-filter and carbon suckers;
- Prior NOC from Fisheries Department may also be considered for smooth implementation of the project activities;
- The labour working at construction site should be aware to protect especially edible fish and to avoid fish catching by any means. As according to law of land fish hunt is prohibited with all types including net, cages and by the use of dynamite;
- Training of work force in the storage and handling of hazardous materials and chemicals should be encouraged and educated to practice waste minimization and reuse to reduce quantity of the waste;
- Immediate collection of spilled oils/fuels/lubricants by collection of contaminated soils and skipping oils from surface water by applying appropriate technologies;
- Construction waste should be crushed and reused in other sites, where possible;
- It will be ensured that no waste or left over construction material is left behind in the cultivation fields;
- Construction vehicles and machinery will be kept in good working condition, and be properly tuned and maintained through the duration of construction work with the objective of minimizing excessive noise and vibration; and
- EPC Contractor shall ensure the compliance with NEQS.

8.5.3 Socio Economic Environment

8.5.3.1 Discovery and Impact on of Heritage Sites and Structures during Excavation

Potential Impact

During excavation, there is a chance of finding artifacts. In case of finding any artifact, the contractor shall immediately report through Supervision Consultant to Directorate General (DG) of Tourism, Sports, Culture, and Archaeology & Museums Department Government of GB to take further suitable action to preserve those antiques or sensitive remains.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

According to the field survey, no notified archeological site was present in the Project Area. This impact can be categorized as low to medium significant in nature.

Mitigation Measures

- In case of finding archeological remains during excavation, the EPC Contractor shall immediately report through Supervision Consultant to Tourism, Sports, Culture, Archaeology & Museums Department Government of GB to take further suitable action to preserve those antiques or sensitive remains. Chance finds procedure is given in **Annex- III; and**
- EPC Contractor needs to obtain approval for excavation and submit the plan of rehabilitation of the site after excavation.

8.5.3.2 Social and Cultural Conflicts

Potential Impact

During the construction phase of the project, conflicts may arise between labor force and local community. Use of local resources and products by the construction workers can generate stress on the local resources. Furthermore, difference in cultural values may also cause discomfort to local residents. This impact is medium adverse in nature.

Mitigation Measures

- Local labor especially from nearby communities will be given preference for the construction works;
- Careful planning and training of work force to minimize disturbance to the local people;
- Public notification through print or electronic media during the entire construction phase to avoid any inconvenience in accessibility to the locals; and
- Adequate training of especially for the transitive workforce of the station (involved both in the construction process and in the commissioning) to regard the customs of the area so that the locals do not feel insecure.
- Code of Conduct will be prepared by the EPC Contractor and adopted during the project execution. All project personnel will be required to sign and follow the Code of Conduct.

8.5.3.3 Occupational Health and Safety

Potential Impact

Occupational Health and Safety (OHS) related impacts may arise during construction phase of the proposed Project due to installation of Contractor camp, movement of machinery & equipment, lifting operations, work at height, concrete pouring, working in night and manual handling during loading/unloading operation, as result of these works there will be a direct impact on the health and safety of all staff working on the Project. The most common impacts include eye injuries which may occur due to stone or metal particles, hazard of being hit by falling objects, major hand-arm and whole body vibration hazards, skin and respiratory tract irritation from exposure to cement dust, overexertion and awkward postures etc.

Other impacts will be falling in trench, contact with electrical and mechanical equipment, equipment failure, uncontrolled movement, unguarded moving mechanical equipment parts, fatigue, unbalanced load, falling objects, hand and head injury, slip and trip hazards, exposed

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

to high levels of noise for longer durations etc. This impact may be classified as high adverse in nature.

Mitigation Measures

- The EPC Contractor will be required to follow the national/local acts related to OHS and World Bank Group General EHS Guidelines, 2007. The EPC Contractor will prepare the site specific occupational health and safety plan;
- Occupational health and safety monitoring programs of the EPC Contractor should verify the effectiveness of prevention and control strategies;
- Providing basic medical training to specified work staff and basic medical service to workers. The EPC Contractor will ensure the provision of basic medicines, first aid kits etc. at the camp site;
- Ensure periodic medical screening of the staff;
- Complying with the safety precautions for the construction workers as per applicable International Labor Organization (ILO) Conventions;
- Training of workers in construction safety procedures, environmental awareness, equipping all construction workers with safety proper task specific Personal Protective Equipment (PPEs);
- Moreover, proper planning should be done for food storage, setting up of kitchens, wastewater collection system and solid waste management. Improper planning for these facilities may result in multiplication of rodents like rats, mice and shrew etc. and vectors like mosquitoes, bugs and flies which will have a negative impact on workers' health and safety;
- Efforts will be made to create awareness about road safety among the drivers operating construction vehicles;
- All trenches deeper than two meter should be protected with wooden bracing to avoid safety risks to workers and locals; Ensure that the site will be restricted for the entry of irrelevant people particularly children, disabled and elderly people;
- Ensure the use of safety and warning signs at the construction site;
- Ensure the provision of fire prevention and firefighting equipment; and
- Ensure the provision of training related to emergency prevention, preparedness and response arrangements by the EPC Contractor.

These requirements will be incorporated into the bidding specification and contract documents, and will be binding on the EPC Contractor, at risk of penalty for noncompliance, as charges to be recovered from EPC Contractor for unsafe act or condition.

8.5.3.4 Community Health and Safety

Potential Impact

Community health and safety issues during the construction of proposed project may include dust, noise, and vibration from construction vehicle transit, and communicable disease associated with the influx of temporary construction labor. The construction activities and vehicular movement at construction sites may result in roadside accidents particularly inflicting

local communities who are not familiar with presence of heavy equipment. Quality of water resources available in the nearby local communities may be affected due to the oil spillage and leakage, roadside accidents, etc. Conflicts may arise between the local community and the construction workers, which may be related to religious, cultural or ethnic differences, or based on competition for local resources. The labor works with different transmittable diseases (HIV/AIDS, COVID-19, respiratory diseases, and skin and eye infections etc.) may cause spread out of those diseases in the locals of nearby community. The impact significance is moderate adverse.

Mitigation Measures

- The EPC Contractor will prepare the site specific community health and safety plan in compliance with relevant sections of the WBG General Environmental Health and Safety Guidelines (WBG 2007), chosen methodology and will be required to strictly follow;
- Ensure that the site will be restricted for the entry of irrelevant people particularly children, disabled and elderly peoples. Ensure the use of safety signs at the construction site;
- Providing basic medical training to specified work staff and basic medical service and supplies to workers;
- Ensure proper maintenance and repair of all vehicles, machinery and equipment to prevent the oil spills;
- Efforts will be made to create awareness about road safety among the drivers operating construction vehicles;
- Timely public notification on planned construction works;
- Close consultation with local communities to identify optimal solutions for diversions to maintain community integrity and social links;
- Provision of proper safety and diversion signage, particularly at sensitive/accident-prone spots;
- Setting up speed limits in close consultation with the local stakeholders;
- The mitigation measures provided in the sub-sections for air and noise & vibration shall be adopted to reduce the air pollution, noise pollution and vibrational impacts on nearby community;
- Ensure effective implementation of GRM (to be prepared by the EPC Contractor) to timely address the issues;
- The communicable disease of most concern during construction phase, like Sexually-Transmitted Disease (STDs) such as HIV/AIDS, COVID-19 will be prevented by successful initiative typically involving health awareness; education initiatives; training heath workers in disease treatment; immunization program and providing health service;

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- All workers must perform complete sanitization at the site as per updated / latest SOPs/guidelines issued by WHO and the national guidelines issued by the GoP[19];
- Ensure prevention of larval and adult propagation of vectors through sanitary improvements and elimination of breeding habitat near to human settlements and by eliminating any unusable impounding of water; and
- EPC Contractor will take due care of the local community and observe sanctity of local customs and traditions by his staff. EPC Contractor will warn the staff strictly not to involve in any unethical activities and to obey the local norms and cultural restrictions.

Any environmental condition that is disagreeable to the public and causes an avoidable nuisance can be addressed with additional provisions in addition to those described above.

These requirements will be incorporated into the bidding specification and contract documents, and will be binding on the EPC Contractor, at risk of penalty for noncompliance, as charges to be recovered from EPC Contractor for unsafe act or condition.

8.5.3.5 Influx of Labor

Potential Impact

For the implementation of Project activities, skilled and unskilled labor is required by the EPC Contractor. Mostly, skilled and unskilled workers have been associated with the EPC Contractor since long which they utilize, where they are required for the Projects, and while other workers are hired from the different areas that belong to different cultural backgrounds. Social problems and conflicts that are associated with Labor Influx are as follows:

- Risk of social conflict: Conflicts may arise between the local community and the construction workers, which may be related to religious, cultural or ethnic differences, or based on competition for local resources. Ethnic and regional conflicts may be aggravated if workers from one group are moving into the territory of the other;
- Increased risk of illegitimate behavior and crime: The influx of workers and service providers into communities may increase the rate of crimes and a perception of insecurity by the local community. Such illegitimate behavior and crimes can include theft, physical assaults, substance abuse, sexual assault and human trafficking;
- Impacts on community dynamics: Depending on the number of incoming workers and their engagement with the host community, the composition of the local community, and with it the community dynamics, may change significantly. Pre-existing social conflict may intensify as a result of such changes;
- Increased burden on and competition for public service provision: The presence of construction workers and service providers (and in some cases family members of either or both) can generate additional demand for the provision of public services, such as water, electricity, medical services, transport, education and social services. This is particularly the case when the influx of workers is not accommodated by additional and separate supply systems;

[19] *https://covid.gov.pk/guideline*

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- Increased risk of communicable diseases and burden on local health services: The influx of people may bring communicable diseases to the project area, including sexually transmitted diseases (STDs), or the incoming workers may be exposed to diseases to which they have low resistance. Workers with health concerns relating to substance abuse, mental issues or STDs may not wish to visit the Project's medical facility and instead go anonymously to local medical providers, this can result in an additional burden on local health resources;
- Local inflation of prices, accommodations and rents: A significant increase in demand for goods and services due to labor influx may lead to local price hikes and crowding out of community consumers. Depending on project worker income and form of accommodation provided, there may be increased demand for accommodations, which again may lead to price hikes and crowding out of local residents; and
- Increase in traffic and related accidents: Delivery of supplies for construction workers and the transportation of workers can lead to an increase in traffic, rise in accidents, as well as additional burden on the transportation infrastructure.

This impact is medium negative and temporary in nature.

Mitigation Measures

- Contractor camp will be established away from residential and populated area;
- Preference will be given to the local people to work with EPC Contractor, and EPC Contractor will hire maximum labor force from the project area because this will reduce the labor influx;
- Awareness will be created among the work force to ensure respect for local customs;
- Construction work will be completed within the stipulated time to move workers to next location;
- Labor force will be shuffled with the time;
- Create awareness among workers on proper sanitation and hygiene practices to endorse proper health and maintain good housekeeping practices at all Project sites;
- Provide adequate personal hygiene facilities in good condition with adequate supply of clean water;
- Make arrangements to treat the affected workers on time to control the movement of vectors disease;
- Sensitize workers and surrounding communities on awareness and prevention of COVID-19, HIV/AIDS and sexually transmitted infections (STI) through training, awareness campaigns and workshops during community meetings;
- Provide proper and free HIV/AIDS and STI health screening and counselling for site workers and community members;
- Develop and enforce a strict Code of Conduct for workers to regulate behavior in the local communities;

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- Taking all sensible precautions to avert illicit, vicious conduct by or amongst the EPC Contractor's personnel, and to preserve unity and harmony, and protection of people and property on and near the sites;
- Prohibiting drugs, alcohol, weapons, and ammunition on the worksite among personnel;
- Site security preparations must be contained within the Bills of Quantities (BoQs) to avoid any delays which might be caused due to insecurity;
- Appropriate fencing, security check points, gates and security guards will be provided at the construction sites to ensure the security of all plant, equipment, machinery and materials, as well as to secure the safety of site staff; and
- The EPC Contractor must guarantee that good relations are maintained with local communities and their leaders to help reduce the risk of vandalism and theft.

8.5.3.6 Gender Based Violence (GBV)

Potential Impact

In the society, female plays important role in managing household as well as in income earning activities, but they face various challenges to get access to educational institutions and employment opportunities due to cultural bindings, economic vulnerability and lack of facilities.

According to Pakistan Demographic and Health Survey (PDHS), 2017-18, 28 percent of women of Pakistan age 15 to 49 have experienced physical violence, six percent have experienced sexual violence, and seven percent experienced violence during pregnancy. Three in ten women who have ever experienced physical or sexual violence sought help to stop the violence, yet 56 percent never sought help nor told anyone.

During construction phase gender based violence might arise due to discrimination made against women by unequal work distribution and unequal pay structure among others. Sexual harassment against women might occur as a consequence of mixing of men and women at the construction site, and moving on the roads and markets. Women in the Project area are participating in other outdoor activities such as livestock rearing, bringing of potable water, collection of fire wood etc. that may also be affected by the Project activities. This impact is medium negative in nature during construction stage.

Mitigation Measures

- Trainings will be given to construction workers, alongside the implementation of strict measures and punishments in case of any sexual assaults, or gender based violence.
- During the timing of educational institutions workers will not be allowed to crowd in the surroundings;
- Alternative routes for pedestrian will be provided to avoid mixing of women with workers;
- Gender protection act will strictly be enforced during the construction activities in the project area, and monitor the implementation through field staff and district level structure;

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- Raise awareness among the communities of the potential risks of GBV, and establish response services in the communities that can respond to instances of GBV (particularly those related to issues of labor influx);
- The EPC Contractor will make sure that no discrimination is made on the basis of gender while hiring of workers. Complete SOPs will be formed and implemented by the contactor regarding working women at site. Implementation on these SOPs will be monitored by the Supervision Consultants;
- Provisions of gender disaggregate bathing, changing, and sanitation facilities; and
- Contractor will take proper measures to address and resolve issues relating to harassment, intimidation, and exploitation, especially in relation to women.
- Establish workers' camps separated from local communities with strict protocols for interaction with local communities in order to avoid project impacts from labor influx.
- Project staff will receive training on the prevention of SEA/SH. Engagement of skilled trainers to raise awareness among project workers of the risks, expected behaviors, and consequences of violations, communicated through training, and publicized codes of conduct. It may also be important to raise awareness of the risks among community members and local health authorities and inform them about available grievance mechanisms.
- Arrange and support local organizations and/or government initiatives on community STD education, prevention, and treatment programs.
- Extensive training for awareness raising strategy which describes how workers and local communities will be sensitized to SEA and SH risks, and the worker's responsibilities under the Code of Conduct.
- The routes/places used by the women will be avoided as far as possible. If unavoidable, alternate routes will be identified for the communities, if required, especially along routes frequented by women folk, such as route to the local water source.
- Construction crew will avoid entering villages and settlements.
- Communities will be informed and consulted before commencing works inside or near the communities.
- Provision related to SEA/SH will be incorporated in the bidding document.

8.5.3.7 Child Labor

Potential Impact

There are two basic conventions on child labor adopted by the ILO, and one adopted by the United Nations. The ILO Minimum Age Convention, 1973 (No. 138) and its accompanying Recommendation (No. 146) set the goal of elimination of child labor, and the basic minimum age for employment or work (in developing countries at 14 years of age or the end of compulsory schooling, whichever is higher; and 15 or the end of compulsory schooling for developed countries). The Convention sets a minimum age of 2 years younger for "light work," i.e., 12 and 13 years, respectively; and a higher minimum age for dangerous or hazardous work (basically 18 years of age, but 16 in certain circumstances). The Convention also has

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

various other flexibility clauses.

Inhabitants of the Project Area have mix economic background and different sources of income. Children of low income groups mostly involve in different earning activities, as their parents prefer to get their children hired in small shops as helpers, and waiters in hotels for earning money, and supporting household livelihoods. However, the Employment of Children Act, 1991 prohibits the employment of child and restrict the employment of adolescents in certain occupations and processes such as construction industry, and whoever employs or permits a child (person under the age of 14 years) to work in an establishment shall be liable to punishment with imprisonment.

The child labor impact might arise during construction stage, as large number of skilled and unskilled labor will be required by the EPC Contractor for the construction activities of the proposed Project. This impact is medium negative in nature during construction stage.

Mitigation Measures:

- Awareness will be created among the local communities about the adverse impacts of child labor. For the public awareness, meetings will be held in the Project area, and announcements will be made using the available local platforms with the involvement of all sectors of the society;
- EPC Contractor through contractual agreement will be bound to follow the labor standards, rules and regulations during hiring the labor force and all activities will be monitored by the social and environmental staff of the implementing agency;
- Client and Supervision consultant will ensure that EPC Contractor shall have its employment policy in accordance with relevant act and labor policies in Pakistan;
- EPC Contractor will ensure the presence of all persons at site are adults and have their proper identity cards with them;
- Penalize EPC Contractors/employees using the child labor and penalize adults who violate children's rights and who force children to enter child labor.

8.5.3.8 Indigenous People

Potential Impact

During the social field survey of the Project, no indigenous group of people was identified, which comes under the definition of the "Indigenous People". So, no impact on the indigenous people is envisaged due to the implementation of the Project.

Mitigation Measures

No mitigation required.

8.5.3.9 Other Social Issues

Potential Impact

The community belonging to the reservoir and Project Area will be affected during the construction phase as follows:

- During the construction phase, the general mobility of the local residents and their livestock in and around the Study Area is likely to be hindered;
- Unmonitored construction activities, e.g. blasting may create an accidental risk for the local residents particularly the women and children;

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- Usage of community common resources like potable water, fuel wood etc. by Contractor workforce may create conflicts between the community and the Contractor;
- Community will have to face the noise and dust problems during the construction activities;
- Induction of outside workers in the Contractor labor may cause cultural issues with the local community; and
- Theft problems to the community by the Contractor's workers and vice versa.

This impact is Site Specific, Medium Term, Irreversible, Likely, Medium Significant.

Mitigation Measures

- During the construction phase, mobility of the workers in the nearby areas should be strictly restricted by the Contractor to avoid any inconvenience to the local communities;
- Proper arrangements in the form of alternative routes should be made to ensure that the mobility of locals should not be disturbed;
- Before starting the construction activities, Contractor should inform residents of the Project Area about the scheme of work, likely disturbances, and their duration as to whom they should addressed their complaints.
- The Contractors will be required to maintain close liaison with the local communities to ensure that any potential conflicts relating to the common resource utilization are resolved quickly;
- Contractor will take care of the concerns of the local community and the sensitivity towards the local customs. Contractor also needs a proper security to avoid any theft issue by the community;
- Use of good engineering practices such as water sprinkling, encasement and provision of silencer and mini stacks of generators etc. should be adopted to avoid inconvenience to the locals due to noise, smoke and fugitive dust; and
- The Contractor will warn the workers not to indulge in any theft activities and if anyone gets involved in such activities, he will have to pay heavy penalty and would be handed over to the police. Similarly, at the time of employing, the Contractor has to take care that the workers should be of good repute. The Contractor camp should be fenced properly and main gate.

8.5.3.10 Impact on Tourism

Potential Impact

The Attabad Lake has become one of the biggest tourist attraction in valley, offering activities like boating, jet-skiing, fishing and other recreational activities. Tourists also enjoy Ice Skating the Lake gets frozen during winters, making it the perfect place for ice skating. Passu Cones is also a popular tourist destination in Hunza valley and all over the world because of its easy accessible sweeping landscapes and vistas of the 7,478m (24,534 ft) tall Passu Sar mountain, the Passu Glacier and Tupopdan.

Due to construction activities of Attabad Hydropower Project and movement of heavy machinery on roads the traffic flow is likely to be affected during construction activities and damage of roads as well, tourists will face the difficulties to reach at their desire destination

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

like Attabad Lake for boating and jet-skiing, to visit the Passu Cones, Khanjrab Pass other tourists spots and high peaks for hiking.

Due to construction of Attabad Hydropower Project livelihood of the locals will disturb who are directly associated with tourism business like boat owners and operators, owners of fast food restaurants, shopkeepers, hotels owners and working labor and so many others attach with tourism.

Mitigation Measures

- The EPC Contractor will prepare and implement the site specific environmental, health and safety management plans to ensure the safety of the locals and tourists.
- Necessary measures will be taken to ensure the safety of traffic during construction, including barricades, safety signs, pavement markings, flags, and lights, erected for tourists and locals as well.
- A Traffic Management Plan will be implemented that will aim at ensuring access tourists to reach their destinations safe and sound, residential areas, and preventing of unsafe situations, especially near construction areas, camps and offices;
- Liaison with traffic police will be maintained in order to facilitate the tourists both local and foreigner; and
- Vehicle speeds near / within the communities will be kept low, to avoid safety hazards.

8.5.3.11 Communication Loss

Potential Impact

The general mobility of the local residents and their livestock in and around the Project Area is likely to be hindered and may need to be travel long distances.

Likewise access to the natural resource may be affected. This particularly implies to the women folk and children where women observe norms and values and do not interact with non-locals. This impact is medium significant in nature.

Mitigation Measures

The EPC Contractor will ensure that the mobility of the local communities and their livestock is not hindered by the construction activities. The EPC Contractor will provide crossing points at appropriate places to facilitate the locals for their daily works, where applicable.

The EPC Contractor shall always consider the local sensitivities while performing the Project activities. All the personnel engaged would also be properly briefed about the local norms and ethics prior to commencement of work.

8.6 ANTICIPATED IMPACTS DURING OPERATIONAL PHASE

The anticipated environmental impacts during the operation are discussed herewith;

8.6.1 Physical Environment

8.6.1.1 Sedimentation

Potential Impact

Sediment sources are glaciers, precipitation in the form of storms and heavy rains, hill slopes, landslides gully erosion, etc. The suspended load is influenced by the availability of sediment sources and triggering events. In Karakorum and Himalayas, large amounts of yearly

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

suspended sediments per square kilometers of the catchment area (more than 2,000 tons/year/ km²) are reported in the river system. The annual suspended sediment load at the weir site is 22.5 M-Tons. The total annual sediment load in Attabad Lake is estimated to be 27.08 M-Tons. The total annual sediment load in volume is 27.71 MCM or 22,466 AF. Almost all of the suspended sediment is brought down by the river during the period of June to September. The river carries on average, about 27% sand, 50% silt, and 21% clay. The unit weight of fresh deposits of this sediment is about 62 lbs/ft³. Based on hydrographic study, It had been observed that river bed level increased by sediment deposition and attained level of 2374m at approximately 600m distance from proposed weir. This rapid increased of bed level in 2020 and present year, 2024 against 2011 year are about approx. 38m and 44m, respectively.

Accumulation of sediment may disturb the efficiency of Project components. Sediment load released from the sand trap could have adverse effect and synergetic with low flow of water will put aquatic system under stress. However, it should be kept in mind that during low flows the sediment concentration is very low. Floods and heavy rains carry large sediment loads, which could have a more severe medium impact than the sand trap flushing.

Mitigation Measures

A sediment flushing tunnel will be constructed at the left side under the Power Tunnel section, consisting of low level outlets and during construction of overflow structure will be used as diversion tunnel. The invert level of sediment flushing tunnel is planned at El. 2380 m.a.s.l. Systematic operation of the flushing tunnel shall be ensured by the Client to flush the sediments.

It is also recommended to conduct a detailed watershed management study of the area and the outcome mitigation measures should be implemented to control the sediment inflow in the river.

8.6.1.2 Liquid and Solid Waste Generation

Potential Impact

Wastewater may generate by the workers during the operation and maintenance related activities and from the residential colony. However, at this stage it is not possible to estimate quantity of waste generation. The improper disposal of liquid waste can cause air, water, and soil pollution. Different types of solid waste including construction, dismantled material, municipal and hazardous (chemicals, spent solvents and oily rags, empty paint cans, chemical containers, used lubricating oil, electrical wires and lighting equipment) wastes are likely to be generated during the operation phase, can potentially cause soil and water contamination. The quantity of this liquid waste is expected to be small. This impact can be categorized as medium to low significant in nature.

Mitigation Measures

- Ensure training program regarding waste minimization quantity of the waste;
- Solid waste generated will be safely disposed in demarcated waste disposal sites and ensure provision of PPEs to workers;
- Ensure immediate collection of solid waste after the competition of maintenance works, no waste or left over construction material is left behind;

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- Proponent should make final disposal arrangements in consultation with the concerned government department and should take approvals for final disposal of the waste at the designated disposal site.
- A separate solid waste management system for waste from the office building and other allied facilities will be required. During the collection of solid waste, recyclable and reusable waste will be separated for resource recovery and reuse of the generated material; and
- Proper monitoring to check the compliance of NEQS will be carried out, if required;

8.6.1.3 Soil and Surface Water Contamination

Potential Impact

The accidental oil leakages from the power house may contaminate the soil and water quality of the Attabad Lake and Hunza River downstream of the powerhouse. The maintenance works (may involve the use of materials, chemicals, fuel and lubricants) may also have potential to contaminate the soil and surface water. This impact is site-specific and can be classified as medium significant.

Mitigation Measures

Proper drainage and dewatering system is recommended for the proposed Project. A drainage pump of appropriate capacity will be specified to cope with the leakage of powerhouse. Dewatering pumps will be specified for Unit dewatering. Both of these pumps will be installed in drainage and dewatering pit and they will provide redundancy for each other. Sites disturbed by the maintenance works shall be restored to their original conditions upon completion of works and photographic record will be maintained to ensure pre-post conditions intact. It will be ensured that no soil is left unconsolidated after completion of work and excess will be disposed of at designated sites. Storage of fuel, paint, and oil containers, oil filters, oily parts, and oily rags on impervious floor under shade or storing of fuel and lubricants on a sand flooring of at least 6 inches thick done on brick edge flooring lined with polyethylene sheet. Material Safety Data Sheets (MSDS) will be strictly followed.

8.6.1.4 Fire Breaking

Potential Impact

For the proposed hydropower plant there is also a risk of fire breaking out in powerhouse which may become a serious risk for residents living in allied facilities and/or nearby in the vicinity of the proposed hydropower Project. This impact can be classified as medium significant.

Mitigation Measures

- Fire protection and detection systems shall be provided and implemented to protect life, property, equipment, and operation of the powerhouse. The detection and fire alarm, fire protection and fire-fighting systems shall include, but not be limited to the following:
    - Firefighting water storage, may be combined with raw water tank, depending on local regulations;
    - Firefighting pumps;
    - Fire water ring main system, including hydrants;
    - Fire protection systems; and

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- Fire alarm and detection system.

- The building / tunnel shall be subdivided into various fire areas, separated by approved fire resistant barriers and elements;
- Fire walls, ceilings and partitions shall have a fire resistance rate of not less than 2 hours;
- All penetrations for electrical cables or pipes in fire resistant walls or ceilings shall be sealed with approved seals;
- One electric motor driven fire pump and one electric motor driven stand-by fire pump, located in a pump house adjacent to the water storage tank, shall draw fire fighting water from the tank and supply it through the fire service main to the hose stations and water spray fixed systems. One electric motor driven jockey pump with a capacity of approx. 3 l/s shall also be provided to keep the line pressure of 5 bars. The fire pump shall have a capacity of approx. 40 l/s at a delivery head of approx. 6 bars;
- The water spray fixed systems shall be designed, installed and tested in accordance with NFPA15;
- The total flooding carbon dioxide extinguishing systems shall be designed in accordance with NFPA 12, standard on carbon Dioxide extinguishing systems (latest edition) and will be adopted for the fire protection of Attabad HPP generators;
- The selection, installation and testing of portable fire extinguisher shall be in accordance with NFPA-10 for initial firefighting. Portable fire extinguishers with capacities of 6 kg chemical dry powder, for rooms containing electrical equipment with capacities of 5 kg clean agent, shall be provided and placed in the rooms and buildings at strategic locations and next to exits;
- In addition to the portable extinguishers, two mobile 30 kg clean agent, and two mobile 50 kg dry powder extinguishers, mounted on wheeled hand carts and furnished with 6 m hoses, shall be provided and located in the machine hall of the powerhouse and GIS floor and diesel generator room; and
- All systems shall be subject to the approval of the insurance company. The system shall be complete with all necessary piping, pumps, safety valves, mobile equipment, and vehicles. The EPC Contractor shall prepare an Emergency Response Plan (ERP) to cope with the emergency situations. Fire protection system for Generator fire protection system is also recommended.

8.6.1.5 Ambient Air Quality and Climate Change Aspect

Potential Impact

The air quality of the area will improve significantly in comparison to construction phase. Vegetation cover in the area will also increase after tree planation. However, during operation phase, operation of stand-by generator and un-necessary idling of diesel run will also result in the emission of pollutants (CO, Smoke, NO_2, SO_2, $PM_{2.5}$ and PM_{10} etc.) into the air, thus deteriorating air quality. Ambient Air quality may also be affected during the maintenance works of subprojects. These emissions may adversely affect the health of the nearby residents and working staff. This impact is moderate in nature.

Mitigation Measures

- Ensure the use of low Sulphur fuel;

- Ensure plantation of trees around the project area that will help in absorbing the emissions;
- The height of the generator stacks shall be enough to disperse the emissions in the air; and
- Ensure compliance with NEQS and provision of budget for regular monitoring of ambient air quality in accordance with the NEQS.

8.6.1.6 Noise and Vibration

Potential Impact

During operation phase, noise and vibration levels may be generated due to the operation of proposed project, standby generators and traffic which will be a constant source of nuisance for the staff and the nearby communities. Noise levels may also be increased during the maintenance works. The significance of this impact is considered to be low adverse.

Mitigation Measures

- Ensure regular maintenance and periodic checking all parts of the standby generators, replacement in case of malfunctioning and periodic noting of noise levels;
- Installation signs to disallow the use of pressure horns;
- Plantation of trees will also help to attenuate the noise impacts to the surrounding area;
- Ensure compliance with NEQS and provision of budget for regular monitoring of noise levels in accordance with the NEQS and vibration (where applicable).

8.6.1.7 Change in Land Use

Potential Impact

During the operational phase the land use pattern of the area will be changed to some extent. The commercial and recreational activities will also be increased which may affect ecosystem of the area and bring economic boom in the area. This impact is Site-specific, Long Term, Irreversible, Likely, Medium Significant.

Mitigation Measures

The tree plantation will be carried out in and nearby the Study Area and will have positive impact on the eco system of the area.

8.6.2 Ecological Environment

8.6.2.1 Flora

Potential Impact

During operational stage of the Project, there will be minimal effect on flora or release of any significant pressure detrimental to flora. Low level impact is expected at operational phase on Flora due to the operation and maintenance activities. This impact is low Significant.

Mitigation Measures

- The implementation of plantation plan recommends compensation for cutting of trees and work should be started during operational phase to ensure the ecological balance and to avoid any impact on local environment;

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- Large scale planting with suitable indigenous trees, shrubs and ornamental plants in the form of tree groves, and linear plantation will be carried out in accordance with the Tree Plantation Plan to improve aesthetic value and offset the effect of removal of vegetation;
- Proper check and balance for above activities is highly recommended. Plantations so raised must be maintained according to the Silvicultural practices which includes proper irrigation, cleaning, pruning, thinning at prescribed intensity, silt clearance and trench-opening, etc.;
- Maintenance and security of the plantation should be done for at-least four years (in consultation with the Forest department). Measures such as fencing, watch guards and fire protection should be considered; and
- All activities must be done under the technical supervision of forest department

8.6.2.2 Fauna

Potential Impact

There is no protected area, game reserve, game sanctuary or national park in the project area so no major impact on wildlife and livestock in the area is expected through noise, vibration and any type of normal activity in the project area. This impact is Insignificant.

However, proposed reservoir area, which is nearly 8 Km in length, shall not be available for grazing to livestock and other wildlife existing in the area, which is adverse impact on fauna.

Mitigation Measures

Strict control must be exercised for stoppage of killing/poaching of available wildlife species (if any) by enhancing protection practices; and

The precautionary measures described for future shall also be applicable during operation phase as relevant for the conservation of wildlife species in the Study Area.

Improved micro climate and moisture conditions along the periphery of the reservoir will help in grass production and improved vegetation, which will be useful for livestock grazing and improve habitat for birds.

8.6.2.3 Aquatic Life

Once the construction phase is completed and water diverted at the site of weir will change the water flow regime from weir to powerhouse. The adverse impact on aquatic life will be due to low flow in the Hunza River especially during low flow season. The minimum environmental flow needs proper follow-up.

Mitigation Measures

- Annual restocking plan of fish fingerlings should be included in the said project to compensate the stock depletion due to decrease in fish breeding grounds.
- Fisheries research unit and a brown trout hatchery with research/management staff should be established at the project side for research purposes as well as impact assessment during operational phases of the project.
- To conserve the aquatic life of the river downstream of the weir, minimum flow of 3 m^3/s has been calculated as the environmental flow. It will be obligatory for project operating agency to release 3 m^3/s in the river throughout the year as environmental flow.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- The design recommended measures should be implemented and maintained by the proponents.

8.6.3 Socio-economic Environment

8.6.3.1 Safety During Reservoir Operation

Potential Impact

During operational stage of the Project, due to the impounding of the reservoir, the safety issues will arise. Main reservoir area is the major threat for accidents. Locals and workers can drown. This impact is site specific and high significant in nature.

Mitigation Measures

Since the reservoir was formed in January 2010 as a result of massive land slide and no new area would be submerged.

However, during operational stage of the Project, a security plan should be prepared for the reservoir area to prohibit youths from using reservoir for bathing, swimming and other recreational activities. Boating should not be allowed without the provision of life saving jackets and presence of a lifeguard.

8.6.3.2 HSE Considerations

Potential Impact

During the operation phase, health and safety issues related to workers and communities may arise. Operation and maintenance activities may cause health and safety risks such as movement of machinery and manual handling during loading unloading operation, poor handling and storage of hazardous substances, injuries due to electric shocks, falling of objects, slips or trips, dust, noise, accidents, transmittable diseases etc. The impact is moderate to low adverse in nature.

Mitigation Measures

- Ensure proper maintenance of machinery and equipment;
- Proper storage and handling of generator fuel, chemicals, solvents and other hazardous substances;
- Ensure emergency prevention, preparedness and response arrangements;
- Emergency numbers should be clearly posted and communicated to the staff and community (where applicable);
- Fire extinguishing equipment should be installed at adequate and appropriate locations;
- Ensure provision of PPEs to the skilled and unskilled labors and visitors;
- Proper training should be given to workers on health and safety measures;
- Hazardous materials should be well labeled and stored in their original containers;
- Ensure that the site will be restricted for the entry of irrelevant people;
- Ensure health awareness; education initiatives; training heath workers in disease treatment and prevention; immunization program and providing health service; and
- Staff will strictly warned, not to involve in any unethical activities and to obey the local norms and cultural restrictions.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

8.6.3.3 Water Rights in Lower Riparian

Potential Impact

The capacity of the reservoir at El 2,409 m.a.s.l is calculated as 125 Mm³, which is very small compared to inflows. As the Attabad Lake HPP is a run-of-river power project, with the implementation of the project there is no chance of reduction of discharge in the river except in the section between weir and end of tailrace (2 km). Presently, in this section of the river, water is not being used for any purposes either for human consumption or for agriculture. Therefore, it is anticipated that there will be no impact on human population due to the diversion of discharge into the tunnel, therefore, no mitigation is required.

8.6.3.4 Employment Opportunities

After completion of the construction works, employment opportunities will suddenly seize and unemployment for local residents may increase. However, with the experience gained from the proposed Project, the local people will have potential opportunities in future hydropower projects in GB, and other parts of country. WAPDA could develop a preferential system for local workers with good qualifications and experience at the end of construction of proposed Project. Construction workers could also qualify for positions in operation and maintenance activities.

8.6.3.5 Impact on Civic Amenities

The accessibility to the project area will be improved due to the construction of link roads and widening of existing road. Schools, mosques, dispensary will be constructed for the project staff but after the completion of the project these facilities will also be available for the locals of the project area. The impacts will be in the category of high beneficial.

8.6.3.6 Impacts on Local Public Health

The project area is lacking in health facilities. After the construction of this project, better health facilities will be available in the area which is a positive impact of the project.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

9 ENVIRONMENTAL MANAGEMENT PLAN

9.1 GENERAL

This Chapter provides an overall approach for the implementation, management and monitoring of the mitigation measures to reduce or avoid the identified potentially significant environment and social impacts for the proposed Attabad Hydropower Project. EMP provide institutional framework, resource allocations and environmental costs required to be included in the Project budget for the implementation of the suggested measures.

EMP is the tool for the implementation of the mitigation measures for the potential adverse environmental and social impacts during the project life cycle and covers all the stages from design to operation and maintenance. However, it is a live document and needs to be reviewed and updated at each stage of the Project based on the changes in the Project design monitoring and evaluation.

9.2 OBJECTIVES OF EMP

The basic objective of the EMP is to manage potentially significant adverse environmental and social impacts of the Project. The specific objectives of the EMP are to:

- Provide the details of the Project impacts along with the proposed mitigation measures, and the corresponding implementation activities;
- To ensure that all necessary corrective actions are carried out and monitored in time to counter any adverse environmental and social impact under a systematic monitoring approach;
- Provide a procedure for timely action in the face of unanticipated environmental situation;
- Define the role and responsibilities of the Project Proponent (WAPDA), EPC Contractor, Management Consultant and other key players in order to effectively communicate environmental and social issues among them;
- Define a monitoring mechanism, reporting frequency and identify monitoring parameters to ensure that all the mitigation measures are completely and effectively implemented;
- Design the training and capacity building plan for enhancing the capacities of the WAPDA, EPC Contractor and Management Consultant on environmental and social management;
- Identify the resources required to implement the EMP and outline the corresponding financing arrangements; and
- Define the requirements necessary for documenting compliance with EMP and communicating it to all the concerned regulatory agencies.

The EMP will be managed through a number of tasks and activities and site specific management plans. One purpose of the EMP is to record the procedure and methodology for management of mitigation identified for each adverse impacts of the Project. The management will clearly delineate the responsibility of various participants and stakeholders involved in planning, implementation and operation of the Project.

9.3 LEGAL REQUIREMENT

All the legal requirements have been discussed in detail in Section-2.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

9.4 INSTITUTIONAL SETUP FOR IMPLEMENTATION AND MANAGEMENT OF EMP

The institutional requirements for the implementation of EMP of the proposed project are provided in below sections.

9.4.1 Institutional Setup for Implementation and Management of EMP

The key players involved during construction phase of the proposed project are the WAPDA as proponent, GB EPA, Management Consultant and the EPC Contractor.

WAPDA will make EPC Contractor bound through contract documents to implement the EMP and other terms and conditions of the Environmental Permit/No Objection Certificate. The whole EMP will be included as a clause of the contract documents. Construction camps will be established after necessary approvals and submission of Site-Specific EMPs to be developed in the light of the relevant agencies' requirements, before commencement of construction works. The organizational setup for implementation of EMP during construction phase is provided in **Figure 9.1**.

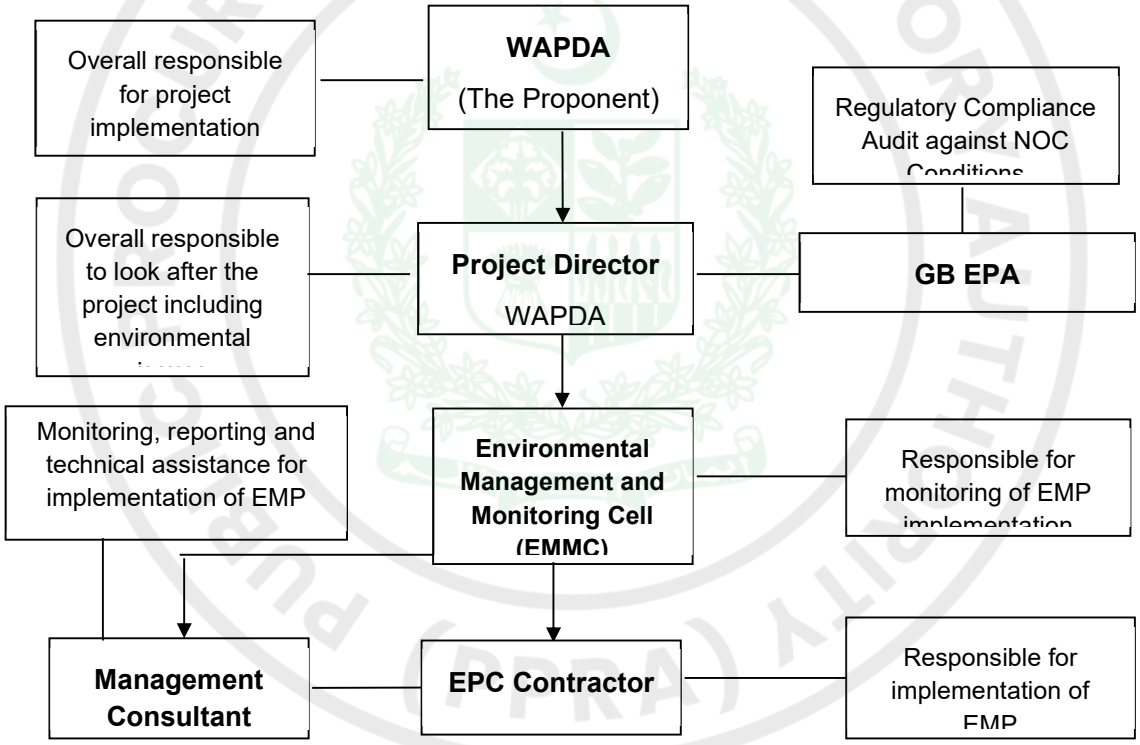

Figure 9-1: Institutional Arrangement for Implementation of EMP

9.4.2 Roles and Responsibilities for EMP Implementation during construction Phase

a. WAPDA / Environmental Management & Monitoring Cell EMMC

WAPDA will set-up Environmental Management/ Monitoring Cell (EMMC) specifically for ALHPP. The staff of EMMC will be deputed from WAPDA. The EMMC will be headed by Deputy Director Environment & Resettlement, who will report to the Project Director of Attabad Lake Hydropower Project. Deputy Director Environment & Resettlement will be assisted by a two member professional team consisting of Assistant Director Environment and Assistant Director Social. The EMMC will be responsible for the proper environmental monitoring

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

proposed under the Project, overseeing and coordinating the work of the Management Consultant on behalf of WAPDA. They will also be responsible for interaction with the Community/ NGO's etc. for socioeconomic and resettlement issues. The specific responsibilities of WAPDA/EMMC are as follows:

- Setting up systems for environmental management;
- Ensuring that the EPC Contractor develop and carry out environmental implementation plans that are consistent with the EMP;
- Liaising between the project staff and the Supervisory Consultant's staff to monitor environmental and social compliance during construction phase;
- Ensuring that the required environmental and social training is provided to the concerned staff;
- Responsible for carrying out random site visits to the construction sites to review the environmental performance of the EPC Contractors;
- Monitoring the progress of environment and social related activities;
- Make sure that the EPC Contractor is implementing the additional measures, suggested by the Supervisory Consultant in monthly environmental monitoring reports;
- To assist EPC Contractor for obtaining necessary approvals from the concerned departments;
- Maintaining interface with the other lined departments/stakeholders; and
- Reporting to the GB EPA on status of EMP implementation.

b. Management Consultant (MC)

The Management Consultant (MC) will administer the civil work's contracts, make engineering decisions, be responsible for quality assurance, provide general guidance and furnish timely responses to the EPC Contractor in all matters relating to the civil works, and ensure that all clauses of the Contract Agreement including environmental and social clauses between the civil works EPC Contractor and WAPDA are respected. MC will have a full-time field based environmental and social specialist to ensure the implementation of EMP. Two separate experts, one for environment and one for social aspects, will be hired. The environmental and social specialist of MC will also develop training modules, conduct environmental and social trainings for the EPC Contractor staff, and ensure social issues are properly addressed and mitigated during the project life.

Environmental and Social Experts (ESEs) of MC will oversee the performance of EPC contractor to make sure that the EPC contractor is carrying out the work in accordance with EMP as mentioned in the contract documents. He will provide guidance to the EPC contractor's ESE for implementing each of the activity as given in EMP. ESEs will be responsible for record keeping, providing instruction through the Resident Engineer (RE) for corrective actions and will ensure the compliance of various statutory and legislative requirements.

However, overall responsibilities of ESEs are as follows:

- To oversee the performance of the EPC Contractor to make sure that the Contractor is complying with EMP;
- Discussing various environmental and social issues and environmental mitigation, enhancement and monitoring actions with all concerned personnel's;

- Inspect, supervise and monitor all the construction and allied activities related to the EMP for the project and oversee the performance of the EPC Contractor to make sure that the EPC Contractor is complying with EMP;
- Visiting construction sites including incomplete construction work sites, where there is no contractor's activities, active construction work sites, completed areas of work sites, construction camps and workshop areas to ensure EPC Contractor compliance with EMP stipulations and conditions of statutory bodies;
- Assisting the EPC Contractor in all matters related to public contacts including public consultation pertaining to environmental and community issues;
- To organize periodic environmental training programs and workshops for the concerned staff;
- Periodic reporting as mentioned in EMP; and
- Suggest any additional mitigation measures (if required).

c. EPC Contractor

Site Environmental and Social Experts of EPC contractor will carry out the implementation of the mitigation measures at construction site. EPC Contractor will be bound through contract documents to appoint the Site Environmental and Social Experts with relevant educational background and experience. The responsibilities of ESEs of EPC Contractor are as follows:

- ESEs will be responsible for Implementation of the mitigation measures at construction site;
- ESEs will prepare Site Specific Environmental Management Plan (SSEMP) and will submit all the plans to the MC.
- ESEs of EPC Contractor will be responsible for the implementation of EMP and to take effective measures against corrective actions plan;
- ESEs will prepare the monthly compliance and monitoring reports as per schedule and will submit it to the MC;
- Provision of proper Personal Protective Equipment's (PPEs) to the workers and train them for their proper use;
- ESEs will conduct the environmental, health and safety trainings for the staff and labor; and
- The EPC Contractor shall submit the Code of Conduct that will apply to all of the Contractor's staff. The EPC Contractor shall submit an outline of how the Code of Conduct will be implemented. The aspects to be addressed include:
    - Ensure compliance with applicable environment, health and safety standards and procedures associated with risks and impacts of project activities;
    - Ensure compliance with all acquired approvals, applicable to the proposed project;
    - Ensure protection of local community (including vulnerable and disable assemblies), and the EPC Contractor's staff, sub-contractors and daily wage workers;
    - Ensure employment of fulltime security guards, and necessary security measures and instruments (CCTV) at site;
    - Ensure provision of adequately stocked first aid kit at site for dealing with accidental injuries, and natural hazards;

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- Prohibit use of illegal items such as weapons, alcohol and drugs at site;
- Ensure that project property is protected against vandalism, theft, and noxious activity;
- Ensure that positive attitude of respect and warmth is given to staff and community members;
- Ensure good housekeeping practices shall be adopted at site;
- Ensure that employment decisions are not made on the basis of personal characteristics unrelated to inherent job requirements, including race, gender, nationality, religion or belief, disability, age, sexual orientation, or ethnic, social and indigenous origin;
- Ensure establishment and strictly enforcement of “No Sexual Harassment Policy”;
- Ensure provision of necessary sanitation requirements for site workers (both for men and women);
- Ensure workers only use specified sanitary facilities provided by their employer and not in open areas;
- Restriction on burning solid waste;
- Restriction on dumping solid and liquid waste into nearby water bodies;
- Prohibition for cutting trees, and clearing vegetative areas for construction camps, and for cooking purpose as a source of fuel; and
- Prohibition on illegal hunting of local fauna.

The Code of Conduct should be written in local and simple language (Urdu and English) and signed by each site staff to specify that they have received a copy of the code; code explained and clarified to them; acknowledged adherence to this Code of Conduct as a condition of employment; and understood that violations of the Code can result in serious consequences. A copy of the code shall be displayed at strategic location of the site, and mainly in the EPC Contractor site office.

d. GB Environmental Protection Agency

GB EPA is the regulatory authority for issuance of NOC for the proposed project. As part of its mandate, protection of environment is its responsibility. Therefore, the agency will undertake an audit (as and when required) of the activities of the project (both phases i.e. construction and operation) with respect to the protocols as defined in EMP and in NOC. The specific responsibilities are as follows:

- Liaison with the Project Director of WAPDA on the proposed project to ensure compliance of measures as given in the EMP and in NOC issued by it for the construction activities of the proposed project;
- Environmental Audit of the activities being undertaken by WAPDA and all other relevant stakeholders as provided in the EMP and NOC through random site visits and meetings.

9.5 PARTICIPATORY CONSULTATION FRAMEWORK

This aspect has been discussed in detail in the Chapter 6.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

9.6 PLANNING FOR EMP IMPLEMENTATION

9.6.1 NOC and Other Approvals

- **EPA Approval Process**

The EIA report duly reconciled with WAPDA is to be submitted to GB EPA for obtaining NOC. A demand draft of required EIA review fee has to be deposited along with the report by the Proponent to GB EPA for initiating the review and EIA approval process. The approval from GB EPA is the mandatory requirement before commencement of the proposed project activities.

- **Provincial Departments of Wildlife, Forest and Archaeology**

At the feasibility stage of the project as per the requirement of EPA guidelines for the Sensitive and Critical Areas, concerned provincial forest and wildlife departments are informed through letters for the proposed project.

During the construction stage, if the implementation of the proposed project involves the clearing of vegetation and trees which belongs to the forest or wildlife department, the EPC Contractor will be responsible for acquiring a NOC from the provincial department. The application for an NOC will need to be endorsed by WAPDA. Similarly, if any Archaeological monument or site is crossed by or near to the proposed project concerned provincial archeological department needs to be contacted for NOC.

Where construction is to be carried out in the close proximity of the any archaeology sites (if identified during construction stage), WAPDA is required to coordinate with the concerned departments to ensure that the impacts are minimized. The EPC Contractor is also required to contact with concerned department before the start of the construction work.

- **Provincial Revenue Departments**

Under the national law, matters relating to the land-use and ownership are the provincial subjects and the revenue department of the concerned province is empowered to carry out the acquisition of private land or built-up property for public purposes, including on behalf of other provinces. For this purpose, the concerned department must lodge an application with the concerned provincial department to depute a Land Acquisition Collector (LAC) and other revenue staff, who will be responsible for handling the matters related to the acquisition and disbursement of compensation.

9.6.2 Stakeholder Coordination

Notwithstanding the efforts so far put in for public participation, this activity will have to be pursued through the forthcoming implementation phases of the Project. In particular, the focus will be on the improvement and modification of the proposed intervention designs.

Participation mechanisms facilitate the consultative process and include information sharing and dissemination, disclosure, and participation of affected people and other stakeholders in the proposed project related activities. In the particular social set-up of the project area, it is also important to involve the religious leaders as representatives of the public as well as part of effective communication process. They can provide a very effective medium to bring information to the affected male population through Friday prayers. Local business community, especially the affected one, should also be brought into the process of awareness and participation.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

The related institutional arrangements should also be in place for continuous consultation throughout the process of planning and implementation. During construction, WAPDA Node will have to implement EMP.

The construction schedule will be established / updated before the commencement of construction work considering the activities specifically suggested in EMP for its implementation.

9.7 ENVIRONMENTAL MANAGEMENT PLAN

The Environmental Management Plan (EMP) provides the framework for the implementation of the mitigating measures and environmental management and monitoring during the design, construction and operation phases of the proposed project. **Tables 9.1** shows impacts, targets, mitigations and the responsible organizations for the implementation of the mitigation measures during the design, construction and the operation phases respectively.

PUBLIC PROCUREMENT REGULATORY AUTHORITY (PPRA) EPADS

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Table 9-1: Environmental Management Plan

Sr. No.	Impacts	Mitigation Measure	Responsibility	
			Implementation	Monitoring
Design/ Pre-Construction Phase				
1	**Field Investigations and setting up of construction camps** Low level adverse impacts on the air quality, increase in noise level, contamination of surface water quality and soil erosion due to the pre-construction activities like geotechnical investigations including drilling, topographical surveys and seismic investigation will affect the existing settings. Activities like drilling, blasting, movement of machines and setup of EPC Contractor and Consultant camps will also impact the soil, wildlife, noise levels etc. This impact would be of medium significance	Good engineering practices and Standard Operating Procedures (SOPs) are required to be adopted by the EPC Contractor to mitigate this impact. Measures such as sprinkling of water on the roads and dirt tracks, use of water to reduce air pollution during the stone crushing operation and tuning of vehicles and equipment will reduce the air pollution. The excavated material will be managed by ensuring proper storage areas located far away from the water bodies. The choice and design of these measures such as reduction of slope gradient and height, reduction in slope angle, removal of unstable material, use of reinforcement material etc. will be the responsibility of the EPC Contractor. The EPC Contractor will be required to train his workforce in the storage and handling of materials, like oil, diesel, petrol and chemicals, etc., which may potentially cause soil contamination. Special measures will be adopted to minimize the impacts on the nearby settlements such as avoiding noise generating activities during night time, etc.	EPC Contractor	MC WAPDA
2	**Seismicity** The Project area falls in Seismic Zone 2B (moderate hazard), which represents Peak ground acceleration from 0.16 to 0.24g, where g represents acceleration	The proposed structure should be designed to withstand moderate to high earthquakes, a very careful analysis, followed by ICOLD Guidelines and using latest software, of the situation will be required during the design stage. For seismic hazard analysis, updated structural and seismic evaluations should be consulted.	EPC Contractor	MC WAPDA

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Sr. No.	Impacts	Mitigation Measure	Responsibility	
			Implementation	Monitoring
	due to gravity. In this Zone, designing of various types of structures are done on the basis of Peak Ground Acceleration (PGA). A high intensity earthquake impacting the poorly designed project site can adversely impact the future development.	Moreover, geo-technical investigations must be conducted prior to construction phase. Continuous monitoring of the behavior of faults will be required during the operation stage and contingency plans to deal with such a situation must be part of the project management. Instruments to monitor seismic activity must be installed at the time of construction. Based on the analysis, the following earthquakes design parameters are concluded and recommended for the proposed project: **Operation Basis Earthquakes (OBE):** OBE at return period of 145 years is recommended as follows: OBE Horizontal = 0.24 g and OBE Vertical = 0.17 g **Safety Evaluation Earthquakes (SEE):** For the design of dam / weir, the following PGA 'g' values for SEE (Safety Evaluation Earthquakes) are recommended: SEE Horizontal = 0.44g and SEE Vertical = 0.29g For the design of appurtenant structures, the following PGA 'g' values for SEE (Safety Evaluation Earthquakes) are recommended: SEE Horizontal = 0.38g and SEE Vertical = 0.26		
3	**Flooding**	Keeping in view the different types flood estimations and generation of high peaks due to GLOFs, it is	EPC Contractor	MC WAPDA

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Sr. No.	Impacts	Mitigation Measure	Responsibility	
			Implementation	Monitoring
	As river water will pass through the headrace tunnel and overflow spillways, there is a chance that these tunnel and spillways could not accommodate the flows in abnormal years, which may pose a threat to the main structures and this impact may be treated as High Significant	recommended to adopt design flood of 10,000 years return period at weir site. Therefore, design flood of 3,250 m^3/s at weir site has been assumed for the calculations of design of structures. It is also suggested to have close monitoring of Glaciers in Hunza Region to have better judgment of GLOFs and remedial measures for the safety of Attabad Lake and downstream areas. However comprehensive study will be undertaken during Detailed Engineering Design of the Project by EPC Contractor.		
4	**Resource Conservation** Resources involved in the construction of proposed Project would include water, fuel and construction materials. Excessive water consumption by the construction staff may stress water resources in the Project Area and in certain cases may disturb the existing water supplies in the Project Area. Construction material to be used for construction includes coarse aggregates, fine aggregates, asphalt, cement, sand, lining material, earthworks, reinforced and structural steel etc. . Almost all the materials to be used in the construction of proposed Project are non-renewable and	▪ Use water bowser tanks for construction works and mineral water bottles/ ground water for drinking purpose; ▪ Reduction of wastage of water through training of workers involved in water use; ▪ Reuse of construction waste materials may be adopted wherever possible; ▪ The efficient and well maintained equipment and machinery should be used; ▪ The equipment and machinery should be turned off when not in use; ▪ Ensure adequate insulation to reduce heat loss through batching plants; ▪ Regularly monitor CO and CO_2 content of the flue gases to verify that combustion systems are using practical excess air volumes; and	EPC Contractor	MC WAPDA

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Sr. No.	Impacts	Mitigation Measure	Responsibility	
			Implementation	Monitoring
	therefore their efficient use is necessary for the future use. Fuel will be used to operate construction machinery. Efficient use of energy resources is important to reduce air emissions. For conservation of energy, efficiency of the engines and burning processes is important. The impact significance is medium adverse	▪ A good camp design and an efficient worksite management plan can help the contractor to reduce the water demand, wastewater and solid waste volumes to the lowest levels.		
5	Flora During the pre-construction phase, activities such as installation of construction camps, construction of temporary roads and mobility of construction staff may damage the local vegetation/trees. As the heavy machinery and camps will be moved and installed, which require significant space due to which available vegetation is expected to be removed. This impact is site-specific, temporary, reversible, possible, medium significant and needs to be encountered prior to the start of construction stage.	▪ The camps, mobility of machinery and construction of temporary road should be properly planned and well designed to avoid any loss to local green cover; ▪ It is recommended to establish the construction camps where minimum or no vegetation exists; ▪ Similarly, the alternate routes for roads and location for camps are recommended where no loss of vegetation is expected; and ▪ An inventory of trees/vegetation may be prepared by the contractor with the help of concerned department (Forest) before clearing the site	EPC Contractor	MC WAPDA
6	**Fauna** As movement and installations of machinery and vehicles will take place so noise and habitat loss is expected. The	▪ As movement and installations of machinery and vehicles will take place so noise and habitat loss is expected. The routes of the available wildlife and other habitats may be affected due to camps set-up and machinery movements and installations.	EPC Contractor	MC WAPDA

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Sr. No.	Impacts	Mitigation Measure	Responsibility	
			Implementation	Monitoring
	routes of the available wildlife and other habitats may be affected due to camps set-up and machinery movements and installations. Temporary access road (if any) may also affect the habitat of locally available fauna. This impact is site-specific, temporary, irreversible, possible and low significant	Temporary access road (if any) may also affect the habitat of locally available fauna. This impact is site-specific, temporary, irreversible, possible and low significant		
7	**Aquatic Life** Fisheries Department Hunza has introduced several thousand fingerlings of exotic fish species namely Salmo Trutta Fario (Brown Trout) at Attabad lake and downstream river during the period from 2012 to date for propagation and the said specie has made breeding grounds at Attabad lake and downstream as well. Besides this a number of indigenous fish species also exist in the same water bodies having commercial as well as ecological importance. The destruction of habitat will have significant adverse impact on the aquatic life and fisheries. Fish usually migrate from one place to another for search of food, shelter and spawning/breeding. Due to implementation of the proposed Project fish migration might be affected up to some extent. Water requirements and movement of aquatics along with other risks may also be anticipated due to the	▪ Annual restocking plan of fish fingerlings shall be included in the project to compensate the stock depletion due to decrease in fish breeding grounds. ▪ Fish ladder shall be in sure for freely movement of fishes; ▪ Fish screening system shall be developed so that fish may not be trap at fore bay or penstock pipe or channel. ▪ Besides the above mentioned points, a Fisheries research unit and a brown trout hatchery with research/management staff should be established at the project side for research purposes as well as impact assessment during construction as well as operational phases of the said project. ▪ The establishment of fish hatcheries under this project should be ensured by GB Fisheries Department, Huzna in close consultation and coordination with GB EPA; ▪ The minimum flow to be ensured through the weir during the whole year. In case the hydrological records are enhanced, the figure of minimum	EPC Contractor	MC WAPDA

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Sr. No.	Impacts	Mitigation Measure	Responsibility	
			Implementation	Monitoring
	proposed project. This impact is categorized as medium to high significant.	requirement for maintenance of aquatic ecosystem has to be revised likewise; ▪ To conserve the freshwater fishery resources, it is important to involve fisheries scientists and local communities in all study phases of proposed project; ▪ Moreover, the impact on fish fauna, both up and downstream of the project site specially the migration patterns and breeding grounds need to be taken into account during all stages of the project and should be monitored by the contractor specialized professionals in consultation with GB, Fisheries Department Hunza; ▪ GB, Fisheries Department has authority to update, change and add/ recommend any standard as per law of land and in best public interest; and ▪ The custodian Department should have a close liaison with GB EPA and Fisheries Department GB to ensure the conservational aspects of fisheries during all stages of the project to avoid any negative impacts on local natural environment.		
8	**Permanent land** will be acquired for the Project components such as Powerhouse, Weir & Associated Structures, Access Roads and Project Colony. Total land to be acquired is approximately 183 acres (05 acres for Contractor's Camp, 60 acres for Project Colony and Powerhouse Area, 103 acres for Intake Area and Access Corridor and 15 acres for Spoil Area) for project components which includes both private	Government owned land for the Project area will be acquired as per the policy of government of GB. While private land will be acquired as per provision of LAA, 1894. The process of land acquisition will start before the Project will enter into construction phase and section-4 of land acquisition act, 1894 will be notified by relevant agency. The process of land acquisition and compensation should be followed in a transparent manner to minimize	EPC Contractor	MC WAPDA

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Sr. No.	Impacts	Mitigation Measure	Responsibility	
			Implementation	Monitoring
	and government land. The estimated total land to be acquired is 777.5 acres due to the impounding of reservoir up to maximum conservation level including free board, including river bed. This will result in loss of land. The estimation of land requirement will be finalized after the detail design by the EPC Contractor. The ownership record of affected land will be prepared by the Revenue Department according to separate categories of the land. The significance of impact is high adverse needs to be encountered prior to the start of construction stage	the impacts to provide judicious compensation to the displaced by providing sufficient budget in the project cost		
9	**Temporary Land acquisition** During the construction activities, EPC Contractor will establish contractor camps, storage areas for materials and equipment including vehicles, workshops, stockpile yard, etc. EPC Contractor need to lease the land for these areas in the vicinity of the construction sites. These areas will be acquired on temporary basis by direct negotiation and agreement with the owners or negotiated with or decided by the district administration office. Temporary acquisition will principally be the responsibility of the contractor. The	Land for above mentioned facilities will be directly rented from the private landowners by the EPC Contractor. The provisions of the Land Acquisition Act (LAA), 1894 will not be involved as the acquisition of the land will be temporary and will be covered by short-term lease agreements between the landowners and EPC Contractor. Temporary acquisition will principally be the responsibility of the EPC Contractor. Rental terms should be negotiated to the satisfaction of the concerned landowners and the agreement should be made in local language to make the process clear. As mentioned, the location of these areas are not finalized yet, therefore a criterion has been suggested which should be followed to avoid the adverse impact on the environment. The land for above mentioned	EPC Contractor	MC WAPDA

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Sr. No.	Impacts	Mitigation Measure	Responsibility	
			Implementation	Monitoring
	significance of impact is high to medium adverse.	facilities should be selected and leased prior to the start of construction phase. Lease agreement should also govern the process of site restoration of the leased or rented land after the construction phase and will ensure through the terms of the construction contracts that landowners are compensated according to the terms of the lease agreements and the site restoration plans agreed upon by the EPC Contractor are duly carried out. The following general site selection criteria have been suggested to be complied by the EPC Contractor: ▪ Minimize the resettlement, relocation of the existing infrastructure like roads, cultural and religious sites etc. and avoid the cutting of trees; ▪ It should be elevated to avoid floods and for other security reasons; ▪ Proximity to the major disaster and emergency management authorities; ▪ Avoid potentially security vulnerable areas; ▪ Minimize disturbance to the natural habitats of flora and fauna; ▪ Avoid densely populated areas/towns; ▪ Avoid wildlife sanctuaries, national parks and game reserves;		

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Sr. No.	Impacts	Mitigation Measure	Responsibility	
			Implementation	Monitoring
		▪ Appropriate distance from the sensitive receptors (for instance, minimum 500m); and ▪ Avoid cultural, religious and historical buildings		
10	**Impact on structures** In the reservoir area of the proposed project miscellaneous residential, commercial and community structures will be affected due to the project intervention. These structures will be demolished permanently and will have to relocate and move their dwellings elsewhere. The community and religious structures are very sensitive to impact and need special care during execution of the project; because people think that these structures might not be rebuilt if once demolished. A graveyards fall in the reservoir area of the proposed Project. Shifting and demolishing of the graveyard may cause serious social issues. Due to adverse impact on the residential, commercial, and community structures, human disturbance will occur which create magnitude social, gender, livelihood and cultural issues. This impact can be categorized as negative, local, high, permanent and irreversible. The inventory of structures along with the detailed measurement of structures will	▪ Due consideration should be given to minimum and no impact on the residential, commercial, and religious structures; ▪ Compensation for the affected structures should be evaluated and provided as per market rates. ▪ Compensation should be given for all affected crops and trees; ▪ The effort will be made by making changes in design to avoid the sensitive and religious structures and to minimize the issues at possible extend. If needs demolishing/shifting, a mechanism will be developed for the restoration of these structures during the detailed design by the EPC contractor with the community consultation; ▪ Affected Persons should be compensated on full replacement cost of each category to construct a new structure of the same type; and ▪ Proper consultations and coordination's with project affected persons during resettlement process.	EPC Contractor	MC WAPDA

Sr. No.	Impacts	Mitigation Measure	Responsibility	
			Implementation	Monitoring
	be completed by the EPC contractor during the phase of detailed planning.			
11	**Impact on Social Life** During the planning and design phase of the project, it is anticipated that there will not be any potentially significant adverse impact on the socio-economic environment. Locals may be temporarily disturbed due to the field investigations and drilling activities, disturbance to electricity poles and existing track/roads within project boundary. This impact can be categorized as medium Significant.	▪ Proper compensation and restoration mechanism of public utilities will be considered during the detailed design of the Project; ▪ Complete rehabilitation of affected public utilities will be ensured; ▪ The provision in the design and budget for the relocation of the existing utility infrastructures wherever required shall be finalized in consultation with the concerned department; ▪ Close coordination with the concerned departments to curtail inconvenience to the residents of the Project Area; ▪ Timely public notification of unexpected disruption of services; and ▪ Good engineering practices shall be adopted to avoid or reduce these impacts.	EPC Contractor	MC WAPDA
Construction Phase				
1.	**Aesthetic value of the project area** Attabad Lake is an important recreational site for the tourists including foreign visitors. Construction activities may result in some visual impacts. The construction activities will involve the cutting of trees/bushes, excavation, soil filling and cutting operation. This disturbs the natural scenic value of the environment. In	The adverse environmental impacts related to the aesthetic could be effectively minimized at the construction phase. These will be mitigated by the control of clearing vegetation to the area in the construction limits and by plantation and quick re-vegetation during the construction phase. Good house-keeping, cleaning, efficient solid waste management system should be implemented to improve the aesthetics of the working environment.	EPC Contractor	MC WAPDA

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Sr. No.	Impacts	Mitigation Measure	Responsibility	
			Implementation	Monitoring
	addition to that the sitting of construction equipment and the lacks of resurfacing/replanting of exposed areas are also the leading factor to aesthetic reduction. The impact significance is medium adverse.	▪		
2.	**Topography** Construction activities are not expected to impact the topography of the area significantly except for those areas where physical activities including digging and excavation, storing or dumping sites for excessive material and movement of heavy construction machinery will be carried out. The excavated material will be generated due to the construction of various components of the Project such as construction of Coffer Dams, Sediment Flushing Tunnel/Under sluice, Weir, Headrace Tunnel, Surge Tank, Penstock, Powerhouse, Tailrace Channel, Project colony. The area where excavated material is to be dumped may also be impacted. The impact significance is medium to low adverse.	▪ The excavated material will require safe disposal by the EPC Contractor. Most of the excavated material could be used in back filling purpose, where applicable. A detailed development and operation plan for borrow areas must be prepared by the EPC Contractor before the starts of extraction of material from each borrow area. EPC Contractor should strictly follow the provisions of approved plan in order to minimize any adverse impact associated with the borrow areas. Likewise, excavated material should be dumped at suitable and approved disposal sites	EPC Contractor	MC WAPDA
3.	**Land Slide**	To avoid the major risks, all structures have been proposed on the left bank of Hunza River. Blasting should be avoided or minimized where possible, if inevitable then low intensity explosive material should be used instead of high intensity explosive material. It is	EPC Contractor	MC WAPDA

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Sr. No.	Impacts	Mitigation Measure	Responsibility	
			Implementation	Monitoring
	Landslides are common in the project area Due to the Project activities, especially in case of blasting or cutting of rocks in some areas, the formation will become loose and the risk of landslides will increase in the immediate vicinity of the construction sites, especially at the right bank of Hunza River, which may be considered as a high adverse impact. The impact significance is high to medium adverse.	strongly recommended to perform appropriate confirmatory geotechnical investigations all along the alignment of Headrace tunnel and other components for assessing strength parameters of natural material either rocks, moraines or scree. This shall be done so that safety of this major Project component and adjacent areas can be ensured through proper design of cut slopes. ▪ Landslide risks shall be mitigated by the installation of safety barriers at construction sites, and monitoring and informing locals about construction schedules, and any weather events that might exacerbate landslide risk. Construction work will be avoided during rain to the extent possible. The EPC Contractor will prepare the Management Plan for blasting activities and implement the same after approval from the Supervision Consultant and Client		
4.	**Site accessibility** The proposed Project Area falls within the Hunza Valley which is located about 119 km from Gilgit city. The Project site can be accessed through Korakoram Highway (KKH) which is the only major mode of transportation in the Project area. Heavy vehicles will be utilized to transfer construction plants, equipment, construction materials, cement and fuel. These activities may have adverse impacts on the existing infrastructure. Apart from that it may cause air and noise	The access roads to the hydropower site have to be pre-determined in consultation with the concerned departments. Access roads would have to be widened and/or improved to carry the anticipated load of traffic. During the course of construction of proposed Project, EPC Contractor will provide the signage and/or traffic control to the extent deemed necessary by the traffic utilizing or accessing the site roads. These signs will inform, control, warn, shift, or stop traffic on all site roads affected by the Project's heavy traffic. The following measures will be taken by the EPC Contractor during	EPC Contractor	MC WAPDA

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Sr. No.	Impacts	Mitigation Measure	Responsibility	
			Implementation	Monitoring
	pollution. The impact significance is high to medium adverse.	the construction phase for the effective implementation of the traffic plan: ▪ National and local traffic rules and regulations, instructions manual for motor vehicle and mobile machinery operation should be followed; ▪ No one will be allowed to drive motor vehicle or operate mobile machinery without a driving license; ▪ It should be prohibited to drive or operate vehicle in case of over fatigued or mental disease; ▪ Traffic speeds on unpaved roads should be limited to no more than allowable traffic speed; ▪ Traffic speed signs should be displayed prominentl y at all site entrances; ▪ A daily routine check-up of vehicles should be conducted no less than 5 minutes before its service; ▪ Use of appropriate signs, equipment, and traffic control measures that conform to the provisions in the traffic manual of city traffic police; ▪ Traffic inspection and security during transportation; ▪ Limit vehicular traffic designated access roads, construction laydown area, parking areas and the Project site; ▪ All damaged, destroyed or modified pavement legend, traffic control devices, signing and striping associated with the proposed development should be replaced as required prior to issuance of a certificate of occupancy; and		

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Sr. No.	Impacts	Mitigation Measure	Responsibility	
			Implementation	Monitoring
		▪ Construction signs, lighting and barricading should be provided during construction as required. ▪ The EPC Contractor should also be responsible to prepare a comprehensive Traffic Management Plan and follow the conditions of Contract Agreement.		
5	**Natural Drainage** Construction activities such as excavation, filling and construction will affect the existing soil pattern in the Project Area including water pathways its surroundings. In addition, this will lead to changes in the existing drainage pattern. The conditions will be more hazardous during the flood periods and may affect the construction activities. The impact significance is high to medium adverse.	During the construction phase, excavated material should be properly disposed of ensuring that it will not block the natural drainage paths. Open drains for drainage of rain/flood water should be constructed, if considered necessary during construction period. ▪	EPC Contractor	MC WAPDA
6	**Soil Contamination & Erosion** During the construction phase of the proposed Project, large quantities of materials, chemicals, fuel and lubricants will be used apart from the generation of solid waste and liquid waste from the construction camps. Fuels and chemicals will be stored at the site for their immediate use, which will contaminate the soil if not handled properly particularly	▪ Sites disturbed by construction activities will be restored to their original conditions upon completion of construction work and photographic record will be maintained to ensure pre-post subproject conditions intact; ▪ Soil contamination by asphalt should be minimized by placing all containers in caissons; ▪ The EPC Contractor will be required to instruct and train their workforce in the storage handling and management of materials and chemicals that can potentially cause soil contamination;	EPC Contractor	MC WAPDA

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Sr. No.	Impacts	Mitigation Measure	Responsibility	
			Implementation	Monitoring
	at asphalt plant sites, workshop areas and equipment washing yards. Similarly, removal of vegetation and shrubs for the purpose of construction activities will lead to loosing of the soil, soil disturbances, and exposure of bare soil surface. This causes problems of soil erosion during rain. Similarly, steep gradients increase erosion on these slopes due to reduced water infiltration and increased runoff accumulation. Soil erosion may also occur in the workshop areas as a result of improper drainage system of equipment washing-yards and improper management of construction activities. The impact significance is high to medium adverse.	▪ Material Safety Data Sheets (MSDS) will be strictly followed during handling and storage of chemicals; ▪ If any contaminated soils are found at the construction sites or at camp sites, they shall be removed and deposited in a sealed pit in at designated area; ▪ The EPC Contractor will be required to prepare training manual and modules for all the construction related activities along with the schedule of training program and submit to the Supervision Consultant for approval; ▪ Solid waste generated at the camp sites will be properly treated and safely disposed only in the demarcated waste disposal sites/areas; ▪ Subproject sites will be selected to avoid or minimize vegetation removal/clearing which would accelerate erosion and increase landslide risk; ▪ The EPC Contractor shall adopt good engineering practices that will help to control or minimize the soil erosion both at the construction sites and in peripheral areas. All the disturbed areas need to be protected against soil erosion by stripping and stockpiling of all the available topsoil for later re-vegetation. Special slope protection measures will be adopted in the sensitive areas; and ▪ Site restoration plan for the Project should be strictly followed.		
7.	**Wastewater Generation**	To dispose the liquid waste generated from the construction activities, the following steps will be taken by the EPC Contractor:	EPC Contractor	MC WAPDA

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Sr. No.	Impacts	Mitigation Measure	Responsibility	
			Implementation	Monitoring
	Wastewater will be generated at the construction camps, from construction activities an residential colony (for EPC Contractor, the Consultant and the Employer staff). If the generated wastewater is not properly treated or disposed of, this may contaminate the surface water apart from soil contamination. Water from dewatering activities (during rainy season) has the potential to contain suspended solids and oil and grease and if disposed of untreated may affect the soil quality.	▪ Domestic and chemical effluents from the construction camp will be disposed by the development of on-site sanitation systems i.e., septic tanks; ▪ The domestic sewage will be treated with biological treatment technology and will be discharged as per NEQS. Proper monitoring to check the compliance of NEQS will be carried out; ▪ Proper monitoring to check the compliance of NEQS will be carried out. Septic tank will be located adjacent to the construction camp; ▪ Sewage from construction camps will be disposed of after proper pre-treatment; ▪ Water discharged to drains should contain a minimum quantity of suspended solids; and ▪ Site for construction camp will be selected at least 500 m away from the settlements		
8.	**Solid Waste** Different types of waste including construction (waste concrete and asphalt, empty containers, excavated material), municipal (from construction camps) and hazardous wastes (including empty containers of paint, lubricants, grease, fuel oil, electrical wiring, pipis etc.) are likely to be generated during the construction phase of the proposed	▪ Minimize the generation of spoils by recycling the excavated rock to the maximum extent possible by using them as aggregate material in the concrete works; ▪ Construction waste will be routinely collected and safely disposed of in clearly demarcated waste disposal sites located near each subproject site following international best practices; ▪ Waste disposal will be carried out following international best practices and will ensure that there are no negative impacts on soil, water bodies,	EPC Contractor	MC WAPDA

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Sr. No.	Impacts	Mitigation Measure	Responsibility	
			Implementation	Monitoring
	Project and from the EPC Contractor's Camps (the solid waste generation is estimated to be 157.5 kg/day (as per 0.45 kg/capita/day waste generation)[20] for 350 construction workers) which may have potential to serve as breeding grounds for the disease spreading vectors and rodents. During the construction phase, significant quantities of rock will to be excavated. In order to reduce the amount of rock to be disposed, excavated rock can be used in the Project for different types of infrastructural works. The remaining spoil will be disposed in designated and safe disposal areas. Throwing away of solid wastes into water channels may cause blockages in drainage channels, contamination of nearby water bodies and soil contamination (render them unfit for plantation). Empty containers containing the toxic, flammable and corrosive materials may pose hazard to the workers. This may result in health risk to work force and public, if disposal site is improperly selected.	existing waste management systems, transport routes, and aesthetic value of the area; ▪ The debris produced during construction would preferably be dumped at nearby depressions rather than being thrown away and left unattended. Leftover material would not be dumped into water bodies; ▪ The labor workforce (including community labor) will be trained on the handling, storage, and disposal of construction waste. Burning of waste shall be prohibited; ▪ PPEs shall be provided and worn by the personnel involved in construction activities and training them in their use; ▪ Waste containers with proper color coding will be provided on site to store different type of waste; ▪ Site Specific Solid Waste Management Plans (SWMPs) will be developed and implemented by Contractors; and ▪ It will be ensured that no waste or left over construction material is left behind in the cultivation fields		

[20] *The World Bank Report 2012 – What a Waste: A global review of solid waste management. Based on UNEP estimates for waste generation in the Asia Pacific. Average is 0.45 kg/capita/day*

Sr. No.	Impacts	Mitigation Measure	Responsibility	
			Implementation	Monitoring
	All these, if left unattended, can become a source of nuisance and environmental pollution in the subprojects area. Discarded materials and equipment may also pose traffic safety risks if left on or near transport routes. This impact is moderate adverse in nature.			
9.	**Surface Water** Surface water quality of the Attabad Lake may get deteriorated due to the construction activities. During the construction phase of the proposed Project, materials like sand, gravel and stones will be required in large quantities. Extraction of the materials will also affect the surface water quality by increasing the sediment load. This water will be used during different construction activities. The movements of heavy vehicles on the unpaved tracks, excavation activities, cut and fill processes in the Project Area, fuel and chemical spills may deteriorate the quality of the surface water. These activities will also increase the sediments and turbidity of the water. Waste streams can bleed toxic materials from items such as batteries, used	The excavated material will be managed by ensuring proper storage areas located far away from the water bodies. All the solid waste from the camps should be properly collected at source by placing containers and disposed of through proper solid waste management system. To reduce the impact of sediment, load the EPC Contractor should make arrangements such as fine screens and drains to limit the siltation into the water bodies. A simplified sedimentation tank shall be built on the construction site for the primary treatment of the construction equipment wastewater, detergents and mud. Wastewater effluent from the Contractors' workshops and equipment washing-yards should be passed through gravel/sand beds to remove oil/grease contaminants before discharging into the natural streams. This is the general guideline principle for the contractor. Appropriate sanitation and water supply facilities will be provided in the labor camps. Spillage of fuel/oils and other construction materials shall be contained with best handling/construction practices and strict skilled supervision. The EPC Contractor will ensure that construction debris does not	EPC Contractor	MC WAPDA

Sr. No.	Impacts	Mitigation Measure	Responsibility	
			Implementation	Monitoring
	computer equipment, leftover paints and pathogenic organisms include specific strains of bacteria like E. coli into the leachate of dumps. Leachate from waste piles caused by exposure to precipitation and from residual liquids in the waste itself may contain organic matter, nutrients, metals, salts, pathogens, and hazardous chemicals. If allowed to migrate, leachate can contaminate surface water. This impact is moderate adverse in nature.	find their way into the water bodies without proper treatment Treating and disposing the sewage in a manner that the soil and water is not contaminated and ensure compliance with NEQS or international standards/guidelines, whichever is stringent will be followed.		
10.	**Ambient Air Quality and Climate Change Aspects** During construction period, the impacts on air quality are mainly due to material movement and the construction activities (particularly blasting of rocks, operation of batching and mixing plants, drilling, stone crushers) causing an increase of emission of carbon monoxide, sulfur oxides, nitrogen oxides, un-burnt hydrocarbons and other greenhouse gases, as well as fine particulate matter. The pollution causing activities during the construction phase are: loading/ unloading and stocking of construction	▪ In order to reduce the dust emissions in the construction area due to material transport and construction activities, provisions will be made for sprinkling of water in the area where earth filling, excavation and other dust emissions causing activities being carried out. It will be ensured that the construction debris is removed on daily basis; ▪ Construction materials and spoil materials will be transported through trucks covered with tarpaulins. During windy conditions stockpiles of fine material will be wetted or covered with plastic; ▪ In no case, loose earth will be allowed to pile up along the approach roads/ public access areas; ▪ PPEs such as dust masks will be made available to the construction workers at the site to avoid potential health hazards;	EPC Contractor	MC WAPDA

Sr. No.	Impacts	Mitigation Measure	Responsibility	
			Implementation	Monitoring
	material, transportation of construction and excavated material, diesel generator, construction equipment, vehicles rock cutting operations, site clearance, excavation, concrete batching and concrete mixer. The ambient air quality over the immediate influence area will be affected and the criteria pollutants levels and greenhouse gases in ambient air might increase, over longer distances depending on atmospheric conditions. Emission of greenhouse gases causes global warming and other climatic changes on regional and global scale. Cutting of trees will also reduce the carbon sequestering and overall increase the CO_2 content in atmosphere. The impact of emissions is assessed to be temporary and moderate and is unlikely to have lasting impacts after construction work is complete	▪ Idling of delivery trucks or other equipment will not be permitted during periods of unloading or when they are not in active use; ▪ Open burning of solid waste at construction site will not be allowed; ▪ All vehicles and other equipment used during construction will be properly and regularly tuned and maintained; ▪ Ensure compliance with the NEQS; ▪ Diesel generator should be fitted with acoustic enclosure and stack of appropriate height for the proper dispersion of emission; ▪ Awareness programs of causes and effects of climate change will be conducted for mitigating GHG emissions, ensure plantation of trees and use solar panels where possible; ▪ Regular monitoring of air quality in accordance with the formulated environmental monitoring plan (given in EMP).		
11	**Noise and Vibration** Noise and vibration will occur due to the operation of construction machinery and other equipment. The major sources of	▪ Construction vehicles and machinery will be kept in good working condition, and be properly tuned and maintained through the duration of construction work with the objective of minimizing excessive noise and vibration; ▪ High noise/vibration emitting equipment will be used during regular working hours (9 AM to 5 PM) so as to reduce the potential of creating a noise nuisance during the night to nearby communities. This	EPC Contractor	MC WAPDA

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Sr. No.	Impacts	Mitigation Measure	Responsibility	
			Implementation	Monitoring
	noise and vibration[21] are construction activities, movement of vehicles, construction equipment, blasting, drilling, pouring equipment, stone crushers and generators etc. High background noise levels can cause significant disturbance to local wildlife, and have adverse psychological and physiological effects on individuals residing in nearby communities. Significant noise pollution impacts are expected only during the construction phase of activities involving large civil works. The cumulative effects from several machines can be significant and may cause significant nuisances. In all cases, the impacts are likely to be short-term and mitigatable and will not have any lasting effects once construction activities have completed. The significant impact may be of high magnitude for the labor working in a place that is close to the area where explosives are in operation. This impact medium adverse in nature.	equipment will be fitted with noise reduction devices such as mufflers and silencers wherever possible ▪ The vibration from major construction activities such as excavation, compacting, drilling, blasting, etc. are considered intermittent and short-term, and likely to be tolerated if prior warning is given to potentially affected residents; ▪ Vibration measurement will be carried out during construction phase by the EPC Contractor near the settlements; ▪ Personal Protective Equipment (PPEs) shall be provided and worn by the personnel involved in construction activities and training them in their use; ▪ Construction schedules will be disclosed to all nearby communities within vicinity of project sites prior to commencement of construction work; ▪ The EPC Contractor shall ensure the compliance with NEQS; and ▪ All complaints will be recorded and responded to in a timely and professional manner.		

[21] *According to British Standards of Noise and Vibration, humans are particularly sensitive to vibration with the threshold of perception typically being in the range of 0.14 to 0.3 mm/sec. Peak Particle Velocity (PPV) and levels above this may cause annoyance. However, significantly higher levels than this can be tolerated for single short-term events and do not cause annoyance or disturbance to humans.*

Sr. No.	Impacts	Mitigation Measure	Responsibility	
			Implementation	Monitoring
12	**Flora** The project will involve destruction of vegetation cover due to the implementation of proposed Project. It is initially examined that approximately 575 number of trees/saplings may be affected (**Annex - II**) due to proposed project activities. The number of possibly impacted trees is calculated by using Remote Sensing technique through GIS and field observation. Moreover, no impact on the production of medicinal plants is anticipated, as the area has least number of these plants. Exhaust of noxious gases from movement of heavy machinery and dust will pollute air which will adversely affect health and vigor of plants. During construction activities the EPC Contractor's workers may damage the vegetation and trees (for use as fire-wood to fulfill the camps requirements). This impact is categorized as medium significant. **Loss of Agriculture Land** Due to the impounding of reservoir area, based on 2424 m.a.s.l, it is estimated that about 14.28 acres of crops of agriculture land may be affected. However, it is anticipated that there will be no impact on agriculture land due to the construction	▪ Incorporate technical design measures to minimize removal of trees, if possible; ▪ Cutting of trees and disturbance shall be avoided, as far as possible so, that negative effects on the process of natural regeneration of species are minimized; ▪ A tree plantation program shall be formulated with the recommendations and technical support of concerned Forest Department; ▪ As a principal, ten trees shall be planted in place of felling of one tree in consideration of mortality. Total 5,750 trees will be planted in lieu/compensation of 575 affected trees of similar floral function at the available spaces in/around the project area; ▪ Proponent shall implement the plantation program with the help of Forest Department and with the consultation of Supervision Consultant; ▪ The Forest Department shall involve the communities (if required) for carrying out plantation; ▪ Open fires should be banned in the area to avoid hazards of fire in the area; ▪ Clearing of vegetation cannot be avoided at the areas specified for project structures, but damage to the natural vegetation may be minimized by establishing camp sites, workshops and batching plants on waste/barren land rather than on forested or agriculturally productive land; ▪ However, if such type of land is not available, it shall be ensured that minimum clearing of the vegetation	EPC Contractor	MC WAPDA

Sr. No.	Impacts	Mitigation Measure	Responsibility	
			Implementation	Monitoring
	activities for other components (such as weir, headrace tunnel, surge tank, penstock, powerhouse, switchyard and tailrace). This impact can be categorized as medium significant. **Pasture and Grazing Land** The Power House will be constructed on the communal land owned by the Ganish village, having grazing area. Similarly, impounding of reservoir area may also result in loss of vegetation cover which will subsequently affect the community's pasture and grazing area and livestock. This impact is categorized as permanent, irreversible and moderate in nature.	is carried out and minimum damage is caused to trees and undergrowth; ▪ Construction vehicles, machinery and equipment will remain confined within their designated areas of movement; ▪ The EPC Contractor's staff and labor shall be strictly directed not to damage any vegetation such as trees or bushes; ▪ EPC Contractor shall provide gas cylinders at the camps for cooking purposes and cutting of trees/bushes for fuel shall not be allowed; ▪ Compensation for the loss of crops to the land owners and cultivators as the case may be will be paid, in accordance with the prevailing market prices and uniformity in rates will be ensured within the local areas; ▪ The whole process of the payment to the farmers will be made transparent, judicious and without any discrimination or favour; and ▪ As far as possible, barren land without any crop will be selected for the camp sites and disturbance to the crops and natural vegetation will be avoided as much as possible.		
13	**Fauna** During construction phase the existing population of mammals and reptiles of the construction areas may be affected due to disturbance arising from construction	▪ Care shall be taken during construction activities for avoiding purposely or chance killing of animals; ▪ If found any wild species and habitat during construing that must dealt carefully and local wildlife department officials should be called;	EPC Contractor	MC WAPDA

Sr. No.	Impacts	Mitigation Measure	Responsibility	
			Implementation	Monitoring
	activities involving excavation, movement of machinery and vehicular traffic, movement of labor, camping, blasting, excavation, drilling etc. The existing animals will leave the directly affected areas due to construction activities and human intervention. Some animals particularly reptiles may get killed during the earthwork's operations. Moreover, the movements of the mammals and reptiles will be restricted during the construction phase; Birds as well will tend to move away from the construction areas and find shelter and food elsewhere due to the activities mentioned above for fear of being hunted / trapped. Noise generated from machinery particularly during the night hours will even scare the wildlife residing in habitats located at some distance from the construction areas. Uncontrolled blasting may even disturb the wildlife of the Project Areas. Food and refuse at the EPC Contractor's camps may attract animals that might in turn be hunted by the workers. This impact is medium significant.	▪ Hunting, poaching and harassing of wild animals shall be strictly prohibited, and Contractor shall be required to instruct and supervise its labor force accordingly and clear orders should be given in this regard; ▪ EPC Contractor must be held responsible for instructing his work force accordingly and for enforcing this restriction. In addition, this shall have to be controlled by the Wildlife Department; ▪ Client must have obtained NOC from the relevant departments prior to construction phase; ▪ Special measures shall be adopted to minimize impacts on the wild birds, such as avoiding noise generating activities during the critical periods of breeding; ▪ Similarly, wastes of the camps shall be properly disposed of to prevent it being eaten by animals, as it may be hazardous to them; and ▪ Noise produced by construction activities may be kept to acceptable level and ensure compliance with NEQS		
14	**Aquatic Life** During construction phase of proposed Project, cutting, blasting, excavation,	▪ Solid waste generated from construction and camp sites will be safely disposed in demarcated waste disposal sites and the EPC Contractor will provide	EPC Contractor	MC WAPDA

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Sr. No.	Impacts	Mitigation Measure	Responsibility	
			Implementation	Monitoring
	drilling, extraction, removing and dumping activities of materials at large scale will contribute heavy sedimentation and soil erosion which may cause habitat destruction, contamination and toxic accumulation of waste not only at Attabad lake but its impact can be seen downstream up to confluence of Gilgit River and beyond. Heavy machinery and equipment shall be used during construction phase, which may also result in heaps of leftovers of explosives, grease, chemicals, lubricants, and other harmful materials. These pollutants through run off rain water enter into the lake and river course increase toxicity of water causing rapid destruction of fish population and riverine ecology. This situation can contribute up to great extent to destruct the aquatic life, ecology, breeding and spawning grounds of fishes, benthic fauna, food chain and abundance of micro and macro living organisms. This may lead rapid shortage of food like benthic population, phytoplankton, zooplankton, nekton etc. which play an important role to sustain food chain with different trophic level in any eco-system. This impact is categorized as medium to high significant.	a proper waste management plan, to avoid the water contamination; ▪ Land sliding and soil erosion are also the main factor to contribute silt load on river bed manifold causing damage to resting and nesting grounds of fishes. Construction of protective walls and gabions at certain points to make sure the stoppage of sliding debris. Plantation and vegetation cover can also be helpful for slope stabilization. Plants, herbs and shrubs reduce the level of pollution and toxicity at a great extent as bio-filter and carbon suckers; ▪ Prior NOC from Fisheries Department may also be considered for smooth implementation of the project activities; ▪ The labour working at construction site should be aware to protect especially edible fish and to avoid fish catching by any means. As according to law of land fish hunt is prohibited with all types including net, cages and by the use of dynamite; ▪ Training of work force in the storage and handling of hazardous materials and chemicals should be encouraged and educated to practice waste minimization and reuse to reduce quantity of the waste; ▪ Immediate collection of spilled oils/fuels/lubricants by collection of contaminated soils and skipping oils from surface water by applying appropriate technologies; ▪ Construction waste should be crushed and reused in other sites, where possible;

			Implementation	Monitoring
16	**Social and Cultural Conflicts** During the construction phase of the project, conflicts may arise between labor force and local community. Use of local resources and products by the construction workers can generate stress on the local resources. Furthermore, difference in cultural values may also cause discomfort to local residents. This impact is medium adverse in nature.	▪ Local labor especially from nearby communities will be given preference for the construction works; ▪ Careful planning and training of work force to minimize disturbance to the local people; ▪ Public notification through print or electronic media during the entire construction phase to avoid any inconvenience in accessibility to the locals; and ▪ Adequate training of especially for the transitive workforce of the station (involved both in the construction process and in the commissioning) to regard the customs of the area so that the locals do not feel insecure. ▪ Code of Conduct will be prepared by the EPC Contractor and adopted during the project execution. All project personnel will be required to sign and follow the Code of Conduct.	EPC Contractor	MC WAPDA
17	**Occupational Health and Safety** Occupational Health and Safety (OHS) related impacts may arise during construction phase of the proposed Project due to installation of Contractor camp, movement of machinery & equipment, lifting operations, work at height, concrete pouring, working in night and manual handling during loading/unloading operation, as result of these works there will be a direct impact on the health and safety of all staff	▪ The EPC Contractor will be required to follow the national/local acts related to OHS and World Bank Group General EHS Guidelines, 2007. The EPC Contractor will prepare the site specific occupational health and safety plan; ▪ Occupational health and safety monitoring programs of the EPC Contractor should verify the effectiveness of prevention and control strategies; ▪ Providing basic medical training to specified work staff and basic medical service to workers. The EPC Contractor will ensure the provision of basic medicines, first aid kits etc. at the camp site; ▪ Ensure periodic medical screening of the staff;	EPC Contractor	MC WAPDA

			Implementation	Monitoring
	working on the Project. The most common impacts include eye injuries which may occur due to stone or metal particles, hazard of being hit by falling objects, major hand-arm and whole body vibration hazards, skin and respiratory tract irritation from exposure to cement dust, overexertion and awkward postures etc. Other impacts will be falling in trench, contact with electrical and mechanical equipment, equipment failure, uncontrolled movement, unguarded moving mechanical equipment parts, fatigue, unbalanced load, falling objects, hand and head injury, slip and trip hazards, exposed to high levels of noise for longer durations etc. This impact may be classified as high adverse in nature.	▪ Complying with the safety precautions for the construction workers as per applicable International Labor Organization (ILO) Conventions; ▪ Training of workers in construction safety procedures, environmental awareness, equipping all construction workers with safety proper task specific Personal Protective Equipment (PPEs); ▪ Moreover, proper planning should be done for food storage, setting up of kitchens, wastewater collection system and solid waste management. Improper planning for these facilities may result in multiplication of rodents like rats, mice and shrew etc. and vectors like mosquitoes, bugs and flies which will have a negative impact on workers' health and safety; ▪ Efforts will be made to create awareness about road safety among the drivers operating construction vehicles; ▪ All trenches deeper than two meter should be protected with wooden bracing to avoid safety risks to workers and locals; Ensure that the site will be restricted for the entry of irrelevant people particularly children, disabled and elderly people; ▪ Ensure the use of safety and warning signs at the construction site; ▪ Ensure the provision of fire prevention and firefighting equipment; and ▪ Ensure the provision of training related to emergency prevention, preparedness and response arrangements by the EPC Contractor.		

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Sr. No.	Impacts	Mitigation Measure	Responsibility	
			Implementation	Monitoring
		These requirements will be incorporated into the bidding specification and contract documents, and will be binding on the EPC Contractor, at risk of penalty for noncompliance, as charges to be recovered from EPC Contractor for unsafe act or condition.		
18	**Community Health and Safety** Community health and safety issues during the construction of proposed project may include dust, noise, and vibration from construction vehicle transit, and communicable disease associated with the influx of temporary construction labor. The construction activities and vehicular movement at construction sites may result in roadside accidents particularly inflicting local communities who are not familiar with presence of heavy equipment. Quality of water resources available in the nearby local communities may be affected due to the oil spillage and leakage, roadside accidents, etc. Conflicts may arise between the local community and the construction workers, which may be related to religious, cultural or ethnic differences, or based on competition for local resources. The labor works with different transmittable diseases (HIV/AIDS, COVID-19, respiratory	▪ The EPC Contractor will prepare the site specific community health and safety plan in compliance with relevant sections of the WBG General Environmental Health and Safety Guidelines (WBG 2007), chosen methodology and will be required to strictly follow; ▪ Ensure that the site will be restricted for the entry of irrelevant people particularly children, disabled and elderly peoples. Ensure the use of safety signs at the construction site; ▪ Providing basic medical training to specified work staff and basic medical service and supplies to workers; ▪ Ensure proper maintenance and repair of all vehicles, machinery and equipment to prevent the oil spills; ▪ Efforts will be made to create awareness about road safety among the drivers operating construction vehicles; ▪ Timely public notification on planned construction works;	EPC Contractor	MC WAPDA

Sr. No.	Impacts	Mitigation Measure	Responsibility	
			Implementation	Monitoring
	diseases, and skin and eye infections etc.) may cause spread out of those diseases in the locals of nearby community. The impact significance is moderate adverse.	▪ Close consultation with local communities to identify optimal solutions for diversions to maintain community integrity and social links; ▪ Provision of proper safety and diversion signage, particularly at sensitive/accident-prone spots; ▪ Setting up speed limits in close consultation with the local stakeholders; ▪ The mitigation measures provided in the sub-sections for air and noise & vibration shall be adopted to reduce the air pollution, noise pollution and vibrational impacts on nearby community; ▪ Ensure effective implementation of GRM (to be prepared by the EPC Contractor) to timely address the issues; ▪ The communicable disease of most concern during construction phase, like Sexually-Transmitted Disease (STDs) such as HIV/AIDS, COVID-19 will be prevented by successful initiative typically involving health awareness; education initiatives; training heath workers in disease treatment; immunization program and providing health service; ▪ All workers must perform complete sanitization at the site as per updated / latest SOPs/guidelines issued by WHO and the national guidelines issued by the GoP[22];		

[22] *https://covid.gov.pk/guideline*

Sr. No.	Impacts	Mitigation Measure	Responsibility	
			Implementation	Monitoring
		▪ Ensure prevention of larval and adult propagation of vectors through sanitary improvements and elimination of breeding habitat near to human settlements and by eliminating any unusable impounding of water; and ▪ EPC Contractor will take due care of the local community and observe sanctity of local customs and traditions by his staff. EPC Contractor will warn the staff strictly not to involve in any unethical activities and to obey the local norms and cultural restrictions. Any environmental condition that is disagreeable to the public and causes an avoidable nuisance can be addressed with additional provisions in addition to those described above. These requirements will be incorporated into the bidding specification and contract documents, and will be binding on the EPC Contractor, at risk of penalty for noncompliance, as charges to be recovered from EPC Contractor for unsafe act or condition.		
19	**Labour Influx** For the implementation of Project activities, skilled and unskilled labor is required by the EPC Contractor. Mostly, skilled and unskilled workers have been associated with the EPC Contractor since	▪ Contractor camp will be established away from residential and populated area; ▪ Preference will be given to the local people to work with EPC Contractor, and EPC Contractor will hire maximum labor force from the project area because this will reduce the labor influx;	EPC Contractor	MC WAPDA

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Sr. No.	Impacts	Mitigation Measure	Responsibility	
			Implementation	Monitoring
	long which they utilize, where they are required for the Projects, and while other workers are hired from the different areas that belong to different cultural backgrounds. Social problems and conflicts that are associated with Labor Influx are as follows: ▪ Risk of social conflict: Conflicts may arise between the local community and the construction workers, which may be related to religious, cultural or ethnic differences, or based on competition for local resources. Ethnic and regional conflicts may be aggravated if workers from one group are moving into the territory of the other; ▪ Increased risk of illegitimate behavior and crime: The influx of workers and service providers into communities may increase the rate of crimes and a perception of insecurity by the local community. Such illegitimate behavior and crimes can include theft, physical assaults, substance abuse, sexual assault and human trafficking; ▪ Impacts on community dynamics: Depending on the number of incoming workers and their engagement with the host community, the composition of the local community, and with it the	▪ Awareness will be created among the work force to ensure respect for local customs; ▪ Construction work will be completed within the stipulated time to move workers to next location; ▪ Labor force will be shuffled with the time; ▪ Create awareness among workers on proper sanitation and hygiene practices to endorse proper health and maintain good housekeeping practices at all Project sites; ▪ Provide adequate personal hygiene facilities in good condition with adequate supply of clean water; ▪ Make arrangements to treat the affected workers on time to control the movement of vectors disease; ▪ Sensitize workers and surrounding communities on awareness and prevention of COVID-19, HIV/AIDS and sexually transmitted infections (STI) through training, awareness campaigns and workshops during community meetings; ▪ Provide proper and free HIV/AIDS and STI health screening and counselling for site workers and community members; ▪ Develop and enforce a strict Code of Conduct for workers to regulate behavior in the local communities; ▪ Taking all sensible precautions to avert illicit, vicious conduct by or amongst the EPC Contractor's personnel, and to preserve unity and harmony, and protection of people and property on and near the sites;		

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Sr. No.	Impacts	Mitigation Measure	Responsibility	
			Implementation	Monitoring
	community dynamics, may change significantly. Pre-existing social conflict may intensify as a result of such changes; ▪ Increased burden on and competition for public service provision: The presence of construction workers and service providers (and in some cases family members of either or both) can generate additional demand for the provision of public services, such as water, electricity, medical services, transport, education and social services. This is particularly the case when the influx of workers is not accommodated by additional and separate supply systems; ▪ Increased risk of communicable diseases and burden on local health services: The influx of people may bring communicable diseases to the project area, including sexually transmitted diseases (STDs), or the incoming workers may be exposed to diseases to which they have low resistance. Workers with health concerns relating to substance abuse, mental issues or STDs may not wish to visit the Project's medical facility and instead go anonymously to local medical providers, this can result in an additional burden on local health resources;	▪ Prohibiting drugs, alcohol, weapons, and ammunition on the worksite among personnel; ▪ Site security preparations must be contained within the Bills of Quantities (BoQs) to avoid any delays which might be caused due to insecurity; ▪ Appropriate fencing, security check points, gates and security guards will be provided at the construction sites to ensure the security of all plant, equipment, machinery and materials, as well as to secure the safety of site staff; and ▪ The EPC Contractor must guarantee that good relations are maintained with local communities and their leaders to help reduce the risk of vandalism and theft.		

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Sr. No.	Impacts	Mitigation Measure	Responsibility	
			Implementation	Monitoring
	▪ Local inflation of prices, accommodations and rents: A significant increase in demand for goods and services due to labor influx may lead to local price hikes and crowding out of community consumers. Depending on project worker income and form of accommodation provided, there may be increased demand for accommodations, which again may lead to price hikes and crowding out of local residents; and ▪ Increase in traffic and related accidents: Delivery of supplies for construction workers and the transportation of workers can lead to an increase in traffic, rise in accidents, as well as additional burden on the transportation infrastructure. This impact is medium negative and temporary in nature.			
20	**Gender Based Violence** In the society, female plays important role in managing household as well as in income earning activities, but they face various challenges to get access to	▪ Trainings will be given to construction workers, alongside the implementation of strict measures and punishments in case of any sexual assaults, or gender based violence. ▪ During the timing of educational institutions workers will not be allowed to crowd in the surroundings;	EPC Contractor	MC WAPDA

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Sr. No.	Impacts	Mitigation Measure	Responsibility	
			Implementation	Monitoring
	educational institutions and employment opportunities due to cultural bindings, economic vulnerability and lack of facilities. According to Pakistan Demographic and Health Survey (PDHS), 2017-18, 28 percent of women of Pakistan age 15 to 49 have experienced physical violence, six percent have experienced sexual violence, and seven percent experienced violence during pregnancy. Three in ten women who have ever experienced physical or sexual violence sought help to stop the violence, yet 56 percent never sought help nor told anyone. During construction phase gender based violence might arise due to discrimination made against women by unequal work distribution and unequal pay structure among others. Sexual harassment against women might occur as a consequence of mixing of men and women at the construction site, and moving on the roads and markets. Women in the Project area are participating in other outdoor activities such as livestock rearing, bringing of potable water, collection of fire wood etc. that may also be affected by the Project	▪ Alternative routes for pedestrian will be provided to avoid mixing of women with workers; ▪ Gender protection act will strictly be enforced during the construction activities in the project area, and monitor the implementation through field staff and district level structure; ▪ Raise awareness among the communities of the potential risks of GBV, and establish response services in the communities that can respond to instances of GBV (particularly those related to issues of labor influx); ▪ The EPC Contractor will make sure that no discrimination is made on the basis of gender while hiring of workers. Complete SOPs will be formed and implemented by the contactor regarding working women at site. Implementation on these SOPs will be monitored by the Supervision Consultants; ▪ Provisions of gender disaggregate bathing, changing, and sanitation facilities; and ▪ Contractor will take proper measures to address and resolve issues relating to harassment, intimidation, and exploitation, especially in relation to women. ▪ Establish workers' camps separated from local communities with strict protocols for interaction with local communities in order to avoid project impacts from labor influx. ▪ Project staff will receive training on the prevention of SEA/SH. Engagement of skilled trainers to raise		

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Sr. No.	Impacts	Mitigation Measure	Responsibility	
			Implementation	Monitoring
	activities. This impact is medium negative in nature during construction stage.	awareness among project workers of the risks, expected behaviors, and consequences of violations, communicated through training, and publicized codes of conduct. It may also be important to raise awareness of the risks among community members and local health authorities and inform them about available grievance mechanisms. ▪ Arrange and support local organizations and/or government initiatives on community STD education, prevention, and treatment programs. ▪ Extensive training for awareness raising strategy which describes how workers and local communities will be sensitized to SEA and SH risks, and the worker's responsibilities under the Code of Conduct. ▪ The routes/places used by the women will be avoided as far as possible. If unavoidable, alternate routes will be identified for the communities, if required, especially along routes frequented by women folk, such as route to the local water source. ▪ Construction crew will avoid entering villages and settlements. ▪ Communities will be informed and consulted before commencing works inside or near the communities. ▪ Provision related to SEA/SH will be incorporated in the bidding document.		
21	**Child Labour**	▪ Awareness will be created among the local communities about the adverse impacts of child labor. For the public awareness, meetings will be	EPC Contractor	MC WAPDA

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Sr. No.	Impacts	Mitigation Measure	Responsibility	
			Implementation	Monitoring
	There are two basic conventions on child labor adopted by the ILO, and one adopted by the United Nations. The ILO Minimum Age Convention, 1973 (No. 138) and its accompanying Recommendation (No. 146) set the goal of elimination of child labor, and the basic minimum age for employment or work (in developing countries at 14 years of age or the end of compulsory schooling, whichever is higher; and 15 or the end of compulsory schooling for developed countries). The Convention sets a minimum age of 2 years younger for "light work," i.e., 12 and 13 years, respectively; and a higher minimum age for dangerous or hazardous work (basically 18 years of age, but 16 in certain circumstances). The Convention also has various other flexibility clauses. Inhabitants of the Project Area have mix economic background and different sources of income. Children of low income groups mostly involve in different earning activities, as their parents prefer to get their children hired in small shops as helpers, and waiters in hotels for earning money, and supporting household livelihoods. However, the Employment of Children Act, 1991 prohibits the employment of child and restrict the employment of adolescents in	held in the Project area, and announcements will be made using the available local platforms with the involvement of all sectors of the society; ▪ EPC Contractor through contractual agreement will be bound to follow the labor standards, rules and regulations during hiring the labor force and all activities will be monitored by the social and environmental staff of the implementing agency; ▪ Client and Supervision consultant will ensure that EPC Contractor shall have its employment policy in accordance with relevant act and labor policies in Pakistan; ▪ EPC Contractor will ensure the presence of all persons at site are adults and have their proper identity cards with them; ▪ Penalize EPC Contractors/employees using the child labor and penalize adults who violate children's rights and who force children to enter child labor. ▪

Sr. No.	Impacts	Mitigation Measure	Responsibility	
			Implementation	Monitoring
	certain occupations and processes such as construction industry, and whoever employs or permits a child (person under the age of 14 years) to work in an establishment shall be liable to punishment with imprisonment. The child labor impact might arise during construction stage, as large number of skilled and unskilled labor will be required by the EPC Contractor for the construction activities of the proposed Project. This impact is medium negative in nature during construction stage.			
22	**Other Social Issues** The community belonging to the reservoir and Project Area will be affected during the construction phase as follows: ▪ During the construction phase, the general mobility of the local residents and their livestock in and around the Study Area is likely to be hindered; ▪ Unmonitored construction activities, e.g. blasting may create an accidental risk for the local residents particularly the women and children;	▪ During the construction phase, mobility of the workers in the nearby areas should be strictly restricted by the Contractor to avoid any inconvenience to the local communities; ▪ Proper arrangements in the form of alternative routes should be made to ensure that the mobility of locals should not be disturbed; ▪ Before starting the construction activities, Contractor should inform residents of the Project Area about the scheme of work, likely disturbances, and their duration as to whom they should addressed their complaints. ▪ The Contractors will be required to maintain close liaison with the local communities to ensure that any potential conflicts relating to the common resource utilization are resolved quickly;	EPC Contractor	MC WAPDA

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Sr. No.	Impacts	Mitigation Measure	Responsibility	
			Implementation	Monitoring
	▪ Usage of community common resources like potable water, fuel wood etc. by Contractor workforce may create conflicts between the community and the Contractor; ▪ Community will have to face the noise and dust problems during the construction activities; ▪ Induction of outside workers in the Contractor labor may cause cultural issues with the local community; and ▪ Theft problems to the community by the Contractor's workers and vice versa. This impact is Site Specific, Medium Term, Irreversible, Likely, Medium Significant.	▪ Contractor will take care of the concerns of the local community and the sensitivity towards the local customs. Contractor also needs a proper security to avoid any theft issue by the community; ▪ Use of good engineering practices such as water sprinkling, encasement and provision of silencer and mini stacks of generators etc. should be adopted to avoid inconvenience to the locals due to noise, smoke and fugitive dust; and ▪ The Contractor will warn the workers not to indulge in any theft activities and if anyone gets involved in such activities, he will have to pay heavy penalty and would be handed over to the police. Similarly, at the time of employing, the Contractor has to take care that the workers should be of good repute. The Contractor camp should be fenced properly and main gate.		
23	**Impact on Tourism** The Attabad Lake has become one of the biggest tourist attraction in valley, offering activities like boating, jet-skiing, fishing and other recreational activities. Tourists also enjoy Ice Skating the Lake gets frozen during winters, making it the perfect place for ice skating. Passu Cones is also a popular tourist destination in	▪ The EPC Contractor will prepare and implement the site specific environmental, health and safety management plans to ensure the safety of the locals and tourists. ▪ Necessary measures will be taken to ensure the safety of traffic during construction, including barricades, safety signs, pavement markings, flags, and lights, erected for tourists and locals as well. ▪ A Traffic Management Plan will be implemented that will aim at ensuring access tourists to reach their destinations safe and sound, residential areas, and	EPC Contractor	MC WAPDA

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Sr. No.	Impacts	Mitigation Measure	Responsibility	
			Implementation	Monitoring
	Hunza valley and all over the world because of its easily accessible sweeping landscapes and vistas of the 7,478m (24,534 ft) tall Passu Sar mountain, the Passu Glacier and Tupopdan. Due to construction activities of Attabad Hydropower Project and movement of heavy machinery on roads the traffic flow is likely to be affected during construction activities and damage of roads as well, tourists will face the difficulties to reach at their desire destination like Attabad Lake for boating and jet-skiing, to visit the Passu Cones, Khanjrab Pass other tourists spots and high peaks for hiking. Due to construction of Attabad Hydropower Project livelihood of the locals will disturb who are directly associated with tourism business like boat owners and operators, owners of fast food restaurants, shopkeepers, hotels owners and working labor and so many others attach with tourism.	preventing of unsafe situations, especially near construction areas, camps and offices; ▪ Liaison with traffic police will be maintained in order to facilitate the tourists both local and foreigner; and ▪ Vehicle speeds near / within the communities will be kept low, to avoid safety hazards.		
24	**Communication Loss**	The EPC Contractor will ensure that the mobility of the local communities and their livestock is not hindered by the construction activities. The EPC Contractor will	EPC Contractor	MC WAPDA

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Sr. No.	Impacts	Mitigation Measure	Responsibility	
			Implementation	Monitoring
	The general mobility of the local residents and their livestock in and around the Project Area is likely to be hindered and may need to be travel long distances. Likewise access to the natural resource may be affected. This particularly implies to the women folk and children where women observe norms and values and do not interact with non-locals. This impact is medium significant in nature.	provide crossing points at appropriate places to facilitate the locals for their daily works, where applicable. The EPC Contractor shall always consider the local sensitivities while performing the Project activities. All the personnel engaged would also be properly briefed about the local norms and ethics prior to commencement of work.		
Operational Phase				
1	**Sedimentation** Accumulation of sediment may disturb the efficiency of Project components. Sediment load released from the sand trap could have adverse effect and synergetic with low flow of water will put aquatic system under stress. However, it should be kept in mind that during low flows the sediment concentration is very low. Floods and heavy rains carry large sediment loads, which could have a more severe medium impact than the sand trap flushing	▪ A sediment flushing tunnel will be constructed at the left side under the Power Tunnel section, consisting of low level outlets and during construction of overflow structure will be used as diversion tunnel. The invert level of sediment flushing tunnel is planned at El. 2380 m.a.s.l. Systematic operation of the flushing tunnel shall be ensured by the Client to flush the sediments. ▪ It is also recommended to conduct a detailed watershed management study of the area and the outcome mitigation measures should be implemented to control the sediment inflow in the river.	WAPDA	
2	**Liquid and Solid Waste Generation**	▪ Ensure training program regarding waste minimization quantity of the waste;	WAPDA	

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Sr. No.	Impacts	Mitigation Measure	Responsibility	
			Implementation	Monitoring
	Wastewater may generate by the workers during the operation and maintenance related activities and from the residential colony. The improper disposal of liquid waste can cause air, water, and soil pollution. Different types of solid waste are likely to be generated during the operation phase, can potentially cause soil and water contamination. This impact can be categorized as medium to low significant in nature	▪ Solid waste generated will be safely disposed in demarcated waste disposal sites and ensure provision of PPEs to workers; ▪ Ensure immediate collection of solid waste after the competition of maintenance works, no waste or left over construction material is left behind; ▪ Proponent should make final disposal arrangements in consultation with the concerned government department and should take approvals for final disposal of the waste at the designated disposal site. ▪ A separate solid waste management system for waste from the office building and other allied facilities will be required. During the collection of solid waste, recyclable and reusable waste will be separated for resource recovery and reuse of the generated material; and ▪ Proper monitoring to check the compliance of NEQS will be carried out, if required		
3	**Soil and Surface Water Contamination** The accidental oil leakages from the power house may contaminate the soil and water quality of the Attabad Lake and Hunza River downstream of the powerhouse. The maintenance works (may involve the use of materials, chemicals, fuel and lubricants) may also have potential to contaminate the soil and surface water. This impact is site-specific	▪ Proper drainage and dewatering system is recommended for the proposed Project. A drainage pump of appropriate capacity will be specified to cope with the leakage of powerhouse. Dewatering pumps will be specified for Unit dewatering. Both of these pumps will be installed in drainage and dewatering pit and they will provide redundancy for each other. Sites disturbed by the maintenance works shall be restored to their original conditions upon completion of works and photographic record will be maintained to ensure pre-post conditions intact. It will be ensured that no soil is left	WAPDA	

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Sr. No.	Impacts	Mitigation Measure	Responsibility	
			Implementation	Monitoring
	and can be classified as medium significant.	unconsolidated after completion of work and excess will be disposed of at designated sites. Storage of fuel, paint, and oil containers, oil filters, oily parts, and oily rags on impervious floor under shade or storing of fuel and lubricants on a sand flooring of at least 6 inches thick done on brick edge flooring lined with polyethylene sheet. Material Safety Data Sheets (MSDS) will be strictly followed		
4	**Risk of Fire** For the proposed hydropower plant there is also a risk of fire breaking out in powerhouse which may become a serious risk for residents living in allied facilities and/or nearby in the vicinity of the proposed hydropower Project. This impact can be classified as medium significant.	▪ Fire protection and detection systems shall be provided and implemented to protect life, property, equipment, and operation of the powerhouse. The detection and fire alarm, fire protection and fire-fighting systems shall include, but not be limited to the following: o Firefighting water storage, may be combined with raw water tank, depending on local regulations; o Firefighting pumps; o Fire water ring main system, including hydrants; o Fire protection systems; and o Fire alarm and detection system. ▪ The building / tunnel shall be subdivided into various fire areas, separated by approved fire resistant barriers and elements; ▪ Fire walls, ceilings and partitions shall have a fire resistance rate of not less than 2 hours;	WAPDA	

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Sr. No.	Impacts	Mitigation Measure	Responsibility	
			Implementation	Monitoring
		▪ All penetrations for electrical cables or pipes in fire resistant walls or ceilings shall be sealed with approved seals; ▪ One electric motor driven fire pump and one electric motor driven stand-by fire pump, located in a pump house adjacent to the water storage tank, shall draw fire fighting water from the tank and supply it through the fire service main to the hose stations and water spray fixed systems. One electric motor driven jockey pump with a capacity of approx. 3 l/s shall also be provided to keep the line pressure of 5 bars. The fire pump shall have a capacity of approx. 40 l/s at a delivery head of approx. 6 bars; ▪ The water spray fixed systems shall be designed, installed and tested in accordance with NFPA15; ▪ The total flooding carbon dioxide extinguishing systems shall be designed in accordance with NFPA 12, standard on carbon Dioxide extinguishing systems (latest edition) and will be adopted for the fire protection of Attabad HPP generators; ▪ The selection, installation and testing of portable fire extinguisher shall be in accordance with NFPA-10 for initial firefighting. Portable fire extinguishers with capacities of 6 kg chemical dry powder, for rooms containing electrical equipment with capacities of 5 kg clean agent, shall be provided and placed in the rooms and buildings at strategic locations and next to exits; ▪ In addition to the portable extinguishers, two mobile 30 kg clean agent, and two mobile 50 kg dry powder extinguishers, mounted on wheeled hand carts and		

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Sr. No.	Impacts	Mitigation Measure	Responsibility	
			Implementation	Monitoring
		furnished with 6 m hoses, shall be provided and located in the machine hall of the powerhouse and GIS floor and diesel generator room; and ▪ All systems shall be subject to the approval of the insurance company. The system shall be complete with all necessary piping, pumps, safety valves, mobile equipment, and vehicles. The EPC Contractor shall prepare an Emergency Response Plan (ERP) to cope with the emergency situations. Fire protection system for Generator fire protection system is also recommended.		
5	**Ambient Air Quality and Climate Change Aspect** The air quality of the area will improve significantly in comparison to construction phase. Vegetation cover in the area will also increase after tree planation. However, during operation phase, operation of stand-by generator and un-necessary idling of diesel run will also result in the emission of pollutants (CO, Smoke, NO_2, SO_2, $PM_{2.5}$ and PM_{10} etc.) into the air, thus deteriorating air quality. Ambient Air quality may also be affected during the maintenance works of subprojects. These emissions may adversely affect the health of the nearby residents and working staff. This impact is moderate in nature.	▪ Ensure the use of low Sulphur fuel; ▪ Ensure plantation of trees around the project area that will help in absorbing the emissions; ▪ The height of the generator stacks shall be enough to disperse the emissions in the air; and ▪ Ensure compliance with NEQS and provision of budget for regular monitoring of ambient air quality in accordance with the NEQS.	WAPDA	

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Sr. No.	Impacts	Mitigation Measure	Responsibility	
			Implementation	Monitoring
6	**Noise and Vibration** During operation phase, noise and vibration levels may be generated due to the operation of proposed project, standby generators and traffic which will be a constant source of nuisance for the staff and the nearby communities. Noise levels may also be increased during the maintenance works. The significance of this impact is considered to be low adverse.	▪ Ensure regular maintenance and periodic checking all parts of the standby generators, replacement in case of malfunctioning and periodic noting of noise levels; ▪ Installation signs to disallow the use of pressure horns; ▪ Plantation of trees will also help to attenuate the noise impacts to the surrounding area; ▪ Ensure compliance with NEQS and provision of budget for regular monitoring of noise levels in accordance with the NEQS and vibration (where applicable).	WAPDA	
7	**Change in Land use** During the operational phase the land use pattern of the area will be changed to some extent. The commercial and recreational activities will also be increased which may affect ecosystem of the area and bring economic boom in the area. This impact is Site-specific, Long Term, Irreversible, Likely, Medium Significant.	▪ The tree plantation will be carried out in and nearby the Study Area and will have positive impact on the eco system of the area	WAPDA	
8	**Flora** During operational stage of the Project, there will be minimal effect on flora or release of any significant pressure detrimental to flora. Low level impact is expected at operational phase on Flora	▪ The implementation of plantation plan recommends compensation for cutting of trees and work should be started during operational phase to ensure the ecological balance and to avoid any impact on local environment; ▪ Large scale planting with suitable indigenous trees, shrubs and ornamental plants in the form of tree	WAPDA	

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Sr. No.	Impacts	Mitigation Measure	Responsibility	
			Implementation	Monitoring
	due to the operation and maintenance activities. This impact is low Significant	groves, and linear plantation will be carried out in accordance with the Tree Plantation Plan to improve aesthetic value and offset the effect of removal of vegetation; ▪ Proper check and balance for above activities is highly recommended. Plantations so raised must be maintained according to the Silvicultural practices which includes proper irrigation, cleaning, pruning, thinning at prescribed intensity, silt clearance and trench-opening, etc.; ▪ Maintenance and security of the plantation should be done for at-least four years (in consultation with the Forest department). Measures such as fencing, watch guards and fire protection should be considered; and ▪ All activities must be done under the technical supervision of forest department		
9	**Fauna** There is no protected area, game reserve, game sanctuary or national park in the project area so no major impact on wildlife and livestock in the area is expected through noise, vibration and any type of normal activity in the project area. This impact is Insignificant. However, proposed reservoir area, which is nearly 8 Km in length, shall not be available for grazing to livestock and other	Strict control must be exercised for stoppage of killing/poaching of available wildlife species (if any) by enhancing protection practices; and The precautionary measures described for future shall also be applicable during operation phase as relevant for the conservation of wildlife species in the Study Area. Improved micro climate and moisture conditions along the periphery of the reservoir will help in grass production and improved vegetation, which will be useful for livestock grazing and improve habitat for birds.	WAPDA	

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Sr. No.	Impacts	Mitigation Measure	Responsibility	
			Implementation	Monitoring
	wildlife existing in the area, which is adverse impact on fauna.			
10	**Aquatic Life** Once the construction phase is completed and water diverted at the site of weir will change the water flow regime from weir to powerhouse. The adverse impact on aquatic life will be due to low flow in the Hunza River especially during low flow season. The minimum environmental flow needs proper follow-up.	▪ Annual restocking plan of fish fingerlings should be included in the said project to compensate the stock depletion due to decrease in fish breeding grounds. ▪ Fisheries research unit and a brown trout hatchery with research/management staff should be established at the project side for research purposes as well as impact assessment during operational phases of the project. ▪ To conserve the aquatic life of the river downstream of the weir, minimum flow of 3 m^3/s has been calculated as the environmental flow. It will be obligatory for project operating agency to release 3 m^3/s in the river throughout the year as environmental flow. ▪ The design recommended measures should be implemented and maintained by the proponents.	WAPDA	
11	**Safety During Reservoir Operation** During operational stage of the Project, due to the impounding of the reservoir, the safety issues will arise. Main reservoir area is the major threat for accidents. Locals and workers can drown. This impact is site specific and high significant in nature.	Since the reservoir was formed in January 2010 as a result of massive land slide and no new area would be submerged. However, during operational stage of the Project, a security plan should be prepared for the reservoir area to prohibit youths from using reservoir for bathing, swimming and other recreational activities. Boating should not be allowed without the provision of life saving jackets and presence of a lifeguard.	WAPDA	

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

Sr. No.	Impacts	Mitigation Measure	Responsibility	
			Implementation	Monitoring
12	**HSE Considerations** During the operation phase, health and safety issues related to workers and communities may arise. Operation and maintenance activities may cause health and safety risks such as movement of machinery and manual handling during loading unloading operation, poor handling and storage of hazardous substances, injuries due to electric shocks, falling of objects, slips or trips, dust, noise, accidents, transmittable diseases etc. The impact is moderate to low adverse in nature.	▪ Ensure proper maintenance of machinery and equipment; ▪ Proper storage and handling of generator fuel, chemicals, solvents and other hazardous substances; ▪ Ensure emergency prevention, preparedness and response arrangements; ▪ Emergency numbers should be clearly posted and communicated to the staff and community (where applicable); ▪ Fire extinguishing equipment should be installed at adequate and appropriate locations; ▪ Ensure provision of PPEs to the skilled and unskilled labors and visitors; ▪ Proper training should be given to workers on health and safety measures; ▪ Hazardous materials should be well labeled and stored in their original containers; ▪ Ensure that the site will be restricted for the entry of irrelevant people; ▪ Ensure health awareness; education initiatives; training heath workers in disease treatment and prevention; immunization program and providing health service; and ▪ Staff will strictly warned, not to involve in any unethical activities and to obey the local norms and cultural restrictions.	WAPDA	

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

9.8 ENVIRONMENTAL MONITORING PLAN

9.9 GENERAL

The Environmental Monitoring along with implementation of the various plans already highlighted during the construction and operation stages will be carried out to meet the following objectives:

- Monitor the actual Project impact on the physical, ecological and socio-economic indicators, in compliance with the provisions of the EIA/ EMP.
- Recommend mitigation measures for any unforeseen impact or where the impact level exceeds than those anticipated.
- Ensure compliance with legal and community obligations including safety at the construction and operation stages.
- Monitor the rehabilitation of borrow areas and the restoration of the construction camp site(s) as described in the EMP.
- To ensure the safe disposal of excessive construction materials, solid waste and effluents etc.

The main emphasis of monitoring during the operation phase will be as follows:

- Appraise the adequacy of the EIA with respect to the Project's predicted long-term impacts on the area's physical, biological and socio-economic environment.
- Evaluate the effectiveness of the mitigation measures proposed in the EMP and recommend any improvements in the EMP, if so required.
- Compile periodic incidents/accidents data to support analysis that will help in minimizing the future risks.
- Monitor the survival rate of the proposed plantations.

WAPDA through the EMMC/MC will ensure two types of monitoring during the execution of the Project activities.

- Compliance Monitoring: to ensure that the proposed measures in the EMP are adhered to as per applicable guidelines/ NEQS etc.
- Effects Monitoring: to establish baseline values for the environmental parameters such as air quality, water quality and noise levels etc.

9.10 MONITORING STRATEGY

All the compliance monitoring will be executed by the EPC Contractor during construction stage of the Project. Supervision of environmental monitoring will be carried out by the MC and WAPDA during the construction stage while compliance and effects monitoring at operational and maintenance stage will be carried out by WAPDA as internal monitoring agency. The staff working under the WAPDA will oversee all the activities of EPC contractor and MC in the field during the construction stage.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

9.11 IMPLEMENTATION AND MONITORING

9.11.1.1 EPC Contractor

Physical implementation of the EMP is the sole responsibility of the EPC Contractor during the construction stage. Contractor will be responsible for in-house monitoring to ensure that the construction activities are being carried out as specified in EMP.

9.11.1.2 Management Consultant (MC)

The MC will be responsible for supervision of the environmental monitoring and will perform the following activities:

- Monitoring of the environmental aspects of the Project during construction to ensure that the environmental requirements of the contract and the mitigation measures proposed in the EMP are implemented.
- Undertake critically important routine visual monitoring of construction, waste disposal and overall environmental management practices by the EPC Contractor and other contractor(s).
- A systematic check of the noise levels using a portable noise meter operated near major construction equipment and machinery.
- Visual checks of exhaust emissions from equipment and vehicles.
- Visual checks of airborne dust on temporary access roads, material stockpiles, disturbed soil, and haul tracks.
- Instrumental monitoring of water, ambient air and noise levels as per intensity and frequency specified in the environmental monitoring program.
- Maintaining the monitoring records and submit monthly reports to WAPDA, describing the details of environmental monitoring parameters, non-compliance (if any) by the Contractor and actions taken for rectification.

9.12 COMMUNICATION AND DOCUMENTATION (MONITORING PERIOD)

Communication and documentation is an essential feature of EMP. The key features of such mechanism are:

9.13 DATA RECORDING AND MAINTENANCE

All forms to be used for recording information during the environmental monitoring will follow a standard format which will correspond to the data base in to which all the gathered information will be placed. Check boxes will be used as much as possible to facilitate data entry. Tracking system will be developed for each form.

9.14 DATABASE

The database may include the following information:

- Training programs;
- Staff deployment;
- Non-compliances;
- Corrective actions
- List of environmental data; and
- List of environmental data to be maintained:

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- Soil and land pollution;
- Disposal of waste;
- Water resources;
- Fuel oil and chemical spills;
- Vegetation record;
- Noise and vibration pollution;
- Air and dust pollution;
- Socio-economic data; and
- Ecological sensitivities.

9.15 MEETINGS AND REPORTING

Monthly meetings will be held at site during the construction phase. The purpose of these meetings will be to discuss the routine activities, non-compliances and their remedial measures. Various reports will also be produced at periodic time intervals, as provided in **Table 9.2** along with information regarding persons responsible for report preparation and review process. Additionally, minutes of meeting will also be submitted as part of routine environmental reports.

Table 9-2: Periodic Reporting Mechanism

Sr. No.	Report Category	Prepared by	Submitted to and Reviewed by
1	Monthly	EPC Contractor	EMMC of WAPDA/ MC
2	Quarterly	EPC Contractor	EMMC of WAPDA/ MC
3	Quarterly	MC	EMMC of WAPDA/GBEPA
4	Annual Report	EPC Contractor	EMMC of WAPDA/ MC
5	Completion Report	EPC Contractor	EMMC of WAPDA/ MC

The system for monitoring compliance with environmental mitigation measures provides periodic inspection (at least biweekly), data compilation, and reporting of results. The MC will utilize a checklist to evaluate compliance with mitigation measures. Checklists serve primarily as guides for reviewing performance to determine general compliance with broad indicators, tentatively as follows:

- General conduct of work;
- Labor provisions and occupational / community health and safety;
- Noise and vibration control;
- Air quality, dust control and site cleanliness;
- Traffic management;
- Drainage and wastewater;
- Solid waste and spoil handling and disposal;
- Protection of community values; and
- Environmental monitoring and other indicators selected for the work at hand.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

The MC will prepare and submit quarterly reports to WAPDA (and to GB EPA as per the conditions mentioned in the NOC /environmental approval) as part of the periodic project performance reporting requirement. Monitoring reports also will summarize the status of complaints under the GRM, as well as results of air, water and noise monitoring conducted by the third party.

9.16 SOCIAL COMPLAINT REGISTER

The Contractor will maintain a register of complaints record from local communities and measures taken to mitigate these concerns.

9.17 PHOTOGRAPHIC RECORDS

Contractors will maintain photographic records during the implementation of the proposed Project. As a minimum, the photographic records will include the site photographs, all the roads, camp sites and monitoring activities, etc.

9.18 NON-COMPLIANCE OF THE EMP

The implementation of the proposed EMP involves inputs from various functionaries. The EPC Contractor will be primarily responsible for ensuring implementation of the mitigation measures proposed in the EMP, which will be part of the contract documents. The provision of the environmental mitigation cost will be made in the total cost of Project, for which the Contractor will be paid on the basis of monthly compliance reports. However, if the Contractor fails to comply with the implementation of EMP and submission of the monthly compliance reports, deductions will be made from the payments to the EPC Contractor claimed under the heads of environmental components.

9.19 REVIEW OF RECORDED DATA

All the data and communication recorded and maintained by the EPC Contractor will be periodically reviewed and checked by MC and EMMC, WAPDA and necessary action will be recommended to EPC Contractor to improve the recording and documentation. All the complaints in social complaint register shall be recorded in accordance with the Project GRM. Resident complaints will be responded to in a timely manner and action taken recorded in accordance with the GRM.

9.20 THIRD PARTY MONITORING

Third Party will be recruited by WAPDA to carry out independent monitoring regarding implementation of EMP. The Third Party shall carryout intermittent monitoring of the project. This will be done on bi-annual basis to evaluate the overall effectiveness of EMP implementation.

WAPDA will ensure the timely hiring and engaging a suitable consultant/firm. For this purpose, EMMC will be responsible for coordination; arranging site visits and providing necessary support to the Third Party. The objective of this Third Party will be to review the entire EMP implementation process and its effectiveness, to identify any environmental and/or social issues caused by the project that may exist at site, and to frame recommendations for course correction and to improve EMP for implementation.

9.21 OBJECTIVES

Following are the main objectives of the Environmental Audit:

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- To evaluate whether the monitoring done by MC is in compliance with the targets as set in the EIA/EMP.
- To determine the conformity of the environmental and social management plans with specified requirements and identify non-conformity in environmental and social parameters as per EIA/EMP.
- Meet regulatory requirements and commitments.

9.22 ENVIRONMENTAL TRAINING PROGRAM

9.23 TRAINING STRATEGY

An environmental training program needs to be conducted in order for capacity building of different key staff and the community's capacity as shown in **Table 9.3** to effectively implement the Project-specific EMP. Initially, the training program will be imparted to the key staff directly associated with the Project and subsequently, separate training program(s) will be run for the community and for the Contractor's staff. Past experience has shown that the exclusion of the community from the indirect benefits due to the Project interventions has largely produced socio-political issues that hinder the success of the Project; therefore, the involvement of the community seems to provide a great incentive for the environmental protection of the area, to win their support for the proposed Project and also for skill development purposes.

The MC will be obligated to provide training to the EPC Contractor's staff, WAPDA and the Community. In addition to the above training, additional training will be imparted as and when required. The criteria to assess the need for additional training are based on the following:

- For preventive O&M rather than only responding to accidents;
- Start of any new process/activity;
- When a specified percentage of staff is newly inducted in the Project;
- When any non-compliance is repeatedly reported, refresher training will be provided;
- When any incident/accident of minor or major nature occurs; and
- Arrival of new contractors/sub-contractors.

9.24 TRAINING OBJECTIVES

The overall objective of the training program is to create awareness and to train the concerned stakeholders to conserve and protect the ecological balance of the Project Area as much as possible at both the stages i.e. construction and operation and to ensure that the requirements of EMP are clearly understood and implemented throughout the Project life. The main training objectives can be summarized as follows:

- To implement the mitigation measure as given in the EMP.
- To train the supervisory staff for the protection of the health and safety of the workers/labour.
- To train the Project staff how to interact and involve the concerned communities.
- To define the roles and responsibilities of the concerned stakeholders according to this EMP.
- To train the stakeholders for the reporting mechanism.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

9.25 TRAINING MATERIAL

The MC will prepare and produce training materials/ manuals according to the training program, one for the key staff and the rest for the community and labor.

9.26 TRAINING PROGRAM

The detailed training program is given in **Table 9.3.**

Table 9-3: Training Program

Sr. No.	Staff	Trainers	Contents	Timing/Frequency
1.	Project Director, Construction, Chief Resident Engineer Resident Engineers, staff of the WAPDA Environmental Management/ Monitoring Cell.	MC	Introduction to GB Environmental Protection Act, 2014. Introduction to the applicable national environmental laws and regulations. Roles and responsibilities of various stakeholders especially the Construction Contractors/ staff and Consultants. Introduction to EMP and its contents and provisions/ limitations. Introduction to the Environmental Monitoring Plan. Documentation mechanism Use of laboratory equipment for testing and monitoring water and air quality parameters etc.	To be initiated soon after the start-up of the Project construction phase.
2.	Construction Manager of the Contractor/ Contractor's staff.	MC	Mitigation measures included in the EMP Good construction practices Wildlife and vegetation issues in the Study Area EMP communication, documentation and monitoring requirements Workers/labour Health and Safety measures Community participation and consultations	To be initiated at the start of the construction phase of the Project.
3.	Operational / Managerial Staff of WAPDA	MC	Introduction to EMP Related mitigation measures given in EMP Safe handling, use and disposal of pesticides (fungicides,	Prior to the start of operation and at least one training session during the first year of operation

Sr. No.	Staff	Trainers	Contents	Timing/Frequency
			insecticides) fertilizers and hazardous wastes etc. Introduction to the Environmental Monitoring Plan and its relevant clauses.	
4.	Camp Staff/ Support Staff (Drivers, in charge of workers/ labour, workshop force, kitchen staff etc.)	MC/ WAPDA EMMC	Road safety and restrictions Proper Vehicle maintenance Defensive driving Waste disposal Emergency handling Fire fighting Sanitation Camp(s) operation Housekeeping	Prior to the start of any construction activity and one training session during the operation stage.
5.	Contractor's Restoration and Clean-up team for borrow materials and camp areas	MC	Site Restoration & Restoration requirements	Prior to the start of restoration activity (one training session)
6.	Community	MC/ EMMC	Introduction to the Project features and operations Interaction mechanism with the Project owner and Project's key staff Introduction of any negative impacts on wildlife, vegetation, water etc. due to Project interventions & mitigation measures adopted. Benefits to the community by the Project/Positive outcomes Mechanism of community participation in the Project activities Complaints/ Grievance handling procedures	To be initiated before the start-up of the Construction Activities under the Project.
7.	Contractor's Staff/ Support Staff (Drivers, in charge of workers/ labour, workshop force, kitchen staff etc.)	MC	An "alleviation programme" with respect to HIV/AIDS and other infectious diseases. Compulsory HIV/AIDS awareness and other infectious diseases prevention training. Educational campaigns to be conducted in the Project Area.	To be started immediately after the start of the construction activities.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

9.27 MANAGEMENT PLANS

Prior to mobilization, within 30 days of commencement, the EPC Contractor will develop site Specific Environmental Management Plan (SSESMP) and Site Specific Health and Safety Management Plan (SSHSMP) which will be relevant to its chosen methodology and meet the requirement of this EMP. The Contract Agreement will have appropriate clauses to bind the EPC Contractor for the above obligations.

Various management plans have been prepared as a part of EMP for the better management and implementation of EMP during all phases of the proposed ALHPP. However, these plans will be updated by EPC Contractor and approval from MC should be sought before start of construction activities. These plans are listed below:

- Tree Plantation Plan;
- HSE Management Plan;
- Emergency Preparedness and Response Framework;
- Borrow Areas Management / Rehabilitation Plan;
- Restoration and Rehabilitation Plan;
- Waste Management Plan;
- Traffic Management Plan; and
- Change Management Plan.

9.28 TREE PLANTATION PLAN

The basic purpose of afforestation/plantation of suitable species in the project area is to reduce the risk been made due to cutting of trees for the proposed project and to enhance green cover and improve the overall environment of the area. Afforestation will not only reduce the risk been made but will also increase the carrying capacity of the area regarding many positive aspects.

Plantation will be done after the removal of trees during the construction work immediately. Plantation of indigenous trees species is highly important to maintain the biodiversity and ecological balance. It is also important to prevent global warming, soil erosion and pollution. Afforestation purifies the environment and helps in reducing the carbon dioxide level. A detailed Tree Plantation Plan has been provided as **Annex-II**.

9.29 HSE MANAGEMENT PLAN

Health risks and work safety problems may result at the workplace if the working conditions provide unsafe and/or unfavorable working environment due to storage, handling and transport of hazardous construction material. Workers should be provided with safe and healthy working environment taking into account risks inherent to the particular sector and specific classes of hazards in project area. During construction phase, EPC Contractor will be responsible for all HSE related issues and to comply with national laws and international standards for occupational health and safety. Guideline for EPC Contractor's Occupational Health and Safety Plan is attached as **Annex-IV**. The ultimate goal of the plan is to eliminate any injury to human and damage to facilities, materials and the environment.

The following measures are identified for health, safety, and environment protection during all activities of the proposed project to minimize risk of accidents, which could endanger the life

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

of personnel, cause damage to properties and environment:

- All EPC contractor staff shall be well informed and trained on the HSE policies and guidelines;
- Contractor shall provide adequate health services as well as site first aid services for its workforce;
- The main priority of the contractor shall be to prevent accidents during mobilization, construction phase of the proposed Project. Prevention of workplace accidents during the construction activities will be achieved using approved work plan/instructions by the supervisors;
- Work safety measures and good workmanship practices shall be followed by the contractor to ensure no health risks for workers;
- Provision of adequate sanitation, washing, cooking and dormitory facilities;
- Proper maintenance of facilities for workers shall be monitored;
- Provision of protective clothing for laborers handling hazardous materials, e.g., helmet, adequate footwear for bituminous pavement works, protective goggles, etc. and contractor will ensure strict use of wearing these protective clothing during work activities;
- Elaboration of a contingency planning by the contractor at work site in case of major accidents shall be carried out;
- A site-specific fire-fighting plan also needs to be developed and implemented by EPC Contractor during construction phase;
- Accidents shall be reported to and investigated by the EPC Contractor. All personnel shall be encouraged to report all accidents/incidents and to cooperate in the investigation of such occurrence;
- Adequate signage, lightning devices, barriers, and persons with flags during construction to manage traffic at haulage and access roads shall be conducted;
- The communicable disease of most concern during construction phase, like sexually-transmitted diseases such as HIV/AIDS, should be prevented by successful initiative typically involving health awareness, education initiatives, training heath workers in disease treatment, immunization program and providing health service;
- Reducing the impacts of vector borne diseases on long-term health effect of workers should be accomplished through implementation of diverse interventions aimed at eliminating the factors that lead to disease;
- All construction activities shall be properly managed through careful planning and the applicable and relevant HSE policies.

9.30 EMERGENCY PREPAREDNESS AND RESPONSE FRAMEWORK

The framework provides an overview of the procedures to mitigate and control the impacts on community, on occupational health and safety, on the environment and on the Project in the event of emergency situations and to respond in life threatening situations usually occurring suddenly and unexpectedly during the construction and operational phases of the proposed project. This framework applies to all the processes of emergency responses to accidental calamities that can occur in an office, construction area and living area as well as first aids and emergency responses as per actual environmental situations during construction. This framework also provides a general reference and a basis for a detailed sub-plans and procedures that have to be developed by the Contractor before the initiation of the construction

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

of the project and will be approved by the proponent. The framework needs to be developed with following objectives:

- Outline the applicable standards with regards to emergency preparedness and response;
- Define the emergency preparedness and response procedures utilized during the construction phase;
- Define persons and departments involved in emergency preparedness and their roles and responsibilities; and
- Define training requirements.

Various categories of risks can be envisaged in a working or construction environment. The response to each hazard will be different. A few types of emergencies/accidents will include the following:

- Natural risk: earthquake, flood, and other natural disaster;
- Political risk: civil strife, upheaval, riot, kidnap, and terrorist attack;
- Construction: fire, traffic accident, falling, hit and electric shock;
- Public health: dengue fever, malaria, food sanitation, high-temperature operation, insect sting, and
- Security: injury and property loss resulted from theft, robbery, and law case.

To minimize human suffering and financial losses, all personnel must know their responsibilities under the emergency preparedness and response plan. The plan should be used to set emergency procedures, implement and communicate the procedures and ensure that any required training has been completed. Planning for emergencies should include the following points:

- Hazard identification/assessment;
- Emergency resources;
- Communication systems;
- Administration of the plan;
- Emergency response procedure;
- Communication of the procedure; and
- Debriefing and post-traumatic stress procedure.

9.31 BORROW AREAS MANAGEMENT / REHABILITATION PLAN

There will be dire need to manage the borrow areas to avoid any environmental damage during the implementation phase of the Project. The EPC Contractor will develop a borrow area management/rehabilitation plan prior to start the extraction of material from each borrow area by using below guidelines.

- Site layout and boundaries with the following provisions:
  - Name, location and ownership of the borrow area;
  - Existing land use of the area;
  - Estimates of the resources to be extracted;

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- Stockpiling location;
- Dust and noise consideration; and
- Sequence of operation.

9.32 RESTORATION AND REHABILITATION PLAN

The implementation of the proposed Project would involve construction workers' camp for staff and laborers, establishment of fences around construction site, over usage of access roads for movement of heavy machinery/motor vehicles linking to various components of project, offices, borrow/quarry areas, etc. During construction, these activities could also result in accumulation of large amount of unused or spoil material at various sites such as at access roads, muck dumping sites, quarry sites, colonies, offices, etc. which will change the existing land cover in the project area. After completion of the construction work, it is required to restore the disturbed area to its original conditions wherever it is possible that is the sole responsibility of the Contractor. Various engineering and biological measures have been suggested for the restoration of these areas:

- Top soil should be stored at designated areas before performing excavation activities at quarry sites (if these are agriculture land) and after the completion of all the construction activities, quarry sites (if applicable) and construction sites should be covered with the top soil to support the growth of plant species;
- The area should be planted with indigenous vegetation that would require the initial establishment of fast growing grasses along with annuals and perennials, nitrogen fixing herbaceous legumes and non-legume shrubs to increase the soil conditioning and to stabilize the project site;
- Material stockpiles shall be removed as soon as the construction work will be completed;
- All the construction, toxic and hazardous chemicals/materials shall be completely removed from the site;
- All fencing and gates shall be removed and pits shall be backfilled;
- The reconstruction of interrupted drainage channels and pipes shall be carried out;
- Rehabilitation of affected roads should be carried out to avoid any inconvenience to the road commuters; and
- A clearance certificate from the consultant has to be taken by Contractor in this regard.

9.33 WASTE MANAGEMENT PLAN

Management of solid and hazardous waste is one of the most important issues during construction phase of the Project.

The major components of the workers' camp waste are garbage, putrescible waste, rubbish and small portion of ashes and residues, wastewater from camps toilets and washing yards, etc. The construction waste will include wastewater, oil spillage from machinery and solid waste (damaged or spoiled materials, temporary and expendable construction materials, etc.). Insecure and unhygienic disposal of the wastes may cause degradation of soil, land and water resources. However, a criterion has been developed for the solid and hazardous waste management at site. The criterion is as follows:

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- All the anticipated solid wastes should be collected through a properly designed solid waste management system. Enough number of containers should be placed inside the camps and within the construction area for the collection of various types of waste;
- These containers will help the component separation of various types of waste at source. Classification will be based on organic waste, recyclable waste, reusable waste (for resource and recovery) and waste for disposal site. Based on the conditions of the region, organic waste should be frequently collected to avoid odour problems;
- Recyclable, reusable and waste for disposal site should be collected twice a week and on alternate days and should be transferred to a properly designed disposal site;
- The sewage system for camps shall be properly designed (pit latrines or, as required, septic tanks) to receive all sanitary wastewaters;
- Lined wash areas shall be constructed within the camp site or at site, for the receipt of wash waters from construction machinery;
- Medical waste and construction waste should be handled with care.;
- Construction waste i.e. waste concrete, bricks, cement, etc. should be disposed of at the designated areas; and
- Construction workers and supervisory staff should be encouraged and educated to practice waste minimization, reuse and recycling to reduce quantity of the waste for disposal.

9.34 TRAFFIC MANAGEMENT PLAN

A comprehensive traffic management plan will be developed by EPC Contractor mentioning routes to be followed for transportation of construction machinery and materials e.g. cement, steel, gravels, sand, etc. Traffic management plan will comprise following contents necessarily:

- Goals and objectives of plan;
- Purpose & Scope;
- Project specific traffic;
- Roles & responsibilities of contractors' environmental personnel;
- Routes to be followed along with necessary maps;
- Transportation timing; and
- Mechanism to address road accidents (if occurs).

9.35 CHANGE MANAGEMENT PLAN

The EIA and EMP have been prepared at feasibility phase of the proposed Project. Both are living documents and it has been foreseen that during the detailed design phase the documents may be updated and the EMP has to be refined. The EMP will be refined in the light of updated results of ambient air quality, noise, drinking water and surface water/wastewater. It will further be updated in the light of possible adverse environmental impacts and if necessary then any additional mitigation and enhancement measures will also be added to the EMP. Any sort of change in EMP has to be informed to all concerned personnel/departments.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

9.36 CHANCE FIND PROCEDURE

In case of any chance find, the Contractor will immediately report through MC to Archaeology Department, GB and take further suitable action to preserve those antiques or sensitive remains. Representative of the Director will visit the site and observe the significance of the antique, artifact and cultural (religious) properties and significance of the Project. The report will be prepared by representative and will be given to the Director. The documentation will be completed and if required suitable action will be taken to preserve those antiques and sensitive remains. In case any artifact, antiques and sensitive remains are discovered, chance find procedures should be adopted by construction contractor workers as follows:

- Stop the construction activities in the areas of chance find;
- Delineate the discovered site or area;
- Consult with the local community and Archaeological Department, GB;
- The suggestion of the local communities and the concerned authorities will be incorporated during taking the preventive measures to conserved the antique, artefact and Cultural (religious) properties;
- Secure the site to prevent any damage or loss of removable objects. In case of removable antiquities or sensitive remain, a night guard shall be arranged until the responsible local authorities take over; and
- After stopping work, the Contractor must immediately report the discovery to the MC.

9.37 CODES OF PRACTICE

The EPC Contractor should seek to develop codes of practice for its staff and employees in order to ensure that the intrusion of workers in the project area does not result in any social and environmental and social issues between the workers and locals which can harm the project by causing unnecessary delays.

These codes should be based on the principles of environmental protection, occupational health and safety, good engineering practices, respect, integrity and sound ethical values. Each code should include, at minimum, the purpose and objectives, a policy statement from the in charge explaining the importance of this code for the success of the project, and examples of such conduct. Guidelines for the code of practices are discussed below.

9.38 GENERAL

General code of conduct should be developed for the project and should include, at minimum, the following practices:

- Rules and guidelines will be given to the workers regarding the use of common resources such as wood, plants, water sources etc. to ensure their sustainable use;
- The code should also include provisions of the solid waste management plan to address solid waste collection and disposal in order to prevent unhygienic conditions and contamination of soil and water;
- The EPC Contractor will be made arrangements to avoid accidental risks such as traffic signs board and speed control measures for the safety of locals;

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- In construction camps, amenities of life including clean food, water and sanitation facilities must be provided to these camps, and the workers should be provided with guidelines on how to dispose of their waste and maintain a sense of hygiene;
- The training of workers in the construction safety procedures, equipping all construction workers with Personnel Protective Equipment (PPEs) i.e., safety boots, helmets, gloves, ear plugs, and protective masks also and monitoring their proper and sustained usage;
- The Contractor should ensure that the construction labor is trained in safety procedures for all relevant aspects of construction;
- Formal emergency procedures should be developed for construction site in case of an accident. First aid kits and other necessary equipment should be kept available at site along with the list of emergency phone numbers at the construction site to be contacted in case of any accident; and
- The safety of the public at all stages of the construction and operation will be ensured by appropriate public education and safety measures such as use of sign boards, barriers and flags and use of proper illumination at night.

9.39 GOOD ENGINEERING PRACTICES

Good engineering practices should be developed for the project and should include, at minimum, the following practices;

- Standard Operating Procedures (SOP) for handling, storage and transportation of oil leakages, chemicals and other toxic materials should be strictly followed;
- Workers must be familiar with the Material Safety Data Sheets (MSDS) of each chemical used at site. MSDS are provided with each chemical drum. Chemicals will be stored as per their MSDS. Utmost care should be taken during the handling of these chemicals;
- Precautions should be taken to prevent spills and all workers should be trained in proper handling, storage and disposal of hazardous or toxic materials; and
- Proper disposal plans of excavated material.

9.40 CULTURAL NORMS

Cultural Code of Practice should be developed for the project and should include, at minimum, the following practices:

- Self-respect and sensitivity to insult is an important trait of the locals. The poorest among them has his own sense of dignity and honour and he vehemently refuses to submit to any insult. In fact, every inhabitant considers himself equal if not better than his fellow tribesmen and an insult is, therefore, taken as scurrilous reflection on his character. So, the contractor should be careful to avoid any unceremonious interaction with the locals and inform their staff to be humble and polite.
- The Contractor should also take care of the norms of local community and their sensitivity towards local customs and traditions;
- The Contractor should brief the staff about local culture and norms;
- As per local culture wearing of pant shirt, half shirts, and short trouser are considered inappropriate attire, therefore the contractor inform the staff to avoid wearing short trousers and short shirt;
- Contractor will strictly warn the staff not to involve in any unethical activities and to obey the local norms and cultural restrictions particularly with reference to women;

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- The Contractor will be required to maintain close liaison with the local elders and religious scholars of nearby local community to ensure that any potential conflicts related to common resource utilization for the project are resolved easily;
- Privacy of women is a major cause of concern for the communities of the project area. Due to the project activities local women may not be able to perform their daily outdoor chores. Women in the project are participate in other outdoor activities such as livestock rearing, bringing of potable water, collection of fire wood etc. that may be affected by the project activities;
- The EPC Contractor will have to select the specific timings for the construction activities so as to cause least disturbance to the local population particularly women considering their peak movement hours; and
- The EPC Contractor will warn the staff strictly not to indulge in any un-ethical activities and to obey the local norms and cultural restrictions particularly with reference to women.

9.41 ENVIRONMENTAL MITIGATION COST

Implementation of the recommendations of the EIA during the construction phase is the sole responsibility of the EPC Contractor and the monitoring activities will be carried out by the MC and WAPDA. Cost for environmental management and monitoring will be the part of the contract document with the Contractor.

The annual estimated cost for the implementation of environmental monitoring and management for the proposed Project is given in **Table 9-4.**

PUBLIC PROCUREMENT REGULATORY AUTHORITY (PPRA) EPADS

Table 9-4: Estimated Cost for the Implementation f Environmental Monitoring and Management

Sr. No.	Parameter	Mechanism	Frequency	Unit Rate (PKR)	Quantity	Cost (PKRs)	Remarks
A	**PRE- CONSTRUCTION PHASE**						
A-1	**Environmental Monitoring Cost**						
1	Drinking Water Quality	Discrete grab sampling and laboratory testing of water samples by EPA approved Laboratory for monitoring.	Once	35,000	6 Nos.	210,000	One time monitoring shall be carried out before the mobilization of Contractor.
2	Surface/Wastewater Monitoring	Discrete grab sampling and laboratory testing of water samples by EPA approved Laboratory for monitoring.	Once	35,000	4 Nos.	140,000

10 CONCLUSIONS AND RECOMMENDATIONS

10.1 CONCLUSIONS

Water and Power Development Authority (WAPDA) intends to develop 54 MW Attabad Lake Hydropower Project (ALHHP) on Attabad Lake situated in the Hunza Valley of GB, Pakistan. ALHPP (36º8'28.87"N and 74º49'19.44"E) has been identified on Hunza River on Attabad Lake. Attabad Lake was formed on January 4, 2010, when a huge mass from the right bank of Hunza River slided down near Attabad Village and blocked Hunza River. The inflow filled upstream valley created a reservoir 22 km long till the end of May 2010. Attabad Lake is about 15 km upstream of Ganish Bridge and about 111 km upstream from Gilgit. Therefore, ALHHP will utilize the Attabad Lake water and head for the generation of the Hydel Electricity. Therefore, due to the implementation of ALHPP, no major adverse impacts are anticipated.

Presently, there is a huge demand and supply gap of electricity in GB resulting in load shedding along with low voltage issues. Locals have no option for commercial and industrial demand to be partly fulfilled from diesel generators. Apart from the high cost of fuel, the use of these diesel generators is affecting the environment as well as tourism in the area.

This report has been prepared in accordance with the requirements of the GB Environmental Protection Act, 2014, Pakistan Environmental Protection Agency Review of Initial Environmental Examination and Environmental Impact Assessment Regulations, 2000; Guidelines for Environmental Assessment (Guidelines for the Preparation and Review of Environmental Reports, Pakistan Environmental Protection Agency, 1997, Guidelines for Sensitive and Critical Areas,1997, Guidelines for Public Consultation, Pakistan Environmental Protection Agency, May, 1997; and Sectoral Guidelines: Pakistan Environmental Assessment Procedures, Pakistan Environmental Protection Agency, October 1997). In addition, this EIA addresses the requirements defined in the national and local regulations. Thus, to fulfil local (GB EPA) legal requirements, an EIA study was conducted for the proposed project.

This EIA study has been updated based on the available information at this stage of the Project as an additional scope of work. The proposed project will be implemented in EPC Contractor mode therefore, Detailed Engineering Design including Final Design will be available after the selection of EPC Contractor.

Analysis of Alternatives such as No Project Option, Project Layout, Headrace, Penstock and Powerhouse Location have been considered during the preparation of EIA study.

During the field surveys, significant efforts were made to identify the main physical, ecological, social, cultural and environmental issues related to the construction and operation of the proposed project. Various stakeholders including government departments and agencies were also contacted for obtaining salient information in this regard along with that from area residents.

Following are the major anticipated positive impacts:

- The Project not only reduces or replaces equivalent electricity generation sources with all the associated environmental benefits but it will also help to avoid all associated pollution caused through extraction, processing, storage and transportation of conventional fuels required for fossil fuel power generation plants.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

- The sustainable power supply with the development of the proposed Project is likely to attract more tourists in the Project area and will increase the local business and recreational activities.
- The proposed Project will also provide skilled and unskilled jobs during the implementation phase and a limited number of jobs during operation and maintenance.
- Hunza and Nagar valleys have precious mineral resources which have remained unexploited. The availability of electricity will certainly develop a set up on large scale to preserve fruits and for exploration of minerals.
- The requirements of electricity have increased in homes, both public and private offices, education institutions, hospitals, and health care centers in towns and habitats in the remote rural areas of valleys in Gilgit-Baltistan region, the electricity shortfall can be decreased with commissioning of this Project.
- Access roads will be built as part of the Project and will facilitate the people for goods and services accessibility. After completion of the Project, these facilities and infrastructure will be available to the general public. Moreover, health facilities created during the construction phase will be available to local communities.

Following is the list of potential adverse impact:

- Permanent Land acquisition;
- Temporary Land on rental/lease basis
- Cutting of trees/bushes falling within the proposed Project Boundary.
- Disturbance due to field activities;
- Temporary Landslide Hazards;
- Disturbance to aquatic fauna;
- Disturbance to infrastructure and public utilities;
- Disturbance to the public movement during construction;
- Noise and air pollution due to the working of construction machinery during construction and traffic during O&M phases of the Project;
- Solid waste and wastewater generation during construction;
- Oil spillages from construction machinery, resulting in soil and water contamination;
- Occupational and community health and safety issues;
- Social and Cultural Conflicts;

Sedimentation, environmental flow, dam safety and emergencies etc. are the anticipated environmental impacts during operation and maintenance phase of the proposed project.

The impact assessment, revealed that with the help of appropriate mitigation and control measures provided in this EIA Study, most of these potential impacts will either be avoided altogether, or their likelihood of occurrence and severity will be reduced, thus making this project environmentally responsible and socially acceptable.

The environmental constraints will have to be monitored by concerned agencies, including Environment Specialist of Proponent and GB EPA. An EMP has been developed as part of the report which provides a detailed mitigation matrix that covers impacts, mitigation measures roles and responsibilities and timings to avoid, minimize or mitigate the adverse impacts of the

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

project.

Project is socio-economically viable and environment friendly if EMP is implemented in true letter and spirit. The plantation will enhance the aesthetics; improve the landscape as well as the environmental conditions along the project area.

10.2 RECOMMENDATIONS

The EIA, EMP, mitigation and monitoring programs, contained herewith are recommended to include within the bidding documents for project works for all project components. The Bidding documents shall clearly state that the EPC Contractor will be responsible for the implementation of the requirements of the EMP through his own SSEMP and SSHSMP, based on the guidelines provided in the EIA report, which will adopt all of the conditions of the EMP and add site specific elements as per advice of Environmental Specialist. This will ensure that all potential bidders are aware of the environmental requirements of the project and its associated environmental costs.

Project affected persons must be compensated for their lost land, property or any other asset as per existing market rates. This step will reduce any future social impacts or political strains due to Project implementation. All personnel staff, employees and EPC Contractor should undertake appropriate training prior to construction works to ensure they are aware of the on-site responsibilities in respect of all environmental and social issues.

The EIA, EMP and all its requirements should be added to the EPC Contractor's Contract, thereby making implementation of the EMP a legal requirement according to the Contract. Therefore, EPC Contractor will prepare its SSEMP which will be approved and monitored by the Supervision Consultant. The Supervision Consultant shall note any non-conformance with the SSEMP and the conditions of environmental approval by GB EPA. The EPC Contractor should be held liable for breach of the contractual obligations of the EMP. In order ensure compliance with the SSEMP, the EPC Contractor will employ an Environmental Manager (or expert specified in EMP) to monitor and report project activities throughout the project construction phase.

The Project is found economically and financially feasible. The calculated economic internal rate of return (EIRR) is above 22.36% (the assumed opportunity cost of capital in Pakistan) and the financial internal rate of return (FIRR) comes out to be 19.17%. The proposed Project is found to be technically feasible, economically viable and environmentally acceptable and will fulfill electricity needs particularly for Hunza City and in general for Hunza, Gilgit and Ghizar Regions. It is suggested that the proposed Project should be implemented as soon as possible after all necessary approvals, design provisions and the implementation of EMP.

The tentative cost estimates to implement EMP is estimated as **PKR. 126.5 Million**. This tentative cost will be included in the overall project cost. This cost will be reviewed and firmed up periodically to ensure realism. The EPC Contractor however shall be paid against the actual execution with evidential proof of EMP activity.

e-Pak Acquisition and Disposal System (EPADS) generated document | © 2026

ANNEXES

ANNEX-I: LIST OF PARTICIPANTS-COMMUNITY CONSULTATIONS

LIST OF PARTICIPANTS-COMMUNITY CONSULTATIONS

Sr. No.	Name of Participants	Occupation
1. Ganish Village		
1	Mubarak Hussain	President (Ganish Local Development Org.)
2	Sadaqat Hussain	Business
3	Tajir Hussain	Community Representative
4	Khadim Hussain	Advocate
5	Sherbaz	Govt. Employee
6	Ali	Shopkeeper
7	Akbar Hussain	Business
2. Gulmit Village		
1	Shair Ullah Baig	Vice Chairman
2	Salman Kareem	Society Member
3	Hadayat Shah	Society Member
4	Sultan Ayub	Numberdar
5	Sikandar Ahmad	Finance Secretary
6	Ahmad Baig	Finance Secretary

7	M. Ashraf Khan	Stakeholder
8	Mullah Walli	President Thrift Society
9	Ali Madad	President Water Supply
10	M. Sharif Khan	Stakeholder
11	M. Iqbal	Stakeholder
12	Wahid Murad	Head Agriculture Society
13	Babar Majeed	President CBES
14	Arman Ali	President Passu Conserving Committee
15	Salah Uddin	President Village Organization
16	M. Adab Khan	Community Stakeholder
17	Aman Ullah Khan	Social Activist
18	M. Ashraf Khan	Stakeholder

ANNEX-II: TREE PLANTATION PLAN

TREE PLANTATION/ AFFORESTATION PLAN

The basic purpose of afforestation/plantation of suitable species in the project area is to reduce the risk been made due to cutting of trees for the proposed project and to enhance green cover and improve the overall environment of the area. Afforestation will not only reduce the risk been made but will also increase the carrying capacity of the area regarding many positive aspects.

Plantation will be done after the removal of trees during the construction work immediately. Plantation of indigenous trees species is highly important to maintain the biodiversity and ecological balance. It is also important to prevent global warming, soil erosion and pollution. Afforestation purifies the environment and helps in reducing the carbon dioxide level. The afforestation activity will further help in enhancing the socio-economic condition of the area and project sustainability.

Importance of Tree Plantation

- Trees contribute to their environment by providing oxygen, improving air quality, climate amelioration, conserving water, preserving soil, and supporting wildlife.
- Trees control climate by moderating the effects of the sun, rain and wind. Leaves absorb and filter the sun's radiant energy, keeping things cool in summer.
- Trees also preserve warmth by providing a screen from harsh wind.
- Trees also lower the air temperature and reduce the heat intensity of the greenhouse effect by maintaining low levels of carbon dioxide.
- Both above and below ground, trees are essential to the eco-systems in which they reside.
- Trees absorb and store rainwater which reduce runoff and sediment deposit after storms. This helps the ground water supply recharge, prevents the transport of chemicals into streams and prevents flooding.
- Trees, shrubs and turf also filter air by removing dust and absorbing other pollutants like carbon monoxide, sulfur dioxide and nitrogen dioxide.

Objectives

- To Restore native species
- To improve the quality of air and reduce its pollution
- To add color to the landscape and enhances the beauty of the environment
- To uplift the quality of our living environment through active planting, proper maintenance and preservation of trees together with other vegetation.
- To Protect and conserve flora and fauna of the project area.
- To attract rain which is a positive impact on the project area at all.
- To reduce sedimentation by plantation in the project area which will act as protection wall against wind born dust particles.

Study Area Enhancement/Rehabilitation Plan

The project area is not rich in natural vegetation but some of planted and natural trees may be damaged**.**

In the project area will be raised on available spaces, in the Project area. Distance from the outer boundary of the ROW and between two plants will be kept as 4 meters. A total of 5,750 plants shall be planted in lieu of expected 5**75** effected plants, which is equal to 1:10 of the effected plants.

Plantation Technique

Plantation of suitable broad leaved and pine species is to be carried out in the immediate vicinity of the project area. The project area can be afforested and vegetation cover can be improved by adopting standard afforestation technique of digging pits. The project area is suitable for plantation activities and can be managed thoroughly with care.

Pits

Pits should be dug in the project area at a spacing of 10' linearly. The pits should be of 1.5 feet dia at the top and 1 feet dia at the bottom with a depth of 1-3/4" ft. The earth taken out of the pits will be deposited below each pit in a crescent shape, so as to form a ridge with a clear berm of 9 inches in front. The consecutive crescents will be joined to catch the maximum quantity of moisture. Moreover, planting should be carried out in the pits and sowing on the berms, before or immediately after the first shower of rain. The choice of species (Forest Department may change as per actual requirement and suitability)

Table: Recommended Species for Plantation in the Project Area

Sr. No.	Common Name	Scientific Name
1	Chinar	*Platanus orientalis*
2	Tooth/Mulberry	*Morus alba/Nigra*
3	Robenia	*Robinia pseudoacacia*

When to Plant

Planting should be completed early in the rains in as short a time as possible. The trees must be given time to become well established prior to the dry season. A good rule of thumb is to start planting when the soil is moist to a depth of 15-25 cm or to the bottom of the planting hole. Failures because planting is too late are more common than failures because of planting too early. To obtain good results and avoid labor shortage in these areas considerable preparatory planning is needed. The size of the plantation might have to be adapted to the availability of labor. If dry sites cannot be planted in time, planting should be postponed until the next season.

Cost

The cost and maintenance of about 5,750 plants for afforestation in the project area has been estimated including cost of layout, digging, planting, carriage and watch and ward and its maintenance for four (04) years. **Table** shows the approximate cost of plantation including four (04) years' maintenance (Standard).

Note: *These all activates of plantation plan should be implemented by Forest Department and they may change/update the standards and choice of species as per rule and approved rates.*

Break-up of Expenditure per Avenue kilometer @ Rs. 1500/- per diem: Break-up of Expenditure per of 250 plants @ Rs. 1500/- per diem:

FIRST YEAR

Sr. No.	Item	Quantity	Rate	Amount (Rs.)
1.	Layout	1 Av.km	2 MD/Av.km	3000.00
2.	Digging of Pits 2.5 ft. each 2.5x250 = 625 cft.	625 cft.	5 MD/Av.km	7500.00

3.	Cost of Plants including	250 No.	Rs100/- plant	25,000.00
4.	Cost of planting of plants	250 No.	Rs. 25/- plant	6250.00
5.	Carriage of plants from private nursery to site including loading/unloading	250 No.	Rs. 10/- plant	2500.00
6.	Cost of Manure and Bhall (silt) including carriage	1 Av. Km		20,000.00
7.	H/watering 50 times 250x50 with water bowser, one driver and one coolie	12500 no.	5MD/per %0	100,000.00

10.	Unforeseen			5750.00
Total				200,000.00

SECOND YEAR

Sr. No.	Item	Quantity	Rate	Amount (Rs.)
1.	Cost of Plants 20% Restocking	50 No.	Rs.100/- plant	5,000.00
2.	Cost of planting	50 No.	Rs. 25/- plant	1250.00
3.	Carriage of plants	50 No.	Rs. 10/- plant	500.00
4.	H/watering 50 times with water bowser, one driver and one coolie	12500 no.	5MD/per %0	100,000.00
5.	Reopening of Pits twice (250x2)	500 cft.	2 MD/per %	1,5000.00
6.	Weeding twice 250x2	500 no.	2 MD/per %	1,5000.00
7.	Unforeseen			1250.00
Total				1,38,000.00

THIRD YEAR

Sr. No.	Item	Quantity	Rate	Amount (Rs.)
1.	Cost of Plants 10% Restocking 25 No.	25 No.	Rs.100/- plant	2500.00
2.	Cost of planting	25 No.	Rs. 25/- plant	625.00
3.	Carriage of plants	25 No.	Rs. 10/- plant	250.00
4.	H/watering 40 times x250 no.	10,000 no.	5MD/per %0	75000.00
5.	Reopening of Pits twice (250x2)	500	5MD/per %0	3750.00
6.	Unforeseen			2875.00
Total				85,000.00

FOURTH YEAR

Sr. No.	Item	Quantity	Rate	Amount (Rs.)
1.	H/watering 30 times	7500 no.	5MD/per %0	56250.00
5.	Pruning and cleaning of plants	250 no.	5MD/per %0	1875.00
6.	Unforeseen			1875.00
Total				60,000.00

Cost for raising 250 plants: = **Rs.4,83,000/-**

For 4 years

Total cost for 5,**750** plants and their maintenance for four (4) years = **Rs. 11,109,000/-** or say

Total Cost= 11.109 Million PKR

Note: *The above rates and calculations are approximate and tentative which will be updated according to the standard rates of concerned Forest and agriculture Departments/Implementing Agency, during implantation stage, as per updated and approved standards.*

Expected Results

(1) Extensive plantation, raised on both sides of the road will improve the ecological balance as both the flora and fauna are integral part of the ecosystem. Native tree species will be resorted which is playing pivotal role in carbon sequestration, which leads to reduce global warming and storing more carbon.

(2) Local people will also get direct benefits in terms of fodder for cattle's, shade, job opportunities during plantations and maintenance for four years, clean air, and balanced temperature. Improved Green cover in the area will also attract the faunal species which are scared away due to construction activities. This shall reduce the noise and air pollution as well.

(3) In many ways, fauna of a tract is dependent upon flora for its resting, nesting and roosting activities. With the improved flora of the project area, due to raising of large number of trees, the fauna and especially the avi-fauna shall be attracted to the area. The birds, which were scared away due to noise and degradation of their habitat, shall return to the area.

(4) Plantation on both sides of the road shall not only reduce the noise and air pollution but will also be a source of attraction for the humans, and Wildlife like mammals, reptiles' birds and other dependents.

PUBLIC PROCUREMENT REGULATORY AUTHORITY (PPRA) EPADS

ANNEX-III: CHANCE FIND PROCEDURE

CHANCE FIND PROCEDURE

In case of any chance find procedure, the EPC Contractor will immediately report through supervision consultant to Archaeology Department of Astor and take further suitable action to preserve those antiques or sensitive remains. Representative of the Director will visit the site and observed the significance of the antique, arte fact and Cultural (religious) properties and significance of the Project. The report will be prepared by representative and will be given to the Director. The documentation will be completed and if required suitable action will be taken to preserved those antiques and sensitive remains.

In case any artifact antiques and sensitive remains are discovered, chance find procedures should be adopted by construction contractor workers as follows:

- Stop the construction activities in the areas of chance find procedure;
- Delineate the discovered site or area;
- Consult with the local community and Archaeological Department;
- The suggestion of the local communities and the concerned authorities will be incorporated during taking the preventive measures to conserved the antique, arte fact and Cultural (religious) properties;
- Secure the site to prevent any damage or loss of removable objects. In case of removable antiquities or sensitive remain, a night guard shall be arranged until the responsible local authorities take over; and
- After stopping work, The EPC Contractor must immediately report the discovery to the Supervision Consultant Expert.

PUBLIC PROCUREMENT REGULATORY AUTHORITY (PPRA) EPADS

ANNEX-IV: GUIDELINE OCCUPATIONAL HEALTH AND SAFETY PLAN

GUIDELINE OCCUPATIONAL HEALTH AND SAFETY PLAN

Occupational Health and Safety covers all personnel working under the project and will be in line with the World Bank EHS guidelines on health and safety.

The Occupational Health and Safety program will aim to ensure that the workplace is safe and healthy by: addressing the hazards and risks at the workplace; outlining the procedures and responsibilities for preventing, eliminating and minimizing the effects of those hazards and risks; identifying the emergency management plans for the workplace or workplaces; and, specifying how consultation, training and information are to be provided to employees at various workplaces.

Some of the risks/hazards associated with workplaces are due to working close to or at sites associated with the various project construction activities. Other risks associated with the project construction phase include risk of increase of vector borne and other different diseases.

The following sections will be implemented during the construction phase to address and ensure workers' health and safety.

SCREENING AND REGULAR UNANNOUNCED CHECKING OF WORKERS

As per the procedure for hiring workers, all contractors and labor agencies are required to make all prospective workers undergo medical tests to screen for diseases and sicknesses, prior to selection and employment of any worker. The contractor is also responsible for ensuring that no worker who has a criminal record is employed at the project site. It will be ensured that all workers undergo medical tests to screen diseases at source and at sites in consultation with the designated Health Officer.

In addition to this, the Project Management will also undertake sudden, unannounced checks on workers to look for diseases such as COVID-19, HIV, STDs, and hepatitis and take necessary steps as mandated by the Contractual agreement between the Contractor and the Worker(s).

MINIMIZING HAZARDS AND RISKS AT THE WORKPLACE

To ensure safety at all work sites, the following will be carried out:

i. Installation of signboards and symbols in risky and hazardous areas, to inform workers to be careful.
ii. Construction of barricades around construction sites and deep excavated pits, to cordon off and deter entry of unauthorized personnel and workers into these areas.
iii. Providing a safe storage site/area for large equipment such as power tools and chains, to prevent misuse and loss.
iv. Proper Housekeeping: Ensuring that materials are all stacked, racked, blocked, interlocked, or otherwise secured to prevent sliding, falling, or collapse. Brick stacks will not be more than 7 feet in height and for concrete blocks they will not be more than 6 feet high.
v. Removing all scrap timber, waste material and rubbish from the immediate work area as the work progresses.
vi. Where scaffolds are required, ensuring that each scaffold or its components shall be capable of supporting its own weight and at least 4 times the maximum intended load applied or transmitted to it. The platform/scaffold plank shall be at least 15 inches wide and 1.5 inches thick. The rope should be capable of supporting at least 6 times the maximum intended load applied or transmitted to that rope. Pole scaffolds over 60 feet in height shall be designed by a registered professional engineer and shall be constructed and loaded in accordance with that design. Where scaffolds are not provided, safety belts/safety nets shall be provided;
vii. Ensure that all ramps or walkways are at least 6 feet wide, having slip resistance threads

and not inclined at more than a slope of 1 vertical and 3 horizontal.

viii. Stacking away all excavated earth at least 2 feet from the pit to avoid material such as loose rocks from falling back into the excavated area and injuring those working inside excavated sites.

ix. Constructing support systems, such as bracing to adjoining structures that may be endangered by excavation works nearby.

x. Only a trained electrician to construct, install and repair all electrical equipment to prevent risks of electrical shocks and electrocution.

xi. Install fire extinguishers and/or other fire-fighting equipment at every work site to prepare for any accidental fire hazards.

PROVISION OF PERSONAL PROTECTIVE EQUIPMENT

Risks to the health and safety of workers can be prevented by provision of Personal Protective Equipment (PPEs) to all workers. This will be included in the construction cost for each Contractor. Depending on the nature of work and the risks involved, contractors must provide without any cost to the workers, the following protective equipment:

i. High visibility clothing for all personnel during road works must be mandatory.

ii. Helmet shall be provided to all workers, or visitors visiting the site, for protection of the head against impact or penetration of falling or flying objects.

iii. Safety belt shall be provided to workers working at heights (more than 20 ft) such as roofing, painting, and plastering.

iv. Safety boots shall be provided to all workers for protection of feet from impact or penetration of falling objects on feet.

v. Ear protecting devices shall be provided to all workers and will be used during the occurrence of extensive noise.

vi. Eye and face protection equipment shall be provided to all welders to protect against sparks.

vii. Respiratory protection devices shall be provided to all workers during occurrence of fumes, dusts, or toxic gas/vapor.

viii. Safety nets shall be provided when workplaces are more than 25 feet (7.5 m) above the ground or other surfaces where the use of ladders, scaffolds, catch platforms, temporary floors or safety belts is impractical.

The specific PPE requirements for each type of work are summarized below.

Table 1: PPE Requirement List

Type of Work	PPE
Elevated work	Safety helmet, safety belt (height greater than 20 ft), footwear for elevated work.
Handling work safety	Helmet, leather safety shoes, work gloves.
Welding and cutting work	Eye protectors, shield and helmet, protective gloves.
Grinding work	Dust respirator, earplugs, eye protectors.
Work involving handling of chemical substances	Dust respirator, gas mask, chemical-proof gloves. Chemical proof clothing, air-lined mask, eye protectors.
Wood working	Hard hat, eye protectors, hearing protection, safety footwear, leather gloves and dust respirator.

Type of Work	PPE
Blasting	Hard hat, eye and hearing protection.
Concrete and masonry work	Hard hat, eye protectors, hearing protection, safety footwear, leather gloves and dust respirator.
Excavation, heavy equipment, motor graders, and bulldozer operation	Hard hat, safety boots, gloves, hearing protection.
Quarries	Hard hat, eye protectors, hearing protection, safety footwear, leather gloves and dust respirator.

PROCEDURES TO DEAL WITH EMERGENCIES SUCH AS ACCIDENTS, SUDDEN ILLNESS AND DEATH OF WORKERS

First aid kits will be made available at all times throughout the entire construction period by the respective contractors. This is very important, because most work sites will be at some distance from the nearest hospital. In addition to the first aid kits, the following measures should be in place:

i. Provision of dispensaries by the individual EPC contractor.
ii. A vehicle shall be on standby from the Project Office so that emergency transportation can be arranged to take severely injured/sick workers to the nearest hospital for immediate medical attention.
iii. A designated Health Officer/worker for the Project will be identified as a focal person to attend to all health and safety related issues. This employee's contact number will be posted at all work sites for speedy delivery of emergency services. The focal person shall be well versed with the medical system and facilities available at the hospital.
iv. Communication arrangements, such a provision of radios or mobile communication for all work sites, for efficient handling of emergencies, will be made.

RECORD MAINTENANCE AND REMEDIAL ACTION

The Project Management will maintain a record of all accidents and injuries that occur at the work site. This work will be delegated by the contractor to the site supervisor and regularly reviewed every quarter by project management. Reports prepared by the contractor shall include information on the place, date and time of the incident, name of persons involved, cause of incident, witnesses present and their statements. Based on such reports, the management can jointly identify any unsafe conditions, acts or procedures and recommend for the contractor to undertake certain mitigative actions to change any unsafe or harmful conditions.

COMPENSATION FOR INJURIES AND DEATH

Any casualty or injury resulting from occupational activities should be compensated as per the local labor laws of Pakistan. Where compensation is sought by the injured party, proper procedures for documentation of the case will be followed, including a detailed report on the accident, written reports from witnesses, report of the examining doctor and his/her recommendation for treatment. Each individual contractor will be responsible for ensuring compensation for the respective workers.

AWARENESS PROGRAMS

The Project management will undertake awareness programs through posters, talks, and meetings with the contractors to undertake the following activities:

i. Dissemination sessions will clarify the rights and responsibilities of the workers regarding interactions with local people (including communicable disease risks, such as HIV/AIDS, COVID-19), work site health and safety, waste management (waste separation, recycling, and composting), and the illegality of poaching.
ii. Make workers aware of procedures to be followed in case of emergencies such as informing the focal health person who in turn will arrange the necessary emergency transportation or treatment.

NOMINATION OF A HEALTH AND SAFETY FOCAL PERSON

Within each site (especially if different sites are being implemented by different contractors), a Health and Safety Focal Person will be appointed. The Terms of Reference for the focal person will mainly be as follows:

i. Function as the focal person/representative for all health and safety matters at the workplace;
ii. Responsible for maintaining records of all accidents and all health and safety issues at each site, the number of accidents and its cause, actions taken and remedial measures undertaken in case of safety issues;
iii. Be the link between the contractor and all workers and submit grievances of the workers to the contractor and instructions/directives on proper health care and safety from the contractors back to the workers;
iv. Ensure that all workers are adequately informed on the requirement to use Personal Protective Equipment and its correct use;
v. Also responsible for the first aid kit and making sure that the basic immediate medicines are readily available.

SUGGESTED CONTENTS OF OCCUPATIONAL HEALTH AND SAFETY PLAN

The suggested contents of Occupational Health and Safety Plan to be developed by the Contractor(s) are described below:

a Purpose

b Scope of Application

c Complying Basis

d Occupational Health and Safety Objectives

e Organization and Responsibility

- Contractor’s Project Manager
- HSE Management Department of the Contractor(s)
- Medical Treatment Room of the Contractor(s)
- Subcontractor’s Project Manager
- Subcontractor’s HSE Managers
- Occupational Health and Safety
- Community Health and Safety

f Health Plan

- Labour Protection
- Sanitary Epidemic Prevention

g Safety Plan

- Summary

- Qualification Review
- Safety Training
- Construction Plans and Documents
- Control Measures
- Monitoring Measures
- Management of the Key Safety Accidents

h Public Security Plan

i Local Community Health and Safety

PUBLIC PROCUREMENT REGULATORY AUTHORITY (PPRA) EPADS

ANNEX-V: BREAKUP OF HEALTH AND SAFETY COST

BREAKUP OF HEALTH AND SAFETY COST

Items	Quantity	Cost / Item (Rs.)	Total Cost (Rs.)	Rationale
(A) Personal Protective Equipment PPEs				
Dust masks	16,800	200	3,360,000	One dust mask per person to be used in a week by 350 labourer for 12 months the quantity will be 16,800 dust masks.
Safety Shoes	350	7,500	2,625,000	One safety shoe per person is supposed to be used for 12 months by 350 labourers.
Gloves	4,200	200	840,000	One pair of gloves is to be used per month per person and for 350 labourer for 12 months, 4,200 gloves are estimated
First Aid Box	6	10,000	60,000	Six First Aid Boxes are proposed for 12 months. The cost includes refilling expenses.
Ear Plugs	4,200	100	420,000	One set of ear plug is to be used per month per person and for 350 labourer for 12 months, 4,200 ear plugs are estimated
Safety Helmets	350	3,000	1,050,000	One safety helmet to be used by each of 350 labourer for 12 months.

Items	Quantity	Cost / Item (Rs.)	Total Cost (Rs.)	Rationale
Safety Jackets (Hi Vis)	700	1,500	1,050,000	Two safety Jacket (Hi Vis) to be used by each of 350 labourers for 12 months and total 700 safety jackets are required
Sub-Total (A)			***9,405,000***	
(B) Others				
Provision of Dust Bins	30	1,000	30,000	Thirty dust bins are proposed to be placed at construction site.
Warning Tape	50	500	25,000	---
Safety Cones	50	1000	50,000	Fifty safety cones are estimated to be placed at active construction site.
Safety Sign Boards	50	10,000	500,000	Fifty safety sign boards are proposed to be placed at active construction site.
Sub-Total (B)			***605,000***	
Grand Total (A + B)			***10,010,000***	

***Cost is estimated for 12 Months**

No. of labour required during construction = 350

ANNEX-V: GENDER ACTION PLAN

GENDER ACTION PLAN (GAP)

Introduction

This Gender Action Plan (GAP) has been developed for the 54 MW Attabad Lake Hydropower Project to ensure gender equality, social inclusion, and equitable benefit-sharing throughout the project lifecycle.

The GAP draws upon findings from the Environmental Impact Assessment (EIA), feasibility studies, and community consultations conducted in the Hunza region. It reflects local socio-cultural conditions, high female literacy rates, strong women's participation in agriculture and home-based enterprises, and the differentiated impacts of energy shortages on women, particularly during prolonged winter months.

Project Context and Gender Profile

The Hunza region exhibits high female literacy (approximately 98%) and strong participation of women in household management, agriculture (around 80%), and home-based enterprises (over 50%). Despite this, prolonged winter electricity shortages disproportionately affect women by increasing domestic workload, limiting productivity, and elevating exposure to indoor air pollution from diesel generators and traditional fuels.

The project's provision of reliable and clean electricity is expected to significantly reduce women's physical burden through improved heating and lighting, enhance indoor air quality, enable income-generating activities such as food processing and handicrafts, support digital access and home-based enterprises, and improve safety and comfort within domestic spaces. Vulnerable groups including low-income households, elderly persons, students, and patients will also benefit through improved access to education, healthcare, and essential services.

Project Components

- Weir and associated structures
- Sediment Flushing Tunnel
- Headrace Tunnel
- Surge Tank
- Penstock
- Powerhouse
- Tailrace
- Switchyard

Objectives of the Gender Action Plan

The objective of the GAP is to mainstream gender considerations into project planning, construction, and operation to ensure inclusive development outcomes. The specific objectives are to:

- Enhance women's access to and benefits from reliable and clean electricity;
- Promote women's participation in project-related employment and livelihood opportunities;
- Prevent and mitigate gender-based violence (GBV), sexual exploitation and abuse (SEA), and sexual harassment (SH);
- Ensure women's meaningful participation in consultations, decision-making, and grievance redress;

- Establish clear institutional responsibilities and monitoring mechanisms for gender actions.

Gender Action Plan Framework

Community institutions such as Village Organizations (VOs) and Women's Organizations (WOs), supported by AKRSP and AKDN, will play a critical role in consultation, outreach, monitoring, and feedback. Their continued engagement will help ensure meaningful participation of women and marginalized groups in project planning, implementation, and monitoring.

Table 1: Key Gender Actions and Measures

Activity	Gender Risks / Issues	Mitigation / Actions	Measurement Indicators	Responsibility	Timeframe
Institutional Strengthening	Weak implementation of gender commitments	Appoint Gender Specialist; integrate sex-disaggregated indicators; regular gender monitoring reports	Gender Specialist appointed; sex-disaggregated data included in reports	EMMC / WAPDA / MC	Design & Implementation
Community Consultation	Limited awareness of women regarding project impacts and entitlements	Inclusive consultations; female representation in PAP Committees; information disclosure	Number of women consultations; %percentage of female representation in committees	EMMC / WAPDA	Throughout Project
Electricity Access Benefits	High domestic workload and indoor air pollution for women	Reliable power for heating, lighting, clean cooking support, and home enterprises	Reduction in generator use; reported reduction in domestic workload	WAPDA / Operator	Operation Phase
Employment & Livelihoods	Limited female participation in project-related jobs	Minimum 10% female workforce; skills training; support home-based businesses	Percentage women employed/trained; number of women-led enterprises supported	Contractor / EMMC	Construction Phase
GBV / SEA / SH Risk Management	Labor influx related social risks	Code of Conduct; awareness sessions; referral mechanisms;	Code of Conduct signed; trainings conducted	Contractor / EMMC	Construction Phase

Activity	Gender Risks / Issues	Mitigation / Actions	Measurement Indicators	Responsibility	Timeframe
		gender-sensitive GRM			
Facilities & Safety	Lack of women-friendly facilities	Separate toilets, waiting areas, lighting, and privacy barriers near institutions	Facilities provided and functional	Contractor	Construction Phase
Gender-Sensitive Grievance Redress	Barriers for women in reporting complaints	Establish accessible, confidential, and gender-responsive GRM; engage Women's Organizations in outreach	GRM operational; number of grievances resolved	WAPDA / EMMC	WAPDA / EMMC
Monitoring & Reporting	Limited accountability for gender outcomes	Quarterly monitoring using sex-disaggregated indicators; participatory monitoring with Women's and Village Organizations	Quarterly GAP monitoring reports	EMMC / MC	EMMC / MC

Monitoring and Reporting

Implementation of the GAP will be monitored through quarterly progress reports incorporating sex-disaggregated data against the indicators defined in Table 1. Women's Organizations (WO) and Village Organizations (VO), and other active civil society organizations such as Agha Khan Rural Support Program (AKRSP) or Agha Khan Development Network (AKDN) where relevant will be engaged in participatory monitoring to ensure transparency, accountability, and equitable outcomes.

Institutional responsibilities are summarized as follows:

- WAPDA: Overall oversight and compliance with gender commitments.
- Environmental and Monitoring Management Consultant (EMMC) / Management Consultant (MC): Day-to-day supervision of GAP implementation, monitoring, and reporting.
- Contractors: Implementation of construction-phase gender actions, including employment targets, facilities, and GBV risk mitigation.
- Operator (Operation Phase): Ensuring sustained electricity benefits and monitoring gender-related outcomes during operation.

Corrective actions will be initiated where gaps are identified, and the GAP may be updated as necessary to respond to emerging issues during implementation.

ANNEX-VI: KEY PERFORMANCE INDICATORS

KEY PERFORMANCE INDICATORS

Indicator Category	Example Indicator	Unit / Target
Energy Efficiency	Reduction in grid losses	% reduction
Pollution Prevention	Compliance with emission/discharge standards (NEQS)	% compliance
Pollution Prevention	Number of pollution incidents reported and addressed	No.
Pollution Prevention	Levels of key pollutants (BOD, COD, heavy metals) in effluent	mg/L
Pollution Prevention	Concentration of particulate matter (PM2.5, PM10) at project sites	µg/m³
Pollution Prevention	Reduction in greenhouse gas (GHG) emissions	tons CO_2 equivalent/year
Occupational Health & Safety (OHS)	Lost Time Injury Frequency Rate (LTIFR)	No. / million man-hours
Occupational Health & Safety (OHS)	Workers trained in OHS	%
Occupational Health & Safety (OHS)	Workplace accidents/incidents reported	No.
Waste Management	Solid and hazardous waste generated, treated, or recycled	tons/year
Waste Management	Project waste disposed of in compliance with regulations	%
Community Health and Safety	Community health and safety incidents (traffic accidents, hazardous exposure)	No.
Community Health and Safety	Community members reached through health and safety awareness campaigns	No.
Community Engagement	Community consultations held	No.
Community Engagement	Project-affected people who feel adequately consulted	%
Grievance Redress	Workers trained on Code of Conduct (including SEA/SH prevention)	No.
Grievance Redress	Project beneficiaries from vulnerable or disadvantaged groups	No.
Grievance Redress	Grievances received and resolved through the Grievance Redress Mechanism (GRM)	No.
Grievance Redress	Grievances resolved within stipulated timeframe	%
Labor and Working Conditions	Workers with signed contracts and access to grievance mechanisms	%

Labor and Working Conditions	Unskilled labor sourced locally	%
Labor and Working Conditions	Project activities accessible to women, indigenous peoples, or persons with disabilities	%
Land Use	People affected by land use or acquisition	No. (Target: zero)
Biodiversity	Area of natural habitat restored or protected	Hectares
Biodiversity	Species (flora/fauna) monitored or protected	No.
